Small shoots of figs can be budded by what is called ring-budding—that is, take the bud with a circle of bark, splitting it at the side of the ring back of the bud. Remove a similar ring from the stock and put the ring with the bud in its place. A waxed-band has to be used to hold in place tightly and exclude air. It is a difficult process, and needs a good mechanical hand. Fig grafting in old wood is much easier. Do not split the stock. Cut the scion with a slope on one side only and push down inside the bark or take a short spur cut with a plate of bark, cut out a piece of bark of the same size on the side of the stock and plant the scion-plate in its place—fastening down tightly and waxing thoroughly.

Stacking Beans.

To the Editor: Will blackeye beans finish curing in stack after tops, pods and all light straws are dry? I cut these beans some two weeks ago and have left them in windrow to cure. The heavy stems and roots are very slow drying, and as it is getting late I am anxious to get them stacked if I can do so without danger of loss in doing so. I want to have them threshed by machine.—Subscriber, Orange Cove, Fresno county.

If everything is thoroughly dry except thick stems and roots and the beans are hard, they ought to stand stacking without injury. Although stacking is not much done in California, it is a common practice at the north, where there would seem to be more danger of too much moisture than in Fresno. Stacks are built on a foot-depth of straw and covered with straw to shed rain.

Collapse of Chicken Manure.

To the Editor: If chicken manure is taken from the dropping boards and stored in a dry place where the rain does not get on it, and after being stored six months the manure has heated and burned down one-half of its bulk, does the remaining half still contain the fertilizing value of the original bulk?—W. L., Penryn.

It does not. The loss in plant food may be even greater than the decrease in bulk. The fermentation sets free the nitrogen and otherwise destroys the organic matter and these are the chiefly valuable contents. You may have left little more than the ash or mineral contents. The manure should have been thoroughly sun-dried before storage and if thus treated the loss would be very light.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., October 22, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.56	2.47	3.13	68	44
Red Bluff	.02	7.87	1.88	82	50
Sacramento	.08	3.96	1.08	88	48
San Francisco	.04	2.70	1.12	84	54
San Jose	.03	6.46	.97	82	42
Fresno	.00	.59	.74	82	48
San Luis Obispo	.01	1.50	1.29	[illegible]	48
Los Angeles	.00	.67	.53	84	58
San Diego	.00	.59	.39	78	58

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

An Honest Pack of Fruit and Vegetables

[Written for the Pacific Rural Press by Geo. P. Weldon, Chief Deputy, State Commission of Horticulture.]

NO CONSUMER can afford to pay the price of good fruit for the inferior grades; on the other hand, he can better afford to pay a much higher price for good fruit than for worm-eaten, poor fruit, for, after all, it is not the number of fruits in a box that determines its value, but the number of good fruits with little or no waste in preparing for the table.

The State Commissioner of Horticulture, G. H. Hecke, is absolutely responsible for the enforcement of the law relating to the standardization of the apple pack, and indirectly responsible for the enforcement of another law which relates to the packing of other deciduous fruits and, in addition, tomatoes and cantaloupes. For some weeks the activities of at least four members of the State office have been practically confined to an effort to enforce these laws. Some arrests have been made and a decided improvement over last year's pack is noted in the pack of all fruits, as well as cantaloupes and tomatoes.

DECEPTION IN PACKING.

It seems strange that a man who is considered perfectly honest and who would resent with force, if necessary, any implication that he is otherwise, will pack apples or tomatoes or perhaps something else with small, worthless, inedible trash in the bottom of the package and the finest specimens obtainable of the particular fruit or vegetable on the top. This practice has been in vogue so long in California that some people have actually come to believe that it is honest, yet it never was and never can be. The first growers who packed in this manner did so with the idea of making the fine fruit on top of the package sell the trash in the bottom of the package at a figure greater than it was worth. The purpose of such a pack today is no different from what it was in the earliest days of the industry.

RETAILER KEEPS EVEN BY FLEECING THE CONSUMER.

What is the result of the deception practiced in placing poor fruit in the bottom and good fruit on the top of the package? The commission man sells to the retailer the fruit or vegetable in the original package. He knows it to be deceptive and would rather that grading had been carefully done, but since it has not been he trusts to the beautiful top layer and the slightly inferior layer underneath to sell the bottom at a good price, which it usually does. The retailer finds it necessary to sell by the pound, and in order to make his profit he must either discard the worthless fruit and charge a price for the good which represents what it is worth plus what he paid for the fruit he couldn't use, or he must mix a few worthless fruits in each pound which he sells, thus getting for them and the good fruit a like amount. In either case the consumer is paying for something which he does not receive. Who is the chief offender in a transaction of this nature—the packer who first arranged the deceptive pack, the commission man who sold it without rearrangement, or the retailer who charged an exorbitant price in order to be sure of his profit?

TOMATOES A GOOD ILLUSTRATION OF DECEPTIVE PACKING.

Perhaps there could be no better illustration than that of the tomato pack which was found generally in the commission houses of San Francisco recently, when a raid was made to improve its condition. The ordinary lug boxes were packed three layers deep. The top layer consisted of large, uniform, solid, smooth, almost perfect specimens; the second layer consisted of tomatoes that were far inferior; and the lower layer consisted of small, half green, and in some cases half rotten specimens, which by themselves would bring very little money. As an object lesson some of these nicely packed boxes were dumped loose in other empty boxes so that the small and very inferior tomatoes were on top. The attention of the commission man was called to the violation of the "Fresh Fruit Standardization Law," which requires that tomatoes when packed be practically uniform in size, quality and maturity, and that there be practically the same number in the lower as in the top layer. He was told that he could sell them loose in the box after dumping if he liked. The reply plainly illustrated the value to the grower and commission man of a deceptive pack. It was: "We couldn't get 15 cents for them that way, while if left packed with the big ones on top they are worth 75 cents." They were left to wrestle with the question, "Why are they worth only 15 cents when turned upside down, when they are the same tomatoes?" Orders were left among the commission men that after a certain date such tomatoes should be sold loose in boxes after being dumped by the County Horticultural Commissioner, if sold at all, with the result that on the date named there was a decided improvement in the pack and only a very few boxes required dumping.

WORMY APPLES SOLD AT EXORBITANT PRICES.

Practically the same thing holds true in the case of certain other vegetables and fruits. In the case of apples the chief difficulty is worms. In the attempt of the State Commissioner of Horticulture to eliminate wormy fruit from the markets the inspectors are met with the plea that the work that is being done is against the interests of the consumer, especially that class of consumer which is not able to pay the price that the best grade of fruit commands. Those who are in closest touch with the situation can immediately detect the fallacy in the argument. For example, while inspecting in the markets of Los Angeles recently many commission houses were found to be stocked with wormy apples ranging from 25 per cent infestation to more than 90 per cent infestation. Prices for such fruit were quoted usually around 50 cents per box, which was somewhere near the true value. Some of the same apples were seen in one of the uptown retail establishments, advertised with a big placard on the front of a nicely arranged pile at 5 cents per pound or 6 pounds for a quarter. The consumer paid for this fruit the price of the best fruit, and carried away something where the waste would be 25 per cent due to cutting away portions injured by worms.

Standardization is for the benefit of the consumer as well as the producer and the commission man. Wormy, inferior fruit can be utilized to good advantage by by-product factories, and its value for such purposes is much greater than for consumption while fresh. During these times of food shortage there must be no wastage, and in all the standardization work at this time nothing of any value is allowed to go to waste.

ARSENATE FOR CABBAGE WORMS

Spraying cabbage with arsenate of lead for worms within three weeks of harvest is not dangerous to people who eat the cabbage, according to the special field agent of the U. S. Bureau of Entomology at Alhambra. The outer leaves which are poisoned are naturally removed before eating. The spray for cabbage worms is made by dissolving two pounds of common soap in hot water, diluting it to 25 gallons, and stirring in ¾ pound powdered arsenate of lead or 1½ pounds arsenate of lead paste. For one gallon of spray use ½ ounce powdered arsenate of lead and an inch cube of soap.

Right and Wrong Pruning of the Apricot

[Written for Pacific Rural Press by John J. Fox.]

There is probably as much diversity of opinion as to the best method of pruning apricots in the different sections as any tree we know of. But one thing is certain and that is that they must be pruned. Non-pruning of apricots results in a superabundance of poor wood growth, too much fruit, small fruit, split fruit, and sunburned fruit, for it will all be on the outside of the tree. Foliage does not grow strong on spindly wood, and a lot of unnecessary evaporation takes place through superfluous foliage.

QUANTITY VS. QUALITY.

There are still some people who are willing to raise apricots this way in order to get the tonnage. Yet the heads of departments were puzzling their brains more than ever this year wondering how to dispose only the big cuts are made and water-sprouts kept out.

WINTER PRUNING AND SUMMER PRUNING

The later growth is left over to come off with the thinning of fruit wood in winter. It does not pay to lay the tree too open through the summer, but the water-sprouts, surplus large wood, dead limbs and those dying from black-heart or borer should all be cut out after the crop is off, as they all evaporate moisture (even the dead and dying ones), and this moisture must be conserved for the tree's needs. Wounds from gummosis, sunburn or tool injury should all be cleaned up back to sound bark, scraped and covered with asphaltum to prevent infection till they can heal over and to keep them from checking and drying out. One man told us this

The above stand of symmetrical, well-balanced trees shows the result of thoughtful, scientific pruning.

of the quantities of small 'cots produced during the past year.

The young trees are headed low, as in other fruits, in order to protect themselves from sunburn and to facilitate picking. They are built like peach trees, with three or four main leaders, and are cut back to the third year. After this they can be cut back to the first whorl of laterals, and no more forcing of wood growth practised at all. The apricot is such a strong grower that, if the tree is healthy and the orchard well managed, there will always be plenty of wood growth till the tree gets old. If it had not been for the rains this year, many 'cot orchards would have needed a very severe cutting. As things stand now, however, considerably more wood can be left, for the trees are in tiptop condition. We do not know whether the new growth induced by the rains will affect the crop next year, but would say not. The common practice of pruning apricots right after the crop is off seems to be the best, provided year that he left a lot of suckers in his apricot trees when summer-pruning because of the dry season, and they needed more foliage to maintain growth. This is just the year when all unnecessary suckers and superfluous growth should have been removed; for the greater the leaf surface the greater is the evaporation of moisture through that surface.

Where the new fruit wood is very spindly and scant, it is evident that the tree has not the vigor to produce it. There is either (a) lack of moisture in the soil (whether from failure of supply or conservation), (b) too many limbs, (c) too much brush, (d) injury from insect pest. It is for the owner himself to determine which of these (or a combination of them) is responsible. In any case a good stiff pruning is necessary as a first step to promote a more vigorous growth of new wood, and a winter clean-up spray is generally needed at least every second year.

Spray Campaign Against Morning Glory

[Written for Pacific Rural Press.]

The Santa Cruz County Farm Bureau is carrying out a demonstration in and around the Pajaro Valley this week that will be watched with close interest by all who have morning glory to dispose of. Professor George W. Cray of the University of California, who has been working on a control spray for this weed during the past three years, is spraying ten demonstration plots on as many ranches which had been set aside by their respective owners for this purpose. These patches of morning glory had been allowed to grow from the middle of August till now. The material used for the control of this persistent weed is an arsenical spray, which has a more killing effect on mature weeds than on young shoots and which must be sprayed on the plants during foggy weather, when it is absorbed by the plant and taken to the roots, where decay sets in during the following week or ten days. If applied during clear, warm weather, only the tops of the plants are killed. The cost is said to be about $5 an acre. A bulletin is issued by the University describing the treatment.

If the demonstrations are successful there will be joy in the hearts of many owners of very valuable land.

The University of California is offering those who have had experience in farming opportunity to obtain the use of land in many sections of the State for growing wheat and other foodstuffs. About 175,000 acres of land have been listed as available for lease or purchase. Applicants for these lands should write direct to the Division of Agronomy, College of Agriculture, University of California.

The Place of the Olive in California

[Written for Pacific Rural Press by John J. Fox.]

The California ripe olive is not simply a relish. It is a food that is coming into favor by leaps and bounds. A piece of bread and a cupful of ripe olives provides not only an appetizing lunch but a satisfying ration. It is also an invaluable remedy in cases of intestinal irritation.

The Californian knows the value of the ripe olive; it is on his table more or less every day. He originated it as it goes to the consumer today. The stranger that enters our gates eats it once and tells all his Eastern friends about it — maybe sends them some as a delicacy. The United States is the largest consumer of ripe pickled olives in the whole world, yet for us the market is only just scratched. Both our pickles and oil have created a name for themselves all over the world as the best the world produces. Yet the amount of both that California produces is quite insignificant compared to what the market can and does use. In 1917 we imported 5,641,759 gallons of olives for our own consumption at the table. The same year we imported 7,533,149 gallons of olive oil for table use and 615,018 gallons for manufacturing and mechanical purposes, of a total value for olives and oil of nearly thirteen millions of dollars. The import duty on the olive oil for consumption is 30c a gallon in bottles and 20c a gallon in casks. Most of the olives we import come from Italy, with France second.

WHAT WE ARE DOING TO COMPETE.

So far we are competing in only one line to any extent and that is with the California ripe olive. Our oil is more in the nature of a by-product, though of excellent quality; i. e., those olives are used for oil making which the pickling factory doesn't need. The chief endeavors of the California grower is to produce a pickling olive that shall be large, firm, shapely, rich and substantial. For the pickling olive is worth about three times the price of an oil olive, as high as $300 being paid this year for pickle and $100 for oil olives. Therefore the endeavor of the grower is to produce as many large olives as possible by (1) planting the best varieties, (2) by thorough pruning, (3) by good cultural methods. Not less than 70 per cent of a crop should be fit for pickling. The sections suitable for the production of the olive have been decided upon and heavy plantings have taken place during the past few years. It will not be long before a large area of young olive orchard will be coming into bearing. Growers' associations as well as private producers are turning out finished manufactures of olives and olive products that will, in course of time, take their rightful places at American tables all over the United States and reduce importations.

VARIETIES.

The leading variety is still the Mission, the best type of which is now chosen and will be adhered to in the future to perpetuate what is known as the Mission olive. Then follow the Manzanilla, Ascolano, Sevillano, Nevadillo Blanco, and Obliza. The trees are no longer planted less than 25 or 30 feet apart. The olive seems to thrive best on well-drained sandy loam soil (especially where there is plenty of lime) and is not deficient in potash. Even rocky places on warm hill slopes grow a good tree provided there is good depth of soil—for the olive is a deep-rooted tree. It can survive a great deal of drought, but to be profitable it demands as much moisture as the average tree—also good cultivation.

The increased demand for the Italian type of olive is, as we reported last week, owing to the impossibility of obtaining transportation for the European article. California will manufacture this type of olive this year to an increased extent to meet the demand, and it is hoped that this will give her an entry to the Latin markets of America. Dried olives are used in Spain and parts of Italy as a staple, just as pink beans are a staple with our own people. Green olives are eaten as a relish before meals as an appetizer. In England they have been used for probably two centuries, at dessert, with wine, to restore the palate. Also as a digestive.

THE OROVILLE SECTION.

Olive trees thrive and bear especially well as border trees and on avenues. The Hammond place at Palermo, one of the largest orange plantations in the north, is completely bordered with olives—all Missions — in addition to the olive groves, and the crop this year will run about 60 per cent, which seems to be the average for the State. We were shown three trees, which stood side by side, that have produced an average of 600 pounds of fruit each for three consecutive years, though they are only 20 feet apart. They are border trees and are, of course, exceptional. This whole place is about half oranges and half olives, splendidly pruned and cared for. One thing that strikes a stranger in this locality is the remarkable freedom of its trees from scale—not one smutty branch did we see, the foliage being silvery and bright. The fruit was exceptionally fine, partly owing to the rains. The trees on this place are 27 years old. On the Elsner place, near by, there is a border of olives equally fine.

NON-CULTIVATION.

The Burt Bros. of Palermo have 60 acres of olives that are only plowed once in several years, an overgrowth of weeds being left to form a perpetual cover-crop. The trees looked thrifty and strong and were carrying about 70 per cent of a crop. A dressing of lime had been given, which Grinnell Burt said would later be disked in. Non-cultivation does not appeal to us as being to the best interest of the soil, though the owners are following this as a deliberate policy and not to save work or expense necessarily. To keep up soil fertility, even if moisture can be furnished in adequate amount, the cover-crop must be thoroughly plowed under and incorporated in the soil to obtain the benefit of all there is in it. Doubtless on some of the lighter soils the ground is sometimes overworked in an excess of zeal and some humus is lost in the effort. We shall be interested in following the results of this system of cover-cropping which has been followed in so many instances in the south in citrus groves.

WYANDOTTE SECTION.

J. H. Bumgarner, in this section, has 22 acres of Mission olives only four years old, from which he took a small crop of fine fruit this year. The land here and the climate is particularly adapted to the olive. The best land throughout this district is gradually being put into shape and planted out chiefly to Missions and Manzanillos. C. H. Mott has 12 acres of Missions, seven years old, bearing a good commercial crop, and has supplemented this with a young planting of Manzanillos—eight acres. Fred Cornell has 60 acres, nine years old, with an average 60 per cent crop on, which is expected to pay him better than his almonds and peaches.

A well-grown olive tree is a delight to the eye and of profit to the grower. It makes a very sightly avenue or border to orchard or vineyard wherever the location and soil is suitable, and is a handsome yard tree. Its venerable and romantic history and setting will always lend interest to this wonderful, virile tree, whose progress as a commercial producer in California is worth watching.

OVER THERE
and
OVER HERE

Thirty-five of our young men, recently graduated from the University of California as dentists, heard duty's call, joined the Army and Navy and are OVER THERE.

In the meantime—

OVER HERE—While the nation is at war Amendment No. 21 has been initiated to open wide the doors of California and let in the riff-raff from every back-woods State to practice as dentists without examination.

Yet, when our boys come back—if they do come back—they must compete with the derelicts and incompetents who would come in without examination—unless this measure is defeated.

There can be but ONE ANSWER.

Vote NO On Amendment No. 21

PEARS IN FAVOR IN THE NEW PLANTING.

[Written for Pacific Rural Press.]

J. E. Bergtholdt of the Silva-Bergtholdt Nursery Co. (Newcastle) will plant 10,000 Bartlett pears on his ranch in the Mt. Pleasant district this year, probably interplanting with Beurre d'Anjou for pollination. This firm now has 900 acres in orchard. Their pears are on both Japan and French root and both seem to look equally well. One plantation of Formosa plums he is interplanting with pears with the object of removing the plums later for the reason that plums in this particular section are liable to injury by frost.

The plum trees are vigorous and about six years old, but the pear seems to come right along as an interplanted tree—probably better than any other deciduous fruit. There is said to be no blight in this section; at least, it hasn't showed up so far. A good growth of grass shows everywhere in this section and a heavy growth will be ready to turn under in the spring. Provided the weather is not so mild as to induce premature blooming, there is a good promise all around Auburn and Newcastle for a heavy setting of fruit next year. Newcastle district and Auburn seem to be rather unique in that they can produce all kinds of deciduous and some citrus fruit and berries. Probably Vacaville and Winters is the only other section that can do this. They have established direct small central markets all throughout the Middle West and are able to ship mixed carloads of fruits direct to the wholesalers, obtaining net prices f. o. b. Newcastle, which is a great shipping point for green fruits. When we were there shipments of grapes, persimmons and late pears were still going through. Being right on the State paved highway and a transcontinental line of railway, it is exceptionally well served. We had an opportunity of going over the nurseries here.

Mr. Bergtholdt told us there was a good demand for pears, peaches and prunes already. We have been asked whether it was permissible to accept Liberty Bonds at par as part payment for trees to plant out. Why not? If the grower has put up so heavily for bonds as to preclude the possibility of paying cash for the trees, it is better to make an exchange than to have those trees destroyed for lack of a planter. Planting of trees should not cease because of the war, for it is the paramount industry of the State of California. And though there is a large new area in all stages of coming into bearing there is also a large acreage of old and decrepit or otherwise unprofitable fruit trees going out of commission each year. Those of us who are horticulturists and are raising fruit for the world's consumption must stay with our jobs. We constitute a good big cog in the wheel of life's driving gear and no cog must be allowed to slip, now of all times. Ours is constructive work of a very high order of importance. We have to make a bonnie fight every year of our lives to produce fruit of a standard degree of excellence (and we ourselves have set that standard high). We have to fight insect pests and fungous diseases, drought, frost, rain, wind or something new every year in order to deliver the goods. This we invariably do. Therefore, we shall continue to plant trees and vines; and if we are crippled for funds to pay for them we will have to turn in some of our bonds.

LET NATURE FILL GULLIES.

A steep-sided ditch, 10 to 15 feet deep, washed out one night in 1916 on the ranch of R. Featherston in Santa Barbara county. He put in loose brush about 3 feet deep at intervals, not tight enough to stop the water and float away but to slow the current enough so sediment was deposited. The following summer the brush was all covered with dirt and more brush was added.

California's apple crop is said to total 3,380,000 boxes.

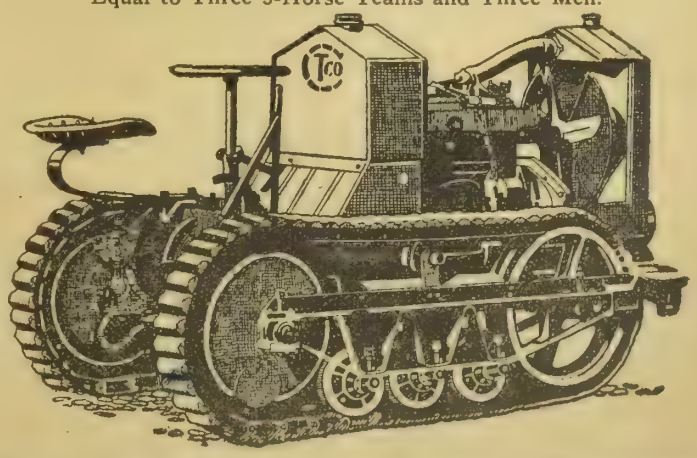
The Cleveland Tractor
"The Little Tank"
Man, Woman or Child can operate it.
Equal to Three 3-Horse Teams and Three Men.



The Tractor for Every Demand
You Cannot Afford to Wait—

I have just been at the Cleveland Factory to increase my orders for tractors. We will get less. The Government has cut down the output. The big loss will come to the farmer, for there will not be enough of all makes of tractors put together to go around, and with the shortage of labor, thousands of acres of land will not be turned over this year. It is going to be a known loss to some farmers and the Government.

F. H. STOW

The Cleveland is small but powerful, it is simple but unusually economical. Comparatively light, yet heavy enough to do its work and keep on doing it.

Thousands of Western Farmers Look for the Giant Trade Mark

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

The Giant trade-mark on each case of Giant Farm Powder is put there for your protection. When you see it you know you are getting the real Giant Farm Powder—the kind that has been cutting blasting costs for more than half a century.

Giant Farm Powders—Eureka Stumping and Giant Stumping—have become so popular that many other high explosives are often in error called "giant powders." Don't be misled. There is only one brand of Giant Powder. Demand the genuine.

"I have tried all stumping powders on the market under every practical working condition," writes James Foran, Big Lake, Wash., "hereafter I will use nothing but Giant." Joseph Labunski, Cedar Camp, Ore., says, "Whenever I use powder, it will be Giant."

Send Coupon or Postal mentioning this Paper

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Almond Notes.

In the Woodland district some almonds have been stained, but there is no direct loss reported. The trees, both young and old, have picked up in condition wonderfully. Many almond growers—especially small men new to the game or old inhabitants who have always grown grain or cattle—are very slack in their methods of pruning and spraying. There is no tree in California that looks more forlorn, disreputable and out-at-elbow than an old almond tree, full of dead suckers and crossing limbs, with foliage all gray with red-spider work and dropping off the tips by the end of July. The almond-growing districts are working into a regular system of care and attention, not before they needed it, but—oh, those roadside and border trees where a man doesn't own a spray pump! They are surely unprofitable servants.

Gloria in Excelsis, Deo.

October 17 and 18—these last two days farmers and dried fruit men have been blessing the north wind, literally giving thanks for it. The dried fruit and raisin men have been extra busy and more has been accomplished than in any previous week or two. The bean men are pulling to beat the band and turning what are in windrow. It will enable the sugar beet men to clean up what there is left and the rice men will be right into harvest. Here's hoping the weather is propitious anyway till this brief notice gets to press. We are getting almost afraid to record current conditions these days. This is probably the first time in the history of California when all men have blessed the north wind and welcomed it.

An Old Apricot Orchard.

We recently passed by the original Briggs apricot orchard near Yuba City, now owned by Dr. Jackson. The variety is called "White Royal" and only about five acres of the old orchard is left. Last year 2000 crates of fruit were shipped from these trees, which are over 50 years old and have not been plowed or sprayed for 20 years. They still look strong and vigorous. The ground is used as a pasture, so of course the trees are bare of foliage as high as a cow can reach. We are not recommending this kind of management, but it is interesting as showing what apricots will do on good ground under adverse circumstances.

Assn. Saved Pear Growers Money.

The California Pear Growers' Association has recently joined the California Federation of Farmers' Co-operative Marketing Associations. The Pear Growers' Association, according to President F. T. Swett, has just closed its first season, a very successful one. While the organization expense was only $3,000 total, due to the directors having donated their time, the association in its first month made contracts which saved over $100,000 to the growers, including the $10 per ton increase on low-priced pre-war contracts.

Loss Reduced by Evaporator.

George H. Hecke, State Commissioner of Horticulture, says his loss on 60 acres of prunes will not be more than 25 per cent, owing to the fact of his having an evaporator on the place to help out. Fifteen per cent of the balance will be No. 2s. On the 8th he was dipping his last picking of green fruit, and it looked good. That which had been through the rain and rehandled looked fair, and the best of it very good. Besides, Mr. Hecke had 50 tons already harvested and in the warehouse before the storm.

A Faithful Record of Service.

At George Roy's place on the San Juan ridge there are some remarkable old pear trees—old '49ers—one of which is reported to have carried 3000 pounds of pears one year. It is a Winter Nelis. We cannot prove this, but are willing to believe it. The average tonnage per acre on the upland in Nevada county is probably five tons where clay is close. On the deep soils, and on bottom land, this should increase to eight tons to the acre for mature trees.

Persimmons Being Shipped.

Newcastle and down the line is shipping persimmons, for which there seems to be a steady demand. New York seems to appreciate them, and from an aesthetic standpoint a No. 1 "Wonderful" is certainly a delight to the eye, both in form and color. As a commercial product its scope is limited, but every garden in California should have one of these bushes, which are beautiful all the year and showy twice—when in bloom and at harvest time.

More Dried Fruit Wanted.

More dried fruit and other California products than ever will be needed to feed the hundreds of thousands of enemy prisoners that have been rounded up during the last few months. The kaiser and his staff probably had to console themselves with this reflection while they were hiding in the cellar at Mannheim to boost the morale of their men.

A New Dip.

Leland Boggs of Napa, on redipping his prunes, used 2 pounds of cooking soda, 1 pound of lye, and ½ pound of alum to 20 gallons of water. He says they came out fine and in good condition. He saved the entire crop from his young trees (about four tons), the first fruit they have borne.

Future for Pears and Almonds.

One of the things that can be said of the road from Grass Valley to Marysville is that it is picturesque throughout its 36 miles of length, while the variations in the roadbed itself dispel monotony and inspire hope. We saw much land that we thought should be fair for pears, also some good almond land.

Prune Prices.

In view of the tremendous losses by prune growers from the inclement season there is a movement on foot to revise prices. When the Government set the price there was four times more tonnage in sight than exists now. And the Government takes all the best, naturally.

Loss in Napa and Sonoma Counties.

The loss of prunes in Napa and Sonoma counties is now estimated at 50 per cent of the total crop.

Horticultural Week—Riverside, November 11-16.

First—The fifty-first State Convention of Fruit Growers and Farmers.
Second—The Annual State Convention of the California Association of Nurserymen.
Third—The First Interstate Plant Quarantine Conference—delegates from every Western State and from the U. S. Department of Agriculture.
Fourth—First Vegetable Growers' Conference.
Fifth—Annual Convention of the State Association of Horticultural Commissioners.

These five big conventions in conjunction compose Horticultural Week. In addition to the usual programs, speakers of national reputation on War, Food Production and Labor will introduce and lead their subjects in discussion.

JOSEPH OPPENHEIM
Inventor of
New Idea and Nisco Spreader
Founder of the New Idea Spreader Company

About 18 years ago when the mails brought to Joseph Oppenheim the patent papers covering his wide-spreading distributor, he sat for a while in deep thought. When asked what was on his mind, he said:

"I am sorry that a patent is good for only 17 years. It will take at least 15 years to educate the people to the wide-spreading machine, and within two years after these patents expire, competition will be imitating and copying."

What a truly remarkable insight into the future! How thoroughly his words have come true! At that time we were building less than 100 spreaders a year and everybody ridiculed the invention, calling it "Oppenheim's wind mill," and other choice names. But he was not discouraged and went forward with a strong faith, and today, in spite of the fact that competition did what he foresaw, our business has grown until we are the largest exclusive spreader manufacturers in the world.

The New Idea Spreader Company is a partnership owned entirely by Joseph Oppenheim's six children, who pride themselves on putting into every machine they make, the quality and the service which was their father's ideal.

NEW IDEA ONE MAN STRAW Spreader Attachment

Here's another New Idea improvement which will mean much to the farmer. It enables you to use your grain straw, which has a fertilizing value of about $8 per ton, for improving your land and crops instead of selling it "for a song" or burning it in the fields.

Easily and quickly attached to New Idea or Nisco Spreaders, giving you two machines in one for very little additional cost.

Write us direct for illustrated circular.

NISCO

The Original Wide Spreading Spreader

Have you read the little story in the panel at the left? It conveys a real message to you and every progressive farmer who uses or should use a mechanical spreader. When you invest your hard-earned money to the amount that a good spreader must cost in these days, you cannot afford to be satisfied with a device which simply dumps the manure nor even one that throws it some distance, here in chunks and there so thin you can't see it. It is **real service** that you want in spreading the manure evenly and widely and thoroughly shredded; a machine that you can load easily and which your horses can pull without undue strain. Is there any better way to get all these desirable quantities than by going to the original source? There is more truth than poetry in the saying that

"An imitation---be it ever so good---is still an imitation."

The growth of our business testifies that the majority of farmers realize this and prefer the original. They want the machine that Joseph Oppenheim invented, and which his family is building at present in immense quantities.

The Nisco Spreader gives you not only all the advantages enumerated above, but it has another very strong feature in its favor, and that is, the machine is built to last. It takes years to wear one out, and we guarantee it for a year against breakage from any cause. Tens of thousands of "Niscos" have been sold all over the country. Some of them sold years ago are still rendering faithful service, while many an imitation has gone to the scrap heap of forgotten things.

Let us send you our catalog which will give you full details. Better still, go to the nearest Nisco dealer and let him show you the machine. If you don't know who he is, or there is none close by, write to us or the nearest branch listed below, and we will see that you get full information promptly.

At the same time, we will be glad to see that you get a copy of our book entitled, "Helping Mother Nature," which has a wealth of information about manure not usually published. It won't cost you a cent.

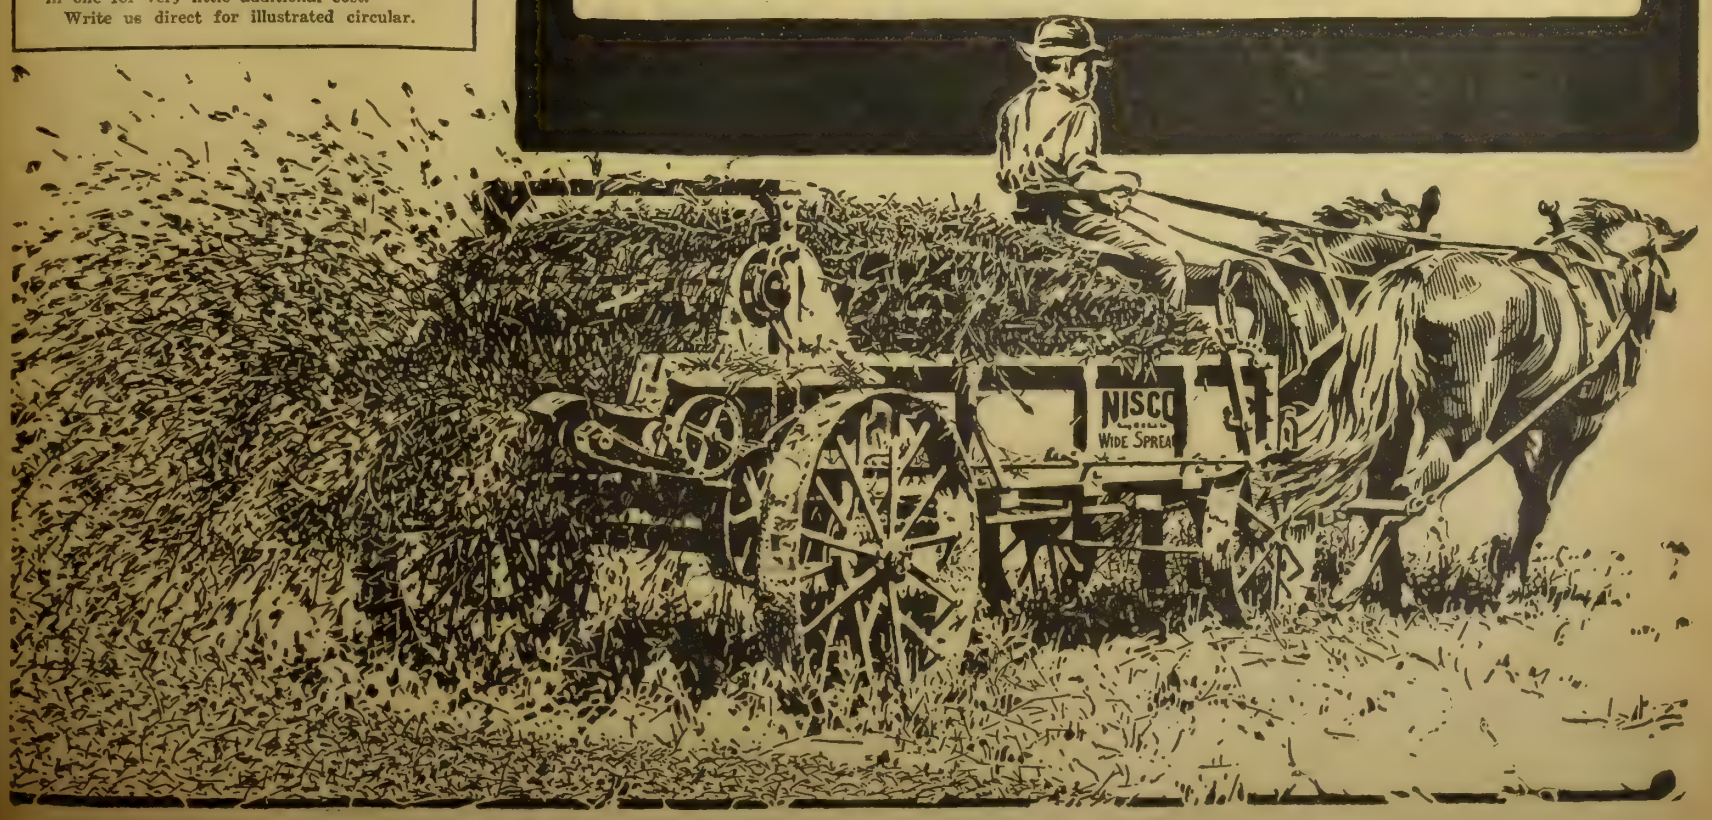
Pacific Imp. Co., San Francisco, Cal. (1)



Spanish and Sweet Chestnuts

Pacific Rural Press, San Francisco.

The California Mountain Fruit Company in Nevada county has ten acres of chestnuts planted out in its orchard as an experiment. E. A. Bolster, the manager, who also has an interest in these orchards, showed us some Rochester and Rochester No. 20, which were as good fruit as is ever shown in the California markets. The trees are planted 40 feet apart and have made really wonderful growth on a reddish clay loam soil of good quality and depth. The fruit was about ripe and many of the burrs were bursting (October 9). The heavy early autumn rains and subsequent warm weather had started the trees up again and we noticed a number of blooms on the terminals, also a few tiny young burrs appearing.

A PROMISING EXPERIMENT.

This experiment seems to be a promising one for Nevada county. We would also like to see it tried in Humboldt and Mendocino counties, where there is a good depth of reasonably well-drained soil. There are probably a few trees scattered around there now, but most that we have seen, though thrifty growers, bear small fruit of like value for the market.

A. L. Wisker of the Loma Rica Nursery at Grass Valley also has six or seven of the improved varieties which he is going to try out. So far as he has gone at present, he favors the Rochester No. 20. He has seedlings of the American Sweet, which he says make a better union with the improved varieties than do the European or Asiatic types. He told us that last week's price on the improved chestnuts in New York was $15 a bushel. This makes walnuts look cheap!

WIDENING INTEREST IN CHESTNUTS.

We were not searching for chestnuts—nobody ever does—but were only investigation horticultural conditions generally; yet in two days we happened upon three different men who were experimenting with this fruit. The other man was Geo. P. Weldon, chief deputy of the State Commission of Horticulture, who showed us some eight samples of improved nuts he had collected and was going to try out. Therefore, if anyone is interested they might write to Mr. Weldon or Mr. Wisker. E. A. Riehl of Alton, Ill., is an authority on chestnuts and we hope to get more information on this tree. Anyone who intends planting one in the yard for beauty—and it is a beautiful tree—would do well to buy or obtain trees of the improved type, which would afford profit as well as pleasure. We are promised reports from these people who are experimenting and hope to examine their problems in person from time to time.

Bean growers of Merced county are rapidly signing up for membership in the California Bean Growers' Association, a co-operative organization.

Some Olive Problems

[Written for Pacific Rural Press by John J. Fox.]

The planting of olives this season will be almost entirely confined to replacing missing trees. We called on Dr. E. H. Buffum of the California Olive Association, who has a fine plantation and a pretty home at Fairoaks. He says the season is a little earlier than usual. The picking of Manzanillos has already begun (October 9) He showed us, in comparing some trees, the necessity of careful pruning, especially in a year like the present, saying that the tendency was to leave too much wood on the trees, thus impairing the size and quality of the fruit; and, further, that olives do not require the close cutting that is practised near the coast owing to the greater heat of the interior, so that climatic conditions as well as the character of the tree, must be considered in thinning out and cutting back.

MEDIUM-SIZED OLIVES POPULAR.

Dr. Buffum also said that they had an increased demand for medium-sized olives, for which they had provided and which had been advertised through slips in each orange box. One of these slips presented entitled any buyer to a sample of the olives sent by mail, which resulted in further orders for the canned ripe olive.

Another interesting problem which came up in our discussion was the distance olives should be planted apart on this ground. If they are planted too close together, covercrops will not grow owing to the heavy shading of the ground. On the other hand, the trees are smaller and the fruit is more accessible.

CROWDED OR OPEN PLANTING.

If the trees are planted too far apart, they grow so big that the expense of harvesting from a tall tree is almost prohibitive, but covercrops can be grown and spray outfits, etc., can be easily maneuvered through the orchard. No definite conclusion was arrived at except that an endeavor must be made to keep the trees within due picking bounds. As with the cherry, nobody seems to know how to do this yet, but every grower wants to.

VARIETIES MUCH MIXED.

There is quite a mixture of varieties of olives at Fairoaks, including the Mission, Nevadilla Blanea, Sevillano, Ascolano and others. There is about 60 per cent of a crop this year, which has been increased in quality by the early rains.

The construction of a grain elevator of 8000-sack capacity is among the improvements being made on the Bellevue ranch of the Crocker-Huffman Land and Water Company, says a report from Merced. The original unit is to include two corrugated iron bins set on concrete, intended to do away with the use of sacks and to have the grain kept where it is rat-proof.

Today's Dream—Tomorrow's Reality

Electricity offers to the farmer of the present the means of eliminating the monotonous grind from the day's routine.

G-E Motors Save Labor

You can free yourself from the physical exhaustion resulting from farm drudgery if you use G-E motor-driven machinery to milk your cows, separate cream, churn butter, cut feed and ensilage, saw wood, thresh grain, pump water and perform the many other tasks which make up the necessary activities of the working day. The cost for power is less than the wages of one farm hand. Ask your lighting company or our nearest office for full particulars.

Unarmed Arms of the Service

Men from the battle front who have been holding the line for months and years complain of the monotony of war. The soldier's life in the trenches soon ceases to be a novelty and becomes a tedious routine.

The morale of the army is of supreme importance and the greatest military authorities of the world are enthusiastic in their praise of the organizations which make it their business to keep the soldier in good spirits.

This work, like that of the Signal Corps, has been more highly developed in this war than ever before. Huts for amusement, comfort and recuperation of the fighting men are in the trenches as well as behind the lines. The unarmed workers go about their duties under shell fire as coolly and as self-forgetfully as the telephone men of the Signal Corps who are frequently their neighbors, and who keep intact, often under a hail of bullets, the indispensable lines of communication.

It is for us who remain at home to support these unarmed heroes to the utmost, with our gifts, our labor, and our unbreakable morale.

How a Lima Bean Grower Gets Good Seed

[Written for Pacific Rural Press.]

L. C. Luhr of Encinitas has constructed a bean grader by the use of which he believes he can improve the quality of his seed for the coming year, says the San Diego Farm Bureau Monthly. It is a very slow and tedious job to pick out the poppers and small limas by hand, and it is safe to say that about one farmer in fifty will take the trouble to do it, for it takes about a day to pick over a sack. With the use of this grader, an 80-pound sack of beans can be picked over in from 50 to 60 minutes by one man.

This grader consists of a trough about 18 inches wide and 6½ feet in length. It is divided off into three divisions. The bottom of the first division, which is 30 inches in length, is made up of one-half round material. These small round redwood cleats run lengthwise up the trough, and are about three-sixteenths inch apart, that is, they are just wide enough to allow a popper to fall through, but will not allow the thick lima bean, either the large or small, to pass through.

On the under side of these one-half-round cleats a supporting board is nailed 15 inches from the top of the trough. This keeps the cleats firm and prevents them from shoving over and allowing any of the large beans to pass through. About two gallons of beans are poured onto the slats at one time. The operator then places one hand on top of the slats and one hand on the bottom (the bottom of the slats being flat, of course) and moves the beans around over the top of the slats, and also slides them along by rubbing on the underside. This keeps the beans well spread out, allowing the thin poppers to pass through the slits between the one-half-round slats. In this way the beans are worked off the slats onto the wire screen of which the next division is composed.

This wire screen extends for 30 inches along the bottom of the trough. It is made of galvanized wire, with ⅜-inch mesh. By continual stirring around, the beans are well spread over this wire, and the small limas fall through into a box which is set under the screen. By continual rubbing on top and bottom, the beans are kept spread in a thin layer over the wire, and very few small beans pass over the wire.

The next compartment is about 15 to 20 inches in length and consists of a solid board bottom. From the end of this compartment a pointed snout is built, at the end of which a sack is hung to catch the beans that the operator passes over this last compartment. The beans are slowly shoved over this board floor, and all the broken or injured beans are removed. When the beans pass into the sack, you have a large, well-filled lima bean, which, if given the proper cultivation, will produce a vine which should greatly increase the amount of beans obtained per acre.

The sides of the trough are about 5 to 6 inches in width, and are made out of any old lumber you may happen to have. The legs at the bottom of the trough are placed about 14 inches from the end, and are 30 inches in height. The legs at the top of the trough are placed 14 inches from the end, and are about 42 inches in height. This gives a slope of about 12 to 13 inches, which allows the beans to fall from the trough very slowly.

On the average, about 6 to 8 pounds of small limas and poppers are removed during this process. All the beans that are removed would produce a high percentage of poppers or small, undesirable lima beans, so by grading them out you will increase the quality of bean produced, and also the quantity, for a large number of the poppers are never passed through the harvester, for the pod breaks before the time of harvesting, scattering the beans over the ground.

HELP THE GOVERNMENT.

Have you written to the Department of Agriculture at Washington lately and failed to receive a satisfactory reply? If so, don't criticise Uncle Sam too harshly, for owing to the enormous increase of war work the departments have been flooded with letters of inquiry on every conceivable subject, and it has been found impossible to give many of these letters proper attention.

There is published daily at Washington a Government newspaper—the Official U. S. Bulletin. This paper prints every day all the more important rulings, decisions, regulations, proclamations, orders, etc., and is posted daily in every public office in the United States; also it may be found on file at all libraries, chambers of commerce, offices of mayors, governors and state officials. By consulting these files most questions will be found readily answered; there will be little necessity for letter writing; the unnecessary congestion of the mails will be relieved; and the mass of business that is piling up in the Government departments will be eased. Hundreds of clerks now answering correspondence will be enabled to give their attention to more important work, for by consulting these Bulletins you not only will get quicker information but at the same time will be rendering a patriotic service.

Earle Mills, Horticultural Commissioner of Butte county, recently called attention to an error in our issue of Oct. 19th, entitled "Planting and Care of Nursery Stock." Following is a correction of the error, "Let the belly of the tree face southwest and the hollow towards the northeast."

Cuts Irrigation Ditches

Be Sure to

VOTE

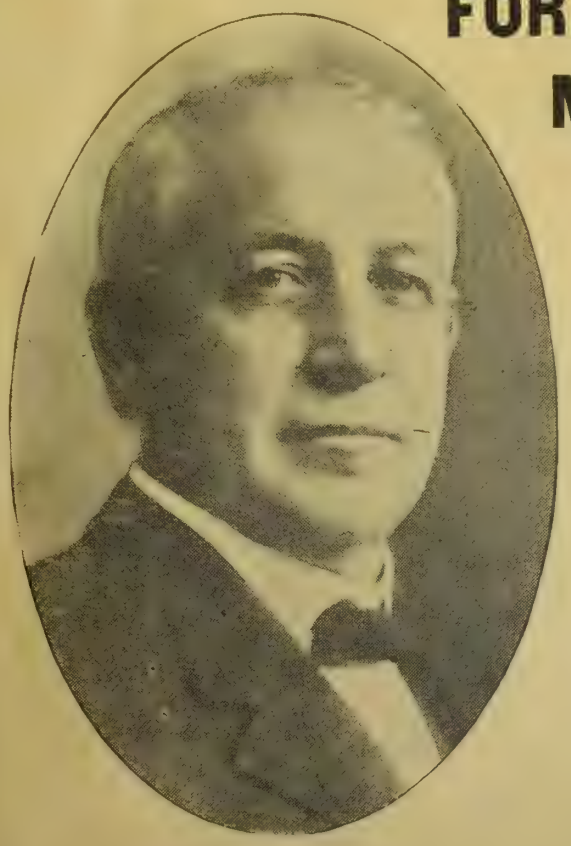
on November 5th

No farm work can be too pressing, no weather too bad to keep you from voting on Tuesday, November 5th.

If nothing else—your duty as a patriot and citizen should prompt you to visit the Polls that Day.

And—if you believe in progressive legislation and clean Government vote

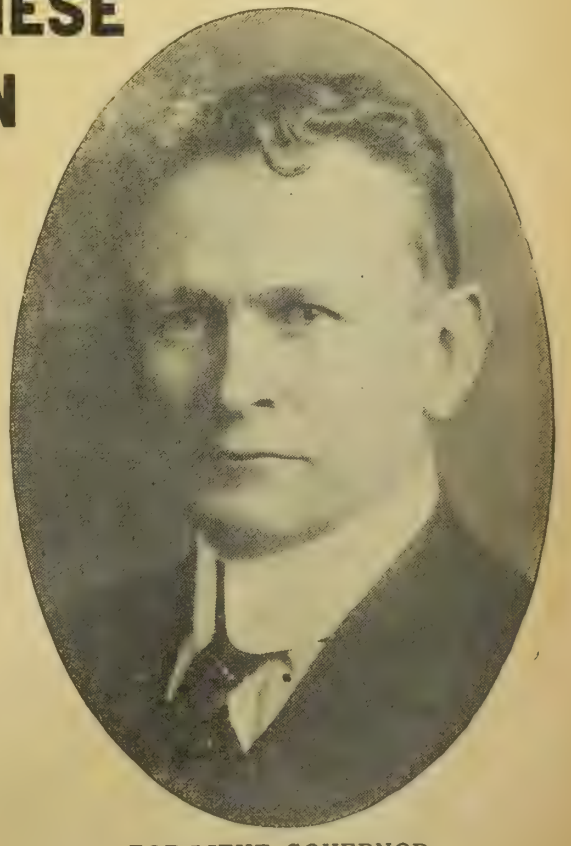
FOR THESE MEN



FOR GOVERNOR

WM. D. STEPHENS

Formerly Mayor of Los Angeles, then Congressman, now Governor of California. A consistent supporter of progressive and humane legislation, including the State Railroad Commission, Blue Sky Law, Rural Credits, Flood Control, Utilization of Water Resources, Woman Suffrage, Red Light Abatement, Closing of Saloons, Ratification of National Prohibition Amendment, and the Land Settlement Act.



FOR LIEUT. GOVERNOR

C. C. YOUNG

Member of State Assembly from Berkeley ten years. Speaker (Presiding Officer) of Assembly for six years of that time, including last session. His record in the Legislature has been one hundred per cent good in the support of progressive legislation and every moral issue. He stands flatly on the same platform as Governor Stephens.

Thousands of Acres of Asparagus

Written for Pacific Rural Press by R. E. Hodges

TWO THOUSAND eight hundred acres of asparagus makes a whale of a lot of good eating and more work than could be obtained for it this year, yet that much asparagus is owned and operated by one man; and nearly nine times that much is grown in the principal asparagus producing section of California. This is the great Delta region of islands surrounded by navigable streams and "sloughs" from the Sacramento, San Joaquin, and Mokelumne rivers. The man who owns one-ninth of the acreage and who marketed more than one-ninth of California's asparagus crop this year is an unassuming gentleman whose establishments comprise most of the business part of his home town on the Sacramento River. Alex Brown stood on the street which winds along the levee through Walnut Grove and gave us the notes in regard to his own holdings from which we write. Conditions and practices in the other fields are of the same nature.

YIELDS AND PRICES.

A two-fifths share of the crop is expected to pay all costs of production and marketing except labor, and net $40 to $50 per acre to the owner for use of his land, giving the tenants three-fifths of the crop for their labor alone.

When asparagus is at its prime age, six or seven years old generally, some land yields 160 to 170 boxes per acre. Other land yields not over 100. A good average is about 140 boxes, each weighing about 47 pounds net, and thus totaling about 6580 pounds per acre. Cutting begins about March 1, but does not get heavy until the last ten days of that month. The March cutting is shipped East. Returns last season averaged about $2.40 per crate of over 24 pounds net, after paying freight and selling charges; but some shippers found their expenses ate up the returns. Mr. Brown and his sons supervised the packing and shipping of his crop, employing 175 to 300 hands daily at Walnut Grove; and they made good money. Through April, May and June the local branches of several big canning companies take the "grass." They paid 3¼c per pound last season, though they had contracted much of it at a lower price. Even at 3¼c, most growers lost a considerable acreage because they could not get the labor at wages that would leave anything. Still less could have been cut if prices for the crop had been held lower.

No new fields are to be planted until the labor situation becomes easier except the 300 acres proposed by Mr. Brown.

LONGEVITY, SOIL, ETC.

The usual profitable life of asparagus plants in the sediment-peat of the Delta is about twelve years. With a large proportion of sediment, they live longer but do not grow so early in the season. Each year the crown from which shoots grow becomes bigger around and nearer the surface. Crowns of old plants may be 16 inches in diameter, the poorest, most spindly shoots coming from the older portions nearer the center. They must be kept covered with dirt, which is done by disk cultivators, until the rows are a foot or higher and there is but little additional dirt available between the rows. None is cut until the second year after planting the roots. It then yields up to 1000 pounds per acre, and increases each year until its prime, as noted above.

There must be special virtue in the peat-sediment soil of these islands, for nowhere else in this State is there an asparagus district that attracts much attention except the early crop from a few hundred acres in Imperial Valley. There is a touch of white alkali salts in the Delta, as elsewhere in similarly reclaimed lands, and this is no particular detriment.

We Wish Potato Markets Were Better

It would be nice if we could hold forth much hope for better potato prices before the present crop spoils. The acreage in the United States is somewhat larger than a five-year average and the crop is being put onto all markets in excess of demand, causing weak prices. The California crop was somewhat damaged by rains, especially where poorly drained. As no frosts have come, those already dug or already mature will not keep long and are not fit for storage. Those not yet mature are likely to keep well in the ground. Idaho and Washington potatoes are coming into California markets, even to Sacramento and Los Angeles, at prices which hold the market for California spuds below what many consider their costs of production.

One Delta grower who used to grow 4,000 acres has 100,000 sacks from 1,000 acres this year—about half dug and hardly salable above the $1.50 per cwt. which he figures as his cost of production. These are of good stock, well graded, as are most of California potatoes. It is well to emphasize at this time of prices which are slack as related to costs of production, that the grower who does not sort and grade his potatoes reasonably close must pay more for sorting, grading, and resacking at the market end than he would have paid at home. He will also find that recently increased freight on the potatoes culled out, amounts to more than the price he gets for the culls. If they are not culled out, he will find the price on the whole lot reduced more than proportionately. Meanwhile he will have paid several dollars per month and board for labor to handle the culls along with the better potatoes, 17 to 26½ cents for extra sacks to carry them, and $1.25 per pound for twine to sew the sacks. While culling and grading potatoes at home, it is well to remember that well filled sacks exposing potatoes across the end often bring several cents per hundredweight more than slackly filled sacks. There may be some hope for holders of sound, well-graded potatoes in the fact that many will spoil and that beans also have suffered severely by weather, wheat restrictions are still rather tight, more potatoes will be dried than ever before, and other foods are relatively high priced. Anyhow, it seems like nothing will be gained by rushing great amounts onto the market now.

Cultivation and the characteristic lateral seepage of peaty soils from the rivers and sloughs supply and hold plenty of moisture, so irrigation is seldom practiced. Where soil gets so dry as to require irrigation, it is flooded quickly and the water shut off soon to avoid damage. Drainage is necessary if the water-table gets up among the roots, or they would rot. No fertilizer or manure have been applied.

HANDLING THE CROP.

The Brown acreage is leased to tenants who occupy nineteen different camps and each with 100 to 175 acres; though 100 acres is about as much as one camp can handle rightly. Tenants furnish labor only, and get 60 per cent of the crop. They sublet the cutting to contractors at about $1.20 per cwt. last year for cutting average crops, about $1 for young four-year "grass," and up to $1.50 for old fields which produce more spindly shoots and less weight per acre. It costs more early in the season when shoots are scarce. Cutting requires about 20 men per 100 acres. Hauling, washing, culling, and cutting to proper lengths requires five men more per 100 acres.

CUTTING FOR THE CANNERIES.

During the canning season every acre must be cut every day or it is not fit for use. This is because the canneries require white shoots that have not been greened by exposure to sunlight. The best shoots are those cut when they just crack the surface of the ground. It takes watchful eyes to get all of such every day.

If any field cannot be cut for two or three days for lack of labor, it is abandoned for the season. Though at great cost and injury to growing shoots, the overgrown ones could be cut out and discarded, there is no object in this where labor has been so scarce that it might have to be missed again. White men cannot be found, according to Mr. Brown, who will faithfully cut every row in all kinds of weather. The Chinese work in rubber coats and rubber boots when necessary. The shoots appear very rapidly during the canning season. They are washed, culled, and cut to seven-inch lengths before hauling to the canneries, where one inch is cut from their bases. There are usually enough "tips" accidentally broken off to supply the demand for that class of canned goods. Occasionally good long grass is cut to two and a half and three-inch lengths for this purpose, where orders are heavy. Large diameter is most desired, but all sizes have brought the same price in the past two seasons. The "asparagus knife" used for cutting is a ⅝-inch shaft of iron 16 inches long, with a chiseled end. No way is known to avoid cutting shoots that may be in the way.

SHIPPING ASPARAGUS.

For shipping to the East, green tips are demanded. These are obtained by letting the shoots grow five to eight inches out of the ground. Renters deliver asparagus all through March at the packing shed in Walnut Grove already washed and cut. It costs 60c to 65c per crate to grade and pack the asparagus, including crates, labels, moss, ribbon, etc. Ribbons which, the second year before the war, cost $1.05 per spool of 1000 yards, cost last year $3.25, except where previously contracted at a lower price. Only the fanciest grade packed by Mr. Brown has any more ribbon than necessary. The "Colossal" grade has red, white, and blue ribbons but no bow-knots.

One man can usually grade what four pack; and the average per man grading and packing combined is 8½ to 9 crates per day. Mr. Brown puts up five grades, according to diameter of shoots, having had 2¼-pound bunches of Colossal grade containing only six stalks. The main thing, says he, is to grade the same every year, so the trade will know what is packed under your label. After bunching, tying, and cutting the butts off, the asparagus is packed in pyramid crates in wet moss.

ASPARAGUS TROUBLES.

Lack of enough dependable labor is the biggest trouble. There is no rust in the Delta to speak of, but the asparagus centipede, a minute white bug, is found on a few ranches It stings the shoots underground at the crown and when shoots are growing slowly in cold weather it makes them woody. Not much effect is seen in hot weather when shoots grow rapidly. Control measures are too expensive to be practicable or necessary.

Partridge Peas

FOR COVER CROPS

Makes also a splendid crop for hog and cattle food. Splendid substitute for vetch seed, which is very costly this season and practically out of the market. Partridge Peas are sown broadcast 40 to 50 pounds per acre.

WILL THIS GRASS RESTORE CALIFORNIA'S PRISTINE PASTURAGE?

(Continued from first page.)

HOW TO START PHALARIS.

The seed should be sown early in the fall at the rate of 4 to 6 pounds if drilled, or 8 pounds if broadcasted. All possible advantage should be taken of the first rains while the weather is still warm. Unlike many grasses, it germinates readily and quickly, and, even though the very fine, hair-like seedlings are exposed to severe frosts, they are not injured. Where the land is foul with weed seeds of other plants it would be advantageous to sow the seed in rows and cultivate.

A quick and certain method of propagation is by division of the roots. A single clump may be divided up into fifty or more pieces and if planted two feet apart each way will soon make good pasture or furnish seed the first season.

WILL ANYTHING EAT IT?

We have not yet conducted feeding experiments, nor have we pastured it, but there is abundant trustworthy information from South Africa, Australia and Argentina to assure us of these points.

Professor Botto of the University of La Plata, Argentina, describes the grass under the name Sweet Tussoc, Phalaris bulbosa, and he gives an analysis of it which shows that the dry grass has a nutritive value almost identical with that of good barley hay and somewhat less than the best oat or alfalfa hay.

He claims that it will carry at least 20 sheep or one cow per acre during the winter months. This is remarkable when compared with our 10, 20 or 30 acres per animal or twice this amount on much of the open range.

HOW TO TRY THE PLANT.

We do not commend this grass as a panacea for all range feed troubles. It is not adapted to scattering seed broadcast from horseback on rough poor range lands not susceptible of cultivation, but it is adapted to the immense stretches of valley lands that have been grained or pastured for many years.

We suggest the planting of this grass where it may remain for four or five years and provide abundant pasture during the summer or winter. For a long time we have been wanting to know what we could do with lands not susceptible of irrigation and which were producing low yields of grain. This plant seems capable of making such lands profitable, and is therefore commended for trial.

[For the benefit of readers who may be attracted by the foregoing statement we may say that there is no seed of the plant to be obtained in this country, and seed secured from abroad has been mixed and a straight perennial strain has been secured by the University by selection. Most of this seed will be planted this year on the University Farm for large seed production later. It is possible that a little of the seed may be obtained by application to Prof. P. B. Kennedy, University, Berkeley, with a small remittance (say 25c) to cover cost of packeting and mailing.—Editor.]

WINTER-GROWING BEANS.

English broad windsor beans are grown between the hills of potatoes in T. C. Holmes' garden in San Francisco. They grow 2½ feet tall, with 5 to 20 pods, many of which contain 7 or 8 greenish white beans. They are hardy against moderate frost and should be planted some time during winter. The later they are planted the more likely they are to become infested with aphis. Mr. Holmes finds the best way to avoid severe infestation is to clip off the buggy tops and take them away. But their separation by potato plants helps greatly to avoid aphis.

The Government makes an urgent call upon the salvage departments of the Red Cross for the saving of fruit pits and nut shells, which are used for the burning of charcoal needed for gas masks. It is stated that the quantity required cannot be obtained save by the co-operation of every consumer of fruit and nuts. The varieties wanted are peach, apricot, prune, plum, olive and cherry pits; brazil walnut, hickory, butternut shells.

Get Full Plow Value Behind Your Tractor

John Deere No. 5 and No. 6 Tractor Plows meet fully every requirement for better and longer service in this section. We recommend them to you on the basis of proved superiority in California fields, orchards and vineyards. We want you to investigate them. It won't take you long. It will pay you to do it. See these plows at your John Deere dealer's store. Drop us a post card and we will send you a folder describing them fully. We'll also be glad to send you our free book, *"Better Farm Implements and How to Use Them."*

JOHN DEERE
Tractor Plows

John Deere Advantages

Steady running—axles rigidly fastened to beams.

Land wheel set back, balancing weight of plow over all wheels—even depth of plowing in uneven ground. Plowing position reached quickly. Bottoms locked down—***stay in the ground*** while plowing.

Exceptionally strong throughout. Highest grade material. Beams warranted not to bend or break. Beam braces have extra long lap. Large bolts and lock washers hold all parts rigidly to place.

Simplest and most dependable power lift—no chain or sprockets. Bottoms raised high and level on half turn of land wheel.

Location of land and front furrow wheels permits work close to trees or vines throwing either to or from the row. Lever can be lowered out of way of limbs.

Quick Detachable Shares, strong and close fitting. Loosen one nut to remove share. Tighten same nut and share is on tight.

Hitch adjustable for any standard tractor.

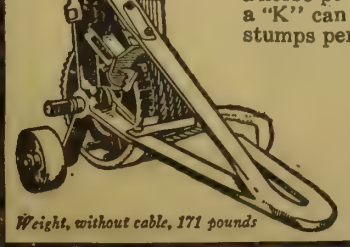
2-Bottoms
3-Bottoms
4-Bottoms

Stop Wasting Money On Your Stump Land
Turn It Into Dollars

GRASP the OPPORTUNITY and put DOLLARS in your pocket by clearing your stump land. Stump land was never so valuable as it is TO-DAY. The "K" Stump Puller will do the work in less time and the least expense. Cost just about ½ of a horse power machine and about ¼ of the cost of dynamite. One man or woman with a "K" can out pull 16 large horses. One person single handed can pull from 50 to 150 stumps per day.

HAND POWER
K Stump Puller



Weight, without cable, 171 pounds

No stump too big for the "K"

works by leverage—same principle as a jack—one man can lift or pull 48 tons alone. Works easy as rowing a boat. Works on hillsides or marshes where horses cannot operate. Has 2 speeds and weighs 171 pounds. Made of the best steel. Absolutely guaranteed against breakage. Endorsed by U. S. Government officials. Highest bank references.

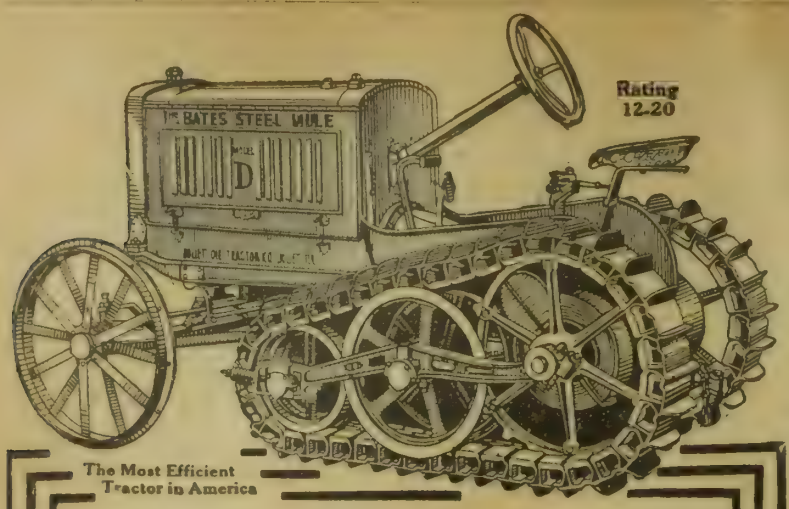
WALTER J. FITZPATRICK Box 12 182 Fifth St., San Francisco, Calif.



The Most Efficient Tractor in America

LONG FIELD EXPERIENCE

has made the Bates Steel Mule crawlers a big success. It has brought the knowledge to build durable crawlers that practically double the usefulness of the tractor. These crawlers allow the tractor to pull much bigger loads and at the same time use much less fuel than if it were a wheel-driven type.

Six years of field experience with thousands of crawler tractors have taught the correct design for a three-plow tractor and what materials are necessary for giving long life to the crawlers. Other knowledge equally valuable has come through this experience. We will gladly show you how you can benefit by the results of Steel Mule development.

If you are one of the few who have not inspected the Model "D" BATES STEEL MULE we have on our floor—be sure and do so at once.

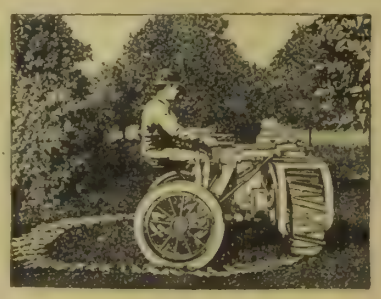
FARM BOOKS! Pacific Rural Press 535 Market Street San Francisco

Get the TrackPULL Book

Tells Why 6-H. P. Bean Tractor is Best For Orchards and Vineyards



No other tractor meets all the special needs for which the Bean TrackPULL was designed.

Send coupon for our free book which tells all the reasons why orchardists and vineyardists particularly need the Bean TrackPULL Tractor.

The makers of the TrackPULL have been manufacturing orchard machinery for 34 years. They long ago saw the special *need* for special *tractors* to use in orchards and vineyards. They used their special knowledge and experience to design a tractor that would fit those needs exactly. No other machine can do what the TrackPULL does because no other is so designed. Don't make a mistake on tractors.

Bean TrackPULL operates through *single track* which does both the pulling and steering. Pulls, "gees," "haws," and backs just like a team. *Same power on turns* as on *straight-away*. No over-loading one side, no pivoting, no *uneven* pulling when tools are hitched off center. Hitch them *away* off center—getting up *close* to trees and vines—pulls *just as well*. 12-year-old boys can handle.

Valuable improvements in Motor, Track Rollers, Drive Sprocket, Bearings and Rear Wheels make the 1919 Model Bean the most efficient orchard and vineyard tractor manufactured. Costs nothing and doesn't obligate you, to investigate fully before you sign up for any other make.

Write us now for the Track PULL BOOK. We'll tell you name of nearest agent who can show the Bean. Let him save you money

General Agricultural Review

Field Crops.

Alfalfa lands are reported to be in good demand all over the State.

Russia is estimated to have more than 4,000,000 acres of land which would produce cotton if irrigated.

Some good crops of alfalfa have been cut from the sloping land sides of Sacramento River levees this season.

Kern county's cotton gin at Bakersfield is expected to be ready for operation by the middle of next month.

A good crop of Egyptian corn was grown between rows of asparagus in a big field on Grand Island, Sacramento county.

The estimate of probable bean production in California this season is for a crop of 8,350,000 bushels, compared to 8,091,000 bushels in 1917.

Southern California potato dealers have been asked by the United States Quartermaster-General to provide 5,000,000 pounds of potatoes for the United States Army.

No celery was grown around Holt, San Joaquin county, this year because growers lost too heavily last season. One man netted $16 for a carload and felt lucky not to get red ink.

The estimated sugar beet crop in the United States for this year was 6,359,000 tons, according to United States authorities. This is an estimated increase of 378,621 tons over 1916.

Some hundreds of acres of one- and two-year asparagus on Staten Island in San Joaquin county were interplanted with pink beans this year, two rows of beans to one of asparagus.

The writer noticed last week two adjacent bean fields in Yuba county, one of which was ready for cutting, the other having been planted so late that there was no possibility of its maturing.

The first order for barley shipment to outside points was listed on the San Francisco Grain Exchange in the shape of a call for 10,000 tons at $2.28 a hundred pounds, and the order called for immediate delivery.

Sacramento Valley rice growers thought they would have to postpone harvest on account of rain last week, but a north wind proved their friend for once by drying the fields enough to begin harvest within a day or two.

Wheat seed sales in various parts of the State indicate that there will be a large acreage this year in response to the war appeal for an increased food production. The Early Baart seed is claimed to be the best in point of yield and milling quality for most of the wheat acreage of the State, and there has been a big demand for this seed.

Turlock's shipments of cantaloupes, watermelons and casabas this season up to October 14, as reported by the Turlock Board of Trade, is as follows: Cantaloupes, 1967 cars; watermelons, 502 cars; casabas, 142 cars. Some shipments by express, not included in the foregoing estimates, would probably bring the total up to 3000 cars.

The acreage of lima beans was this year placed at 145,000, and on October 1 the average yield per acre established to be 18 bushels, making the preliminary estimate of production 2,610,000 bushels, equivalent to 1,957,500 80-pound sacks. The estimated production by counties in 80-pound sacks was as follows: Los Angeles, 210,000; Orange, 360,000; San Diego, 108,000; Santa Barbara, 72,000; and Ventura, 1,207,500.

Thomas Riggs, Jr., Governor of Alaska, recently conferred with the officials of the Agricultural Experiment Station at San Francisco regarding the establishment of a mill to grind the crops of Siberian wheat interior Alaska is expected to yield during the seasons to come. This wheat matures in the brief period of about four months from the time the seed is put into the ground. This quick growth makes the wheat adaptable to the Alaska short summers.

Deciduous Fruits.

A good crop of Tuolumne's large, finely colored apples is now being packed.

California's late crop of apples was much improved by the heavy downpour of rain during September in the important apple growing districts.

One million and a quarter cans of peaches is the record this season of the Pomona canneries. About one-third of the peaches have been purchased by the Government.

Schedules returned by crop reporters October 1 show the total production of peaches in California to be 63 per cent of normal, or about 11,750,000 bushels, compared to a production of 14,151,000 bushels in 1917.

This State's production of the commercial apple crop is estimated at 3,380,000 boxes, compared to a production of 3,520,000 boxes in 1917. The commercial production of the United States is estimated at 24,400,000 barrels, compared to 22,519,000 barrels last year.

A large tree planting has been made in Kings county this season. F. K. Howard, County Horticultural Commissioner, reports inspection for this purpose as follows: Apricots, 18,582; grapes, 83,669; peaches, 9931; prunes, 34,901; miscellaneous fruits and nuts, 16,016; ornamentals, 19,407.

Stanislaus County Horticultural Commissioner Rutherford states that the red-humped caterpillar has made its appearance in the fruit orchards in several parts of that county. When knocked off a tree, the caterpillars seldom get back, but as a precautionary measure a spray of paris green should be applied, says Mr. Rutherford—half a pound mixed to a paste and added to 100 gallons of water, or in lesser proportion of both if sufficient.

Sacramento Valley is witnessing a most unusual phenomenon, it is reported. Pears, apricots, plums and cherry trees are profusely adorned with bloom, the trees' activity being attributed to the recent warm rains followed by warmer weather. There is no chance of the trees bearing fruit, say experts. Farm Adviser Ralph D. Robertson of Stanislaus county reports that a few almond and apricot trees in that county also have been beguiled by the spring-like rains and warm weather into a glorious bloom.

Citrus and Semi-Tropical.

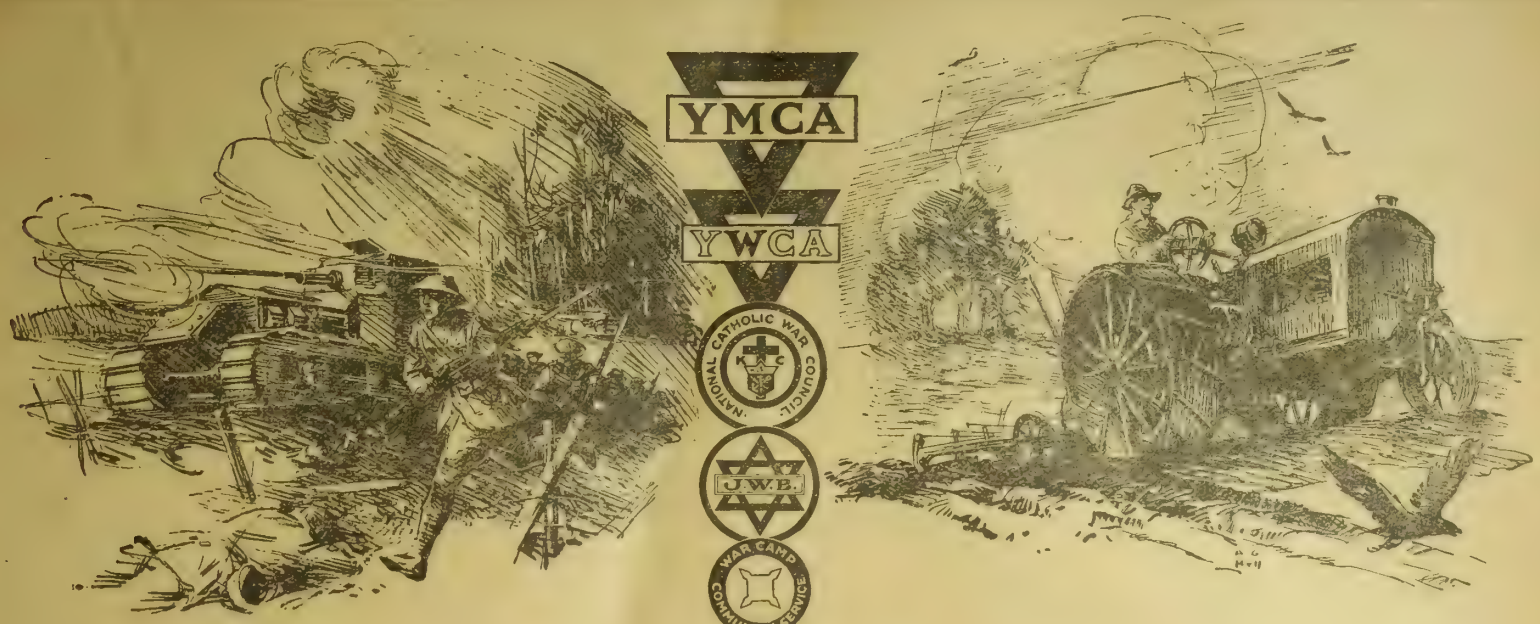
A car of Valencia oranges shipped from Lindsay was sold last week at Baltimore for a record price on Tulare county oranges. The fancy fruit in this car averaged $13.60 per box and the choice and standards sold on an average of $13.10.

The orange trees at Fairoaks look a good color but in light crop. Here the color standard only is accepted because the fruit in this section does not sugar up 8-10. The quantity content is high and a special flavor is claimed. The use of cover-crops is a common practice. All kinds of commercial fertilizers are used to a greater or less extent.

Miscellaneous.

It is reported that representatives of the new republic of Finland are essaying to contract for Fresno raisins.

The United States Food Administration has announced that it is no longer necessary for farmers to continue conservation of straw for feeding purposes, as the stock food situation has improved.



Over there Over here

THROUGH mud and rain, through gas and shrapnel, our boys are pushing on to Victory. It's a task that tries the souls of strong men. They *must* have rest and recreation.

At the canteens, they buy the little comforts of life at cost. In the war-service huts, they find everything needful to write the letters you receive. They attend a show, see a "movie" or hear good music—all free. Always, they find in the hut secretary a friend. They forget for a little while the grim scenes of war and return to duty refreshed. These are some of the things that keep fighting men at top notch.

YOURS is the task of growing the food these fighting men must have. The toiling millions in the munition factories, arsenals and shipyards also look to you for sustenance. And they do not look in vain.

Your work is vital to winning the war and you are doing it manfully, mindful of Country, forgetful of self. You are working early and late, putting forth your strength unsparingly. You have produced bounteous crops that feed a hungry world. Yet to you are spared the comforts of home and the presence of loved ones. Yours are the privileges of earning and giving.

Give to "keep good men good and brave men strong". Give to bring cheer to those who are daring their all for you and yours. And when the boys come home victorious, you can honestly say, "I have done my part, too. I have backed you to the limit."

Seven allied activities, all endorsed by the Government, are combined in the United War Work Campaign, with the budgets distributed as follows: Y.M.C.A., $100,000,000; *Y.W.C.A.,* $15,000,000; *National Catholic War Council (including work of the Knights of Columbus and special war activities for women),* $30,000,000; *Jewish Welfare Board,* $3,500,000; *American Library Association,* $3,500,000; *War Camp Community Service,* $15,000,000; *Salvation Army,* $3,500,000.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles

DISTILLATE IN AUTO.

Since gasoline saving is part of the war program, H. A. Clark's experience using distillate in a Chalmers may aid materially. Mr. Clark has for several years burned nothing but distillate, using a Schebler carbureter of the model in which water from the radiator circulates through a jacket for heating purposes. An improvement on this, thinks Mr. Clark, will be his plan to disconnect this jacket from the radiator and connect it so gas from the exhaust will take the place of hot water. The carbureter is assisted, and gasoline priming made most convenient by a contrivance attached by Mr. Clark himself. He drilled a quarter-inch hole in the intake manifold just above the carbureter and inserted one end of the top bar of a short T pipe. From the other end of the top bar he led a soft copper tube to a funnel cock set under a quart can of gasoline fixed under the dashboard. The gasoline can has a cock underneath so it can drip into the funnel cock at any rate desired. In the stem of the T pipe on the manifold is an auxiliary air valve picked up for $1 at an auto wrecking establishment. A piano wire leads from this through a flexible tube to the dashboard for regulation. Around the stem of the T pipe an inch T pipe has been fixed with the ends calked tight and its stem connected by flexible tubing to the exhaust to heat whatever air passes through the auxiliary. Some air sucked in with the gasoline gets well mixed en route and the amount is regulated by the funnel cock.

Perhaps part of Mr. Clark's freedom from carbon trouble is due to the water he adds to the distillate-air mixture. This is accomplished by fixing a flat six-quart can under the dashboard and leading a copper tube to the funnel cock under the gasoline can. There it can drip as desired after the engine has been started. No more carbon has been found using distillate than is common in engines using gasoline, and the engine is in first-class condition.

DISTILLATE BURNER ON AUTOS.

Burning distillate in a Ford with no change in carbureter or engine has been tried by most Ford owners. It has been discarded by almost as many on account of carbon trouble or the difficulty in starting cold, or even the scoring of cylinder walls due to excess of unvaporized distillate in the fuel eating off the lubricating film on the cylinder walls. Any fuel heavier than gasoline, and even the gasoline of today, is generally more thoroughly vaporized if heated before going into the explosion chamber. It must be in gaseous form, with a proper proportion of air to explode cleanly with full power and minimum carbon. Distillate and heavier fuels not preheated go into the combustion chamber in a foggy, less explosive, slower-burning condition than they should. We recently advertised the Wilmo manifold, which is built to insure complete vaporization of distillate and kerosene on several makes of automobiles. This manifold is a combination of the intake and exhaust manifolds with the dividing wall calculated to be thick enough to preheat the mixture as it comes from the carbureter, but not to overheat it because overheating before the explosion also reduces power. Wilmo manifolds are being used quite generally in the West and users are claiming more mileage per gallon of lower grade fuel, which reduces the cost per mile quite considerably.

APPLETON TRACTORS NEW HERE.

One of the new tractors operated in the Los Angeles demonstration is the Appleton, made by the Appleton farm machinery people and handled in California by C. S. Anthony, whose local agency for Avery tractors was recently relinquished. The Appleton tractor, rated as 12-28 horsepower, pulled two 12-inch moldboards fast and easy 10 inches deep in the dry adobe of the demonstration. It has a heavy four-cylinder Buda motor, cast en bloc, with splash and force-feed oil system, Bosch magneto, Schebler carbureter, Bennett air cleaner, multiple dry disk clutch, sliding gear transmission, bevel gear differential, 54x12-inch rear wheels, front wheels on irreversible automobile type steering gear, which makes steering easy on cloddy ground. A separate brake on each rear wheel also aids steering. The right front wheel may be set over sidewise and adjusted for height so it runs in the furrow while the rear wheel is on solid ground. The exhaust passes through a "stove," which heats the air before it passes into the carbureter and also heats the mixture before it goes into the engine.

A $70,000,000 farm machinery corporation was recently authorized when the New Jersey Board of Public Utility Commissioners approved a merger agreement between the International Harvester Co. of Chicago, which is incorporated in New Jersey, and the International Harvester Corporation, which has been a distinct but auxiliary company looking after the former's business abroad and certain lines of it in this country.

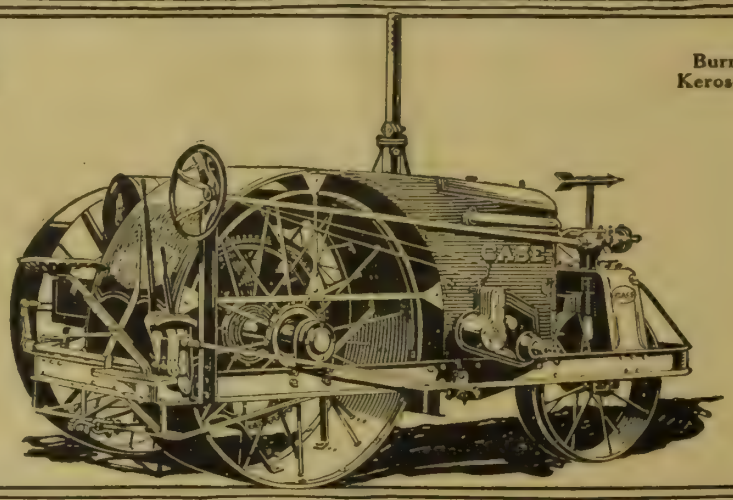
Case 10-20

Burns Kerosene



Ready for Immediate Delivery

TO supply a limited number of hurry-up calls for tractors to put to work at once, we offer this Case 10-20.

We do not know how long our supply will last, but those we have will be distributed as fast as transportation facilities can bring them.

Thus you are able, if you act at once, to obtain a well-known, tried machine, of which there are thousands in daily use all over the country.

We have built this 10-20 since 1914 and farmers everywhere attest to its economy and dependability.

This 10-20 has plenty of reserve power. Its rated pull of 1,650 pounds on the drawbar can be increased to 2,600 pounds. It pulls three plows anywhere a good team can pull one plow continuously.

Its design and hitch is such that all side draft—so common in most 3-plow tractors—is avoided. All wheels run on unplowed ground—the combined tire width is 32 inches.

It has a 4-cylinder Case motor, with removable head. It is equipped with a Case-Sylphon Thermostat which insures complete combustion of kerosene at all loads. And it has a Case air washer, which prevents dust and grit from entering the cylinders.

Examination of this 10-20 will disclose its splendid design and workmanship. As you go over its specifications and illustrated description you are certain to agree with the thousands of owners that this tractor is 100 per cent efficient.

Write for our catalog. Or obtain it from a Case Dealer.

And if you are interested in the immediate delivery of this Case 10-20, place your order at once, so as to avoid disappointment.

J. I. Case Threshing Machine Company, Inc., 1379 Erie St., Racine, Wis., U. S. A.
Founded 1842 (808)

TRACTOR PARADE ON MARKET STREET.

The civic authorities of San Francisco and the military authorities in this district, recognizing the value of the tractor in food production, have authorized a tractor parade on Market street. In these history-making days it is quite usual to see new things, and the people of the city of San Francisco are to see a tractor parade on Market street, Wednesday forenoon, October 30.

Heretofore, during great military and patriotic parades, tractors were not permitted on Market street, for fear of damage to the pavement, but consent has now been given and forty of these modern engines for power farming are to parade up Market street, headed by a platoon of police, by a regiment of Uncle Sam's fighting men, by a high officer of the Army, by the Governor of California and those who are interested in making this demonstration interesting, instructive and patriotic.

HOW TO FIX THAT HAY RAKE.

To the Editor: If your correspondent who has trouble with hay catching in his ratchet wheels will do the following he will have no more trouble from that source. Take the wheels off from the rake, lay them down with the ratchet wheels up. Now take a couple of old dish-pans, cut a hole into the bottom of each the size of the ratchet wheels, punch a few small holes around the bottom of the pans and fasten with wire to the spokes of the wheels, so that the hollow of the pans extend over the ratchet wheels towards the rake. Replace the wheels, then watch your neighbors copy.—Nicholas Weber, Maxwell.

COMMUTATOR GUMMED.

When your Ford engine balks on a cold morning after running well the night before, don't take things apart until you have applied a few drops of kerosene to the commutator through its lubricating cup. The writer warmed up the atmosphere about an hour, cranking and trying to locate ignition trouble, but the engine started beautifully after the kerosene treatment. Lubricating oil had gummed on the commutator in the cold night until it could not make good contact.

POWER NOTES.

The Food Administration suggested the advisability of rice growers in Stanislaus county installing pumps. Those growers who followed the suggestion were recently found to have no lack of water, while others have protested against reduction of their irrigation water by order of the State Power Administrator.

"Tractor taxi service" for farmers who do not see the need of owning tractors is an idea proposed by the Dauch Mfg. Co. not only to serve small farmers but to demonstrate the value of tractors and thus increase sales. Many dealers in other tractors have also found the best way to sell a tractor is to operate it on the prospective buyer's ranch.

A marked difference in orchard tree condition and size of fruit was made on W. E. Allen's ranches in the hills west of Suisun by irrigation this season with two deep-well turbine Layne & Bowler pumps. Mr. Allen is well pleased with the way the pumps worked.

IS THIS YOU?

Remittances have recently been received from San Jose and Loleta, but the senders neglected to give us their names.

If you live in one of these places and renewed your subscription, see if your expiration date on the label has been changed. If not, tell us when you renewed and in what form your remittance was made. and we'll try our best to connect you with one of those on hand.

Too bad we are not mind readers.

The Government is calling the attention of farmers to camp garbage for hog feed. It is free from coffee grounds, glass and other substances injurious to animals, and tests have shown very profitable results from its use. If you are located near an army camp or cantonment, better look into this. The Food Administration furnishes suggestions for the practical utilization of such garbage.

The State Board of Education will have 1000 farmers trained in the handling of tractors.

Seven Big Motor Trucks
BARGAINS

We have seven high-grade motor trucks that we were compelled to take back from purchasers by reason of the Moratorium Act.

Two .....2½-ton Trucks
Three .....3 -ton Trucks
Two .....3½-ton Trucks

PRICES $750 UP.

Terms if Desired

Some of these trucks are equipped with Dump Bodies and Hydraulic Hoist, some with flat rack suitable for grain hauling.

These trucks have all been thoroughly rebuilt in our own shops by our motor truck experts and are equipped with new tires.

We guarantee them the same as we do new trucks. This is your opportunity to secure a good motor truck and save hundreds of dollars.

If you want a serviceable motor truck at a big bargain—Act quickly.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler
of the "Giant" Type
WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD
send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Schmeiser Manufacturing Co.

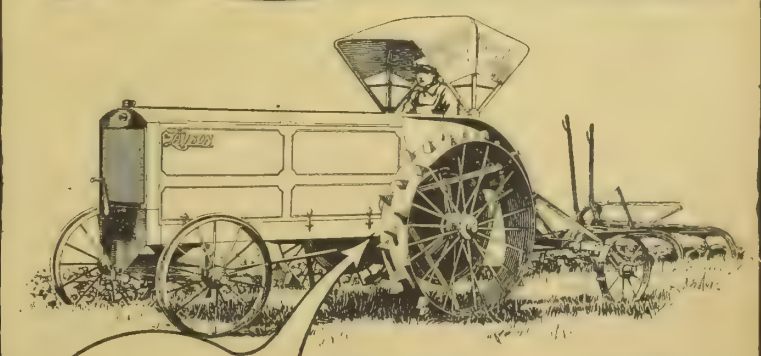
12 Mechanic Street DAVIS, CAL.

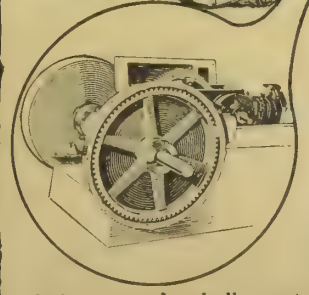
Manufacturers of

Sure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED





We Designed Our Own Transmission

Don't overlook the Transmission when you buy your tractor. Next to the engine, it is the most important part of the tractor.

LAUSON Transmission was designed by our own engineers—selective sliding gear type—two speeds forward, one reverse. Transmission gears are made of the finest alloy steel—heat treated for a glass hard finish with annealed center; tough, resisting, long wearing. Splined shafts are used and all mounted in Hyatt roller bearings. Gears and bearings run in oil in dust-proof case.

Drive Shaft is of high carbon steel. Final drive gears are semi-steel, machine cut—all completely enclosed in a dust-proof housing and running in oil.

We have important information which you should take into consideration before purchasing a tractor. We will be glad to send it to you without any obligation and give you the name of our nearest dealer where you can inspect the LAUSON 15-25.

Large Size in COWS

Is favorable to economical yielding of milk. The food required to support an animal is not in proportion to size, as a given number of large cows than of small ones will do. For this reason the Holstein-Friesian cow usually returns a greater net profit on the total amount of food consumed.

Grain Increases Dairy Profits

Mr. Dairyman, your average cow, receiving alfalfa alone, eats 30 pounds daily, which at $20 per ton costs you 30 cents per day. You get an average of 20 pounds of milk per day per cow.

By reducing the alfalfa 10 pounds per day, and adding a grain ration of 2 pounds each of barley, dried beet pulp and coconut meal, you will save 10 cents on alfalfa and add 15 cents to the cost for grain. This will make the total cost of the new ration 35 cents, as against 30 cents for alfalfa alone—an increase of 5 cents per day.

But from the new method of feeding you can expect an increase of 4 pounds of milk daily, worth 16 cents (including both butterfat and skim milk). So you will receive 16 cents additional and pay out 5 cents more for feed, leaving you an extra profit of 11 cents per day per cow by reducing the alfalfa and adding grain.

Guesswork? No! This table has been worked out by Prof. F. W. Woll of the University Farm, at Davis, and while there may be slight variations in individual cases his figures are very conservative and you really ought to make more additional profit than he estimates.

Furthermore, you must take into consideration that a cow receiving grain will be kept in better physical condition and will produce larger and more vigorous calves.

Don't be penny wise and pound foolish, and feed alfalfa alone. Sell some of your alfalfa, if necessary, and buy grain. It will pay you.

A NOTABLE HOLSTEIN SALE.

The A. W. Morris & Sons Corporation is so well and favorably known that it seems as though the mere announcement of a sale by them ought to be enough to attract buyers from all over the land. Yet for the benefit of beginners who are not well posted it may be well to state that the Morris Holsteins undoubtedly comprise the greatest herd of dairy cattle in the world today. They hold more world records than any other herd on the map and, mind you, these are long-distance records, too.

The Morris people care little how much a cow can produce in a week or a month. It's the amount she can produce in an entire lactation period that interests them—yes, and several lactation periods, too, for the Morris cows have a trick of not only breaking yearly records but of keeping right on and excelling their own records during each succeeding period.

Persistency and prepotency—those are the predominating characteristics you find in the Morris Holsteins, and they are the qualities you want in your foundation animals.

On November 12 you will be given an opportunity to bid on 105 head of registered Holsteins selected from the immense Morris herd of over 450 head. There will be animals of both sexes and all ages; animals of the greatest producing blood lines of the breed. Included will be 90 cows bred to bulls of world-wide repute.

Here is an opportunity to secure foundation blood of the highest quality. The sale will be held on the Morris farm at Woodland.

GUERNSEY CHARACTERISTICS.

To the Editor: I would like a description of a thoroughbred Guernsey cow—color markings, horns, etc. —C. H. A., Shafter.

[Answered by Livestock Editor.]

The average Guernsey cow weighs about 1000 pounds—about the same as an Ayrshire and about 100 pounds heavier than the Jersey. Bulls weigh about 500 pounds heavier. The breed has been considered coarser boned and more irregular in conformation than the Jersey, but of late years more symmetry has been developed. The color resembles the Jersey in general, but includes some colors not found in that breed—a reddish yellow, or lemon, or orange fawn, with white markings. The white is usually found on the face, the flanks, legs and switch, but may be on any part of the body. The horns should be amber colored, slightly curved, and not coarse. According to the standard, the nose should be cream colored and not dark, but this is a minor point and some of the best producers of the breed have had dark-colored noses.

DAIRYMEN WILL BUY ASSOCIATION ALFALFA.

Arrangements have been completed by which the San Joaquin Valley Milk Producers' Association will buy a large amount of hay from the California Alfalfa Growers' Association. The dairymen are taking this step, according to Fred W. Hansen, as a natural consequence of the advantages offered by co-operation on a large scale between farmers and also because of the belief that the co-operative associations of producers, wherever possible, should lend a hand to bring success to these popular movements. Col. Harris Weinstock, State Market Director, has approved of the plan. The dairymen will have the advantage of getting their hay at guaranteed association prices, storing in warehouses throughout the producing regions.

OPENING OF LIBERTY FAIR DELAYED.

We announced last week that the opening of the California Liberty Fair at Los Angeles had been postponed from October 12 to October 26, but it has been found necessary to defer the opening to a later date—probably November 2. We hope to make a definite announcement of the opening date next week.

Auction Sale of Registered HOLSTEINS

INCLUDING SEVERAL A. R. O. COWS.

Also grade Holsteins, Registered Durocs, Jersey boar, sow and pigs, work stock and ranch toats.

All registered stock over 6 months old is tuberculin tested.

RIVERVIEW FARM

Offers the 17-month-old Holstein-Friesian bull

'SEQUOIA ZOZO PIETERTJE'

This bull's dam, who is also the sire's dam, is a cow of outstanding size and type with a semi-official record of 20252.4 lbs. of milk containing 735.69 lbs. fat, or 919.6 lbs. of 80% butter. Record at age of nine years. **Price $250.00.**

For photos and pedigree apply,

R. F. FISHER, Carlotta, California.

ELKHORN FARM

Offers:

Ayrshire Bull for Only $150

Born Nov. 29th, 1917. White with red cheeks and of good size. Grandson of Finlayston—greatest bull of breed, having 95 A. R. records to his credit. Dam has A. R. record of 9850 lbs. milk and 460 lbs. butter as a three-year-old. Sire—Baron's Best of Bargeroch, has 11 A. R. daughters, averaging over 10,000 lbs. milk testing over 4%, and gives his daughters large and well-shaped teats.

WHERE CAN YOU BEAT THIS HERD HEADER FOR THE MONEY?

J. HENRY MEYER

R. F. D. No. 2, Box 82. Watsonville, California

First Prize Breeders Young Herd at Sacramento

The get of Prince Riverside Walker combine show type with great producing backing. The cow making the highest official yearly butter record for 1917-1918, as shown by the report just issued by the Holstein-Friesian Association of America (see if it is the world's official record for one year), is Aaggie Acme of Riverside 2nd. She is out of the same dam as our senior herd sire, PRINCE RIVERSIDE WALKER.

The junior three-year-old heifer making the highest yearly butter record for 1917-1918, as shown by the report just issued by the Holstein-Friesian Association of America is Miss Valley Mead De Kol Walker. She is by the same sire as our senior herd sire, PRINCE RIVERSIDE WALKER.

Buy your herd sire in the blood lines that are doing things TODAY and that will increase in value in the records they are bound to make in the TO-MORROW. We have just a few good bull calves by PRINCE RIVERSIDE WALKER, out of splendid dams. They move young at our prices.

OUR ENTIRE HERD IS TUBERCULIN TESTED.

Tulare Holstein Farm

W. J. HIGDON, Owner TULARE, CAL. H. L. REDD, Herdsman

First Tulare Sale of Holsteins

[Written for Pacific Rural Press.]

The dates November 20 and 21 have been claimed for a double event. One is to open the new $8,000 sales pavilion built by the Tulare Livestock Association at Tulare, the other is to offer to the farmers of California an opportunity to buy foundation dairy stock at their own prices. For in this new pavilion will be held the First Tulare Sale of 125 registered Holsteins, consigned from such well-known herds as A. W. Morris & Sons, Bridgford Co., R. F. Guerin, W. F. Mitchell, C. L. Hughes, W. J. Higdon, Alex Whaley, Chas. Yocum, R. C. Sturgeon and E. G. Wharton.

The sale will contain more females bred to bulls out of 35- to 40-pound dams than have ever before been offered in one sale in the West. Every animal will be guaranteed to be a breeder, and every one over six months of age will be tuberculin tested and sold subject to retest by buyer.

Watch for further announcements of this great sale.

Important to Hog Raisers

[Written for Pacific Rural Press.]

During the Fresno Fair a meeting of hog raisers was held and officers of the California Swine Breeders' Association, including Prof. J. I. Thompson of the University Farm and C. B. Cunningham of Mills, emphasized the importance of having every hog man in the State join the association, whether breeder or feeder, and whether raising purebreds or grades.

The object is to make the association strong enough so that it can get the State Legislature to put through a much-needed feed inspection bill, help the farmers in buying feed, and doing many other things of vital importance. Similar work is now being done for the beef cattlemen by the California Cattlemen's Association.

Great interest was developed, and Fred Hartsook, the Poland-China breeder of Lankershim, offered the services of his men and his 23 automobiles in helping to perfect the organization. Ray Gatewood of Fresno was elected chairman and organizer for that county.

Hogmen in other counties wishing to join should write to Prof. J. I. Thompson, Davis, Cal.

Tagus Ranch to be Leased in Small Tracts

[Written for Pacific Rural Press.]

The well-known 6000-acre Tagus Ranch in Tulare county is to be leased in tracts of 20 acres and up, beginning December 15. This wonderfully rich ranch, which is just a few miles north of Tulare, has a spur track on the main line of the S. P. and is only five miles from the Santa Fe. It is abundantly watered by twenty-eight 20-horsepower electric pumping plants.

To clear the ranch of its present stock and equipment a monster auction will be held from December 10 to 13, during which the great breeding herds of Holstein, Shorthorn, Polled Angus cattle, Duroc-Jersey hogs and Belgian horses will be completely dispersed. Also five tractors and over $50,000 worth of farm implements will be included. Fuller announcement will be made later.

POSTPONED!

Will Open Nov. 16th

As a matter of Public precaution, and after consultation with the Board of Health, the California International Livestock Show has been postponed. It will open

November 16th and Conclude November 24th

Exhibitors who desire may send their animals at any time. The Show is now ready to care for them

California Holsteins Stand High

[Written for Pacific Rural Press.]

California cows give a good account of themselves in the latest report of official tests issued by the Holstein-Friesian Association.

Bridgford Company, Knightsen, heads the list with three cows. Boweda, first in the full-aged class, making 30.095 pounds of fat in seven days; Tulip Walker, second in the junior two-year-old class with 21.161 pounds fat, and Fairmont Pauline De Kol 2nd, fourth in the same class with 19.147 pounds fat.

Stalder Bros., Riverside, are represented twice; Gerben Abbekerk Maid being fourth in the full-aged class with 27.565 pounds fat, and Stanislaus Princess Cleopatra, second in the senior four-year-old class with 25.658 pounds fat.

Laurameka, owned by M. H. Tichenor, Palo Alto, is fifth in the full-aged class with 27.13 pounds fat.

K. P. Tola Joe, owned by Gotshall & Magruder, Ripon, is first in the senior three-year-old class with 25.543 pounds fat.

Margaret Aralia De Kol, owned by A. W. Morris & Son, Woodland, is first in the full-aged class of long-time semi-official records with 926.19 pounds fat in one year.

Pennant Wayne Clothilde, owned by J. H. Harland Company, Woodland, is tenth in the junior two-year-old long-distance semi-official class with 480 17 pounds fat for one year.

In the distribution of prize money during the past official year California stands fifth, being exceeded only by Minnesota, New York, Washington and Ohio. Minnesota has a total of 14 first-prize winners, the other three States 11 each, and California 10. For butter records alone, Minnesota, New York and California tie for first place—each having seven first-prize winners.

In the list of prize money to the credit of different ones as breeders, A. W. Morris & Son lead the entire United States in the butter class with $278.75, but are third in the milk class with $125. This makes them third in the United States for the entire total, the amount to their credit being $403.75. J. H. Harlan Company is credited with $137.25. Alexander Whaley $54, and McAlister & Son $52.

California in Line for Clean Herds and Milk

[Written for Pacific Rural Press.]

A deputy State Veterinarian, together with an inspector from the State Dairy Bureau, recently made a tour of inspection of the four northern counties, Shasta, Modoc, Siskiyou and Lassen, doing both testing and inspecting of the principal dairy herds of those counties, and they have made a most favorable report of the condition in which the dairies were found. There were practically no reaction of tuberculosis—the only cases being those of cattle shipped in.

The inspectors were encouraged to find the small-top milk pail finding its way in favor. They impressed upon dairymen the importance of clean cattle, clean milkers, small-top milk pails, sterilized utensils, and thorough cooling of the milk to 50 degrees or lower.

In connection with this inspection it should be mentioned that the Bureau of Animal Industry of the U. S. Department of Agriculture is beginning to issue a publication in which will be listed every dairy herd in the United States that has been officially accredited as free from tuberculosis, or that has passed successfully one test with a view to certification.

An accredited herd is one that has successfully passed two annual or three semi-annual tuberculin tests applied by a regularly employed veterinary inspector of the Bureau of Animal Industry or of the State where co-operative work is conducted and has otherwise complied with the regulations governing the work. Certificates of freedom from tuberculosis are soon to be issued to all owners of accredited herds.

Indemnity for Condemned Cattle

[Written for Pacific Rural Press.]

The 1919 agricultural appropriation bill just passed by Congress contains an item of great importance in the campaign to eradicate tuberculosis among cattle and swine, as it provides for an indemnity to owners whose cattle are slaughtered because they have been found infected with tuberculosis.

The Department of Agriculture is to pay one-third of the difference between the appraised and the salvage value of the slaughtered animals, provided that the State, county or municipality in which the cattle are owned is co-operating in the tuberculosis work and pays at least an equal amount. In no case is the Federal Government to pay more than is paid by the State, county or municipality. No payment by the Federal Government is to be more than $25 for any grade animal or more than $50 for any purebred, and no payment is to be made unless the owner has complied with all quarantine regulations.

This provision is expected to remove much of the opposition among cattle owners that has hindered tuberculosis eradication work. Through it the Federal Government, the State, county or municipal governments and the owners of cattle will share equally in the loss resulting from slaughtering infected animals for the protection of other animals not infected. Let us hope that California will come through with an appropriation bill for her part.

Bargains Picked Up at Modesto Sale

[Written for Pacific Rural Press.]

The sale ring at the second offering of Holsteins, conducted under the management of the California Breeders Sales and Pedigree Company at Modesto, October 17, proved a bargain counter for buyers. Consignments were made by the Bridgford Company, Knightsen; J. S. Gibson Company, Williams; J. M. Campbell, Escalon; and Luther Thompson, C. G. Outland and R. L. Holmes, all of Modesto.

Thirty-two cows and heifers and eight bulls were offered, and the quality was high. The animals were backed by good records for both show qualities and heavy production, but the attendance was made up of farmers who bought at farmers' prices, the females averaging $215 and the males $302.

Lewis & Company of San Jose got one of the biggest bargains of the sale when they purchased Potoki Johanna 2nd, with a record of 27.86 pounds, for $675. E. J. Killeram of Modesto had great luck when he picked up R. L. Holmes' first prize senior yearling at the recent State Fair for $285. Mr. Holmes secured a new bull, Sir Chimacum Wayne Wooderest, for $685. This two-year-old bull was consigned by Luther Thompson and promises to be an epoch-maker.

The sale was very ably cried by Col. Ben A. Rhoades and Col. Cy N. Clark, and while the prices were not exceptionally high the farmers secured excellent bargains and many new purebred herds will be started as the result of this sale.

When the *Hired* Man Becomes the *Tired* Man Do Your Butter Profits Drop?

If he used a SHARPLES he wouldn't need a bell

He can't see the butterfat he loses in the skim milk when turning a fixed-feed separator *under speed!* But it's there, sure enough.

Ringing of a bell may temporarily speed him up like a spur to a jaded horse. But it's human nature to relax when tired. Why not have a separator always in tune with the feelings of the one who works it? Why not have a separator that will skim clean at low-speed, high-speed, middle speed? That has *clean-skim built into it!* In a word—

SHARPLES
SUCTION-FEED
CREAM SEPARATOR

SKIMS CLEAN AT ANY SPEED

Are you wasting butterfat? Tests prove exclusively that 95 per cent. of all separators are turned underspeed much of the time and that's when you begin to lose cream with any separator but a Sharples. It's the wonderful Sharples Suction-feed that absolutely prevents cream loss due to turning underspeed. The Sharples bowl is a plain steel tube—no discs—therefore, easiest to clean. Write to the nearest office for catalog, addressing Dept.

Livestock Queries

PIGS HAVE THUMPS.

To the Editor: Some of my fall pigs have a jerking, twitching movement of the flank, acting as though they had hiccoughs. What is their trouble, and what should I do for it?—A. D. F., Modesto.

[Answered by Livestock Editor.]

Your pigs have thumps. The disease is caused by a disordered digestion which irritates the nerves connected with the diaphragm, causing sudden contractions at irregular intervals. It occurs in pigs that are too fat, due to too much food and too little exercise. Prevention is better than a cure, so if a pig begins to look unduly fat and particularly chuffy around the neck, put it into a rather large wooden box with sides high enough so that it cannot jump out and let it chase about and squeal for a couple of hours in endeavoring to get back to its mother. Repeat once or twice a day until the pig loses its surplus fat. The method is good also when a case of thumps has already developed, but if several pigs have it a better way is to drive the sow out of her pen, and when the pigs become hungry they will chase back and forth and squeal in trying to get to her, and thus get the needed exercise. Reduce the sow's feed, and make the pigs exercise daily.

COW HAS ARTICULAR RHEUMATISM.

To the Editor: I have a Holstein cow, five years old, and a good milker. Less than a year ago she began to be lame at intervals in the left hind leg. It looked as if she might be stifled. She gets over the attack in a few minutes and walks as well as ever for hours—sometimes days. I applied various remedies without results, but she seems to be getting worse, the leg remaining stiff for long intervals.—A. F. W., Stony Ford.

[Answered by Dr. Edward J. Creely, San Francisco.]

Your cow probably has articular rheumatism. Mix and apply briskly once daily the following: Soap liniment, 7 ounces; chloroform, 1 ounce; tincture iodine, 2 ounces; oil origanum, 2 ounces. At the same time mix and give internally one teaspoonful daily of the following: Salicylate soda, 6 ounces; sal nitre, 6 ounces; pulo gentian root, 4 ounces; pulo ginger root, 4 ounces. If this does not effect a cure, write us again and let us know whether or not the lameness shifts to the other limb; also if there is any swelling of the joints.

A GOOD FLY SPRAY.

To the Editor: Please give me a formula for a good fly spray for cows.—C. L., Del Paso.

[Answered by Livestock Editor.]

There are quite a number of patent sprays on the market, some of which are effective, but many are unsatisfactory and are quite expensive. You probably will find it more economical and satisfactory to make your own spray and the following is one of the most reliable: 4½ quarts coal tar dip, such as Kreso; 4½ quarts fish oil; 3 quarts coal oil; 2 quarts whale oil; 1½ quarts oil of tar. Add these ingredients to lukewarm soft water in which 3 pounds of laundry soap have been dissolved, and the total brought up to 30 gallons by adding more soft water.

This spray serves to rid the cow of flies and does not cause the coat of the animal to become thick or harsh, although dust adheres more readily. This, however, applies to all sprays. None has ever been made that will do the work without collecting dust to a certain extent.

J. J. McDonald of Monticello, Napa county, continues to increase his flock of sheep. He recently bought 250 head from James Mee of St. Helena. Mr. Mee sold to reduce, as he did not have feed for his increased flock.

125 FIRST TULARE SALE REGISTERED HOLSTEINS 125

Will be a High-Class Sale in Every Respect

There will be a total of ten consignments, including the entire dispersal of the herds of Charles Yocum and E. G. Wharton. A partial list of the females includes:

A DAUGHTER of a 31-lb. cow bred to the $6,500 36-lb. bull King Korndyke Pontiac 20th.
A 17-LB. JUNIOR 2-YEAR-OLD daughter of Mutual Fobes Longfield De Kol, bred to Kink Korndyke Pontiac 20th.
SEVERAL RICHLY BRED YOUNG COWS AND HEIFERS bred to King Korndyke Pontiac 20th and Prince Riverside Walker.
A 20-LB. COW bred to Sir Aaggie De Kol Acme 2nd, who has the second highest backing in the world for yearly butter records of five of his seven nearest dams.
FOUR OTHER WELL-BRED COWS AND HEIFERS bred to Sir Aaggie De Kol Acme 2nd.
SEVERAL HIGHLY BRED HEIFERS bred to King Sadie Vale Idyl Segis, son of the 35-lb. state record 4-year-old, K P Idyl Segis.
TWO 23-POUND COWS bred to Prince Hiske Walker, full brother to the 34-lb. 4-year-old, Lady Hiske Walker.
A FULL SISTER to a 27-lb. 4-year-old, bred to Prince Hiske Walker.
A DAUGHTER of a 26-lb. cow, bred to Prince Hiske Walker
TWO DAUGHTERS of Sir Skylark Ormsby Hengerveld, and they are both good ones.
A DAUGHTER OF PRINCE GELSCHE WALKER, bred to Sir Aaggie De Kol Acme
A DAUGHTER OF SEGIS PONTIAC DE KOL BURKE out of a daughter of King Mead of Riverside
A DAUGHTER OF KING KORNDYKE PONTIAC out of a daughter of Juliana King of Riverside
TWO GRANDDAUGHTERS of the former world's record cow, Finderne Pride Johanna Rue.
A GRANDDAUGHTER OF KING SEGIS, bred to It State Bells.
A DAUGHTER OF KING SEGIS PONTIAC JANNEK, bred to King Mead of Riverside.
THE HIGHEST RECORD JUNIOR 2-YEAR-OLD ever sold in the west, over 24 lbs. butter in 7 days, bred to the twice grand champion 30-lb. bull, King Segis Alcartra Prilly.
A 26-POUND 4-YEAR-OLD granddaughter of De Kol 2nd's Butter Boy 3d.
A DAUGHTER OF KING KORNDYKE SADIE VALE, bred to King Segis Alcartra Abbekerk, 30-lb. son of the $50,000 bull.
AN 18-LB. 3-YEAR-OLD daughter of a 34-lb. sire and a 30-lb dam, bred to King Segis Alcartra Prilly.
AN 18-LB. JUNIOR 2-YEAR-OLD daughter of King Segis Pontiac, bred to King Segis Alcartra Prilly.
A DAUGHTER OF A 31-LB. 4-YEAR-OLD, bred to King Segis Alcartra Prilly
A 21-LB. 4-YEAR-OLD daughter of a 26-lb. cow, bred to King Segis Alcartra Abbekirk.
A DAUGHTER OF KING SEGIS PONTIAC 13TH, bred to the 35-lb bull Segis Pontiac Abbekerk
AND MANY OTHERS of outstanding breeding, bred to some of the highest record and most promising sires in service in the west.

Bulls for the Breeder and Dairyman

Besides the consignments of high-class bulls of real herd heading quality, the dispersal of two herds through this sale accounts for the presence of several bulls of choice breeding but younger ages than are usually found in consignment sales. Dairymen will find an especially attractive offering of bulls in this sale, that will go for just what they choose to bid for them. The list of bulls includes:

A SON OF KING SEGIS ALCARTRA ABBEKERK, out of a 30-lb. dam.
A SON OF KING SEGIS ALCARTRA PRILLY, out of a 31-lb. 4-year-old daughter of Judge Hengerveld De Kol.
KING IGNARO MEAD, by King Mead of Riverside and out of a daughter of Ignaro De Kol, that made over 29,000 lbs. milk and 1077 lbs. butter in one year.
IT STATE BELLS, by It and out of a 27-lb. 4-year-old daughter of King of the Pontiacs.
A SON OF KING KORNDYKE PONTIAC, out of a daughter of King of the Pontiacs that made 714 lbs. butter in one year as a senior 2-year-old.
A SON OF KING MORCO ALCARTRA, son of Tilly Alcartra, out of a 28-lb. dam
A SON OF PRINCE GELSCHE WALKER, out of a 29.67-lb. daughter of Korndyke Queen De Kol's Prince.
A SON of the 31-lb. cow, Fidessa Helena
And many others of choice individuality and record backing.

Some Facts to Keep in Mind

Every animal in this sale is positively guaranteed to be a breeder.
Every animal over six months of age tuberculin tested and sold subject to retest by the buyer.
The females in this sale of bred to two 40-pound bulls, one 36-pound bull, three 35-pound bulls, one 32-pound bull, two 30-pound bulls, and others of outstanding yearly record backing, all of them constituting the largest list of high record reference sires that has yet appeared in a sale in the west.

San Francisco Livestock Show Postponed

The opening of the California International Livestock Show at San Francisco has been postponed from November 2 to 16, on account of the Spanish influenza epidemic.

Every seeming disadvantage can be turned into a real advantage, and Joseph E. Painter, the resourceful manager, already has plans in operation which will make the show all the bigger and better because of this delay. Several breeders were too late in getting their entries in, but if they will send them at once they will be accepted without question.

The big tents are up, and everything is ready for the reception of stock. Breeders who desire to ship their animals in advance may do so, and they will find every convenience at their disposal for caring for their stock.

Don't forget the new date—November 16. Change your plans accordingly and arrange to attend without fail. It will be the biggest event of its kind ever held on this coast. You can't afford to miss it.

Beef Cattle Turn Trash Into Cash

[Written for Pacific Rural Press by R. H. Whitten.]

Have you ever stopped to think of the many pounds of beef you might produce by utilizing all of the by-products grown on your ranch?

We hear a great deal nowadays about the efficiency of the dairy cow in converting farm crops into human food, but we must remember that she requires much higher priced feed to produce milk than the steer does to produce beef, and the net result is not so favorable to the dairy cow as one might suppose.

In considering the efficiency of dairy and beef cattle it has been customary to compare the milk produced during one lactation period by the farmer with the edible meat produced in one year by the latter, and the showing has been a rather poor one for steers. But the records fail to show that from two to three years were spent and a heavy feeding expense was incurred in simply getting the cows to a producing age.

A few beef cattle on the ranch will make the waste return as good a profit as high-priced feeds.

It is estimated that at present prices it costs $150 to grow a heifer to producing age, and it is not until then that she is ready to compete with a steer. If all goes well thereafter, probably she will outstrip her beefy brother, but, unfortunately, things don't always go well.

The heifer may not breed, may abort, may fail to become a good producer, may have a defective udder, or may have one or more of a hundred other troubles, and in such a case a big depreciation must be placed upon her. A similar depreciation cannot occur with a beef animal, for his carcass determines his worth, and even with minor troubles his carcass will still command a high price.

The owner of a bred heifer must gamble on the future. If she develops into a good producer, he wins his bet. If she proves defective, he may have to sell her for half her actual cost to him. The owner of a steer plays a more certain game, for he can cash in when the feeding period is over.

This does not mean that it is all easy going in the beef cattle game. Like all other lines, it has its disadvantages as well as its advantages. It is a real business, and it should be understood thoroughly before it is gone into on an extensive scale. But nearly every farmer would do well to keep a few beef cattle to clean up what otherwise would be wasted or used in a less profitable way.

Like as not this means you, Mr. Reader. How about that straw you burned last fall? How about those cornstalks? How about the field of alfalfa that was too foul to cut for hay? How about the hay that was rained on? Do you realize how much money is slipping through your fingers by not having enough beef cattle to consume such feed? Think the matter over seriously. Probably your land isn't yielding the utmost in profit yet, and if this is the case undoubtedly a few beef cattle will help to boost the returns.

Statisticians report that the exports of bacon for the first seven months of this year were almost equal to the total bacon exports for five years preceding the war. The figures are 736,959,092 pounds, as compared with 912,370,461 pounds. The doughboys are eating twice as much bacon, proportionately to beef, as they formerly did. Even so, the beef shipments have increased amazingly and exports of fresh beef for the single month of July exceeded those for the entire year 1914 by five times.

THE HEREFORD CORPORATION

OF WYOMING

Ranch six miles east of Cheyenne, Wyoming. Twenty-five thousand acres devoted exclusively to the production of Registered Herefords. Sixteen hundred head on ranch at present time.

MISS RIALTO 2ND,

Never Defeated Grand Champion Wherever Shown.

We won Grand Champion on carload of females at Denver the last two years. We have stock for sale at all times. Glad to answer questions and explain anything. Look us up at the fairs—we are here on the Coast for that purpose. We have calves from these herd headers with us in our show herd:

HERD SIRES

Wyoming Fairfax, Grand Champion at Denver in 1918.

New Era, Senior Champion at P.-P. I. E.

Gold Dust, first in two-year-old class at Denver, 1917.

See us at Liberty Fair, Los Angeles, and California International Livestock Show, San Francisco.

We have consigned 10 females and 2 bulls to Hereford sale, to be held on San Francisco Fair Ground, November 22.

The Hereford Corporation of Wyoming

Wm. Cox, Herdsman Raymond S. Huster, Vice-Pres. and Gen. Mgr.

CHEYENNE, WYOMING.

Herefords

LEADING HERD OF THE STATE.

My stock is the result of nearly 40 years of careful breeding and selection. Have for sale a carload of registered bulls and a carload of heifers—1917 calves, grandsons and granddaughters of Beau Donald 31 No. 109885 and Mr. Perfection No. 215575.

They will go quickly. Write or call at once.

Shorthorns and Berkshires

Our second annual sale of Shorthorns will take place in January. Demand is very good for Berkshires, but we can supply your wants.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send, on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

H. F. Friel of Waddington, Humboldt county, has a grade Holstein cow that is giving 80 pounds of milk per day, testing 3.6 per cent, yet she was fed only green stuff.

Tulare county dairymen received the highest price on record for September butterfat, the prices ranging from 62½c to 65c per pound. The total amount distributed was $152,-497.31.

J. W. Scudder of Holt, San Joaquin county, is gradually working into purebred Holsteins by using a registered bull and getting a few purebred females as a starter toward replacing his grades.

Owen Duffy, manager of the State Farm at Napa, reports that for 261 days Raphaella Johanna Aaggie 3rd produced 24,464.6 pounds of milk and 664.236 pounds of butterfat. This certainly is going some!

With plenty of green feed and a big yield of milk, and butterfat bringing the highest prices they have ever known, the dairymen of Humboldt county are happy and bought lots of Liberty Bonds.

S. H. Greene, the well-known California creameryman, has been appointed head of a committee on dairy products and milk distribution of the Food Administration for California. Mr. Greene will assume his duties at once.

D. F. Conant of Rancho Santa Marguerita, Modesto, the well-known Jersey breeder, has just sold a bull to W. F. Sprowl of Modesto out of Mamie Owl, the cow that made 6 pounds of butterfat in three days at the State Fair.

The annual convention of the California Creamery Operators' Association, which was to have been held at Visalia on October 17, has been postponed indefinitely at the request of the State Board of Health because of the Spanish influenza.

W. J. Higdon, Tulare, calls our attention to the fact that in an advertisement we published for him last month we credited him with winning first on get of sire at the State Fair, but instead Mr. Higdon was awarded first prize on breeder's young herd.

After a conference with Food Administration officials, the milk distributors of San Francisco have agreed to reduce the price of cream from 10c for quarter pints, 18c for half pints and 35c for pints to 8c, 14c and 26c respectively. Los Angeles has indicated that it will adopt a similar scale.

A representative of the Department of Agriculture is in the State on a mission to arrange for the production of about two million pounds of casein on the Coast in the next year for airplane work. Casein, which is a milk by-product, makes the only glue impervious to water, and airplanes are covered with it.

D. F. Conant, Rancho Santa Marguerito, Modesto, reports that his Jersey cow, Lady Kate's Rosette 361239, made 69 pounds of butterfat for August on official test. Hecla's Margery made 55 pounds butterfat in one month. Mr. Conant now has nine cows on official test, all making good records.

Swine and Swinemen.

The Ireland Ranch of Owensmouth won the blue ribbon with their Duroc futurity litter at the Riverside Fair.

J. J. Pendergast of San Bernardino recently sold to Roy Bradley of the same place two Golden Model Duroc sows sired by Col. Select, and a boar of Great Model breeding.

Nate Hauck of Alton, Humboldt county, recently sold two registered Poland-China gilts to H. W. Ekholm of Escalon and Mr. Ekholm was so well pleased that he immediately ordered two more.

C. P. Slocum of Willows has been kicking himself for selling the junior champion Duroc boar at the State Fair to the Elliott-Brant Rancho at Owensmouth. He says that it will cost him from $1,000 to $2,500 to replace him.

W. B. & E. W. Hewitt of Van Nuys were among the new Duroc breeders who fooled the old-timers at the Riverside Fair. They won second on their futurity litter and had two six-months-old boars that cleaned up everything in sight.

Fairbanks Ranch of Redlands, owned by F. C. Fairbanks, son of the late Vice-President Fairbanks, made its initial bow at the Riverside Fair with a fine herd of Hampshires and will be heard from often hereafter. A. E. Harvey is manager of the ranch.

Donald H. Graham, the progressive young Duroc breeder of Lancaster, reports that his young herd boar, Orion's King Gano, is coming along nicely, weighing 460 pounds at 364 days in breeding condition. The boar is by Orion Cherry Prince, he by Orion Cherry King, and is out of Lady Gano, she by Col. Gano.

The junior champion Duroc boar purchased from C. P. Slocum & Sons at the State Fair by Elliott-Brant Rancho of Owensmouth has been named Ebro—an abbreviation for the ranch name. The boar has the same blood lines as the one purchased in the East that died en route, being sired by a Kings Col. boar and out of a Golden Model sow.

Donald H. Graham of Lancaster recently sold a Duroc boar to M. C. De Fraga, Bolinas; a boar to George W. Nichols, El Centro; a young sow to D. W. Reed, Del Sur; a boar to Mrs. L. M. Taylor, Los Angeles; six bred sows and a boar to the Martin-Morrison Ranch, Lancaster; also a boar was sold to Fred W. Dow, to be shipped to the State of Sonora, Mexico.

Because he is obliged to attend school now, Hiram Hendern of Fairoaks cannot show his Chester Whites again this season. But his wonderful record at the State Fair shows that success in swine raising is not beyond the reach of school boys. He won grand championship, senior championship and first prize senior yearling sow with Wonder Bernice; reserve grand championship and first prize junior show pig with Betsy Wonder; first prize and reserve junior championship on Uncle Sam; first prize in get of sire and in produce of dam and in the Boys' Livestock Judging Contest. What a hogman this youngster will be when he grows up!

Beef Cattle.

Recently at the Kansas City stock yards two Shorthorn steers were sold weighing 3790 pounds at three years of age. They commanded the high price of $18 per cwt., the two bringing $682.20. Who says that it does not pay to breed and feed for weight?

The famous bull, Woodford, herd sire at the Hereford Farms of Col. E. H. Taylor, Jr., of Kentucky, was burned to death recently in a fire which destroyed the new barn at that breeding establishment. Last winter the auctioneer at the International sale asked the Colonel if he would consider an offer of $50,-000 for Woodford and the latter replied that he would not. His death is a serious loss both to Col. Taylor and the Hereford industry at large.

Miscellaneous.

Edward Lovell of the Blackhawk Ranch sees an excellent future for draft horses. He recently received a letter from a friend in England who says a big, well-built work horse will bring from $700 to $1,000 over there today. If this is true, what will they be worth after the war?

Thomas Harrison of Glen Ellen reports that inquiries for milking Shorthorns are pouring in from all over the Pacific Coast. He recently sold a fine young bull to Gus Knoll of Crescent Mills, one to M. A. L. Lewis of Medford, Ore., and one to M. G. E. Whittaker, Chehalis, Wash. The latter will be shown at San Francisco before being shipped. He is eight months old, weighs 900 pounds and is considered by Mr. Harrison a grand prospect for a herd bull. His dam with first calf made a record of 7000 pounds milk.

Hats Off to the Swine Breeders' Ass'n.

[Written for Pacific Rural Press by R. H. Whitten.]

NEW AIMS AND PURPOSES

To stabilize market conditions in order that the producer may be assured a reasonable profit.

To secure the enactment of a pure-feed law so that the buyer will know what he is getting when he buys commercial feeds.

To collect data on the condition of the swine industry, with recommendations wherein it can be improved, and to distribute this to hog raisers.

To encourage the use of purebred sires.

To assist in increasing the export trade in hogs to the islands of the Pacific and South America.

To co-operate with the Federal Food Administration in such ways and at such times as will be to the greatest benefit to the nation and our allies.

To assist in every way possible toward the more profitable production of more and better hogs, and give the swine raisers an organization that will be in a position to bring about improved conditions which the growers desire, but wherein they are helpless through lack of organization.

Co-operative organization has been a big factor in making many California agricultural pursuits more profitable, thereby stimulating production. With this fact in mind, the hogmen of the State are setting about in a spirit of earnestness to make the California Swine Breeders' Association include every hog raiser in the State and make for him a better profit, yet at the same time not attempting any movement toward sending pork skyward to the consumer. A stabilized market, selling by carload lot through county unit organizations at which sale every packing house will be represented as well as every other method attainable, will be sought by the association in its efforts to make the pork business more satisfactory to the growers, thereby increasing California's production.

The greater pork production for the current year has not been due to the increase made by owners of large herds of hogs, but more through the effort of farmers who have not heretofore raised hogs feeding them on farm by-products or growing them because they were urged to do so by patriotic solicitation. It is to get the big pork producer into the notion of increasing his breeding herds and to induce the small fellow just becoming interested to grow more pigs and keep improving them, that the State organization is working.

Some farmers have had their good and bad years with hogs, which have at times been attributed to the lack of adequate market facilities. To bring about better marketing arrangements than exist at present is one of the chief objects of the California Swine Breeders' Association, and to bring this plan closer to the producers county units of the State organization are being formed in the pork-raising sections of the State.

While the organization is being built up to the point where it can begin to perform some of these highly essential functions, the officers are taking the lead, with the help of other stock and poultry organizations, toward getting a pure-feed law enacted in this State. Secretary J. I. Thompson has secured from a number of Eastern and Middle Western States copies of their laws governing the sale of commercial feeds, and the next Legislature will be asked to adopt a similar law for California.

Many hog, cattle and poultry growers were in desperate straits during the past year as a result of the feed shortage and the high prices for the mill substitutes for barley and the coarser grains that went skyward. Some commercial feeds of merit reached the market, while others were found to be lacking. The purpose of the proposed law is to compel the manufacturers to label the containers with the feed value of the ingredients. This will doubtless save California feeders millions of dollars annually. A conference of the representative interests will soon be held so that the measure will be in shape to present to the Legislature when it meets next January.

The organization work of the association is being carried on by the officers until county units are formed, and then each county branch will go after every hog raiser in its community so that the association will be made a truly representative one. The officers consist of the following: President, C. B. Cunningham, Mills; vice-president, Alex. D. McCarty, San Francisco; secretary-treasurer, J. I. Thompson, Davis; directors, M. Bassett (Hanford), W. S. Guilford (Butte City), H. H. Braly (Newbury Park), Elmer Lamb (Ceres), R. K. Walker (Bonita), and Frank B. Anderson (Sacramento). Each of these directors, representing a section of the State as well as a certain breed of swine, will be apportioned a number of counties in which he will look after the organization work.

Swine Mortality Lowered

[Written for Pacific Rural Press.]

Fewer swine died from disease last year than in any year since 1883. The loss was only 42.1 hogs per 1000, while it ran as high as 144 per 1000 in 1887.

Despite this fact, more anti-hog cholera serum was manufactured last year than in any previous year. This is ascribed to the greater value of hogs, with the consequent greater loss when one dies, and to the fact that hog raisers are becoming more appreciative of the value of using serum manufactured under Federal supervision.

Department of Agriculture officials warn hog raisers against the use of preparations other than serums, as experience has shown that nothing except serum, properly prepared and administered, is effective. Other medicines are worse than useless because they not only fail to cure or prevent disease, but allow the loss of the animals they are advertised to save, thus taking money from the farmer and meat from the nation's supply.

Antitoxins, serums and other biological products for the treatment of domestic animals must be produced in establishments operated under Government license before they may be marketed in interstate trade, and must be prepared under the supervision of trained Government veterinarians. In 1917, 250,041,290 cubic centimeters of serum were prepared, and of this amount 1,867,106 cubic centimeters were destroyed as unfit for use.

Prof. R. F. Miller, head of the sheep department at the University Farm, Davis, has been offered a position as head of the Animal Husbandry Department at the Texas Agricultural College and expects to accept the position after finishing his work in connection with the sheep campaign that he is now conducting. The offer is a flattering one and is a big recognition to California as a training school for advanced livestock men.

Sheep and Mud Don't Agree

[Written for Pacific Rural Press by R. H. Whitten.]

Now that the rainy season is coming on, provision should be made so that sheep will not be compelled to stay in muddy corrals or in wet fields, as such conditions almost always cause foot rot. Also the feet should be kept well trimmed, for foot rot occurs more frequently when the trimming of the feet is neglected.

Foot trimming is a phase of sheep raising that requires just as much attention as feeding and shearing. This applies particularly to California sheep, as most of our sheep carry considerable Merino blood and the hoofs of Merino sheep grow much more rapidly than those of any other breeds. All breeds of sheep should have their feet trimmed twice a year—in spring and fall—and if they carry a large amount of Merino blood this may be necessary more often, especially if the sheep are running on soft ground, where there is no gravel or stone to wear their hoofs down.

Sheep should be kept on dry ground to eliminate the possibility of foot diseases.

When sheep are neglected, the outside horny part of the hoof grows over the sole. A hollow space is thus left between the hoof and the sole, in which dust collects, and this finally begins to make the foot sore, with the result that foot rot starts in.

In chronic cases of foot rot the hoof grows out rapidly and becomes very hard. Often the toes will be so thickened and lengthened that the front part of the foot will be raised above its natural incline and the tendons at the heel will be subjected to additional strain, which will tend to increase the lameness and awkwardness. The toes will frequently attain an added length of three inches and will curl up like sled runners, greatly interfering with the progress of the animal. Crooked and broken-down pasterns result.

Before trimming the hoofs, it is well to turn sheep out on damp ground, as this will clean their hoofs and make the horny parts so soft that they will cut easily. Generally it is best to start with a pruning knife and remove the largest portion of the surplus hoof, using a sharp jack-knife to finish it. If the hoof is sufficiently softened, a jack-knife may be used to do all of the work. Cut away all loosened and diseased portions of the horn and shorten the long toe, being careful not to cut deep enough to make the foot bleed. Cut the hoof down sufficiently to make it level with the sole of the foot and to allow the foot to stand straight when placed on the ground.

If foot rot has set in, probably there will be feverishness in the affected foot, and the skin in the cleft of the hoof will be red and swollen. If the trouble is left unchecked, pus forms in the cleft and the disease gets under the skin and spreads over the entire wall of the hoof. During the summer months blow-flies lay eggs in the diseased hoof and the maggots spread from the foot to the wool, finally killing the sheep if attention is not given.

If the trouble happens in the summer time, put the sheep on the driest pasture obtainable until they are cured, but if it occurs during the rainy season it may be necessary to provide dry quarters.

If you simply have a small flock, the sheep can be caught and each foot treated separately. Clean all mud and filth from between the toes, trim the feet if necessary, and then apply pulverized blue vitriol (sulphate of copper) made into a batter with the addition of scalding, not boiling, vinegar. Stir briskly until it is of the consistency of cream and put on the affected parts with a paint brush or a small wooden paddle. Be sure that enough of the horn is pared away from the diseased parts so that the remedy can reach the sore. By repeating this treatment two or three times the foot will heal nicely. If it is not necessary to treat all four feet, it may be well as a preventive measure to apply the solution to the sound feet.

Where a large flock is to be treated, the best way is to walk the sheep through a trough containing fresh slacked lime, with enough water added to make it run well, and put in deep enough to cover the feet. The trough can be put in a gateway so that the sheep can be made to walk through it slowly in passing from one field to another. It may be necessary to repeat this treatment several times.

calco troughs for watering & feeding hogs

Water and feed your hogs with Calco Sanitary Troughs—don't risk the loss from deadly disease germs.

Calco troughs—with smooth metal sides and round bottoms—are absolutely sanitary. Made of rust-resisting Armco Iron and cast iron—they are strong and rigid—yet light.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

INFLUENZA IN THE CHICKEN YARD.

Catarrhal colds, chicken-pox and other poultry troubles are almost as prevalent as the Spanish influenza. Even animals, it seems, are having trouble. The other day a burro died at Long Beach—sneezed itself to death. That sounds like a joke, but is intended simply as a caution to be on the watch for sneezing chickens. The sneeze and shake of the head, watery eyes and nostrils are the first symptoms. They develop into others so quickly that you have not time to think much about it before there is a lump under one eye, and possibly both eyes. When the chickens refuse to eat or appear to have difficulty in swallowing, there is very likely canker in the mouth, and it may extend down the throat into the air passages.

For catarrhal colds give a physic. If the eye begins to swell and you catch it before the lump becomes solid or hard, bathe with pure peroxide of hydrogen or some simple disinfectant; but when the lump hardens, as it will in a short time, use straight coal oil and dip the head in, holding under until the bird gurgles; then take the head out and wipe off the superfluous oil. For canker in the mouth make a mixture of powdered gum arabic, sugar of milk and permanganate of potash crystals. The first two are to hold the last one to the place it is put on. Bluestone is sometimes used, but it's very harsh treatment. I prefer Loefler's solution, though it is a little more expensive.

But the best remedy is prevention. This is done by building up the vigor and constitution of the flock, by cleaning up all refuse, and keeping a good tight roof over hens in a house that is well ventilated. Closed-up poultry houses are an abomination in California, or anywhere. Borate of soda is a cheap healing wash for cleansing the eyes and nostrils and if hens are to be made profitable these colds must be nipped in the bud by individual care. Treat the ailing birds several times if needed, for cleanliness is absolutely necessary. Chickens should not be allowed to run down and lose vigor, hence prevention lies at the root of all cure.

Tincture of nux vomica is a remedial agent I have never seen fail, and if you read your "California Poultry Practice" you will see it mentioned as a valuable remedy. Tincture of nux vomica has a stimulating effect on the gastric mucous membrane, it is a tonic, appetizer and a liver alterative at the same time. Being poisonous, it must be kept out of the reach of children, and given to chickens in small doses. Ten drops to a pint of drinking water is sufficient, and it will do no harm to the smallest chicken in that quantity.

BROODY WYANDOTTES.

To the Editor: Last fall I bought two Buff Wyandotte pullets and one cockerel. They had scaly legs when they arrived. One pullet started to lay in December and laid until the middle of January, when she started to cluck. What I want to know, is clucking a characteristic of the Wyandotte?—Mrs. A. A. B., Mina, Nev.

[All Wyandottes are good setters and mothers, but some strains sit and get broody more than others.]

SWELL-HEAD.

To the Editor: A number of our turkeys begin running at the nostrils, then puff up around the eyes, usually first on one side, then later on both. These swellings are rather whitish. Is this swell-head? They seem to eat well and some have quite red heads otherwise. What is the cause? It seems to be very contagious. Please advise.—Subscriber, Chico.

[The trouble is catarrhal roup, called swell-head. The cause is cold, either from sleeping in a draught or on cold, wet ground. Give a dose of Epsom salts or castor oil in a little warm mash at night; souse their heads in coal oil, just far enough to clean the heads and nostrils. Wipe off the extra oil, as, if left on, it will take the skin off and make them look ragged; then feed them well. You may have to give two dippings, but that should kill it if you find and stop the cause.]

VEGETABLE PROTEINS MAKE GOOD EGG RECORDS.

The scarcity of beef scrap, together with its high price, has led poultry specialists of the U. S. Department of Agriculture to conduct feeding tests with laying hens in which cheaper and more plentiful kinds of protein feed are tried. In these tests feeds rich in vegetable protein have been used in connection with beef scrap to make up the laying ration. One pen of hens fed a mash containing 20 per cent beef scrap produced the greatest number of eggs, but a second pen, fed a mash consisting of 10 per cent peanut meal and 10 per cent beef scrap, produced an average of only ten eggs less during the test period of five and a half winter months. Mashes made with soy bean meal, cottonseed meal and velvet bean meal, in combination with beef scrap, have been fed with fairly satisfactory results.

CHICKEN-POX.

To the Editor: Our chickens have chicken-pox. Can you give us a remedy? Also, some of our pullets go lame and we cannot account for it. We will be grateful for information.—Mrs. W. P., Modesto.

[Chicken-pox can be cured and stopped from spreading by simply rubbing the heads of all the flock with carbolated vaseline. Rub it well into the sores and surrounding surface, then you may not have to do it but once. Drop ten drops of tincture of iron on a cube of sugar, break it in two and give that amount to two chickens. There is nothing in cube sugar, but I find it is easy to put medicine down a hen's throat on it without a lot of fuss. Barley is all right, but I would soak it a few hours to remove the sharp sticker at the end. Examine your lame chickens for lumps; it may be that a barley beard has gotten under the skin somewhere and is causing lameness.]

VEGETARIANISM FOR HENS.

[Written for Pacific Rural Press by H. R. Dakin of Santa Cruz.]

I am surprised at the result of a year's experiment in feeding poultry and the number of eggs secured from the kind of hens I have, though I really expected some such result. I try and get the hens to eat at least four times as much green food as all other food. The green mash given them in the morning to last all day contains four times as much greens by weight as everything else, and at noon I feed greens from the garden, four times as much by weight as they have scratch feed at night. You might think where they have greens in the mash that they would not need a green feed at noon, but if it is omitted the egg record lowers.

The following feed is for one hen: 4 to 5 ounces ground kale and chard (one-third chard and two-thirds kale); ¼ ounce coconut meal; ¼ ounce meat meal; ½ to ¾ ounce good quality bran. This makes the morning feed. At noon they get from 4 to 10 ounces of fresh greens. At night 2 ounces of scratch feed. For about six months I fed corn meal instead of coconut meal.

During the first six months there were six hens in the yard laying, as follows:

	Eggs Laid	Wholesale Value
Aug. (½ month)	61	$2.10
Sept.	94	3.55
Oct.	132	5.70
Nov.	112	5.05
Dec.	117	5.05
Jan.	87	4.05
Feb. (½ month)	67	2.55
Total for six months	670	$28.05
Cost of all feed except greens		6.30
Net profit over feed bought		$21.75
For six months per hen, eggs laid		111
Net profit from each hen		$3.625

During the second six months, finishing the middle of August, there were eight hens laying, as follows:

	Eggs Laid	Wholesale Value
Feb. (½ month)	67	$2.05
Mar.	180	4.20
April	223	5.15
May	177	5.10
June	137	4.20
July	119	4.20
Aug. (½ month)	76	2.70
Total for six months	979	$27.60
Cost of feed		8.30
Net profit over feed bought		$19.30
For six months, per hen, eggs laid		122
Net profit from each hen		$2.40
For one year, eggs laid per hen		233

For one year, net profit from each hen for eggs only, $6.00, at wholesale prices.

I have charged all cost of feed to the hens, therefore the hens boarded one rooster for one year.

Some have said, "Of course you give them the table scraps, of which you make no account." My family is small and these times there are not table scraps enough to feed the cats, which, though good hunters, need feeding.

For one month I fed ground greens coated with a very little middlings, with no increase of scratch feed at night (which is a small one, two ounces to each hen), and no chance for other food except greens at noon.

These hens have had no petting; barely attention enough to feed them and gather the eggs. The droppings were cleaned out not oftener than once a month, as I was busy with other things.

The hens are not all good. I have one extra good hen. Half of them are good and half I would not keep if I were in the poultry business. Still, with feeding a green mash, they have made a good record and I claim have proved my point—that green stuff is really a food and not merely a tonic.

POULTRY NOTES.

The central thought to be borne in mind in considering the growing of more poultry as a war necessity is the fact that the keeping of poultry is a means of converting into good food materials that cannot be utilized by man, that cannot be eaten by any other kinds of stock, and that, without the poultry, would be absolute waste.

The principal facts in regard to the raising of rabbits are as well established as those of rearing other domestic animals, and the directions which a beginner needs are few.

The California Honey Producers' Co-operative Exchange has joined the California Federation of Farmers' Co-operative Marketing Association.

Poultry Breeders' Directory

Rates 3 cents per word per week.

HOW ABOUT IT? We do not favor very late fall chicks; breeding stock has been in full moult—fertility and vitality both impaired. **But,** we do believe in January and February chicks—conditions are for better results—satisfaction. We are already booking orders for early delivery. Supply will not equal demand then, so get busy and plan ahead for yours. Our circular (free) will give you information and prices; tell you about our stock and plant and why 1919 will pay big. **Our Breeds**—Rhode Island Reds, White and Barred Rocks, Black Minorcas, White, Brown and Buff Leghorns. Baby chicks by express or parcels post from 15 to thousands. Capacity 12,000 chicks weekly. We insure safe delivery and quote delivered price on request. Suppose you write us? The Mission Hatchery, Box 17, Campbell, Cal.

BARRED PLYMOUTH ROCKS—Winners at leading shows and wonderful layers. Choice stock for sale. "Nothing better in poultry." Catalog free. Chas. H. Vodden, Box 396, Los Gatos, Cal.

ROSE AND SINGLE COMB Rhode Island Reds, 220-egg record. Breeding stock, hatching eggs. Wm. Larm, 3915 Thirty-ninth avenue, Fruitvale, Cal.

EASTMAN'S BRED-TO-LAY, Hoganized and trapnested Barred Plymouth Rocks, Cockerels; Eggs. Fairmead Poultry Farm, Fairmead, Cal.

WHITE LEGHORN BABY CHIX from heavy laying (Hoganized) stock, $15 per 100. We guarantee safe arrival. The Pioneer Hatchery, 408 Sixth street, Petaluma, Cal.

PRIZE WINNING Rouen and colored Muscovy ducks for sale. Choice Light Brahma cockerels, $4 to $10 each. Muscovy eggs, $2 per 15. Emma Miller, Farmington, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal. Stamps.

BABY CHICKS and hatching eggs from our selected purebred S. C. White Leghorn hens. Tupman Poultry Farm, Ceres, Cal.

LAST FALL CHICKS IN OCTOBER—Booking orders for spring deliveries. Several varieties. Stone Poultry Ranch and Hatchery, Palo Alto, Cal.

MAMMOTH BRONZE TURKEY TOMS and hens for sale. Order now before prices advance. Also Collie dogs for herding. John G. Mee, St. Helena, Cal.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch, R. 2, B. 144D, Pomona, Cal.

ALBERT M. HART, CLEMENTS, CAL.—Breeder and shipper of bronze turkeys.

PUREBRED Brown Leghorn Cockerels, $5 each. Geo. Loomis, Albion, Cal.

THE HOME CIRCLE

HELP!

Lord God of the Nations,
Help me to see
My duty to man—my
Duty to Thee!
Where the red lines of death
Have deep furrowed the land
And the harvest of woe
Is full ripe to the hand
Of war's dreadful reapers,
Help me to see
My duty to man—my
Duty to Thee.

Lord God of the Nations,
Help me to hope—
While murder-mad armies
With crimson hands grope
For the life of the world,
And the lust of their creed
Offers mothers and babes
On their altars of greed—
While our soldiers of peace
In this war hell cope
With these murder-mad slaves,
Help me to hope.

Lord God of the Nations,
Help me to give
Myself and my all that
Freedom may live.
As millions have died
On this war-cross for Thee
And for man whom thou lovest,
Do thou give to me
The courage and strength
To die if need be—
Lord God of the Nations
Help me to give.

—Harold Bell Wright.

A FIG FOR THE SPARROWS!

Frank Denby sat on the front steps of his father's house and surveyed his mother's flower beds with a prospecting eye. Time was flying faster than his camping fund was growing and he was still two dollars short of the price of a scout tent.

"Mother," he began tentatively, "a thorough weeding wouldn't hurt your flower beds. I see a good many little patches of grass, and the walks are not specially clean."

Mrs. Denby, sitting at the window, raised her eyes from her sewing and looked out over the garden.

"You're right, Frank, but old Dick is going to give me a day next week. You wouldn't take the old man's job away from him, would you?"

"No," said Frank, dubiously, "but I certainly would like to get a job myself."

His mother sewed thoughtfully for awhile and then she spoke.

"The figs are beginning to ripen. If you'll manage to keep the sparrows from pecking holes in the fruit and spoiling it, you may have all the figs from one tree to sell. But you can't peddle them. You must make a sale to the fruit market."

"Nick Shapiro will buy them from me. I'll see him today," said Frank. The scheme struck him as being a good one.

"And you'll have to get up early in the morning, for that is when the sparrows get in their work," added Mrs. Denby.

Frank pulled himself up from the steps with energy for fresh enterprise.

"Guess I'll go take a look at the prospect," he volunteered.

There were three fig trees, loaded with fruit just approaching a state of luscious ripeness. Frank raised his hand and picked one of the figs to break it open. In the softest spot, where the fruit showed a faint reddish tinge, was an ugly, jagged hole, somewhat larger than a sparrow's beak. He tried others to find that a goodly portion of the ripest figs had been ruined in the same way. Then he went back to the house, got out his shotgun, and began to clean it. Half an hour later he was on his way down town to make the deal with Nick and to purchase a good supply of bird shot.

"Where are you bound for, Frank?" a voice called to him as he passed his next-door neighbor's gate at a pace that pre-figured death to sparrows. Old Mr. Benson was sitting under the big oak in his front yard and Frank stopped at his question to explain where he was going and why.

"You needn't shoot the sparrows," said the old man when Frank had finished; "I'll tell you a way to make them let your figs alone. They're afraid of white string, and if you'll just get a big ball of it and interlace your fig bushes with it you won't be troubled by sparrows."

Frank looked skeptical.

"They're not afraid of anything else under the sun." He rather held to the gun and bird shot as trustier means of protecting his interests.

"I don't see how they can be afraid of white string," he protested.

"Try the twine," said Mr. Benson.

The deal with Nick was made to the satisfaction of both the contracting parties, but Frank went home in a still uncertain frame of mind, having purchased a large ball of twine and no bird shot. He went out immediately to set about carrying out Mr. Benson's instructions, but as he twisted the string in and out among the twigs and leaves he felt as if his task was a fruitless one. Nevertheless he finished it up with thoroughness, and if the twine had been more ornate in character his mother's fig trees, when he got through, would have presented the appearance of gayly bedecked Christmas trees. His neighbor, George Frost, thought as much when he spied him from the next yard, and called out:

"What's the answer, Frank? Getting practice for next Christmas?"

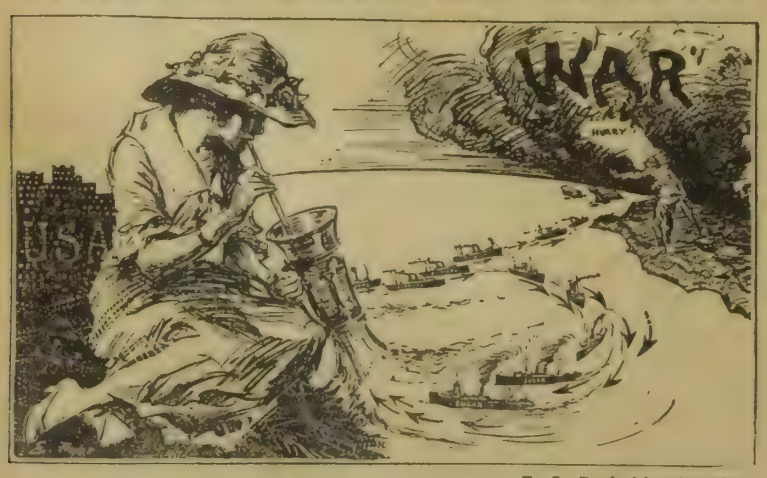
"Haven't got Christmas in the back of my head," said Frank, the shortness of his reply being due mainly to the long tediousness of his job.

At the supper table he unburdened his doubts in the bosom of his always receptive and usually sympathetic family.

"Do you see why sparrows should be afraid of white string?" he asked.

"No. Unless they think they will get their feet caught in it," laughed Mr. Denby. "It may be prenatal instinct. But Mr. Benson wouldn't

DON'T DRINK SHIPS!



U. S. Food Administration.

Are you shocked to see the lady drinking ships?

You drink ships every time you use sugar unnecessarily, in a beverage.

Seventy-five per cent. of the sugar used in this country has to be brought here in ships. Every possible ship is needed for the transportation of troops and supplies to the other side.

Eliminate sugar as a luxury, and you release many ships for war purposes.

Teach your appetite to remember this—
DON'T DRINK SHIPS.

"The Simplest Thing in the World"

When a seemingly difficult problem is solved with an ease that is almost ridiculous, it is tantalizing—anyhow it "gets" the most of us and we immediately want to investigate.

That is precisely the effect that "the simplest thing in the world"—the Premier Burner—has on people who look into our display windows—they come in immediately to investigate. One look at the burner in operation is su..cient for them to realize that at last the problem of perfect combustion in an oil-gas maker has been solved and promptly give utterance to the expression, "why, it's the simplest thing in the world"—that's why we use the expression, it's the first thing they think of saying.

DO YOU WANT TO INVESTIGATE?

Just ask for Circular "B" and tell us the size and style of your stove—we will send you detail drawings showing installation.

The burner is guaranteed and prepaid anywhere for $5.00.
For any cook stove or heater.
Installed by anyone.

A CLEAN, CHEAP GAS FIRE AND NO FUEL PROBLEMS.

Premier Burner Co., 246 South Spr ng St., LOS ANGELES, - CAL.

send you on a wild-goose chase, and there must be something in his idea."

"I'm going out in the morning, and if there's a sparrow in sight I intend to get the bird shot," said Frank.

The sun was just coming up through the big oaks in Mr. Benson's yard when Frank slipped softly out the door and went into the garden. As he came near the fig trees he was struck by the peculiar stillness, where heretofore his ears had been met with vociferous chatter and the soft flutter of vanishing wings. And instead of finding a small army of marauders he saw one lone sparrow perched for sentinel duty on the topmost twig of the tallest tree. The sentinel retreated precipitately, and Frank began an inspection of the fruit tree to see if the birds had been in reality kept from injuring it. Not a fig had been molested. They hung untouched, ready to be converted by a little deft manipulation into camping paraphernalia.

A week later Frank sat beside Mr. Benson on the bench under the old oak.

"I cleared three dollars and thirty-five cents on those figs," he announced.

"Cleared?" said Mr. Benson. "You weren't out anything except a ball of string and a little time."—Annie L. McMakin in the Churchman.

HOME DEMONSTRATION WORK ORGANIZED.

Congress is providing for full organization of the home demonstration branch of the work of the Farm Bureaus.

County home demonstration agents will be located in counties where a competent farm home department of the Farm Bureau is formed, and where the board of supervisors make an appropriation of $1,500 per year for the expenses of the woman agent. These will be located in the first twenty counties that qualify.

City home demonstration agents will be located in cities where a similar organization (yet to be devised) is formed, and where the city council appropriates $1,000 for the expenses of a city home demonstration agent, or $500 for the expenses of each assistant city home demonstration agent. These are to be located as follows: In San Francisco and Los Angeles, one agent and two assistants in each city; in Oakland, one agent and one assistant; in Sacramento, Stockton, Fresno, Bakersfield, San Diego and Berkeley, one agent—provided the above cities qualify as outlined.

The home demonstration work, both county and urban, in this State will be under the direction of Miss Harriet G. Eddy as assistant professor of agricultural extension in the University of California. Under Miss Eddy's direction will be two divisions, one of county work and the other of urban work. Miss L. D. Clark will remain in her past position as head of the county work. The position of head of the urban work has yet to be filled.

Miss Eddy brings to this new branch of service a full knowledge of the State of California and of its problems. She has for nine years been organizer of the county library system, which is without parallel in any State of the Union, and which now covers almost all of the counties in the State. In this organization work she has been brought into intimate personal contact with a large number of boards of supervisors, women's clubs, farm bureaus, and other organizations of the State.

JUST AMERICANS.

The war has taught the people many lessons they needed very much to learn: It has made possible many things that were impossible. And there is scarcely a man or woman in America who has not in some degree been lifted by it out of his old prejudices to a higher, broader plane of thought. We shall see the truth of that statement splendidly demonstrated the week of November 11-18, when seven agencies engaged in war work for our soldiers and sailors are to unite in a great campaign for funds with which to continue their ministry. Of these seven agencies two are Protestant, the Y. M. C. A. and the Y. W. C. A.; one, the National Catholic War Council, embracing the Knights of Columbus, is Catholic; the Jews are represented by the Jewish Welfare League, and the other three, the American Library Association, the War Camp Community Service and the Salvation Army, have no denominational affiliation. According to the almost general conception these organizations could not be consolidated. But when President Wilson suggested that they get together the impossible was done in a single day. What years of discussion and convention had failed to bring about, the larger spirit, which the war has engendered, was achieved without an effort.

The sum sought by the seven agencies is immense, $170,500,000, the largest single gift ever asked of any people at one time. Yet compared with the figures to which the war has accustomed us it is small. Measured against the huge total which we shall pay to keep our boys under arms next year, this sum, which is to provide for their comfort and cheer, becomes almost insignificant. It is less than ten cents a day for each boy—less than the average man spends for cigars.

It will be raised—not grudgingly but in a spirit of splendid enthusiasm. The country will go over the top for the Big Seven as it has gone over the top for the Liberty Loan and the Red Cross.—Bruce Barton.

"VICTORY MIXED."

The new "Victory Mixed" flour, which contains the required 20 per cent substitutes, has been placed on the market. The "Victory Mixed" brand will be manufactured by the mills in the five following combinations and the labeling of any other flour product as "Victory Mixed" is prohibited: (1) Mixed wheat and barley flour; four pounds of wheat flour to one pound of barley flour. (2) Mixed wheat and corn flour; four pounds of wheat flour to one pound of corn flour. (3) Mixed wheat, barley and corn flour; eight pounds of wheat flour to one pound barley and one pound corn flour. (4) Mixed wheat and rye flour; three pounds of wheat flour to two pounds of rye flour. (5) Whole wheat, entire wheat or graham flour or meal to contain at least 95 per cent of the wheat berry. Pure wheat flour may still be purchased at the ratio of four pounds to one pound of substitutes.

PERFECTION OIL HEATER

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, October 23, 1918.

WHEAT.

The following are the Government prices of wheat, subject to modifications heretofore noted:

No. 1 hard $2.20
No. 2 .... 2.17
No. 3 .... 2.13
No. 1 soft 2.18
No. 2 .... 2.15
No. 3 .... 2.11
Club or Sonora, No. 1 .... 2.16
do, No. 2 .... 2.13
do, No. 2 .... 2.09

BARLEY.

Barley is weaker, but otherwise there is no change in the situation. The Grain Corporation has made no announcement regarding the results of its request that offers of barley be made for shipment from Port Costa at $2.25 and $2.28 sacked and delivered.

Choice feed, per ctl .... $2.05@2.10

OATS.

Oats are weaker, with little demand.

Red feed, per ctl .... $2.30@2.40
Red seed .... 2.80@3.00

CORN.

There have been some offers of new corn, but not enough as yet to establish quotations.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked .... Nominal
Milo maize .... "
Egyptian .... "

HAY.

Receipts for the past week were 698 tons compared with 553 the previous week. As has been the case for the past two weeks the receipts have been alfalfa and grain hay, which had been more or less damaged by the September rain. Some alfalfa that was in stacks during the rain and is now being baled shows up fairly well, although the evidence of the rain can be seen in streaks of discoloration. The feature of the market this week is the placing of orders by the Government for about 8,000 tons of grain hay, most of which was placed with dealers in this city.

Wheat No. 1 .... $26.00@28.00
do. No. 2 .... 22.00@24.00
Choice tame oat .... 25.00@27.50
Wild oat, new .... 22.00@24.00
Barley, new .... 22.00@24.00
Alfalfa .... 18.50@22.00
Stock .... 18.00@21.00
Barley straw .... 50@80c

FEEDSTUFFS.

The feedstuffs market is practically confined to the milled grains and alfalfa meal. It was somewhat stiffer this week, due perhaps to the fact that the north winds which have prevailed are expected to be followed by frost which may injure the green feed seriously. However, at present green feed was never in better condition in most places.

New alfalfa meal, per ton .... $35.00@36.00
Cocoanut cake or meal .... Nominal
Cracked corn .... $86.00@88.00
Oilcake .... Nominal
Rolled barley .... $47.00@49.00
Rolled oats .... 57.00@58.00
Bran, carload lots in S. F. .... None offered
Mixed feed, do, do .... None offered
Middlings, do, do .... None offered

POTATOES, ONIONS, ETC.

The vegetable market showed the effect of the influenza scare and business generally was reported dull. In most cases prices were maintained. Potatoes and onions showed a slacking up. Some onions of inferior grade were brought in and sold as low as 50 cents.

String beans .... 4@7c
Wax beans, per lb. .... 4@5c
Pole beans .... 4@7c
Carrots, per sack .... 85c@$1.00
Rhubarb, San Jose, per box .... $1.00@1.25
Summer squash .... 50@60c
Pumpkins $1.00
Cucumbers, Alameda, lugs .... 75c@$1.25
Eggplant, per box .... 75c@$1.00
Lettuce, Sacramento, doz. 15c
Celery, bunch .... 20@25c
Tomatoes, per crate—
Bay .... $1.00@1.50
Potatoes—
Garnet Chile, on street .... None
Whites .... $1.65@1.90
Sweets, per sack .... 3.25@3.70
Onions—
River Reds .... None
Yellows .... 75c@$1.00
Australian Browns .... 75c@$1.00
Garlic, new .... 13@15c
Green corn, Alameda, per sack .... Nominal
Okra .... 5@7c

BEANS.

The market for the new crop of beans showed a sharp break during the past few days, and more beans are coming into the market now as the threshing season progresses. At the same time dealers say that there is practically no demand and they have marked down prices all along the line in hopes of moving the crop promptly. Michigan stocks have also shown a decline and this in turn affects the California market. The Michigan freight rate to the Atlantic seaboard is so much below the California rate that the California growers would have to deduct at least 50 cents a hundred from their price to stand on a parity with Michigan in the Eastern market.

Bayos, per ctl .... $ 7.60@ 7.75
Blackeyes, new crop .... 6.75@ 6.90
Cranberry beans .... 9.75@ 9.90
Limas (south, recleaned), new crop .... 11.00@11.25
Pinks .... 7.25@ 7.40
Red kidneys .... Nominal
Mexican Reds .... 7.25@ 7.40
Tepary beans .... 6.25@ 6.50
Garbanzos .... 8.00@ 8.75
Large whites, new crop .... 8.90@ 9.00
Small whites, new crop .... 10.00@10.25

POULTRY.

Hens were the feature of the poultry market this week. During the week two carloads of Eastern Poultry arrived, almost exclusively roosters. Local receipts of all descriptions were light and notwithstanding the arrival of Eastern roosters prices advanced on these. Turkeys were not in great demand and 38 cents was the top on young stock. Belgian hares were in demand and sold higher.

Turkeys, live, young spring, lb. 38c
do, old .... 35@36c
do, dressed, old .... 42@44c
Broilers, 1½ to 2 lbs. .... 39@42c
do, 1¼ lbs. 45c
do, ¾ to 1¼ lbs. 47c

BUTTER.

Butter established a price of 61 cents for extras on Monday's call and that price will prevail until next Monday. The receipts of butter are growing as the effect of fresh feed on dairy cows is becoming manifest. With the high price demand has fallen off, and many purchasers are depending upon storage butter.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	62½	62½	62½	61	61	61
Prime first	61	61	61	Nominal		
Firsts			Nominal			

EGGS.

Eggs continue to go higher, the close of Wednesday of this week being 8 cents above the same time last week for extras and 6 cents higher for extra pullets. The price of eggs on the New York market is 90 cents, and even at 82½c the dealers can ship to that market and make a profit. As long as such profit can be made it is expected that eggs on the San Francisco exchange will be governed almost entirely by New York quotations.

Extra 1sts			Nominal			
Firsts			Nominal			
Extra pullets	62	64½	65½	69	68½	69

CHEESE.

Very little Oregon cheese is coming into this market at present, and the price has been advanced 2½ cents for fancy triplets in order to attract some. First California flats were advanced 2 cents and fancy California flats were advanced half a cent on account of the demand for a substitute for the Oregon cheese.

California Cheddar, flats, fancy 30½c

FRESH FRUITS.

The prevailing sickness in the city is seriously affecting the demand for all kinds of fruit. Peaches are the only one of the list to sell lower. Blackberries are out, and strawberries and raspberries are stronger and higher.

Apples .... $1.50@2.50
Peaches, 4-box crate .... 1.00@1.25
Figs, black, per box .... None
do, double layer .... 75c@$1.00
do, Single Row Whites .... 75c@$1.00
Strawberries, per chest .... $9.00@12.00
Blackberries, per chest .... None
Raspberries, per chest .... $9.00@12.00
Plums .... Nominal
Cantaloupes, flats .... None
do, ponies .... Nominal
do, standard .... Nominal
Watermelons, per lb. .... Nominal
Pears, Bartlett, per box .... $1.50@3.00
Grapes, Tokay .... 2.00@2.50
do, Muscat .... 2.25@2.50
Persimmons .... 1.00@1.50
Alligator Pears .... 4.00@5.00
Pomegranates, per box $1.50

CITRUS FRUIT.

The citrus market is very erratic. Due to the demand of the sick, lemons jumped to $9 for fancy, and one dealer reported there was no market, as each dealer was asking and getting about what he pleased. The other descriptions of lemons advanced in proportion. Oranges sold as high as $12.50, but there were but few in the city, and the navels are not expected to arrive for a week or more.

Oranges $12.50
Lemons, fancy 9.00
do, choice 7.50
do, standard 6.50
Grapefruit .... Nominal

DRIED FRUITS.

The dried fruit market is quiet this week, but it shows no signs of weakness. The situation has changed so little that last week's comment tells the story.

Last week's quotations remain unchanged.

RICE.

Paddy rice, 1918 crop $4.32
Clear No. 1, 1918 crop, at mill 7.00

HONEY.

The market remains firm and unchanged.

LOS ANGELES

Los Angeles, October 22, 1918.

BUTTER.

Receipts were somewhat better, 330,200 pounds, against 334,800 pounds the same week last year. The demand, however, was equal to the supply, all coming in being taken by distributers. San Francisco held steady up to Monday, when the market there broke 1½c on extras and Chicago and New York for the same time declined 2½c on extras. Prices got so high as to encourage the consumption of butter substitutes. The market, therefore had to drop to encourage people to return to butter again.

We quote:

California fresh extra creamery 60c
do, prime first 58c
do, first 57c

Daily quotations:

	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
1918—						
Extra	60	60	60	60	60	60
1917—						
Extra	47	47	47	47	47	46

EGGS.

This has been a famine market the past week. Receipts by rail for the week only 410 cases, against 403 cases the same week last year. The truck receipts continue to run about four times as large as the arrivals by rail, making the supply for the week 2050 cases, against 2015 cases the same week last year. Under such showing the market went kiting during the week. There were withdrawn from cold storage during the week 5959 cases to make up this shortage, against 4214 cases the same week last year.

Daily quotations:

	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.

Pullets	43½	43½	44	44	44	44

POULTRY.

The market for light stuff was further advanced the past week and demand good both for broilers and fryers. Hens unchanged; heavy and in fair demand. Turkeys scarce; higher. Ducks slow sale and geese dull.

The following prices were agreed upon last Friday, October 18, and hold good until the coming Friday:

Broilers, 1@1¼ lbs. 41c
Broilers, 1½@1¾ lbs. 41c
Fryers, 2@3 lbs. 32c
Roasters (soft bone), 3 lbs. and up 30c
Stags and old roosters, per lb. 20c
Hens .... 26@30c
Tom turkeys .... 31@34c
Ducks .... 22@28c
Geese 15c

VEGETABLES.

There was a glut of potatoes and onions on the market the past week and under excessive supplies the market for both ruled lower. Sweet potatoes were also dull and lower. Garlic scarce and sharply higher. Cabbage dull but steady. Tomatoes in very good demand and shipping stock higher. Celery steady and in fair demand. Peppers steady and selling fairly.

Bell peppers, per lb. .... 2½@3c
Chile peppers, per lb. .... 2½@3c
String beans, per lb. .... 4@4½c
Lima beans .... 3½@4c
Potatoes, northern, per cwt. .... $1.75@2.00
do, Idaho Russets, per cwt. .... 2.00@2.10
Sweet potatoes, per lb. .... 2½@3c
Garlic, per lb. 20c
Onions—
Australian Brown, per cwt. .... $1.00@1.25
White Globe, per cwt. .... 1.40@1.50
Cabbage, per 100 lbs. 1.25
Celery, crate .... 3.00@3.25
Tomatoes, No. 1 lug .... 65@75c
do, No. 2 lug .... 25@35c

FRUITS.

There was a very good demand the past week for all fancy stock, but poor stuff was hard to move. Apples were in best demand. Freestone peaches out of the market. A few northern clings are coming in and they are higher. Best pears continue to sell very well and market is firm

Figs, Black Spanish, per lb. .... 5@7c
do, White, per lb. .... 5@7c
Pears, local, per lb. .... 3½@4c
Pears, Mountain .... 4@6c

do, Black Morocco, lb. .... 4@4½c
Apples—
King Davids, 4-tier $2.75
Black Twigs, 4-tier 2.75
Baldwins, 4-tier 2.00
Red Pearmains, 4-tier 1.75
White Pearmains, 4-tier 1.75
Rhode Island Greenings, 4-tier 1.50
Yellow Newtown Pippins, 4-tier 1.75
Apples, Bellefleur, 4-tier .... $1.65@1.75
do, 3½-tier .... 1.70@1.80
do, Gravenstein, 4-tier 2.25
do, do, 4½-tier 2.00
do, Bellefleurs, local, per lb. .... 2½@3c
Peaches, northern clings, per lb. .... 5@6c

WALNUTS.

A steady market and very good demand was had the past week for what few walnuts offering. The association has no nuts for sale.

	1918	1917
Fancy budded	34½c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

BERRIES.

Blackberries are out of season and the offerings of strawberries and raspberries were light. Raspberries were sharply higher and strawberries were steady.

Strawberries—
Fancy, per 30-basket crate .... $3.50@3.75
Poor to choice 30-basket crate .... 1.50@2.65
Raspberries, 30-basket crate .... 5.50@6.00

MELONS.

Few good melons on sale the past week and the market was dull and weak.

We quote from growers:

Casabas, per lb. .... 1@1¼c
Watermelons, per 100 lbs. .... 75c@$1.00
Honeydew melons, 16-inch crate .... 75c@$1.00
do, jumbo crate .... $2.75@3.00

BEANS.

The market was both dull and lower the past week. Growers were offering more freely and as the Government was not buying and as trade was disposed to take only such lots as needed for immediate use, limas were lowered ½c, blackeyes ¼c and teparies ¾c, and but few wanted at the lower prices.

Limas, per cwt. $10.50
Large white, per cwt. 9.00
Small white, per cwt. 10.00
Pink, per cwt. 7.50
Tepary, per cwt. 5.50

HAY.

There was a little better tone to the market the past week. The dairy people, having pretty much used up their accumulated stocks, were in the market for more alfalfa. The receipts were only fair and the market showed more life for this kind of hay. No demand for horse hay.

We quote f. o. b. Los Angeles:

Barley hay, per ton .... $23.00@24.00
Oat hay, per ton .... 25.00@27.00
Alfalfa, northern, per ton .... 20.00@21.00
Alfalfa, local, per ton .... 21.00@23.00
Straw, per ton .... 9.00@10.00

COTTON.

The market the past week was a little stronger, but it was nervous and trading cautious. The current week the market opened slow on Monday, awaiting Germany's answer to President Wilson's last note, and trading light. October closed in New York at 31.46c and December at 30.40c. In New Orleans October closed at 29.97c and December at 29.18c.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, October 22, 1918.

The average prices for sound stock of Tokays and Malagas remain practically unchanged from the past two weeks. The demand continues active and the favorable weather of the past week has permitted shipping to continue, though there is a wide range in the quality of different varieties from various districts.

The first car of Emperors packed in sawdust for the season was offered for sale at auction in New York last week, but after 120 drums had been sold at an average of $5.50 the balance were withdrawn on account of a tendency for the market to decline. It is evident that the trade is skeptical as to the keeping quality of the Emperors and especially those shipped since the rain.

Some districts have completed their shipments for the season, but if the weather continues favorable the movement of Emperors, Malagas and Tokays will continue for ten days to two weeks.

Averages for the week:

New York: Grapes—Malaga, $2.06; Alicante Bouchet, $2.07; Zinfandel, $1.76; Cornichon, $2.04; Tokay, $1.75; Emperor, $2.29; Muscat, $1.65. Peaches—Levi, $1.75. Pears—W. Nellis, $3.04; Bartlett, $2.05; Clairgeau, $4.25; Morceau, $3.70.

Boston: Grapes—Tokay, $2.01; Cornichon, $1.98; Malaga, $1.77; Emperor, $2.09; Muscat, $1.66; Alicante Bouchet, $1.85; Zinfandel, $1.57; Verdell, $1.95. Pears—B. Clairgeau, $4.13; E. Buerre, $3.27; Comice, $3.95.

Chicago: Grapes—Cornichon, $2.13; Malaga, $1.78; Emperor, $2.81; Tokay, $1.50; Muscat, $1.30; Zinfandel, $1.20; Malvoise, $1.15. Pears—W. Nellis, $2.55.

Shipments from Otcober 11 to 19, inclusive: 83 pears, 2600 grapes. Shipments to date, 1918: 21,644 cars. Shipments to date, 1917: 19,905 cars.

Special Citrus Market Report

Los Angeles, October 21, 1918.

The prevalence of the Spanish influenza throughout the East and the consequent demand for oranges from the hospitals and military posts served to give the Valencia market another boost, sending the fruit above the very high levels that have been maintained latterly at Eastern distributing points. New York touched the highest records, the best average last week going to the extreme figure of $18.60 for fancies. On one day's shipment the average price recorded for the ten cars sold was $12.10. F. o. b. quotations have ranged from $10 to $12. The present week has undoubtedly cleaned up the commercial supply.

Although California has been shipping lemons freely to all markets, quotations continue to show an upward trend, in sympathy with other citrus fruits. F. o. b. quotations are reported on a basis of around $7. No foreign lemons are available.

DOWN, BUT NOT DOWNED

As you read this issue please bear this in mind: We had prepared a special issue for the California International Livestock Show at San Francisco—were all ready to go to press when the announcement was received that the opening of the show had been postponed two weeks. This meant the getting out of an entirely different issue; it meant doing a whole week's work in twenty-four hours.

How well we have succeeded we will leave to your judgment, but among ourselves we think that the issue is a hummer. We believe that the new Harding grass described in Prof. Kennedy's interesting article will solve California's forage problem, and will put millions of dollars into the pockets of our farmers. We believe, too, that Mr. Whitten's paneled article on the use of grain for dairy cows will prove an eye-opener to dairymen and will increase their profits greatly.

Read the good articles by Mr. Hodges on asparagus and potatoes; by Mr. Fox on olives and apricots; by Mr. Whitten on beef cattle and sheep. And then stop to consider that you paid less than two cents for this issue. About the biggest value you ever received, isn't it?

There'll be articles just as timely, just as interesting, just as practical in next week's issue. Watch for it; tell your friends about it. No matter what happens to thwart our plans, you'll find us equal to every emergency. You'll find every issue of the paper worth many times an entire year's subscription.

Special Livestock Market Report

San Francisco, October 23, 1918.

CATTLE—The cattle market this week shows a downward tendency, though quotations remain unchanged. There are not many coming in from California points, the bulk of the supply originating in Oregon and Nevada. The prevalence of the influenza and the resulting restriction of beef consumption operating adversely. The same depressing tendency is observable in the East.

Grass steers—
- No. 1, weighing 1000 to 1200 lbs..11½@12c
- No. 1, weighing 1200 to 1400 lbs.11½@11¾c
- Second quality .....10@10½c
- Thin .....8@9c

Cows and heifers—
- No. 1 .....7½@8c
- Second quality .....6½@7c
- Common to thin.....4@5c

Bulls and stags—
- Good .....6@7c
- Fair .....5@6c
- Thin .....4@5c

Calves—
- Lightweight 11c
- Heavy 8½c
- Medium 10c

SHEEP—There is little doing in mutton sheep. The supply is light, especially of fat, desirable stuff. The demand is correspondingly light. There has been a pretty steady depreciation in live mutton values at Eastern markets due to oversupply and the large proportion of stunted range animals offered.

Lambs—
- Yearlings .....12@12½c
- Milk .....14@14½c

Sheep—
- Wethers .....11½@12c
- Ewes .....9@9½c

HOGS—There is a lull in the hog market this week, and as a consequence we note a slight decline in quotations. There is less killing than there would be under normal conditions. The lack of sufficient help to handle the animals is keenly felt, due to influenza prostrations.

Hogs—
- Hard, grain fed, 100@140.....16½c
- do, do, 140@300.....17c
- do, do, 300@400.....16½c

Los Angeles, October 22, 1918.

CATTLE—The best fed steers continue in very good demand and unchanged. The tone of the market, however, is weak. More offering than for some time. Besides from California and Arizona, a number of steers were in from Nevada and in good demand and firm.

Per cwt. f. o. b. Los Angeles—
- Beef steers, 1000 to 1100 lbs....$9.00@12.00
- Prime cows and heifers..... 8.00@ 9.00
- Good cows and heifers..... 7.00@ 7.50
- Canners, per cwt..... 5.50@ 6.00
- Calves, per cwt..... 8.50@10.00

HOGS—Coming in a little more freely and in sympathy with declining markets East, the market is lower. The demand, however, is very good for most offerings.

Per cwt. f. o. b. Los Angeles:
- Heavy, averaging 275@300 lbs..$15.00@16.00
- Mixed, 225@275 lbs..... 15.50@16.50
- Light, 175@220 lbs..... 16.00@17.50

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—There is no change in this market from a week ago. Offerings light and prices holding up under scarcity, but demand only fair.

Per cwt. f. o. b. Los Angeles—
- Prime wethers .....$9.00@10.00
- Prime ewes ..... 8.50@ 9.50
- Yearlings ..... 9.50@10.50
- Lambs .....15.00@16.00

The California Farmer

has so many things his cousins in other States do not enjoy—few of the comforts are lacking.

He has the best of roads; in many cases more than one automobile; electric light; telephone; power-farming machinery.

A great many of the California farmers have pipe lines and water tanks—some do not.

It is to the latter this is addressed: Whatever else you have to make for comfort on the farm there's nothing so necessary as a redwood water tank and pipe line.

The Pacific redwood tanks and pipe lines outlast the average human life.

To construct and install a Pacific redwood tank and pipe line will cost probably only half as much as you think.

Their cost to install is away below metal and to maintain is so small as to hardly be noticed.

With every facility at our command for getting the lumber and bringing it to our yards, unloading direct from ship to mill, drying and preparing it for working, the cost for any unit is reduced to the minimum.

Then there are 600 men, with the finest mechanical devices for handling at least cost for labor and fuel. And what is most important there is the perfect design, the result of thirty years of pipe and tank building.

That's the factory — the plant covers 100 acres — and is situated on the water front one mile long.

This, combined with direct connections with three transcontinental railroad lines, offers unequaled shipping facilities.

The engineering staff is prepared to submit you an estimate as to the cost of installing a tank and pipe line.

Tell us the size of tank you want, how high the tower, the distance the water is to be carried, and any other information about the water supply and demand on your farm.

We will cheerfully figure the cost of an outfit suitable for your purpose, and promptly write you.

Tractor Work Gets Done When Bosch is Used

There is no half-way business about the work of a Bosch-Equipt tractor—no falling down in the middle of the job
Bosch stands the gaff

If a manufacturer puts Bosch Magnetos on his tractors, you can be sure his one big idea is to give you service, for Bosch costs him more than ordinary ignition systems. If he is careful enough to use Bosch, he is careful about the rest of his tractor, too.

BOSCH Magneto Ignition with Impulse Starter

is a promise of real tractor service. If either your present tractor or the new one you decide upon has some other ignition system, have Bosch installed instead. Its rip-roaring sparks, its rugged sturdiness and its never-failing dependability will make a world of difference.

The Bosch Impulse Starter has ended starting troubles for Bosch users. Simple in design, but big and strong, it makes quick, easy starting a certainty.

The Bosch works and organization are deep in war service, but few, if any, kinds of war service are more necessary than yours. For the country's sake as well as your own, your tractor must keep working. Your ignition **must not fail.** You are entitled to a Bosch Magneto.

When you order a new tractor, specify "Bosch Magneto Ignition." For your present tractor, have Bosch fitted by the nearest Service Station.

BE SATISFIED **SPECIFY BOSCH**

THE PACIFIC RURAL PRESS

Forty-eighth Year

SAN FRANCISCO NOVEMBER 2, 1918 LOS ANGELES

7-1-20 State Library

Signal Success in State Land Colonization

Written for Pacific Rural Press by John J. Fox

THE OBJECT of the Land Settlement Act of 1917 is stated as being for the purpose "of promoting closer agricultural settlement, assisting deserving and qualified persons to acquire small improved farms, providing homes for farm laborers, increasing opportunities under the Federal Farm Loan Act and demonstrating the value of adequate capital and organized direction in subdividing and preparing agricultural land for settlement."

The writer was privileged to take part in a preliminary survey of values on the Durham project the early part of this year and went over the ground very thoroughly for three days with George C. Kreutzer, the superintendent, and Dr. C. F. Shaw of the University of California. It was at once apparent that a better choice could not have been made for the initial application of the Act. First, all the land to be distributed is good and much of it excellent. Second, water supply for the irrigated land is ample and the title thereto beyond question. Third, it is well drained.

Furthermore, it is adjacent to the prosperous city of Chico, itself the center of a large area of productive land, and is connected therewith by the State highway, excepting half a mile of macadam. It is also served by two lines of railroad, with depots within half a mile.

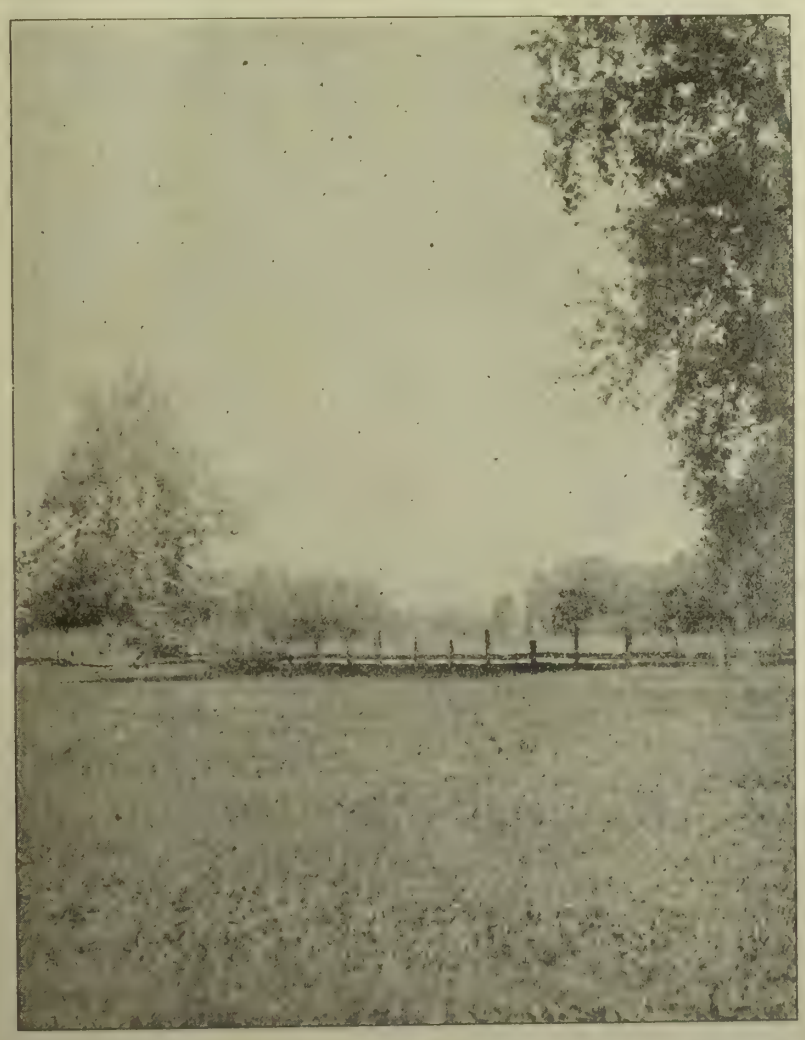
Rapid Development.

We recently revisited the settlement (six months after the first visit), and this is what we found. The land had been classified and valued by the Farm Settlement Board. Farms had been laid off into areas differing in acreage according to their value and bearing capacity.

Leveling, grading and ditching had been accomplished and drainage surveys carried out. The first unit was allotted to applicants on June 15 and consisted of 53 farms. All were sold except three, the applicants for which were not accepted, and these three go in with the next unit. There were, in addition, 26 farm laborers' lots, of two acres each, disposed of to workmen, half of whom have already built their cottages.

On this first unit there were 860 acres of grain and 750 acres in alfalfa. The grain men took occupation on June 15 and made about $20 an acre net on their grain within a couple of months of their purchase, as they bought the land with crops on. The alfalfa men have taken three crops and have been making $17 a ton in the shock for it. It is really marvelous to see what has taken place here in six months. There was one farm laborer whose neat cottage we saw who, when he put in his application in May, had not sufficient money to pay in the necessary deposit of $20,04 on his lot. On June 15 he paid this deposit. On October 16 he paid $160 on his house. It is erected and furnished. He is living in it and has a Liberty Bond flag in the window. Here is a living symbol of Patriotism and Thrift.

This outlined method of colonization, of building homes, and populating the bare acres of this State is the most practical and useful measure ever conceived for such a purpose. To merely exhort and chide for a return to the land has always proven futile; to invite earnest men to embrace an opportunity that has been created whereby they may enjoy the fruits of their labor, is to accomplish something. It swells the tax list and increases the productivity of the soil and more important than all enlarges our most valuable class of citizens—those who feed mankind.



Though most of the land in this colony is open, it is picturesquely dotted with large valley oaks and has many well-wooded building sites like the above, many of which are already occupied with sets of buildings. A Japanese offered $30 an acre rent for this land.

Co-operative Purchasing.

Mr. Kreutzer, who had five years of land settlement work in Australia, assists settlers in taking bids for materials, for buildings, fences, etc. In addition, the Land Settlement Board has bought carload lots of cement, wire, nails, fence posts, well-casing and other material and sells to the settler at cost. The board bought 800 sacks of seed wheat on the same plan. This system of co-operative purchasing is a relief to the newcomer as well as being a saving of expense.

In the new unit, now open to the public, applications close on November 20 and the drawings are made December 20. Applicants put in their first, second and third choices of plots and then, from information filled in on the application blank and from personal interviews with applicants, the board decides who shall be accepted. This decision is based more on the ability of the applicant as a farmer than on the amount of money he may possess, and it is final. Which should lead to a very efficient community.

There are 28 farms in the new tract. From 20 to 160 acres to a farm—mostly forties. The land is chiefly loam and clay loam and the average price will be in the neighborhood of $200 an acre, including the water rights.

The Soils.

The land bordering Butte Creek is a rich, deep alluvial loam that will produce anything from alfalfa, beans and truck to prunes and walnuts. Part of it was formerly a Chinese truck garden.

The University College of Agriculture has prepared a soil map, which shows the character of the soil on each farm and the prices placed are on their estimated productive value respectively. The land varies in character from a silty loam to adobe. On this latter rice was grown last year which produced about 50 sacks to the acre. This is good grain land and would turn off heavy crops of corn, beets and forage crops, while some should be good pear land.

Work of Agricultural Engineers.

All the farms have been laid out tentatively to the best advantage for working them with the greatest economy and efficiency, and these plans are provided to the farmer gratis, to carry out as he wishes. The Settlement Board also furnishes blueprint plans of houses and farm buildings, from which estimates can be made and contractors work. These are also given to the settler free of charge. Water for domestic use is obtained at about 40 feet, while the irrigation water comes by gravity from Butte Creek. Leveling, grading and new distributing channels for irrigation are still being carried out by the board, which will provide for the system until the settlers are able to organize

EDITORIALS

VOLUMINOUSNESS.

TO THE EDITOR: Your editorials are too voluminous.—B. M. H., Fresno.

Your kind words are very welcome. They show that you are either reading our editorials or refusing to read them—in either case you are bestowing upon them your careful attention. Yours is the first intimation received for a long time that anyone else is either reading or refusing to read them. Inferentially, then, all other readers are passing up this page as a conventional piece of typographical decoration: without which they would be as discontented with the paper as was the man who hurriedly went to the movie without slipping in his glass eye; but with which each issue pleases them immensely—providing nothing worries them into reading the editorials. We believe that is the normal condition of the newspaper reader, because that is the way we feel about it. We subscribe regularly for four daily papers so that we may catch all hues of public opinion. We do not read all the editorials, but if they ever fall short a few inches of their accustomed length in a single issue we condemn that journal for slacking. The usual editorial voluminousness is therefore essential to the satisfaction of the patrons of any journal.

Pondering upon this attitude of the common mind toward editorial expression, we shudder to think how our critic might have hurt our feelings if he had really been reading our editorials and had felt compelled to be as frank with us as a shy guest once was with his hostess. The lady had been serving cake of her own making and was apologizing for the quality of it, as it is proper to do—even if its deliciousness puts one over on the ambrosia of the gods. The embarrassed man, fearing effusiveness of compliment, as is common with shy people, and desiring to render judicial and discriminating praise, received his portion of the cake with this response: "I am sure, my dear madam, that the cake is most delicious—what there is of it." Then, realizing with a shock what a wreck he had made of his intended compliment, he continued: "And there is really a great plenty of it—such as it is."

Our generous critic does not seem at all shy in his praise of our work, but it surely does make us shiver to think what he might have said if he had been so cruel as to resort to specifications!

ANTE-VOLUMINOUSNESS.

WAS IT Mark Twain who declared that his head was full of useful information and it bothered him to see how facts would keep leaking into his most serious compositions? Our problem is the antithesis of Mark's: Our effort is to write nothing but facts and our trouble is that there are so many weighty and significant facts abroad in agriculture today that we are able to pack into each week's editorials only a few of those which press for declaration. We remember well how it was in earlier days, when the farmer was generally conceded to be beyond the pale of public affairs—men whose duty it was to sculpture out crops from rocky and rebellious soil, deliver them over at the farm gate or on the village street to the dealer who assembled, warehoused and transported them and did all the banking business which the moving of crops entailed. One had to cudgel his brains in those days to break loose an agricultural fact which had any relation to world affairs, which were out of sight of the farm itself. The farmer was conceived to have nothing to do with anything but his soil, his seed and his beasts, and his chief duty was to torture himself and his family into misshapen lumps of rheumatism by exposure, over-exertion and under-nutrition, so that professional, financial and mercantile people would have plenty to eat to enable them to do all the great things to which the world gave opportunity. In those days there was no voluminousness in agricultural editorials. The original rural writer was expected to tell how to make a calf drink, how to set a hen, how to ring a hog; with perhaps a flight now and then into higher economics to demonstrate that a farmer ought to haul in his crops as soon as possible while the roads were good so that dealers could fix prices (after they had bought the stuff for whatever they liked to pay) at whatever figure the world traffic would bear! It was to the glory of the American farmer that even under such depressing conditions he labored on and valiantly. He gave his sons strength and ambition which carried them into the greatest activities the country needed. They became great soldiers, statesmen, leaders in professional and commercial life and all that, but they did that by escaping from farms, not by staying on them. In those days rural editorials were not voluminous.

HOW VOLUMINOSITY CAME.

Natural science was the father of voluminosity in agricultural editorials. Its rays illumined an industry which was dark, dreadful and depressed, disclosing surprising opportunities for application of new truth and undreamt of openings for exhortation to apply it. Economics was the god-father of voluminosity, carefully watching and wisely ministering to its development in agricultural discussion. Wonderful has been the influence of natural science and economics as applied to agriculture during the last half century. As in the life of a man, the first two decades were required to get a start: the two decades following demonstrated wonderful activity and efficiency: the last decade has brought achievement and the world-recognition of it by all the races of men and the leaders of them. "Food will win the war"; "Farmers are the second line of national defense"; "Increased food production alone can make democracy safe." Thus has come into common parlance recognition of the relation of improved and more capable agriculture to all that makes human life and aspiration possible and enduring. It is freely conceded to be the foundation upon which they must rest—not the old agriculture which was held to be automatically continuous and sociologically servile, but a self-conscious, self-assertive productive art and effort to which the world must be just and generous or it can never itself be free and progressive in the greatest interests of mankind! And what about the writing of such things? In the nature of things it must be voluminous to present even a part of the facts which every farmer should ponder and interpret. It is his duty to do this. It is our duty to remind him of it. He who rebels against such voluminosity as this duty requires should turn back his clock about fifty years!

PRODUCTS AND POLITICS.

WE HOPE readers will remember that it is just before a national election for Congressmen and not lose their heads in the violent ruction which has cropped out between Republican and Democratic leaders. President Wilson, as head of the Democratic party, has called upon the people to elect Congressmen of his political kind and ex-Presidents Taft and Roosevelt and others are lambasting him for putting a political "stick" in a patriotic lemonade. All these parties are simply doing what is to be politically expected of them as leaders of their parties, which must live and push or kick after the war dies and must therefore get as many of their men into position to do one or the other of these things as they can. To claim that either of the parties has a monopoly of patriotism and patriotic efficiency is, of course, nonsense. Lincoln saved the unity of the country by the help of war-Democrats and Wilson will save the liberty of the world by the help of war-Republicans, and it could not have been done in either case without help from the opposition. All should therefore remember that the country is always on the way to the bow-wows for a week before an election and always comes back again the day after it. President Wilson has fourteen ways to hit the Huns and calls for Democratic help to man his battery. Ex-President Roosevelt and his associates have one way, viz.: "to hell with the kaiser." There is no danger that the world-devastators will get away; therefore, it does not matter much whether they are riddled with buckshot or shot from a cannon. What does matter in the election next week is not only to get real Hun-beaters into Congress, which, of course, every voter will look out for, but to get men from this State who will work and vote right for national policies which will be fair to the industries of this State and not send them glimmering through a mist of economic fallacies such as came in 1913 and would have lured them onto the rocks if the war had not set in such strong counter-currents. Remember, then, that California needs Congressmen who will know how and be forceful to protect California products when reconstruction of national attitudes and relations begins. How would the allied effort for mankind have suffered if California had not established her particular products which have rendered such superlative war service? Do not forget, then, that the continuance of them was endangered by the policies of 1913 and may at any time be replaced in jeopardy. President Wilson does not need to win the war with the help of any man whose economic fallacies would weaken or endanger the industries of California. More important also than any particular way to get the kaiser either by one shot or fourteen is to vote right on the constitutional amendments. California agriculture is in no shape to have "all public revenues, State, county, municipal and district, raised by taxation of value of land" nor to enter upon a journey in that direction on the first of January next. For decades the land has borne relatively too much taxation. The California constitution, which prescribes that all property shall share in carrying the burden of taxation, needs no narrowing amendment: it simply needs more strenuous effort for enforcement. It is such things that California voters have to look out for next Tuesday. They should not be alarmed by political clatter, no matter from what source it may come.

APPROXIMATION OF EXTREMITIES.

IT IS trite to emphasize the meeting of extremes, for it seems to be a common way, and yet it is striking to find the wettest things on earth becoming suddenly the driest. We were surprised when Mr. Horst turned his hop kilns into vegetable driers, but that was only the beginning of a movement which culminates in the transformation of the Anheuser-Busch brewery in this city into a dehydrator. Officials of that corporation have announced that their local plant would be operated by a new corporation, the American Products Company, and would be used for dehydrating vegetables. The company already has a $50,000 Government contract. There seems a great scope for such transformation, for Chicago alone had forty breweries, with a combined investment of $33,000,000 and employing 1580 men, which, under the Government's ruling, went out of business October 1. We do not know how far the Government intends to turn wet things into dry, but it is surely going some. Congress recently passed a law and appropriated funds for the promotion of dehydration and empowers the President, if necessary, to authorize the establishment and operation of plants for drying foodstuffs. It is now announced from Washington that Secretary Houston has appointed a board of experts to devise methods of drying fruits and vegetables as a means of conserving the food supply of the nation and to have control of the dehydrating industry

which is expected to be established. This is a course of production which gives Mr. Horst great credit for foresight and should promise great things for California, which has resources for growing a great variety of things for chasing surplus water from. Any farmer who happens to have a misfit brewery on his place would apparently have no difficulty in getting a Government contract to dry things and he might possibly condense the steam into a by-product to irrigate more things. And in this way again extremes might meet! Evidently Uncle Sam does not intend to have his two million boys go hungry, even if they do have to stay abroad for two years to get the Huns settled down into rational ways of living.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Menace and Morals of Weevilly Wheat.

To the Editor: There is being distributed by grain dealers to poultrymen in this district wheat infested with weevil—brought here, I presume, from Australia. Isn't there great danger in the spreading of the pest by transportation to the users of it and it being carried to grocery stores and other places in egg cases, etc.? Why, if there is danger, did not the Government officials see to it before it was landed that the vermin were destroyed while yet in the ship?—A. A. T., Santa Rosa.

We cannot say what is the attitude and obligation of quarantine officials toward importation of weevilly wheat, nor are we sure that the presumption that it is from Australia is warranted. California has so many native grain weevils that we doubt whether an alien intruder could be identified without a sight of his passport. Our own warehouses have been so densely populated with them from pioneer times that possibly a few million more would hardly increase the menace to stored grain. Theoretically it is a question whether weevilly wheat might not constitute a better balanced ration for fowls through its greater protein content because of the bugs. Practically, of course, weevily wheat is inferior because the poultryman is desirous of buying wheat, not bugs, and because if he buys by the sack he will lose the contents of the excavated kernels. If he buys by weight, it is doubtful if he loses anything, for a cental of bugs may feed the hens better than a cental of starch. It is much like the case of the customer who bought a roll of butter by weight and afterward, finding a hole in it, brought it back to the grocer with much indignation. "All right," said the diplomatic grocer, "tell me how much the hole weighs and I will return you that much money." The solution of the question probably is: if you do not want weevilly wheat, do not buy it!

Rye and Rye Grass.

To the Editor: Who has rye seed for sale? How much do you plant per acre? What other grass seed makes good pasture for the year 'round and could also be cut for hay? We want this pasture for dairy cattle. We want something we can plant now and have winter pasture and also something that will grow the year 'round.—G. M., Los Molinos.

As was shown in last week's Rural Press, what you want is exactly what Californians have been wanting for the last half century and are still wanting it and they will be anxious to see if Prof. Kennedy's protege comes through with the goods.

Rye is, of course, a grain like barley in the fact that it must come from seed every year. It is a good winter grower and is good for winter grazing or soiling. If cut early, it also makes hay; but if left too long is very poor, tough stuff. Perhaps you have in mind "rye grass," which is a very different thing from rye. English rye grass (often called Australian) and Italian rye grass are perhaps the two best grasses introduced to California because they are good fall starters and winter growers and because they will live from year to year on land which retains some summer moisture, but they are not sufficiently drouth-resistant to live through the dry season on dry lands, unless irrigated. In that case they make very large summer growth.

Both rye and rye grass should be sown in the fall—just as soon as the land gets moisture enough to hold growth from the seed. Rye is sown at about 100 pounds to the acre for green feeding: the rye grasses about 40 pounds per acre. Rye can usually be obtained from local grain dealers: if not, both rye and rye grasses can be had from any seed dealer advertising in the Rural Press.

Cultivation or Mulch.

To the Editor: Is it best to plow an orchard of citrus fruits or walnuts where one turns up a mat of small fibrous roots? Is cultivation and cover-crops better than a mulch?—S. P. B., Fullerton.

As a rule, yes—decidedly better. The surface root-mat is quickly restored, so far as it serves well the purposes of the tree, so there is no loss in destroying it, from that point of view. Beyond that it is bad for the tree to be dependent upon a permanent surface mat of roots because it not only limits the tree to the use of a small part of the soil but it prevents the access of water and fertilizers to the lower soil and may even make the lower strata practically useless. There are places where the top of the soil is about all there is of it and where hardpan or open gravel below may make it necessary to depend upon the surface. In such a case a frequently restored mulch of straw or manure may be one's chief reliance. On a fairly deep soil, however, such as fruit trees should have, tillage to grow a cover-crop and to turn it under (either a winter or summer cover-crop or both) is the best policy, if there is water enough to grow both cover-crops and tree crops in good shape. This is answered from the point of view of tillage and cover-crops as related to the soil needs of the tree. There are other aspects of cover-crops in their relation to the aerial activities of the tree in which they may be decidedly beneficial or occasionally otherwise. Every man must watch to see what happens in his case and shape his policy on his own place accordingly.

Killing a Cane Border.

To the Editor: I have a bamboo border around my alfalfa. It has served its purpose in preventing the blowing of the sand and is now becoming a nuisance—spoiling the hay around the edge of the field and the roots filling up the boxes in the ditch. I prefer productive trees in its place. Can it be removed, and how?—W. L., Livingston.

You probably have cane (Arundo donax) and not a true bamboo. Clear off the top growth as soon as the first frost kills it and rip up the border with a plow roughly to give later frosts a chance at the roots during the cold weather. When they have done all they can for you, plow again and pull and grub out all the roots you can—following them into the alfalfa with a pick, when necessary to loosen the ground, and dragging them out while the light soil is moist. This will enable you to plant your trees for the new border by February. Keep the border frequently worked with a weed cutter to cut below the surface all cane shoots before they get to the light and the roots will die. The cane which keeps starting in the alfalfa must be grubbed out—getting out all the roots you can whenever a new shoot shows you where they are. It will probably keep you busy from time to time all summer.

Harrowing Red Top Clover.

To the Editor: Would you advise harrowing red top clover in the fall the same as alfalfa? In other words, would it benefit it in any way?—B. H. M., Altaville.

We cannot answer confidently. There is so little red top clover grown in this State that experience is scant and we would like to know what readers have had. Theoretically, red top clover should not stand harrowing as alfalfa does because it is mostly dependent upon fibrous roots growing near the surface and though it may make a few forking deep roots it has no such hold on the ground as alfalfa has and might therefore be much more subject to injury by pulling out. The best way to proceed, if you have a piece on which the surface is badly crusted, will be to harrow with a light, straight-tooth harrow, when the ground is dry enough to hold the plants well, and let us know how you come out with next season's stand.

Winter Growth in Alfalfa.

To the Editor: I have 80 acres of alfalfa and plenty of water the year through, and would like to know of some kind of grass that will grow in this vicinity all winter for pasture for dairy cows. I wish to disk the alfalfa and sow the grass to give green feed. I have heard Sudan grass is injurious to cows in frosty weather and others recommend rye grass. Please give me correct information about both.—T. S., Lenare.

Although we would be very slow to sow-in anything which would encumber a good stand of alfalfa, there is considerable experience favoring getting winter feed on a poor stand by additions of other plants. This is sometimes done by sowing rye or barley. If you wish to put in a perennial grass which will grow quickly in winter and keep at it all summer with enough water, English rye grass is perhaps best and should be put in at once. Twenty pounds of seed per acre ought to be enough if there is considerable alfalfa alive. Sudan grass is not suited for your purpose, not for the reason you state, but because it is killed by frost. It is therefore not a winter-grower in most places.

Work That Pays

The war has depleted our field staff to such an extent that we need a few red-blooded men to attend to our renewals and secure new subscribers. It is real, necessary, war-time work, for we are helping Uncle Sam to increase food production by showing our readers how to raise more and better crops.

We can use elderly men, and lack of experience is no barrier. No investment necessary, except that you must have an automobile. Straight salary; permanent work, with advancement

Write for our proposition and tell us a little about yourself. You will be glad you investigated.

Machine Driers Interesting.

To the Editor: Don't you think it would be a good scheme to give us some help on prune driers? There is lots of interest in this now. You might make a strike by getting up some really truly information, with specifications and plans on the subject—that would be a real service.—J. R. C., Chico.

All right: we will soon give you detailed drawings, etc., of an evaporator which has capacity enough to be of assistance in a pinch and which is free of patents and therefore one can build it for himself with whatever mechanical skill the country affords. We believe it is a good thing to have a safety drier on the place in case of early rains—even if one is kept busy nine years out of ten keeping the hens from roosting in it. But do not think for a moment that California is going to take to machine evaporation of prunes or other fruits as a continuous performance. What is usually lost by early rains might not pay the interest on what a saving outfit of driers would cost—but still it might make growers feel better and that is worth a lot.

Prune Trees in Hard Lines.

To the Editor: What treatment is best for my prune trees, which seem to be dying of gum disease? I have four trees in my yard, six or seven years old. Last season they yielded a large crop of extra fine fruit. I noticed after the fruit was picked that two of the trees seemed to be turning brown and leaves curling up. This season these two trees are nearly dead and gum is breaking out all over them. The other two trees did bear but little fruit this year and are breaking out with the gum.—S., Glenn.

Supposing that you have assured yourself that they are not being eaten up by scale insects, we should guess from their dying in the fall that they were perishing for lack of sufficient moisture in the late summer. It is possible, however, that you may be in a place where summer water rises from underflow and that would kill them; or you may have alkali enough in your subsoil to do it. If they are free from scales, the trouble is in the soil and no medical treatment of the tree will help it. Gumming in such a case is not a trouble in itself but a sign of trouble—a way of dying.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., October 29, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.02	2.49	3.77	64	42
Red Bluff	...	7.87	2.30	84	48
Sacramento	...	3.96	1.37	82	46
San Francisco	...	2.70	1.49	80	54
San Jose	...	6.46	1.21	76	40
Fresno	...	.59	.95	78	48
San Luis Obispo	...	1.50	1.75	84	46
Los Angeles	...	.67	.79	90	56
San Diego	...	.59	.48	84	56

Fertilize Fertilize Fertilize

HAUSER'S ORGANIC FERTILIZERS

Blood, Bone and Tankage properly applied will increase your crop production. It's your patriotic duty to do this for bumper crops are necessary in Our Country's program of winning the War.

"Hauser's Organic Fertilizers are high-grade plant foods from the best organic sources. We have the right material and equipment to prepare Fertilizers to give best results under California conditions.

"Our Service Department will help you with your Fertilizer problems. Write for our booklet Fertilizer Efficiency."

HAUSER PACKING CO.
LOS ANGELES, U. S. A.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste — (Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

Cover-Cropping and Planting Pears

[Written for Pacific Rural Press.]

In the Prisk Bros.' pear orchard, situated between Nevada City and Grass Valley, a lap of ground is left in the center of each row of trees unplowed for the dual purpose of providing humus and preventing erosion on the hill sides. For the plowing is always done across the hill side and never up and down. The trees on hill side are planted on

THE EQUILATERAL TRIANGLE SYSTEM.

to facilitate irrigation—so that it may not be necessary to lead the ditches too close to any tree or make short turns. This seems to us to be an excellent reason, though we do not like the triangle on the flat because when the trees attain any size you have to tack back and forth across an orchard to get anywhere—a serious objection in spraying, pruning and harvesting, or for any other purpose. E. M. Shaw, the manager, told us he took 196 packed boxes of Winter Nelis pears from 22 old trees. The 150 acres of young pears are Bartletts, with Beurre d'Anjou for pollination—four rows of the former and two of the latter alternately. The reason and desirability of the rows being set in multiples of two is that they can be sprayed when needed without one lead going "blind," as would be the case if a row stood alone and both varieties did not need spray at the same time.

These trees are four years old and the difference between those that are irrigated and those not irrigated (by reason of their location) is very marked, the former being more than twice the size of the latter and already beginning to bear fruit.

NEVADA CO. A PEAR SECTION PAR EXCELLENCE.

In about three years' time there will be 2000 acres of pear trees in profitable bearing in Nevada county, according to D. L. Norton, the County Horticultural Commissioner. Shipping facilities are good and, though the tonnage per acre is less than in the river sections, the quality, color and texture of Nevada county pears is excellent. They took the premium at the World's Fair for their display of pears, assembled and prepared by Mr. Norton.

We had not been in this vicinity for 15 years, when we took in a large part of the county horseback (the roads being less good than they are now). The improvements that have taken place in this mountain county since that time have been very marked—land cleared, orchards planted and roads built and improved.

This is par excellence a pear section and is generally not suited to peaches or almonds. Some experiments are being carried out with the chestnut that look very promising and on which we shall deal in a separate article.

A Vineyard Which Is an Institution

[Written for Pacific Rural Press.]

The American Vineyard Company has one of the largest Thompson Seedless vineyards in the State and it really amounts to an institution. It lies four and a half miles west of Livingstone, on the Merced river, and is in new territory. The land is generally a good sandy loam of varying quality and 1100 acres have been leveled and set out to vines. It is laid off into 12 blocks with a well and reservoir provided to irrigate each block. The vines receive two irrigations a year, the lift of water being 28 to 30 feet, and electric power is used. The company had all the ground surveyed and leveled before planting. Now the water is piped to the highest point in each block and gravitates from these in ditches. The first irrigation is applied in May, the second in July and August. It will take 80 men five weeks to water the whole tract, as the land is listed away from vines and the ground between is flooded. The blocks are 600 feet wide. The vines are now two years old and are now being staked. They should produce a remunerative crop next year.

ACCOMMODATIONS.

The central buildings are comfortable and commodious and show consideration for the welfare of the employees that should insure a contented crew. The average laborer's only satisfaction in life is a good, wholesome, adequate meal, nicely served, where he doesn't have to fight flies for it, and a good place to rest. These things are here provided. There are dormitories, shower baths and cooking arrangements for 125 men, in addition to a Mexican camp and a Chinese camp, segregated by themselves. In the kitchen there are women cooks. The utensils and surroundings are clean and so are the tables in the dining hall.

REFUSED ONLY TWICE IN A LIFETIME.

I was there just about dinner time and I thought of a man I once heard who remarked (when he was offered something out of a bottle), "I never refused but twice in my life—once when I wasn't there and once I wasn't' asked."

There is a small store on the place to provide for resident cottagers, campers and men of whom there will be 70 employed all winter.

The power used for pumping plants carries 220 volts, except the one near the house, which uses 440 volts. Thirty-six horses and mules are kept for working the place, in addition to two heavy tractors.

These large enterprises are interesting and generally well managed, yet the writer always prefers to see the individuality of the small grower. Fifty or sixty families and homes in the country on such an area as this creates a neighborhood.

AIR DRAINAGE.

D. F. Norton, Horticultural Commissioner of Nevada county, says that east and west ridges in his section are practically free from frost, while between the ridges there is a danger of frost. Also north and south ridges are liable to injury. Mr. Norton does not explain why this is or venture to speculate on the reason, but offers it as an interesting matter of fact.

Labor for farmers' needs will be considered at a farm labor conference to be held in the offices of the State Council of Defense in San Francisco, November 8. The conference will be held with the committee on resources and food supply and the Department of Agriculture cooperating. Prof. R. L. Adams is executive secretary of the committee. All State organizations are requested to send delegates.

Overcutting of Fruit Wood on Apricots

[Written for Pacific Rural Press.]

When R. E. Lignori bought his orchard of 24-year-old apricot trees in Livermore Valley, the neighbors told him it had never failed to produce. Mr. Lignori was not content but hired some expert pruners from the Santa Clara Valley, who, as is quite customary in the latter section, cut off most of the fruit wood and forced a brushy top at the expense of fruit bearing. He claims that two crops were practically lost. The lesson he takes from this is not to cut back much in these old trees, but to thin out enough to open the tree to air and sun. The 1918 crop as a result proved a pretty good one.

To Win the War

The consumer of Food
Must Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.

While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.

Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

HANDLING FRUIT UNDER ADVERSE CONDITIONS.

[Written for Pacific Rural Press.]

L. A. Waldon of Sutter county will have 40 tons of dried prunes where he should have had 200 tons this year. His loss on Sultanas and Thompson Seedless raisins will be 75 per cent—those saved were already in the warehouse for the most part. We noticed that his salvaged fruit was on trays bottom side up, which served to keep them that much off the ground. The above losses, we believe, was an average of that sustained by growers in this section, and nobody could have saved more without artificial means of evaporating. Mr. Waldon only lost about 25 tons of peaches from his 150 acres of this fruit and which yielded 75 per cent of an average crop. This section (near Yuba City) is excellent for peaches, prunes and seedless grapes, or any kind of field crop for that matter, and the water-table, being within about 11 feet of the surface, makes irrigation available at a very reasonable rate. Harry Stabler calls this section the Mesopotamia of America. M. J. Newkorn, who also has 150 acres of peaches (besides prunes and cherries) in this district, has equally well managed orchards. The handling of the peach orchards in this section is methodical, uniform and business-like.

PRESENT ESTIMATE OF PRUNE CROP.

In reply to our inquiry, H. C. Dunlap, manager of the Prune and Apricot Growers' Association, believes an estimate of the possible prune production for the State—in merchantable grades—to be about 57,000,000 of pounds, figuring from the percentage of loss at different points. Mr. Dunlap says: "The latest news in our line is that the Government has released, for sale to the trade, the sizes larger than 40-point and smaller than 90-point, so that the Government 'commandeer' now applies only to all first quality fruit in sizes 40 to 90." And further, that the packers and the association are all making in the neighborhood of 50 per cent deliveries against early contracts going to the trade.

No real outlet for badly damaged fruit has, as yet, developed. Pure fruit people will give no assurance that they will allow marketing of fruit seriously attacked by molds and fermentation."

FALL SPRAYING WITH OIL EMULSIONS.

[Written for Pacific Rural Press.]

Fall spraying with crude oil emulsion after the leaves have fallen is considered more destructive to aphis eggs and San Jose scale than spring spraying by F. W. Orchard, a Sonoma county apple and pear grower. He has sprayed for himself and neighbors for eight years and uses a 16 per cent emulsion, which is stronger than he would care to use in spring.

He prefers the oil spray because it spreads better—"crawls" under rough bark edges and crevices not touched directly by the spray. He also says that the condition of the bark is softened and improved by the emulsion spray.

LIMA BEAN ASSOCIATION EXPANDING.

The California Lima Bean Growers' Association is this year for the first time marketing other kinds of beans grown by its members, according to Manager R. L. Churchill. These are principally bush limas and small whites. The association has more than doubled its membership over last year, and will market about 40 per cent of the total crop.

NEVADA COUNTY PEAR CROP.

D. F. Norton, Horticultural Commissioner of Nevada county, reports 57,341 boxes of pears shipped from his district to the 1st of October. He says there will be over 60,000 boxes altogether and largely from young orchards.

APPLES NEED POLLENIZERS.

[Written for Pacific Rural Press.]

Both Newtown and Bellflower apples really need another variety growing nearby to act as a pollenizer, according to E. A. Hall of Pajaro Valley, who grows both kinds. The Bellflower especially needs a pollenizer and it is becoming a common practice to intersperse other varieties for this purpose. Mr. Hall's orchard consists of three-fourths Newtown Pippins and one-fourth Bellflower.

"That's the Kind of Fruit You Want"

"And that's the kind you'll always get from us. Of course they can't all be 'firsts'—there is bound to be a runt here and there—but you'll get the biggest percentage of first grade fruit if your trees are always in prime condition—as ours are."

"You see—the reason that we are successful with our trees is because we start them right. When we plant we blast out the holes with

HERCULES DYNAMITE

That loosens up the soil and gives the young trees a chance to get their roots well started. The trees need nourishment and can't get all they need unless the ground around them is loosened more thoroughly than it can be with a spade. Then, when the trees begin to bear we keep the ground around them well loosened by blasting between the rows every year or so. This keeps them in good, healthy condition; and healthy trees bear prime fruit."

"I found out about dynamite for farm use about four years ago. Sent to the Hercules Powder Co. for their free book 'Progressive Cultivation.' It tells you all about the uses of dynamite on the farm and in the orchard. The book has put money in the bank for me and I wouldn't be without it."

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Butte County Advances.

W. L. Sweet, the newly appointed Farm Adviser of Butte county, has made a good start in his field of action and, with the co-operation and support of the leading farmers, which will undoubtedly be his, good tangible results must follow his efforts. He will follow out the projects in the various sections of the county according to their needs, as the olive and citrus, the deciduous fruits and the grain-growing sections are each of them distinct. The committees have been formed and the year's work outlined at their last meeting. It is Mr. Sweet's intention to follow out all known suggestions to control June drop in oranges. A record of this work will be of interest to all citrus growers in the State. At Chico the bureau will consider the installment of both community and individual evaporating plants for dehydrating fruits and vegetables of all kinds. The increased demand for these two commodities had focused the importance of such a step and the recent rains have brought the matter to a climax.

Gridley Notes.

W. H. Becker at Gridley has a nice grove of White Adriatic figs, from which he only saved one-third of the crop this year. He also has a 10-acre prune orchard on the bottom that is coming into bearing. We venture the opinion that in this whose section east of Gridley French prunes should be allowed to go after pruning the second year's growth, as it is good land and the trees are built by then. As there is quite an acreage in this splendid section of young prunes, we shall watch its development with much interest. Prunes are safer than almonds in this section along the Feather, and pears on heavier soil. T. B. Hutchins of the Central House district has 75 acres of prunes, of which little more than half the crop was saved. He also has about 3000 pear trees along the river that are good bearers and strong, large trees—good for 100 years, from their appearance. Shipping is from East Gridley, close by, and there is room for more pear development here.

Almonds in the Northern Counties.

A very large proportion of the almonds in the northern counties were harvested in a clean, bright condition, with fine quality meats, and there will be no absolute loss that we have discovered anywhere in commercial orchards. The trees generally look well—the young orchards exceptionally well. Plantings of almonds in the Wyandotte and Bangor sections will continue, as it seems well suited to this fruit. Fewer almonds and more prunes will be set in the valley sections of Butte, Sutter and Yuba counties. Some vigorous young almond orchards are to be worked over to French prunes where cropping conditions are precarious. This seems to be a good move. To work over very old almond trees is generally to court disappointment unless the limbs be thoroughly vigorous and unaffected with wood rot.

Prune and Apricot Growers' Ass'n.

The Prune and Apricot Growers' Association reports that the 1917 crop of apricots are almost all sold and will soon be all packed and shipped out. A large portion of this year's crop has been contracted for, but the association has temporarily withdrawn from the market in the expectation of better prices by reason of damage to prunes and raisins by rain, and most of the peaches are asked for by the Government for men in the service.

A Good Crop.

G. L. Barham of Chico, who has 40 acres of eight-year-old prunes on the Humboldt Road, claims less than 25 per cent of a loss of prunes (October 14). The original estimate for this year's crop was 160 tons dried. Mr. Barham had 11,000 trays out and he stacked and laid out seven times in the course of the season. He had a crew of men and women hand picking the trays when we were there and everything had been re-dipped.

Nursery Stock May Be Late.

Although soil conditions for digging nursery stock will be good, it will probably be a late season for the nurserymen in California, owing to early rains in sufficient quantity to keep the trees in growing condition. A few frosts would expedite matters. The young trees should be of a good, sturdy nature, no matter what the grade this year.

Enterprising Fig Grower.

S. L. Barker of Yuba City has 12 acres of Calimyrna figs just coming into bearing in commercial quantities. He developed a market for his fruit in the East by buying up figs and turning out a good article so as to have an established connection by the time his own trees were producing. This is certainly seizing time by the "foretop."

Prunes for the Soldiers.

The Prune and Apricot Growers' Association received a rush order on October 9 from the Quartermaster's Office at Washington for one million pounds of prunes to be shipped to the army abroad, at three days' notice. The army inspector was on hand to inspect all fruit intended for the shipment and the association went right to the bat to

Prolific Avocado.

Harry Stabler, the well-known horticulturist from Yuba City, has an avocado tree five years old from which he gathered 50 fruits this year and there are still a number left on the tree. He has several other strong trees (seedlings) that will be worked over this season.

Syrup from Prunes.

Professor W. V. Cruess of the University of California has recently demonstrated that a good syrup can be made from damaged prunes. One ton of prunes will yield from 50 to 60 gallons, worth from $35 to $45, at a factory cost of not over $10 a ton.

Losse Blenheim
Apricots

One of the finest 'cots in existence. The fruit grows to a uniformly large size—is of finest flavor and quality—and brings a big price in the market.

We offer the Genuine Losse Strain—budded from the original Losse orchard.

GAS ENGINE MACHINES ARE ABUSED

[Written for Pacific Rural Press.]

I am the farm tractor. I am capable of so multiplying the American food production per man that the withdrawal of men from farming will not decrease the total food produced. I am of a family that has within two decades sprung into such prominence in world economy as no other family has ever attained. As Abraham's race has multiplied until it is a vital part of every land, so our Abraham, the gas engine, in its own form or in the form of tractors, trucks, automobiles, etc., has become a vital part in the life of every nation, especially among its food producers. Conscious of our importance, my family is also proud. We are too proud to notice occasional neglect and abuse, but, where we serve, there also we believe the workman is worthy of his hire. Our hire is naught but fuel, water, lubrication, and adjustment of loosened or worn parts. We insist on these essentials. He who withholds our hire is worse off than if he had a millstone around his neck. It means naught to us that neglect and abuse are due to ignorance. Those we serve have no excuse for ignorance. They can find in the Pacific Rural Press announcements inexpensive opportunities open to every Californian to dispel his ignorance. When he shall have done that, we will do more work than his abuse permits us to do now. The University Farm at Davis provides a practical lecture and demonstration course for beginners with tractors, November 11 to 19, and for experienced operators, November 20 to 22. The University Extension Division provides night lectures on automobiles in San Francisco for men in classes of 15 or more whenever so many apply. Similar lectures, with practical work on various machines, are provided for women exclusively in daylight hours. The University of California at Berkeley gives a correspondence course of 15 lessons to any Californian who applies. The State Council of Defense is "launching" three moving schools for tractor drivers, one to start southward from Madera, one to start northward from Modesto, and one to start northward from Saticoy, Ventura county. At designated high schools on dates to be announced soon expert instructors, with supplies of tractor parts, will give a two weeks' course of lectures, at the conclusion of which they will move on and a corps of real tractors, accompanied by mechanical experts, will at once appear, ready to be taken apart, assembled, started, and driven by the students in these courses. Instruction will also be given in soil handling with tractors and in the handling of tractor implements. Now, if you are a producer of food and if you want your gas engine family to have the morale to win the war, apply to these agencies or to the commercial automotive schools and quit abusing your faithful servants.

You Can Sell Your Wheat

[Written for Pacific Rural Press.]

A report to the Pacific Rural Press that Australian wheat was occupying so much space in California warehouses that California wheat could not be promptly accepted is erroneous, according to J. T. Brown of the Food Administration Grain Corporation. Nobody who has offered wheat to the Corporation has been refused shipping instructions. Storage space has been reserved for all such offerings. A large quantity of Australian wheat has been received and is constantly being sent through. A small amount of it has proved weevily and has been sold for chicken feed, but practically all is available for milling. This does not justify any let-up on wheat conservation, however, for it is just as necessary now as ever to keep ships busy on the short Atlantic haul rather than on the long Pacific haul; and we want to accumulate a reasonable reserve for use next year in case of poor crops. Inquiry for seed wheat at the Grain Corporation offices, as well as from seed houses, justifies prediction of tremendously increased acreage in California next year.

BIG PRICES FOR LATE PEACHES.

Late freestone peaches shipped from Porterville, from the Ernest Rockholt orchard, recently, brought 10c a pound in Chicago. The returns netted the producer $1.15 a box.

60 lbs. PER H.P.

That's Enough For Any Engine to Weigh

Any engine that weighs more than 60 pounds per horsepower is too heavy for farm work. It wastes gasoline, material, time and energy.

Cushman Engines weigh only one-fourth as much as ordinary farm engines, but they are balanced so carefully and governed so accurately that they run even more steadily and quietly. No loud explosions—no fast-and-slow speeds—but smooth, steady running like automobile engines.

278

CUSHMAN Light Weight Farm Motors

4 H. P. weighs only 190 lbs., being only 48 lbs. per horsepower. Besides doing all ordinary jobs, it may be attached to any grain binder, saving a team, and in a wet harvest saving the crop. Also it may be used on corn binders and potato diggers.

8 H. P. weighs only 320 lbs., being only 40 lbs. per horsepower. For all medium jobs. Also may be attached to hay presses, corn pickers, saw rigs, etc.

15 H. P. weighs only 780 lbs., being only 52 lbs. per horsepower. For heavier farm jobs, such as 6-hole corn shellers, ensilage cutters, large feed grinders, small threshers, etc.

20 H. P. weighs only 1200 lbs., being only 60 lbs. per horsepower. For heavy duty jobs, such as shredders, shellers, grain separators, heavy sawing, etc.

Cushman Engines do not wear unevenly and lose compression. Every running part protected from dust and properly lubricated. Equipped with Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump. Ask for Book on Light Weight Engines.

Note What It Does

How Special TrackPULL Tractor Works Orchards, Vineyards

Tractors are too important to buy without first getting all the reasons to show why some are better than others for your particular kind of work.

The Bean TrackPULL Book tells plainly why you need a Bean Tractor if you want orchard and vineyard work. Worth its weight in gold because it posts you on vital qualities in such a tractor. You know what your tractor must do. Send for catalogs of all tractor makers and compare with Bean TrackPULL Book. Then decide on your tractor.

The Bean TrackPULL operates through single track which does all pulling and steering. Full power on turns same as on straightaway. Makes no difference how far off center you hitch — pulls just the same. Works close to trees and vines. Pulls, "gees," "haws," and backs just like team. 12-year-old boys can handle.

Made by manufacturers of orchard machinery for 34 years. All their specialized experience built into it.

Advanced improvements in Motor, Track Rollers, Drive Sprocket, Bearings, and Rear Wheels make the Bean the most efficient orchard and vineyard machine ever manufactured.

Get invaluable Bean TrackPULL Book Now — send the coupon before you forget it. Save money. Learn name of nearest agent who can show machine.

See These Valuable Improvements Which Mean Increased Reliability

1. Motor — Improved oiling system. Improved carburetor control. Governor equipment if desired.

2. Track rollers — Provided with hardened steel thrust bearings.

3. Drive Sprocket—Solid steel ring, machine cut, hardened and heat treated assures long service.

4. Bearings — Provided with improved dust protected greasing facilities.

5. Rear Wheels — Provided with dust cap, wear resisting bushings and improved greasing facilities.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Superior Asparagus Variety.

To the Editor: Your article on asparagus, October 26, suggests the desirability of communicating to interested growers our experience with a superior variety. In 1904, at the request of the Massachusetts Asparagus Growers' Association, I established an asparagus breeding station for the U. S. Department of Agriculture at Concord, Mass. I secured seed of all known kinds of asparagus, about 76 varieties. Among them was the Reading Giant, secured from Sutton Bros. of Reading, England. This variety proved superior to all others, particularly in yield, size of stalk, tenderness, quality, and rust-resistance. In California I have tried it out on about three acres near Riverside. This bed is now in its fifth year and shows the superiority of Reading Giant as it did at Concord. If anyone desires to try this variety, I will be glad to go further into the matter. — A. D. Shamel, U. S. Department of Agriculture, Riverside.

[There is every reason for Delta growers and gardeners everywhere to try this variety in comparison with the best varieties locally grown if Mr. Shamel can supply seed or roots.—Ed.]

Beans in Monterey County.

Our previous estimate of 50 per cent damage to small whites in Monterey county seems about right, as observed last week. Many fields will not be threshed. Many of them have lost 30 to 50 and 70 per cent. Where pods rested on the ground, the beans sprouted or rotted, or at least became discolored. Many of these are light weight and can be blown out, but practically every crop will have to be hand picked. Already the warehouses are full and very few of the beans can be moved. One man said he could sell at 9½c, but most buyers are going slow until the Government sets the price for its requirements. Meanwhile the growers are needing money.

Harrow Barley in Spring.

Forty-nine sacks of common barley per acre on 47 acres is the crop harvested by Ross Nissen of Monterey county in the dry year of 1913. Forty acres did not go so high, but ten acres went so much higher that they raised the general average to 49 sacks, averaging 115 pounds per sack. The reason for the good crop on the ten acres was that when it was about five inches tall Mr. Nissen harrowed it, in spite of the fact that harrowing made the barley look like it was practically destroyed. It broke the surface crust and saved moisture much needed later but unavailable for crops grown without harrowing.

Sugar Beets on Alkali.

Sugar beets, once well started, will stand quite a lot of alkali, according to M. A. Klein, investigator at the Spreckels factory. To get them up on alkali land, however, the alkali must not be concentrated at the surface. One way to weaken such concentration is to flood and drain the land shortly before planting. If flooding is impracticable, plant them as early after winter rains as possible while the alkali is spread through the soil and before it comes back up. Alkali is washed from sandy soils much easier than from heavier land because water moves more freely in the former.

Boys and Girls Enlisting.

"Victory Boys" and "Victory Girls" are being enlisted by Acting Principal A. B. Scofield in charge of agricultural work at the Salinas High School. These organizations will make a business of working for the United War Work Funds. The drive is to commence early in November.

Deep Plowing for Grain.

Though in places on the ranch of the Salinas Land Co. the cow manure had not been plowed under for two years and a thick plowsole had resulted from repeated shallow plowing, part of it was plowed deep, coming up in big chunks. Rains prevented proper working down, but the crop showed distinct improvement from the line where deep plowing commenced.

Castor Bean Prices Raised.

A dollar a bushel increase over the Government contract price for castor beans has been allowed to recompense growers for high costs of production. The new price is $4.50 per bushel. We have observed some castor beans in Butte county sprouting in the burs and some plants putting out burs which cannot mature.

North Sacramento Valley.

Many places where poor corn stands were obtained, enough has sprouted since the rain to make a good stand, though of course it will never mature. Teparies and blackeyes planted in some places as a second crop are also too young to mature before reasonable frost time.

Farm Loans Made.

The Federal Farm Loan Bank at Berkeley closed loans for $436,900 in September. This is one-sixteenth of all the loans closed by similar banks in the United States in the same month.

Investigation in Texas by the Federal Horticultural Board has shown no instance of infestation of any plant other than cotton by the pink bollworm.

Reasons why Styleplus Clothes are worn everywhere

Because they are stylish in appearance—designed and tailored by experts.

Because they are built for service—carefully constructed of good materials that can be depended on to wear well.

Because they are moderate in price—enable you to dress well and practice thrift.

Styleplus are manufactured on the standardized plan—a few grades in big volume, with costs reduced and clothing values increased.

At the price, each grade is always an exceptional value.

There is a big advantage in buying clothes at a store. You can *see* the different styles, try them on, and make the best selection. You can be certain of the fit *before* you order the clothes.

So make your pick today at the Styleplus Store in your neighborhood.

Two grades in Styleplus suits: $25 and $30.

Three grades in Styleplus overcoats: $25, $30 and $35.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. AA) for Styleplus booklet and name of local dealer.

SIGNAL SUCCESS IN STATE LAND COLONIZATION.

(Continued from first page.)

an irrigation district to be controlled and maintained by themselves. Meantime an annual charge is made to meet only the cost of maintenance and operation.

STOCK BREEDERS' ASSOCIATION.

Settlers under the first unit have already formed a co-operative stock breeders' association and it is expected that every settler who intends to keep livestock will become a member. The association will buy nothing but choice purebred stock, and then charge their members a reasonable fee, just so as to come out even. They have adopted the following breeds for the colony: For dairy, Holsteins; for beef, Durhams; hogs, Duroc-Jerseys; sheep, Rambouillets and Romney Marsh—all large breeds, be it observed, well suited to the strong productive land they will help to enrich. The superintendent aids in the organization of the co-operative associations and also assists new men with practical advice and direction. It can reasonably be expected that with this large area of rich land in the hands of chosen practical settlers it must become not only a very desirable community to live in but one that will become widely known for the quality of its livestock.

FARMS, NOT LOTS.

The fact that these farms will furnish their owners a good, comfortable living and not merely a bare, hard-earned subsistence, will lead to that community spirit and progress which is the very soul of a settlement. The success of the Durham State Settlement may lead to unlimited projects of a like nature. It is a pattern whereby private colonization corporations may learn to administer their subdivisions and make good.

Here the cards are all on the table and the buyer knows, so far as can be shown, his soil and the terms of payment. No specious arguments are needed to induce the wary stranger to part with his coin—the price is plain and is never changed. He may be considered fortunate if he is accepted as a colonist. Where a large number of farmers are the individual units of a co-operative community, with all the advantages that the State has to offer in the line of scientific and practical aid, this settlement should become a center of attraction for visitors and farmers throughout the State.

A beautiful setting in a park of stately oaks and maples has been reserved for a community hall, which will belong to the settlers. There are good sites for building on both sides of the main road which bisects the project, many of which are set in a cluster of large valley oaks. Much of the permanent improvement in the shape of larger buildings will be postponed until after the war is over and both labor and materials have returned to normal prices and accessibility.

Agriculture, with its numerous ramifications, is the greatest and most inspiring profession in the world. Each branch of it, whether the productive effort be for stock, fruit, cereals, vegetables or what-not, has been reduced to a science. To be successful it is necessary to pursue the best methods that accumulated knowledge and experience has to offer.

And no farmer has a better opportunity of doing this than at the Durham State Land Settlement.

May its functionaries increase and multiply and replenish the earth.

WHEAT WORTH MORE THAN LAND.

A wheat crop worth five times the value of the land it was grown on would look good to lots of people. A piece of pasture in Butte county had been appraised at $6 per acre. On 88 acres of this 512 sacks of Early Baart wheat were grown last season, worth $2,636.78—five times the appraised value of the land it grew on.

A Mark of Value

There are many kinds of raincoats at varying prices. You cannot estimate their value by their looks.

But you can recognize the Raynster Label and avoid uncertainty. The Raynster Label identifies honest worth—it is the manufacturer's assurance of full value in materials and workmanship.

The Raynster Label is found in a complete line of weatherproof garments—heavy rubber surfaced work coats, smart cravenetted cloth coats, slip-ons, featherweight silks, and warm, heavy ulsters.

Many of these coats look like good overcoats and are generally worn as overcoats as well as raincoats.

Outfit your family with Raynsters. There are Raynster models for women, men, girls and boys. You'll find a Raynster at just the price you want to pay.

The Choice of Those Who Know

Manufacturers and leading motor car distributors *recommend* ZEROLENE. The majority of motorists use ZEROLENE. ZEROLENE reduces wear and gives more power because it keeps its lubricating body at cylinder heat. Gives less carbon because, being refined from selected California asphalt-base crude, it burns clean and goes out with exhaust. ZEROLENE is the correct oil for *all types* of automobile engines. It is the correct oil for your automobile. Get our lubrication chart showing the correct consistency for your car.

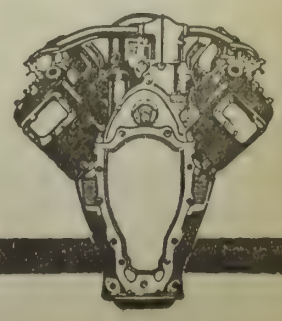
At dealers everywhere and Standard Oil Service Stations.

STANDARD OIL COMPANY
(California)

ZEROLENE
The Standard Oil for Motor Cars

Correct Lubrication for the "V"-Type Engine

This, the "V"-Type of automobile engine, like all internal combustion engines, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. Zerolene fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude.*



General Agricultural Review

Field Crops.

Thirty thousand acres of beans, mostly large whites, are growing in one block in Sutter basin.

Indications are that Stanislaus county will this year turn out 60,000 sacks of rice. Harvesters are now at work.

The sweet potato crop around Merced will be 25 per cent heavier than last year's. Growers are reported to be getting $2.50 per cwt.

The variety of lettuce known as the Los Angeles Market lettuce is said to be worth one million dollars to the growers of the Southwest.

Indications are that the Oakdale district will have almost 30,000 sacks of rice this year, while the county output will be double that amount.

Word received from Washington says that the price of castor beans has been raised to $4.50 per bushel to the grower by the War Department.

Bean straw is bringing $13 a ton in the field in the vicinity of Sawtelle. The prevailing prices before the war ranged between $4 and $5 a ton.

It is thought that the rice crop of Yolo county this season will total 700,000 sacks. The Globe Rice Mills at Woodland have begun milling the season's crop.

The Federal Government is calling on California farmers to plant 538,000 acres of wheat this fall and winter in order to meet the war demand for foodstuffs.

A call for laborers to harvest the $15,000,000 rice crop in the Sacramento Valley and other districts in the State has been sent out by C. B. Sexton, superintendent of the State Public Employment Bureau. Men will be paid at least $4 a day, with board and lodging, according to Sexton.

Honey sorghum in Stanislaus county is reported to be a profitable crop. Some farmers are getting from 100 to 300 gallons of molasses per acre. In several districts thirty tons of sorghum is being taken per acre. Many of the farmers are using their sorghum for silage and the surplus is being put into molasses.

Deciduous Fruits and Nuts.

Owing to the epidemic of influenza, it has been decided to postpone the Mendocino Apple Fair two weeks until November 6.

Co-operation in the purchase of manures, oils, sprays and lime are being considered in these days of scant labor in handling carload lots.

The apple crop of 1918 is estimated to exceed that of 1917 by 7 per cent, the great increase being in the State of New York, where growers have large evaporating plants.

In view of the increased difficulties of transportation many farmers are ordering their supplies of spray, oil and other materials early. They have also to arrange for quick removal on delivery to avoid demurrage.

Inspectors are in Placer county examining orchards for pear blight while the leaves are still on the trees. From the holdover blight comes next year's trouble, and after the foliage drops it is difficult to recognize it.

Peaches, apricots and tomatoes to the amount of 7500 cases have been shipped by the cannery at Armona (Kings county) on orders from the British Government. Five thousand had been previously shipped to the United States Government.

Walnut growers outside of the association are said to be receiving big prices for this year's crop—higher prices than those fixed by the association. Two sales of 30c per pound, or $600 per ton, orchard run, are reported, the buyers furnishing the sacks.

The California Peach Growers' Co. has established a camp and sawmill at Hog Ranch, near the Hetch Hetchy Railroad. They are sawing from 50,000 to 60,000 feet of lumber daily. By next summer the company expects to ship to the San Joaquin Valley two carloads a day.

The Hercules Powder Company has expert chemists at work in efforts to salvage tons of fermented prunes, damaged by the unusual storm in September. The company believes that it will obtain acetone for high-grade explosive in sufficient quantities to pay for the cost of manufacturing it.

The fourth carload of almonds was shipped last week by the Oakdale Almond Growers' Association. They were of varieties undamaged by the rain. Investigation has disclosed that the almond meats are not damaged, no matter how much the shells have been discolored, and unless there is a good market for these damaged nuts they will probably be shelled and the meats sold.

Growers in the vicinity of Morgan Hill, Santa Clara county, forecast a big prune crop for next year. They point out that the trees are holding their leaves in a natural condition, buds seem to be thrifty and cover-crops are making an unprecedented growth for this season of the year, promising an abundance of nitrogenous plant food for the development of new wood and more vigorous bud systems and all that goes to produce a large quantity and high quality of fruit.

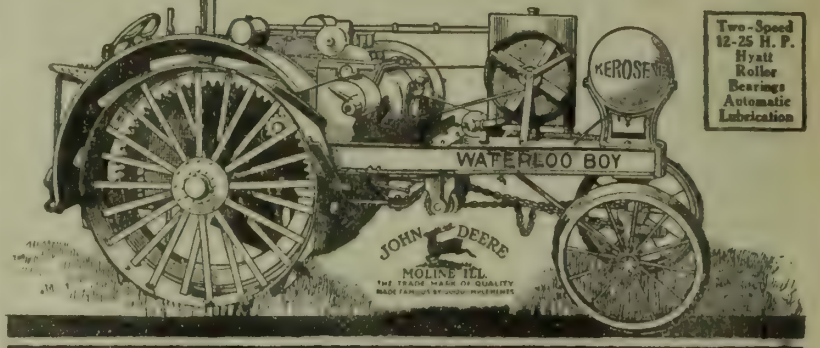
Citrus and Semi-Tropical.

Uncle Sam takes from 500 to 1000 boxes of oranges every month for the troops stationed in the Philippine Islands.

The first Mandarin oranges of the season shipped from Oroville to the San Francisco market arrived this week. They brought $2.75 per small crate.

Orchardists at Chico are getting in their fuel oil for orchard heating while the getting is good and the roads leading to their orchards are hard.

Meets All Power Requirements



Two-Speed 12-25 H. P. Hyatt Roller Bearings Automatic Lubrication

WATERLOO BOY
ORIGINAL KEROSENE TRACTOR

Experience has demonstrated that this three-plow tractor, with 25 H.P. at belt is the ideal "general utility" tractor for any size farm. Its light weight, simplicity, great durability, ample power and economy give it

The Widest Range of Availability At Minimum Operating Cost

Discriminating buyers are choosing the Waterloo Boy because of its demonstrated success in the hands of users under all conditions; because it is built and fully guaranteed by a responsible manufacturer; because of its dependability in emergencies, unusual fuel economy, and because conveniently located distributors insure prompt and courteous service when needed.

Write for free illustrated catalog giving full information.

Geo. W. Branding, Milford, Ill., writes: "Your tractor has given complete satisfaction. I plowed seventy acres in eight days with a three-bottom John Deere Plow; did most of my discing with it using two 16 in. wheel discs at all times. Kept close record of operating cost—$2 per day paid for all fuel and lubricating oil when doing a full day's work."

Chas. W. Carlson, Stromburg, Neb., writes: "Your tractor is O. K. It is cheap to operate—not more than two gallons kerosene to the acre, plowing good depth, with 3-bottom 14 in. John Deere Plow. Plowed old alfalfa, sod pasture, stock and stubble ground without trouble. I use the tractor to pull 28 in. thresher and thresh 33 loads of wheat to a barrel of kerosene."

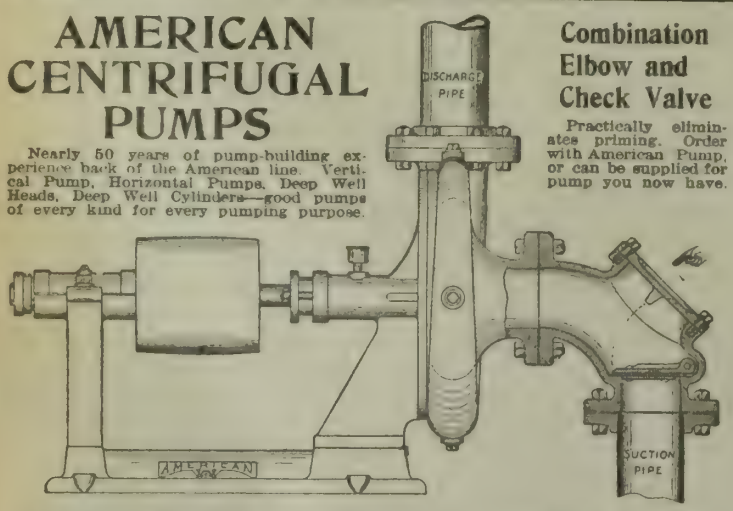
JOHN DEERE, 6006 W. Third Ave., Moline, Ill.

AMERICAN CENTRIFUGAL PUMPS

Nearly 50 years of pump-building experience back of the American line. Vertical Pump, Horizontal Pumps, Deep Well Heads, Deep Well Cylinders—good pumps of every kind for every pumping purpose.

Combination Elbow and Check Valve

Practically eliminates priming. Order with American Pump, or can be supplied for pump you now have.



GAS ENGINES, OIL ENGINES, MOTORS, Etc.

Put your irrigation problems up to irrigation experts. We'll show you how to get the MOST WATER with the LEAST TROUBLE at the SMALLEST COST. Write for our catalogs of Gas Engines, Oil Engines, Motors, Direct-connected Motor-and-pump Outfits, or any of these in which you are interested. We'll answer your inquiry fully and carefully.

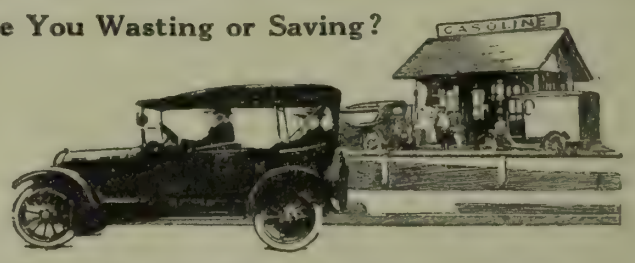
Are You Wasting or Saving?



Is Your Motor Producing or Consuming?

Thousands are running old cars this winter as a necessary measure of loyalty and economy. But it is not necessary to put up with an old car's loss of power and waste of gas and oil.

Renew your old car's power—stop its waste of gas and oil—check its carbon troubles—make it economical transportation by installing a full set of

McQUAY-NORRIS LEAK-PROOF PISTON RINGS

They repay their cost many times over in saving gasoline and oil. They increase power, reduce carbon, save trouble, delay and expense.

Send for FREE Booklet—"To Have and To Hold Power"—a simple, clear explanation of piston rings, their construction and operation.

McQUAY-NORRIS Superoyl RINGS

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Rings in the lower grooves.

Your dealer can get you any size or oversize quickly. Over 300 jobbing and supply houses in all parts of the country carry complete size assortments. If you have any difficulty getting them, write us.

Manufactured by
McQuay-Norris Manufacturing Company
2838 Locust St. St. Louis, U. S. A.

This has been a trying season for citrus fruits and orchardists in all districts have had light crops. Fancy prices, however, have made up, in a measure, for the crop deficit.

The Klink (Tulare county) Citrus Association packing house began packing grapefruit and lemons this week. There is a heavy crop outlook in the Klink-Venice district.

Orange growers of Riverside district, according to the Arlington Heights Fruit Exchange, are making a price of about $10 a box on Valencias selling on the New York and other Eastern markets at record-breaking prices.

Some olive trees growing in the dooryards of farmers near Escalon, planted originally as novelties and whose yields have heretofore gone to waste, are this year bearing good marketable crops of Manzanillos and putting some good money into the pockets of the thrifty owners.

Visalia orange growers are considering the possibility of an earlier start than usual in the harvesting of the Washington navel crop. The 8-to-1 test will be observed. Oranges in the vicinity of Red Bank last week passed a 9-to-1 test. It is believed that picking will begin in a week or two.

A new variety of decay has attacked a proportion of the late pomegranates in the Porterville section. The fruit rots from the inside, and in the early stages can only be detected by an expert in the handling of fruit. Samples of the fruit have been forwarded to the State University for investigation.

Grapes.

The average crop of Thompson's Seedless raisins in California is one and a half tons to the acre. Fifty pounds to a vine means three and three-quarters tons to the acre.

Grapes from the United States henceforth are to be allowed entrance into New Zealand. Heretofore imports of the fruit into New Zealand have been allowed only from Australia.

A carload of wine for the Eastern trade was made on the Santa Cruz island. Importations of French and Italian wines having been stopped by the war, New York is making heavy demands on the California vintage.

It is reported from Ontario, Cal., that the wineries there and in the surrounding country are being turned into plants for the manufacture of grape syrup, said to be equal to maple sugar both as a table syrup and as a substitute for sugar.

The California Raisin Co. asks growers to make sure that no fruit unfit for human consumption is sent in and to grade their fruit carefully and so avoid losses on the quality. When the fruit is sent in without proper hand sorting, it loses its grade and is reduced in food value and in price.

More Light Than 20 Oil Lamps

AT LAST—the light of lights—A beautiful lamp that lights with common matches just like oil lamp, but makes and burns its own gas from common gasoline, giving a brilliant, steady, restful, white light of 300 candle power.

Most Brilliant Light Made

Brighter than the brightest electricity. More light than 20 oil lamps. Cheapest and best light made. Costs less than one-third of a cent per hour. Safer than the safest oil lamp. The

There's Cheer in the

Pictures from Home

To a homesick boy at the front, a picture of Dad waiting at the end of the lane while "Shep" brings up the cows is worth more than the Croix de Guerre.

Pictures of mother, how much they mean to him now! And of kid sister—perhaps she is "wearing her hair up" by this time—all the old familiar scenes around the farm, yes, and that little girl with the big blue eyes that lives down in the village—these will mean a world of comfort to the boy who is lonesome among a million strangers.

The Y. M. C. A., the Red Cross, the Knights of Columbus and kindred organizations are doing a world of good in ministering to the bodies and minds of our boys. But in their hearts, homes are first. Cheerful letters and cheerful pictures from home—these will keep their hearts light and their courage high.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

TRUCKS HAULED BULK GRAIN.

[Written for Pacific Rural Press.]

One hundred and eighty horses and mules were used on 45 three-ton wagons for 65 days in 1917 to haul bulk grain from seven combined harvesters, each cutting a swath 34 feet wide, as told us by A. E. Denton of Moreing Bros.' ranch in Sacramento county. The crop was 1225 pounds per acre on 24,000 acres and the haul was one to eight miles.

This year seven 3½-ton Republic motor trucks kept six harvesters busier than they had been kept the year before by the horses, though in justice be it said that the crop was only 828 pounds per acre from 20,000 acres.

Several reasons led to the change from horses to trucks. The draft stock was sold at $150 per head average for all that had been owned on the ranch. The rest had been hired at $40 per month and feed for each four-horse team. The trucks cost $20,000. There was a tremendous saving of high-priced barley last winter. About 45 teamsters were saved, besides the man who had kept busy the previous season hunting teamsters to replace those who didn't want to work too long at a time, especially those who didn't show up Mondays. It saved a lot of leather harness and iron horseshoes, besides some veterinary fees. The trucks required drivers not much higher priced, they required practically no repairs, they carried four and a half to five tons per load, and their fuel and oil cost but little as compared with feed of the horses they replaced. The trucks were fitted with 6x12-foot bodies 3 feet deep, with three heavy braces crosswise and 3½-inch iron rods under the braces about a foot below the top edge. They ran alongside bins built onto the sides of the harvesters, received their loads by gravity, ran quickly to the elevators and up a sharp incline with the front wheels, leaving the back wheels low enough so the grain ran out into a hopper when the end gates were opened.

FIX THE ROOF IN DRY WEATHER

The Arkansawyer was huddled in a semi-dry corner of a leaking roof during winter rains because it was too wet to fix the roof then; and in dry weather he didn't need to have it fixed. Are you his prototype with regard to pump irrigation? Are you going to wait until your crops will be lost unless you have a pump because you think next winter's rain will be enough? If you do, will you be able to get well drillers, a pump outfit, and freightage to carry it promptly when you must have it? We know that crops could have been greatly better in many districts if more water had been available, one of them being the country around Merced. We are told that there is plenty of water in the ground there, with an average lift not over 18 feet and not able to be pumped down over four feet any time during the year. Ditch water has been unreliable, but some ranchers did not wait till they needed water before contracting for wells and equipment. One man with two wells irrigated 87 acres and probably made enough more than he would have made without the wells nearly to pay their cost in this one year.

RIGHT MACHINE SAVED BEANS.

[Written for Pacific Rural Press.]

Some people plant beans with a sugar-beet drill. This requires 30 to 35 pounds of small whites per acre, according to Ed Corda of Monterey county, because if set for a smaller amount it crushes many beans. Mr. Corda expected to use a beet drill, but beans were selling at 11c or 11½, so he bought a regular bean planter. With this he got as good a stand as he wanted by using only 12 to 14 pounds of seed per acre. On the 30 acres planted last spring he saved about 540 pounds of beans. These now look beautiful beside the present year's crop, which is full of discolored ones. Figuring them at 9½c per pound, the beans he saved by planting with a machine built for the purpose are now worth $51.30. As the drill cost $110 cash, it repaid nearly half of its cost in planting only 30 acres one season.

MAN OR ENGINE?

The pleasure of cranking a fanning mill to clean several sacks of small white beans was recently permitted to us on a ranch in Monterey county. The beans went in at the rate of 20 to 25 sacks per hour and the sweat came out aplenty. Also came the notion that a 1-horsepower gas engine would have used less gasoline than we were using of elbow grease and would have liberated a man for other work. The engine would have kept the fanning mill busy, whereas it stood idle much of the time while its operators rested or sacked the beans. The engine could have been used for numerous other similar jobs about the ranch the year around which are being done by man power.

(K) Tractor Chisel

KILLEFER QUALITY

KILLEFER EFFICIENCY

Our Heavy Tractor Chisel is made to use with the larger Tractors for extreme deep chiseling and is an excellent tool for preparing the ground for Beans, Beets or other crops. If used before the winter rains it will open up the ground to a depth of ten to fourteen inches, aerating the soil and allowing the moisture to penetrate below the usual plow pan, which is to be found in almost all of our land.

The chisel is the "A" frame type. The depth is regulated by turning the hand wheels; one hand wheel for the foretruck and one each for the rear wheels. This gives a three-point suspension, making the tool follow the contour of the land perfectly. **Made in 6 and 8-ft. widths.**

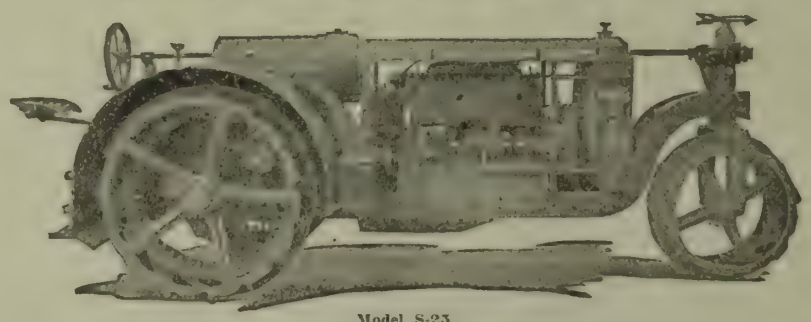
The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Box 156 Arcade P. O. Los Angeles, Cal.

Samson

GMC TRACTORS SIEVE-GRIP GMC TRACTORS

Tractor



Model S-23

Simplicity, dominant feature of the **GMC SAMSON SIEVE-GRIP TRACTOR**, goes hand in hand with efficiency. Correct design and few and accessible working parts assure low up-keep cost and long life to the **GMC SAMSON SIEVE-GRIP TRACTOR.**

Thousands of owners testify that where the **GMC SAMSON SIEVE-GRIP TRACTOR** goes the farmer's trouble ceases. This is its record for nearly two decades of trying service here and in far corners of the earth.

Mere youths are successful operators of the **GMC SAMSON SIEVE-GRIP TRACTOR, and in the emergency, even women have proved equal to the task.**

The **GMC SAMSON SIEVE-GRIP TRACTOR** performs tasks requiring the power of ten horses and does the work better, faster and cheaper than any other power. It is also adapted for many farm labors for which horses are unsuited.

The **GMC SAMSON SIEVE-GRIP TRACTOR** is simplicity itself.

Further information is furnished by our illustrated booklet, Better Farming.

ARE YOUR LIGHTS LAWFUL?

[Written for Pacific Rural Press.]

Valorous San Jose traffic officials had probably been instructed to help out the treasury by capturing a few automobilists whose lights were not conforming to the law. There are many such; and we are in full sympathy with an impartial local enrichment by such means. But in a case that recently came to our attention the officials were apparently as discreet as they were valorous. So was the small boy we once saw robbing the blind beggar's box of pennies. Probably, we suppose, the traffic officials whispered together that it would be safest for them to begin on a Ford! So they hailed our friend one Sunday night recently and after about ten minutes of various kinds of testing found his Ford lights a trifle out of focus and told him to come back to see the judge a few days later. He lives near San Francisco and works by the week, so he could not afford the time or gasoline required for such a visit. He had scraped up a little money for the first payment on Liberty Bonds, but didn't like to let go of that. He wrote the judge, asking to be let off on the ground that he had so recently had the lights tested by responsible parties to conform to the law and because the infraction was so slight. The judge answered that he could avoid appearing personally if he would send $5! This reduced his Liberty Bond subscription by $50.

The writer, when driving at night and meeting other machines, aims to fix his eyes on the road ahead rather than on the approaching headlights. Even at that, when meeting some machines, the road is absolutely invisible until the glare effect has passed. It is frequently necessary to slacken speed to avoid possible accident to pedestrians who might step onto the highway at that time. This is bad enough, and such glare lights are 100 per cent too frequent, but they are not a circumstance to those on a machine which the writer recently met just after leaving San Jose. It was at least half a mile away, but not a particle of highway could we see until this arrogant, unlawful and supremely dangerous light-hog had passed. It was necessary to pull to one side and stop. We presume the hog passed safely through or at least into San Jose without official rebuke. He was not driving a Ford.

Valorous officials of San Jose, would it be in order for you to stop also these flagrant violators of all laws of safety, since you have so gloriously conquered a dim little Ford?

TRACTOR CORN BINDER ON PEAT.

[Written for Pacific Rural Press.]

Can a wheel tractor operate a corn binder satisfactorily in the peat soil of the Delta, where ordinary farm implements require extensions to make the wheels broader? F. F. Lyons has demonstrated that it can. His soil is about as peaty as any, though a little sediment has mixed in from river overflows onto what is now the Terminus tract of San Joaquin county. Half of his 400 acres of corn were bound into bundles to shred for cattle feed this fall—and it was some corn, too, most of it 10 to 12 feet tall and plenty sturdy. He figured that with his 12-25 wheel tractor pulling two corn binders faster than horses would walk he could put the corn through a husker and shredder at about the same total price he could contract for it to be hand picked and hauled—$15 per acre. But with the binders and shredder he got it safely in with least possible labor irritation and had two and a half to three tons of dry fodder per acre in addition. Such shredded fodder last year fattened 500 cattle for prime market prices on Mr. Lyons' ranch. It is figured as worth at least $15 per acre. The left-hand tractor drive wheel had an extension, making it double width. A wheel on each binder had long lug extensions. Everything worked beautifully so far as traction was concerned, using one man to drive the engine and one to handle both binders.

SWATH ROD ON MOWER.

[Written for Pacific Rural Press.]

To the Editor: If W. R. of Maxwell will put a sleeve over the outside shoe of the mower and run a rod forward from it about 12 inches, then bend the rod sharply back, having it long enough to reach the rear end of the swath board by an upward curve, it will help in keeping the alfalfa from falling along the edge of the swath in the way of horses and mower on the next round. A rod about upright from the shoe will help support the long curved one, which should be of Norway iron, so it will bend to any curve desired. — F. D. Williams, Napa.

TRACTOR PARADE CALLED OFF.

The tractor parade on Market street has been indefinitely postponed on account of the epidemic.

A WADE does 10 mens work
Saws 25 cords a day!

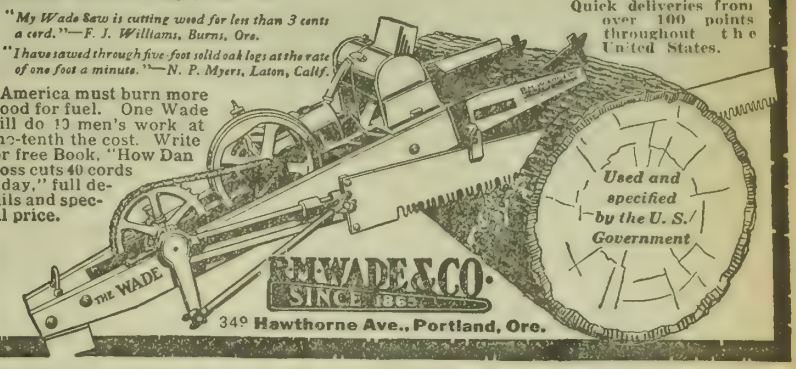
A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the U. S. When not in use for wood cutting, the 4 H. P. motor will run mills, churns, pumps, etc.

"My Wade Saw is cutting wood for less than 3 cents a cord."—F. J. Williams, Burns, Ore.

"I have sawed through five-foot solid oak logs at the rate of one foot a minute."—N. P. Myers, Laton, Calif.

Quick deliveries from over 100 points throughout the United States.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free Book, "How Dan Ross cuts 40 cords a day," full details and special price.



Used and specified by the U. S. Government

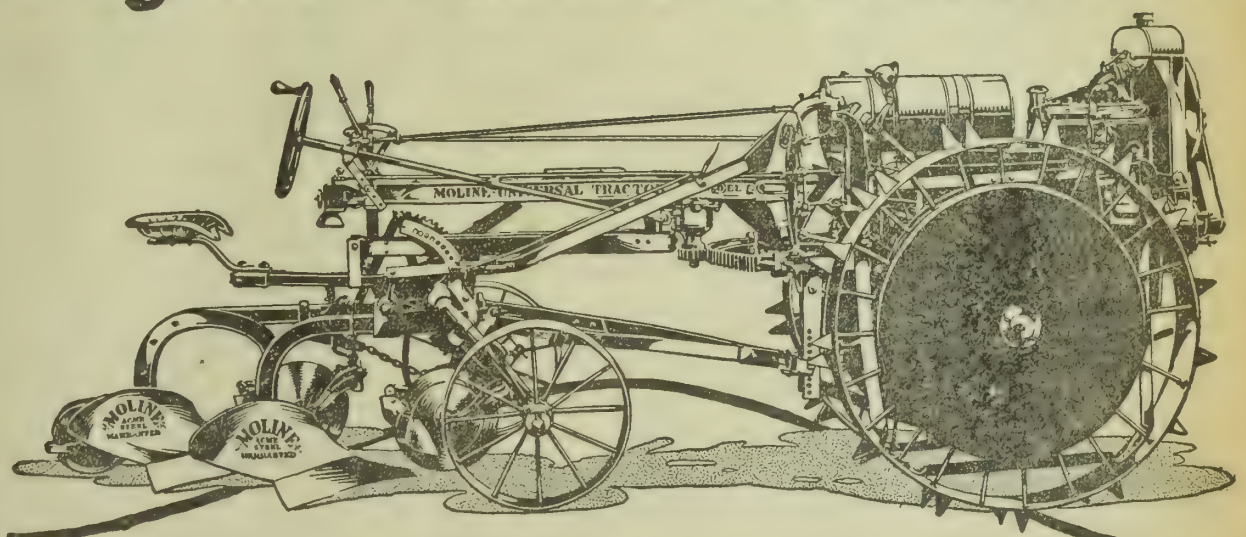
349 Hawthorne Ave., Portland, Ore.

Buy Your Moline Tractor Now



Because:

You may not be able to get a Moline-Universal if you delay ordering.

You will help relieve spring congestion of shipping by buying now.

You will have plenty of time to become familiar with its construction and operation before the spring rush and will be able to work your tractor in on belt work and other light jobs.

It is the only tractor which does all farm work including cultivating.

One man operates both tractor and implement from the seat of the implement where you must sit in order to do the best work.

Tractor and implement form one unit—backs as easily as it goes forward—turns in a 16-ft. circle.

It has plenty of power for your heaviest work, yet light in weight to operate economically on light jobs. All the weight on two big drive wheels—no dead weight—no extra expense.

Substantially constructed for many years of service.

Electric lights for night work and self starter for non-robust labor.

You can practically double your efficiency—you can produce more food with less help. You will need it, order now.

Write today for full information and name of your nearest Moline Dealer. Address Dept. 97.

MOLINE
UNIVERSAL TRACTOR

Purebreds Bring Bigger Profits

[Written for Pacific Rural Press by R. H. Whitten.]

RELEASED BY BOARD OF CENSORS FOR GOOD OF FARMER

IMPORTANT:—Over 85 per cent of the registered animals sold in the sales this fall have gone to farmers making their first purchases of purebreds. At the recent Modesto sale of Holsteins 50 animals went to thirty-one different buyers, and nearly every animal went to a beginner.

These facts show the way the wind is blowing. Have you made the start with purebreds? If not, don't remain among the leaves in the whirlwind. Join those who are making the future sure for themselves by buying the kind of stock that practically guarantees Sure Success.

Why raise purebreds? For just one reason—Greater Profit. With land, labor, feed and livestock all going higher, it is necessary to make each acre produce to its utmost, and this cannot be done with ordinary stock.

Beef cattle that weigh only 1000 pounds at three years and have thin backs and cat hams are not giving adequate returns for the precious feed they eat. Boarder dairy cows that produce worthless calves are pro-Germans of the insidious and damaging kind. Ewes that shear six pounds and produce peewee lambs are robbing the nation of food and clothing. The hog that eats five and a half pounds of feed for every pound of gain is not only a profiteer but an alien enemy.

Seriously, the problem is most important. The future of civilization, as well as the success of each individual farmer, depends upon making the maximum use of every resource, and ordinary animals cannot be permitted to go on wasting precious feed. They must go the way of the profiteer, the slacker and the enemy spy.

The purebred is the animal that solves the problem, because he produces the greatest amount of meat, milk or wool from the feed consumed. He can be depended upon not only to do this with certainty but also to transmit the same qualities to his offspring, because his good points have been bred in him, while if the grade has any good points he got them by chance and there can be no certainty about the quality of his descendants.

It is an established fact in breeding that "like begets like," but it does not necessarily follow that because certain features are prominent in the parents they will be in the offspring also, for the young partake quite as much of the characteristics of their ancestors for many generations back as they do of their parents. Consequently, not until breeding has been carried on long enough for desired qualities to become fixed characteristics can the reproduction of these qualities be depended upon.

A grade or scrub animal possesses mixed blood, each strain warring for supremacy, and even though it may be a very good individual it is apt to reproduce the undesirable qualities of some of its scrub ancestry, to the detriment of its offspring.

But for many years back the ancestors of the purebred were selected because they were able to produce more dollars' worth of meat, milk or wool than the average animal of the time. Their offspring were carefully selected and mated, and this process of scientific breeding has been kept up until today, when we buy a purebred animal, we buy the result of generations of breeding and selection. We buy a long line of ancestors, every one of which approached the ideal for a profit-making animal, and we can depend upon the animal to transmit its good qualities to its offspring.

So you see a pedigree simply represents a method of keeping track of the parents of an animal and keeping undesirable blood out. It is a guarantee of what is back of the animal—of what has contributed to its make-up. It is what enables you to carry on your work with certainty when otherwise it would be only a game of chance.

One of the national breed associations has proposed the slogan, "A purebred cow on every farm." This should be taken up by all breed associations and a universal slogan, "A purebred female on every farm," should be adopted. It isn't necessary to urge purebred herds. Let a farmer get one purebred female and give her an opportunity to prove herself alongside of grades, and nothing else will be necessary to persuade him to change his entire herd over. He will find purebreds best by every test.

How about you, Mr. Reader? Have you any purebreds in your herd? If not, why not? It is said that prejudice lives on ignorance, and if you are prejudiced against purebreds like as not it is because you are ignorant of their superior money-making qualities. Get a purebred female. Put her to the test. Make her prove her additional worth over grades. Give her a fair chance and she'll make good. She'll convince you that, no matter how well grades have been paying you, purebreds will pay you a whole lot better. She'll start you on the road to greater prosperity than you have ever before enjoyed. For that's her business.

Present Condition of Our Ranges

[Written for Pacific Rural Press.]

Not since 1904 have the ranges of California had anything like the start they have this year. Throughout the State there is a good thick setting of grass. The weather following the rain has been good growing weather, with enough sun to give some substance to the herbage. Under any circumstances our ranges are now practically safe for the season and prices on provender in the remoter districts have gone down to stay. Many a man who was wondering if he had saved enough hay and fodder to carry him through the winter now feels on easy street, for already the new grass affords sufficient feed to carry stock through till frost, snow or any other feed-time comes. For there are not many men who are badly overstocked this year. We have taken a long time to learn the lesson of overstocking our ranges, many of which have been sadly depreciated in value and carrying capacity by this practice. Sheep ranges have suffered especially. The forest service has done much to assist in rebuilding overfed ranges under its control by a strict limitation of stock accepted and a careful ranging of the stock by attention to old watering places and springs and by the opening of new ones to obviate unnecessary travel for range animals.

SPLENDID START THIS YEAR.

This year, with a good start on the range, there will be a good opportunity to let it grow and get a good seeding. John Gray of the forest service on South Mountain in Trinity county showed us a section of range which had been shut off from cattle to the second season. It had been getting very bare and suffering from serious erosion. When we saw it there was a good overgrowth of native grasses and wild oats and it was the best piece of range on the mountain side. If some portions of our ranges could be set aside for a year or two, or at any rate not grazed till fall, they could, with a little seeding and attention, be brought back to their old carrying capacity.

Now that stock is so valuable, it will pay to go to some expense in this matter of conserving our grass and putting it to the best advantage. Various conditions govern our choice of winter ranges and nobody can generalize on their management. But

Your Daughter and an Empire

can positively relieve you of the tiresome, irksome disagreeable task of milking. You and your sons can spend more time in the fields both morning and evening.

Empire Milking Machines are so simple—so easy to operate—that a boy or girl can milk the entire herd with it in less time than it took you and your hired hands.

Hard milkers or easy milkers—nervous or calm cows—large or small teats—even or uneven udders—make no difference to the Empire. It milks them all. And the teat cups stay on without surcingles.

The New Empire Super-Simple Pulsator has no piston. Nothing to wear and lose vacuum. Its action is regular and positive, gentle and soothing to the cow. Usually produces greater milk flow and lengthens period of lactation.

Learn the details. Have the Empire dealer in your locality give you a demonstration. Write for our 1918 Catalog No. 45,

More Dollars From Your Dairy

NOW You Can Get *ALL* the Butter-Fat Profits from Your Herd

YOUR cows are all right. The butter fat is in their milk, but you are wasting this precious profit by using old-fashioned separation methods or an old or inferior separator. Swedish farmers won't tolerate such extravagance. They have to make every penny possible. That's why the best cream separator in the world—the **Viking**—is made in Sweden. You can profit **at once** by the work they do. Start today. Get a

VIKING CREAM SEPARATOR

Made in the Largest Separator Factory in the World

It is **lower** in price and **greater** in capacity than other separators of equal rating. It is guaranteed to skim down to a mere trace. It gets you every possible penny's worth of butter fat that is in the milk.

More Than One Million In Use

In every country in the world where good dairying is conducted, you will find **Vikings**, not only because of the profitable work they do, but also because of their construction. Made of the finest Swedish iron and best tool steel, the **Viking** is

Guaranteed for a Lifetime

It is the simplest and easiest-running separator on the market today. Operation starts at a touch on the handle. Bowl cleaned thoroughly in 3 minutes. Investigate. Go to the **Viking** dealer in your town and see it in operation. Get our books. They are full of facts for farmers. Every one a profit payer.

Even though you don't think you will ever buy a **Viking**, send for them. They're free.

Quick Shipments Always Assured from Warehouses at 29 Different Distributing Points Throughout the United States and Canada.

wire fences will help. Farming for winter keep is being more widely practiced, so that silage, corn, stover and roughage of all kinds may help out the range. More cheap shelter sheds are being provided and, after the war, when hay is not so dear, more of it will be used—all to the lasting benefit of our range and grass lands.

RANGES INJURED BY PREMATURE PASTURING.

We often turn out on the summer range too early, without any regard to the season, and if the grass has not had a good start much damage is done to the young stand of grass. Range management is not the least important branch of the science of forestry, and it has to be backed by judgment and experience. If Mr. Gray's system of resting a portion of the ranges is carried out universally, it must result in permanent benefit to them and increased condition on the stock. The way some sheep ranges are mismanaged is a disgrace. As every stockman knows, overstocking is a losing game. To judge a range according to the year is his business. And to thin it down on a falling market requires courage and decision. To add to the grass-producing properties of a range by range management is not so often practiced. In times of peace prepare for war. In a year of good grass like the present one there is a good opportunity to prepare the range for dry years by not overstocking.

ATTRACTIVE FEATURES AT CALIFORNIA INTERNATIONAL.

According to the present plans of the projectors, this show is scheduled to open November 16.

Among the attractive features of the California International Livestock Show will be the horses from the R. B. Pemberton stables of Chicago. These horses are of international fame as high jumpers and exhibition horses, and among them will be several champions from various classes.

S. E. Kramer of the Seventh Avenue Riding School of San Francisco has entered ten horses in the various classes and has authorized the announcement of first and second prizes for the best lady rider, side or cross saddle.

Mrs. Winslow Anderson of San Francisco has entered two of her famous horses.

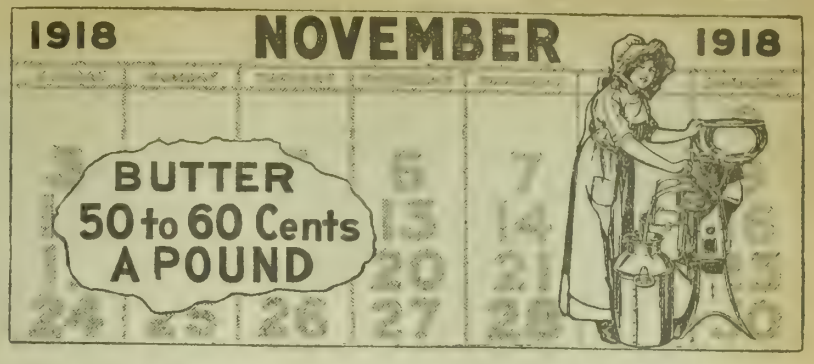
In the cattle classes the Congdon & Battles Company of Yakima, Wash., have entered the only Aberdeen-Angus cattle in the breeding classes in the entire livestock show. O. V. Battles, a director of the Aberdeen-Angus Association, has authorized the distribution of $500 in trophies in the various classes of this breed. The only other showing of Angus cattle will be those shown by the University of California, which will have a number of Angus steers.

From the present indications of the poultry and carload exhibits, the swine and sheep tents will be taxed to their capacity. In the poultry tents plans have been made for building additions to the present generous quarters.

Among the features in the moving picture and lecture halls will be the films from Frank Hardy, secretary of the Shorthorn Breeders' Association of Chicago, showing all the prize-winning Shorthorns at the Chicago International Livestock Show. Films of the famous Hereford prize-winners of Chicago will likewise be shown.

BEWARE OF THESE FAKIRS.

Several men are going through the rural sections of California, representing themselves as agents of the Internal Revenue Department, selling books to ranchers purported to explain how income tax returns should be made. They are asking $5 for a book that it is said can be bought at any book store for 25c. They do rapid-fire work, selling a large number of copies in a section, and then moving on to another section before the ranchers get wise to the fact that they have been duped. Don't let these bunco artists get you.



NOW IS THE TIME

to get your new

DE LAVAL CREAM SEPARATOR

WITH butter prices soaring no cream producer can afford to go another month without a New De Laval Cream Separator.

This is true whether you have no separator, or an inferior or half-worn-out machine, or even an old style De Laval.

In cold weather your waste of butter-fat is relatively greater, either with gravity skimming or a poor separator; and at present prices for cream a De Laval would very soon pay for itself out of its own savings.

Order your De Laval now and let it begin saving cream for you right away. Remember that a De Laval may be bought for cash or on such liberal terms as to save its own cost. See the local De Laval agent, or, if you don't know him, write to the nearest De Laval office as below.

HAUSER PACKING CO. LOS ANGELES

Growing a Boar Pig for a Herd Header

[Written for Pacific Rural Press by E. H. Whitten.]

A well grown out boar that shows breeding qualities as well as size.

Have you bought a young boar at one of the shows this fall? Or do you intend to buy one at the Los Angeles or San Francisco shows, or direct from some breeder? Good! Hope you get a corking good one, for the opportunities for a top-notch boar to make a name for himself never were better. But good breeding must be supplemented by proper care and feeding if you expect him to win fame for himself and profit for you.

When you buy a young boar for a future sire, or pick out one in your own herd for that purpose, don't put him in with a lot of other young pigs, for if you do he will not get the attention he should have. Put him in a pen with another boar of his own age or a little younger, and keep them together constantly so that they will not fight. If it is ever necessary to remove his companion for a long enough time so that they will forget each other, don't attempt to put them together again if they are over six months old. Instead, put a barrow in with him, or a smaller runt pig that will run instead of fight.

Often a growing boar can be induced to eat more by putting a runt in with him, for, true to his name, he doesn't want the runt to get any of the grain or slop, and he eats more than he otherwise would. But in this case his exercise must be increased to correspond.

Don't ever put a sow in with him. It may teach him to rant, and a ranting boar can ruin himself in a few hours. For the same reason don't have him in a field where he will be separated from gilts or sows only by hog fencing. Keep him in a field surrounded by a tight-board fence, or, if this is impossible, have the pens each side of him empty or occupied by barrows.

Don't stuff the boar and make him fat just to look nice to visitors and to have them comment on him. A real breeder knows that a boar's growth the first year should be in frame, bone and muscle, and that if he is developing properly he will not put on any fat, but will grow tall, long and rangy. He will be developing a frame that he can fill out later.

Don't let him gain more than 1½ pounds per day at any time. He cannot grow faster than this without a part of the gain being in fat, and if a young boar is allowed to take on fat he will be stunted and injured as a breeder. He will not be as large at maturity as the boar of lighter weight, whose growth is entirely in bone and muscle; neither will he have as vigorous a constitution.

Give him a variety of feed, but do not overfeed. Allow him only what he will clean up in twenty minutes, and if this is not sufficient to make the desired growth get him to eat more by increasing his appetite through additional exercise. Increase the feed only as his appetite increases and as he cleans up the feed quickly.

The importance of exercise cannot be emphasized too strongly. Generally if a boar is on alfalfa pasture he will take enough exercise of his own accord, but if he does not, or if he is in a dry lot where there is no inducement for him to exercise, and he acts sluggish and lazy, he should be forced to take enough exercise to keep him in "athletic" condition. Get behind him with a buggy whip and walk him about a mile a day. You can train him so that he will respond to a mere touch of the whip.

While the boar is young and growing he needs a ration heavy in protein, but as he matures the ration should be gradually changed so that he will have only enough protein for maintenance, except during the breeding season, when the amount of protein should be increased.

No young boar can develop the maximum of bone and muscle unless the proper feeds are provided; neither can he develop into a prepotent breeder without plenty of exercise, regardless of the feed provided. But the combination of the two strengthens bone, hardens muscles and develops constitutional vigor. It gives you a boar that will both look right and breed right.

DON'T MISS THE MORRIS SALE.

If anyone has any doubts as to the profitable future of the purebred dairy cattle business, he merely needs to read the reports of the fall sales. There never was a time when so many thinking farmers changed from grades to purebreds as right now. Not all farmers can own entire purebred herds immediately, but there are very few who cannot make a start in the right direction if they will make up their minds to do so.

At the A. W. Morris & Sons sale, to be held at their farm, Woodland, Thursday, November 12, farmers will be given an opportunity to secure foundation Holsteins of the highest quality. Over 90 cows and 15 bulls will be offered, all bred along heavy-producing lines, and many of the females carrying calves by some of the most noted bulls of the breed.

Plan to attend and take your check book along. You can't attend this great sale without wanting to take home some of the good stock that will be offered.

ELLIOTT-BRANDT HERD MAKES HIGH RECORD.

The Elliott-Brandt Rancho of Owensmouth was awarded the highest scores in the milk and cream testing contest at the Liberty Fair grounds last week. The score for both milk and cream was 98.5 per cent, which is above perfect, as scoring is always done on the basis of 98 points.

The judging was done by C. F. Hoyt, U. S. Milk Inspector. There were about forty dairies and creameries entered in the contest, but the Elliott-Brandt Guernseys carried off the honors with ease.

How the packers have helped to develop good stockyards

—and how this has benefited you as a producer

WHOSE job is it to provide and maintain stockyards, or markets, for the open buying and selling of cattle?

Who shall see that these markets have good pens where your stock can be properly watered, fed and taken care of until sold?

Stockyards, in early days, were not efficiently managed, and were not financially attractive to investors, except in the largest markets.

As the packers built their big-capacity plants at the various live-stock centers, they naturally became interested in helping to develop adequate stockyards facilities, where stock raisers could ship their animals.

The present high efficiency of most of the principal stockyards is due largely to the time, the effort, and the money the packers have put into them.

All stockyards, including those in which packers are interested, are conducted as *public* market places for the benefit of all.

They are open to all—to producer, commission man, dealer, speculator, the packer's buyer—and with exactly the same rights to each.

Packer-ownership gives no special advantages to the packer and no control over live-stock prices.

These spot-cash markets have been a factor of very great importance in promoting the growth of the live-stock industry.

If stockyards efficiency can be increased by Government ownership and operation, all well and good. Swift & Company is content to stand on its record of having helped the live-stock industry by the part it has played in developing these market places.

Swift & Company, U. S. A.

A nation-wide organization owned by more than 22,000 stockholders

LIBERTY FAIR ASSURED.

Rumors that the Liberty Fair will not be held have been squelched by a public announcement from the fair authorities and the Los Angeles Chamber of Commerce that the enterprise will be staged just as soon as the city health department will permit the opening of the gates.

An added entry list is promised for the California Liberty Fair on the opening date, and every exhibit will be in place. In addition to the many other features in connection with the opening there will be a gigantic celebration, which promises to be memorable in the annals of California history.

There is much that might be said regarding the great world war. However, at this time Californians are coming together in an effort to show that victory means a final end of carnage and bloodshed, and the world is to be made safe for democracy largely by the splendid work the American troops have done and are doing in the great world war.

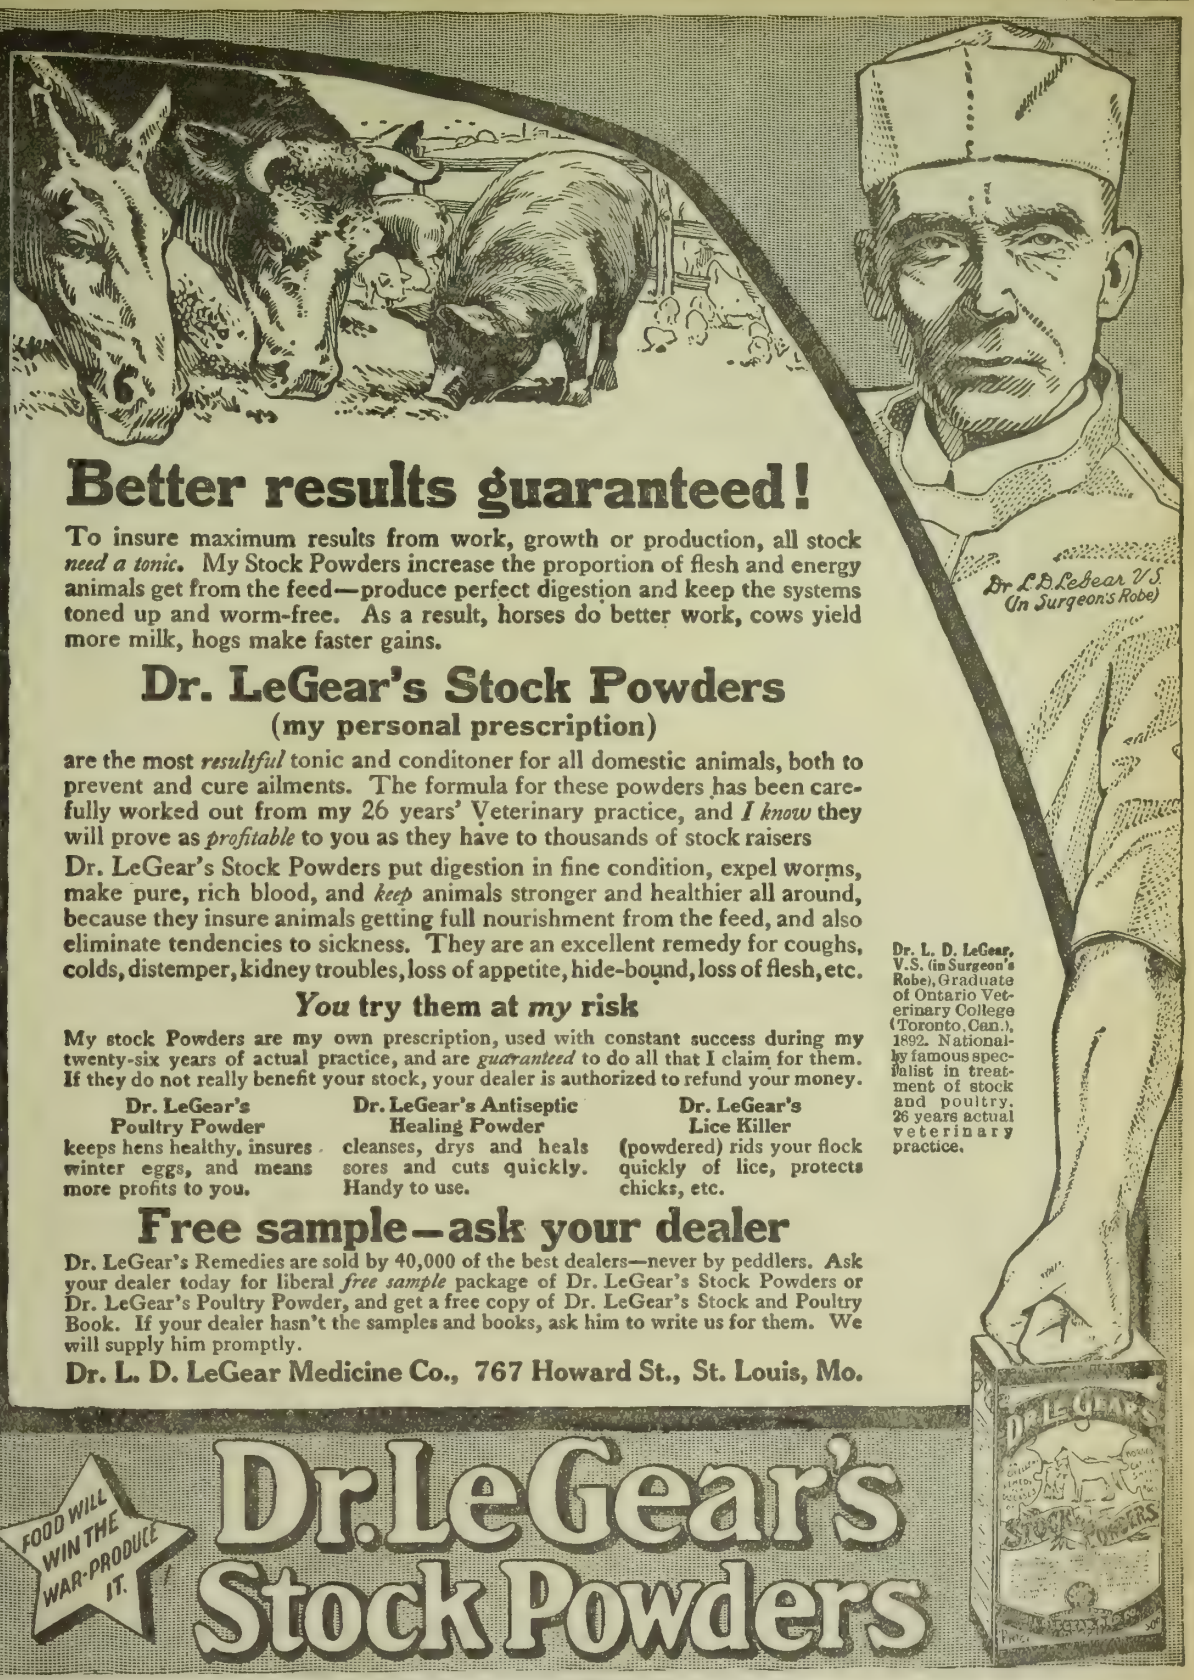
The Government exhibit, partly in place, is one of the most interesting and educational exhibits ever sent to the West. Much has been said regarding this wonderful display, but to be properly appreciated it must be seen. The student, the merchant, the manufacturer, the capitalist, the farmer and the laborer will have a part in this great display. It is not enough to say it is educational—it is instructive—and includes the minutest detail in connection with the world war and with the food plans for conservation now in progress.

With nearly 2000 head of livestock already on the grounds or in shipment to Los Angeles, the livestock display of the fair will be the largest in the history of any fair held in the Western States. These cattle have been sent here with the idea of giving the stockmen of California new ideas along breeding lines. This stock is the best the United States affords and many of the prize cattle will remain in Southern California. Arrangements have been made for an auction to be held on the grounds, and it is anticipated that the men who intend to take a leading part in stock raising and stock breeding in California will be bidders for these prize animals.

C. R. Thomas, manager of the livestock department of the fair, is overjoyed. Every pen has been taken and entries signed, and many of the pens are now occupied with prize stock. This means that this offering will again be educational.

Arrangements have also been made in the other departments whereby the goats, sheep and hogs will be taken care of, and the $60,000 in premiums will be distributed as soon as the judges' awards are made.

In the cattle barns are the herds of the Miller-Maxwell Company of Pueblo Springs; the ebony Aberdeen-Angus herd of Congdon & Battles of Yakima, Wash.; the Canadian prize-winning herd of the Curtice Cattle Company of Peaceful Valley Rancho, Calgary, Alberta; the Hereford herd of the Wyoming Corporation of Cheyenne; the Hereford herd of A. B. Cook of Townsend, Mont., and the Hereford and Shorthorn herd of William Henn of Kansas City, Mo.



Better results guaranteed!

To insure maximum results from work, growth or production, all stock *need a tonic*. My Stock Powders increase the proportion of flesh and energy animals get from the feed—produce perfect digestion and keep the systems toned up and worm-free. As a result, horses do better work, cows yield more milk, hogs make faster gains.

Dr. LeGear's Stock Powders
(my personal prescription)

are the most *resultful* tonic and conditoner for all domestic animals, both to prevent and cure ailments. The formula for these powders has been carefully worked out from my 26 years' Veterinary practice, and *I know* they will prove as *profitable* to you as they have to thousands of stock raisers

Dr. LeGear's Stock Powders put digestion in fine condition, expel worms, make pure, rich blood, and *keep* animals stronger and healthier all around, because they insure animals getting full nourishment from the feed, and also eliminate tendencies to sickness. They are an excellent remedy for coughs, colds, distemper, kidney troubles, loss of appetite, hide-bound, loss of flesh, etc.

Dr. L. D. LeGear, V.S. (in Surgeon's Robe), Graduate of Ontario Veterinary College (Toronto, Can.), 1892. Nationally famous specialist in treatment of stock and poultry. 26 years actual veterinary practice.

You try them at *my* risk

My stock Powders are my own prescription, used with constant success during my twenty-six years of actual practice, and are *guaranteed* to do all that I claim for them. If they do not really benefit your stock, your dealer is authorized to refund your money.

Dr. LeGear's Poultry Powder keeps hens healthy, insures winter eggs, and means more profits to you.

Dr. LeGear's Antiseptic Healing Powder cleanses, drys and heals sores and cuts quickly. Handy to use.

Dr. LeGear's Lice Killer (powdered) rids your flock quickly of lice, protects chicks, etc.

Free sample—ask your dealer

Dr. LeGear's Remedies are sold by 40,000 of the best dealers—never by peddlers. Ask your dealer today for liberal *free sample* package of Dr. LeGear's Stock Powders or Dr. LeGear's Poultry Powder, and get a free copy of Dr. LeGear's Stock and Poultry Book. If your dealer hasn't the samples and books, ask him to write us for them. We will supply him promptly.

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

W. H. Ginn & Sons' sale of registered Holsteins at Corcoran realized an average of $180 a head. The average was low because there were 33 heifer calves and 13 bulls in the sale. Thirty-four cows averaged $226.

O. J. Ames, Oakdale, has sold three Jersey heifers to George K. Taylor of Livermore. One of these heifers took first prize as senior heifer calf at the Modesto Fair in 1917. She was the youngest daughter of Elaine of Venadera.

The Oregon Dairy Council has issued a letter to every draft board in that State, calling attention to the shortage of farm labor and asking the boards to go slowly in depleting the material any further. It is about time to do the same in this State.

Tilly Alcartra, the world's record cow of A. W. Morris & Sons of Woodland, has produced 26,659.6 pounds of milk and 859.10 pounds butterfat in nine months. She will complete her year January 26 and is to calve about April 1. She has 2700 pounds lead on her world's record year and is still gaining.

Prof. W. H. Rider, the well-known dairy authority, who has been at the head of the animal husbandry department of Syracuse (N. Y.) University, has accepted the appointment as director of the Holstein-Friesian Association of America. Prof. Rider's numerous contributions to the dairy press have made him well known as a writer.

J. Henry Meyer of Elkhorn Farm, Watsonville, is rejoicing because May Mischief of Penhurst, a full sister of his Ayrshire bull, Penhurst Statesman, has just completed a senior two-year-old record of 11,543 pounds of milk and 474 pounds of butterfat, carrying a calf at the same time. Garclaugh May Mischief, the world's champion Ayrshire, with a record of 25,329 pounds milk and 1053 pounds butter, is the grandam of these animals.

Swine and Swinemen.

Carruthers Farms, Live Oak, has started H. E. Vogel of Fresno in the Berkshire game by furnishing him with two fine bred sows.

Llanno Vista Ranch of Perris has been showing its Hampshires this fall and has made a most creditable record. They have a fine lot.

Dr. Spencer, proprietor of Derryfield Farm, has moved from Fair Oaks to Placerville and will raise Durocs on a more extensive scale.

At the National Swine Show, recently held at Cedar Rapids, Berkshires won first, second and third on ham exhibit, also grand champion barrow.

J. W. Wilkinson, manager of Falfadale Ranch at Perris, is making Duroc history in that section. He has shown a large number of hogs at the shows in the southern part of the State this fall and has captured a good share of the ribbons.

Recently in one of the southern markets eight Duroc hogs, aged seven months, sold for $332.93. The same day eight razorbacks, one and a half years old, sold for $25.50. And still there are some people left who don't think that it pays to breed up.

Conejo Ranch of Newbury Park made another great clean up, winning 29 firsts, 2 seconds and 1 third on Hampshires and Duroc hogs at the recent Ventura County Fair. Councillor, the well-known Duroc boar, again carried off honors, as did Perfect Quality, the grand champion Hampshire sow.

J. Francis O'Conner, who started a herd of registered Berkshire hogs on his farm near Santa Rosa a short time ago, has purchased the National champion sow, Lady 110th, from the Frank Brush herd at Santa Rosa. This sow won at the National Swine Show last year when the Brush herd was exhibited there by C. E. Barrows.

The Chester Whites are making history back East. Wildwood Prince Jr., considered one of the greatest boars of the breed, recently sold at the record sum of $6,000. This boar was the sensation of the 1917 National Swine Show, and it was claimed that he represented the most improved specimen of modern-day requirements of a pork-making machine.

The well-known Uneeda herd of Duroc-Jerseys, owned by H. P. Slocum & Son of Willows, is to be sold. This herd was shown at the California and Oregon State Fairs this year and won a goodly number of the championships and other prizes awarded for this breed. Clayton Slocum, the manager, is in the draft, subject to call any time, and his father, H. P. Slocum, is not able to look after the herd.

Alex. D. McCarty of San Francisco, owner of Riverina Farm, Modesto, has just purchased the great young Corn Belt boar, King Jones Over, bred by Fred Sievers, Audubon, Ia. This boar is a son of Siever's King Jones and has been purchased to assist Kansas King in the Riverina herd. Kansas King was the first prize senior yearling pig at Topeka last year and was purchased for McCarty by Prof. Thompson of the University Farm.

The recent rise in hog prices has brought the Poland-Chinas more than ever into the limelight at markets throughout the country. At Denver an 80-head load of Poland-Chinas brought $20.55, going 30c over the previous record figure at that market. The $20.05 record at East St. Louis was made by 120 head of Poland-Chinas averaging 264 pounds, making the average price per hog $52.90. A record of $20.35 was established at St. Joseph in the sale of 39 Poland-Chinas that averaged 280 pounds.

Beef Cattle.

Carruthers Farms of Live Oak recently sold a year-old bull by Count Glory to Carlton Gray of Oroville.

At Chicago recently 21 head of 1107-pound high-grade Shorthorn yearling steers sold at $19.60. This is the highest price on the open market for beeves of any age and also creates a new "high" for yearlings.

T. J. Miller of the Maxwell-Miller Cattle Co., Steamboat Springs, Colo., reports that the demand for Shorthorns is growing greater all the while. Their quality, endurance and adaptability are steadily being recognized and appreciated as the ranchman's best investment.

Three public sales of Herefords held recently near Kansas City furnished the keynote for the season. Two hundred and three head, largely home bred and of ordinary quality, brought an average of $741, showing business is on a sound basis. At another sale of higher-class stock an average of $898 was reached.

A cablegram has been received from Buenos Ayres, Argentina, stating that in a sale which followed the recent stock show a Shorthorn bull sold for $38,700. The three top bulls averaged $24,510. Twenty-two imported bulls averaged $6,020. Enthusiasm for beef-making on South American ranches with Shorthorn bulls seems to have no financial limitations.

Sheep.

Sheep have decreased fifty million head in the world since the war began.

At the recent sheep carnival in Australia a ram sold at the record price of $13,125, but this record was short-lived, as $15,750 was paid for another ram a week later. The new record breaker is an ideal representative of the big-framed, plain-bodied, strong wool type of Wanganella origin.

L. C. Shirley, chairman of the sheep committee of Chico county, advises all farmers who have weeds, grass going to waste or extra pasture to buy sufficient sheep to utilize this feed. He says that if properly managed sheep will return satisfactory profit, even though they may cost $18 per head. He and his assistants will be glad to assist Chico county farmers in purchasing sheep.

At the Salt Lake ram sale two records were broken by the Rambouillet range rams consigned by Bullard Bros. of Woodland. Twenty-four yearlings sold for $300 per head and the entire consignment of 74 range rams averaged $195 per head. Among their individual consignments the top ram sold for $1,000, another for $575, another for $500, and 19 others sold at prices ranging from $425 to $125.

One thousand breeding ewes, composing the experimental flock at the United States Sheep Experiment Station at Dubois, Idaho, were moved to the national forest reserve for summer and fall grazing. They are being kept under practical range conditions, and the adaptability of range for different types of sheep is being studied and experiments conducted to determine economical methods of utilizing range. Also investigations will be made relative to the practicability of running sheep loose in fenced pastures as compared with the herding method which is now generally practiced.

R. B. Burviss, who owns 50 acres of valley land near Lakeport, finds it quite profitable to keep a few sheep to clean up the waste. He keeps about 20 during the fall and winter, and the increase in the spring brings the number up to 35 or 40. In 1915 they paid him 30 per cent on the money invested; in 1916 40 per cent and in 1917 better than 50 per cent, for they cost him almost nothing.

CARRUTHERS FARMS
LIVE OAK, CALIFORNIA

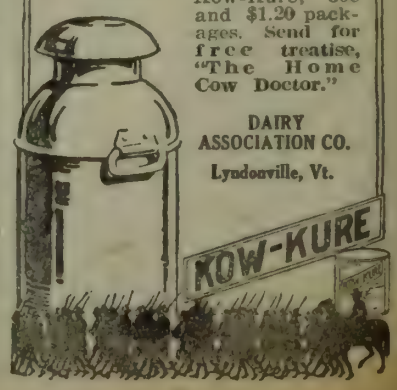
Registered Sows, Gilts and Boars fore sale.
San Francisco Office
226 Southern Pacific Building

MILK and WAR TIME
In these days of high prices for dairy products, the "poor milker" is more than ever a liability.
But before you sell the cow that is not producing well, try to improve her condition. Her milk value is much greater than her meat value.
Most poor milkers are non-productive because of some defect of health, which can be quickly remedied by intelligent treatment.
Kow-Kure is a medicine that acts quickly on the organs of digestion and milk production. Its widely known tonic and curative qualities have made it the standard cow medicine for the prevention of disease and the treatment of Abortion, Barrenness, Retained Afterbirth, Scouring, Lost Appetite and Bunches.
Give Kow-Kure a trial; it will do for you what it is doing for thousands of others. Feed dealers and druggists sell Kow-Kure; 60c and $1.20 packages. Send for free treatise, "The Home Cow Doctor."
DAIRY ASSOCIATION CO.
Lyndonville, Vt.



LIVESTOCK DIRECTORY.

SWINE.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

PREVENTION BETTER THAN CURE.

Constitutional vigor is a state of good health and good bodily resistance to disease. The fowl that is well bred, well fed and properly housed, without being pampered or coddled, possesses this quality to such a degree that it will not contract disease so long as the condition is maintained. At that we must go back to the parent or grandparent stock for the initial powers of resistance. If they were all right, then it ought to be an easy matter to keep their progeny all right. I find, however, that many who buy good stock fail at the very outset to give their poultry the proper housing and care, so that, little by little, the constitutional vigor is sapped, and it occurs in such a way that the blame falls on the stock.

Poultry that has been well bred—this does not mean feather breeding, but bred for vigor—will often go through epidemics and exposure to contagion without being affected at all; if, however, the housing is wrong, no matter how well they are fed the trouble will attack them. A poultry house ought to have more consideration than it usually gets. Most people arrange the house so as to have sunshine part of the day at least. I know from experience that sunshine is a great germ destroyer, but nevertheless I prefer to ignore it when building a poultry house. Cold winds do a great deal more harm than sunshine does good. That is my reason for ignoring sunshine in building. Build your houses fronting a direction where the least stormy wind and rain come from, and you will find that in different localities the direction differs, so that there is no one direction which answers for all. Study your own locality and build accordingly. If your strong windstorms come from the south, put your house fronting north. By doing this you save feed, save your poultry from sudden attacks of cold, save yourself the inconvenience of attending to poultry where the wind is blowing in, bringing gusts of sleet and rain with it. Next to good parentage I place housing as the most important in holding a flock up in health and vigor. A house built in the right direction, with three tight walls, back and two ends, and a good roof over them 12 feet deep and perches at back, is a properly built house, provided the whole front is wired instead of boarded. If the house is built any deeper than 12 feet, it is just so much waste, and if it is too high there is not only waste but the house will be too cold. We want a normal amount of light and air with the least amount of cold because a house where the temperature is too low takes its toll in feed to furnish heat in winter, though it may be a little cooler in summer. Cement is really much cheaper than lumber, and if built right is cooler in summer and warmer in winter, there are no cracks for the wind to drive in, nor to act as a harbor for mites; so that, all things considered, where a permanent house is being built one should figure out the cost of lumber and cement before making a choice.

Now if a person buys hens that have been housed under these conditions, and put them into damp, dark, poorly ventilated houses, where the wind and rain beats on them with every change of weather, while the fowl may hold up for a time they will eventually take colds one after another and eventually succumb to the ravages of some one of the ills the hen is heir to.

SIGNS OF LACK OF VIGOR.

If a bird droops its tail it is not at its best; it should be taken up and examined. If the skin is not clear and of right color for the breed, it is a sign of losing health; dirty, scaly skin indicates both lack of vigor and presence of lice. The legs should be of good color, free from dirt and scales, and they should always be plump; shrunken, withered looking legs indicate weakly specimens, but if the inside of legs is red there is health and vigor. Hot, inflamed legs mean sickness. The plumage should be smooth, clean, carried close to the body; loose, ruffled feathers indicate lack of vigor. Except in very hot weather or in broody hens, the wings should be kept well tucked up; drooping wings indicate discomfort, and when they are wet and sticky underneath there are catarrhal conditions that should be looked after.

The general appearance of healthy fowls is alertness, good carriage and a sprightly activity that tells the looker on that they are healthy and vigorous, ready for breakfast or anything that comes along. When a fowl is not ready to feed it should be an object for investigation to find out why.

TURKEYS HAVE SWELL-HEAD.

To the Editor: I have about 20 young turkeys, about half grown. Since the September rain they have taken the swell-head and the roup. They have it badly. What is the best known remedy?—I. J., San Benito.

[Give them a physic. An ounce of castor oil mixed in hot water and then made into a crumbly mash should be enough for 20. Then take each one separately and dip head and nostrils into a can of coal oil, hold the head under till the bird gurgles, then wipe off the extra oil and turn loose. Do this twice if necessary, with one day between, and feed extra well. See that their sleeping place is dry and free from draughts and they will get all right. Coal oil is a harsh remedy, but a sure one.]

Poultry Breeders' Directory

Rates 3 cents per word per week.

BARRED PLYMOUTH ROCKS—Winners at leading shows and wonderful layers. Choice stock for sale. "Nothing better in poultry." Catalog free. Chas. H. Vodden, Box 396, Los Gatos, Cal.

Entries for Livestock Show Exceed Anticipations

The entries for the Poultry Division of the San Francisco Livestock Show, postponed to November 16-24 on account of the influenza epidemic, are much in excess of the number that was anticipated by the San Francisco Poultry Association, but room will be supplied to accommodate them all. George H. Croley, the Show Secretary, reports that the entries by breeders who never before have shown their fowls demonstrate the increasing interest in purebred utility fowls. A number have asked if their fowls will be returned in case they are unable to be present at the closing of the show. The superintendent gives constant attention to all the fowls during the show and will carefully recoop and reship promptly all exhibits the day following the close.

Get More Eggs Waste Less Feed

Increase income—reduce costs! Make your hens lay heavily now while eggs are bringing high prices. Prevent feed waste due to sluggish or imperfect digestion. Make every hen lay by using

Pratts Poultry Regulator

The sure-fire egg-producer which has triumphantly stood every test of nearly a half-century of general use.

Pratts Poultry Regulator is not a severe stimulant which gives but temporary results. It does not force but induces hens to lay because it builds them up naturally, puts them in such fine physical condition that regular egg-production is bound to follow. And it keeps them laying right through the period of high prices. It assists the birds to thoroughly digest and make use of every particle of food, thus prevents waste and reduces feed costs. Test it with a part of your flock and compare results.

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

THE HOME CIRCLE

SERMON BY JACK-IN-THE-PULPIT

Grandma was spending the Sunday with a sick-a-bed daughter, auntie was taking her after-dinner nap, and Billie and Bettie were meandering through the cool and shady woods in search of a spot in which—as per directions—to "sit still awhile, without getting all het up a-running and a-romping," when they came across a slim white birch with a sturdy Jack-in-the-Pulpit straightly upstanding at the foot of it.

"Let's us sit down right here," proposed Bettie, "across the way from that lovely tree. My sakes! how many leaves do you 'spose it's got on it?"

"Millions of 'em," promptly responded Billie, adding, after a second look, "Why, I guess there must be's much as two hundred leaves on it."

"Let's count 'em," cried Bettie, fixing a pair of dancing brown eyes on the shimmering, quivering foliage, and immediately started in. "One, two, seven, thirty-nine, forty."

"Fifty-three, fifty-five," droned Billie; but before he could reach sixty the Jack-in-the-Pulpit before mentioned raised a thin, high voice and went on: "Fifty-nine, sixty, sixty-one, sixty-two; and that reminds me, all you dear children of the wildwood—all you beetles, bees; you birds and butterflies; and you two human children, also, who have strayed in to help us keep Sunday—of sixty-three most excellent reasons for obedience, which obedience, as you most likely know, is the unhesitating doing what you're told the minute that you're told by those who know best what is good for you. Obedience to parents, teachers and the law is what keeps us safe as to body and soul; so that we may all of us—whether we dwell in nest or burrow, in eyry, cobweb, cocoon or man-built small brown cottage on the edge of these woods—develop into straight and healthy, good and useful grown-ups.

"Let us, therefore, dear children, obey our kind, wise elders and 'the voice of the Lord our God, that it may,' as the Prophet tells us, 'be well with us.' Whereas, if we are not obedient, it may go with us as it did the other day with a dear little Fish I used to know.

"This small Fish lived not far from here in a little salt-sea creek that sends its blue waves a-lapping up on a sandy strip of beach which every rising tide covers with dancing ripples, and every ebb leaves full of soon-dry tiny pondlets; in which, while they last, the village children paddle, puddle and sail their chip and paper boats.

"This blue creek is quite as brimful of happy, busy creatures as are our own green woods; and among all these big and little finny fellows there's no one better known nor more highly respected than Mrs. Killie-Fish and her large family. All day long the Killies, like their eel, crab and shell-fish neighbors, work and play in the deeper mid-creek; but every once in awhile, when particularly hot, bright weather and specially high tides call the boys and girls down to the water and in a-wading, Mrs. Killie-Fish will take her small fry up on the tide into the foot-deep shallows for a game of 'catch-who-catch-can' with Ned, Nellie, Tom and Flora, and all the rest of them. And then such splashings, and such stampings with sun-tanned hands and feet; and such fun! with easy honors to the Killies, of which not one has ever yet been caught!

"Now, Mrs. Killie-Fish, though the most indulgent of mothers, expects her children to mind what she says; 'for how could I possibly,' she very sensibly asks, 'raise my enormous family if they couldn't be depended upon to come and go and do exactly as they're bidden?' And so each time before she lets them go in among those village water-babies she reminds them that they must keep in the creek and out of the little beach-puddles; that they must keep within sight and hearing of her and that they must always immediately come a-swimming after her when told to. And all of them always mind, and none of them ever even asks, 'But why, mother?' All of them, that is, but little Flip, and that's why something so dreadful happened to him one day.

"It was hot and it was sunny and so, of course, the beach was swarming with happy little paddlers; and up among and in and out between them swam Mrs. Killie-Fish and all her little Killies. 'Keep close as can be to me, children,' she told them, 'and don't stray into those little just-for-five-minutes puddles'; and all her sons and daughters obeyed her; all, that is, but Flip—heedless, adventurous, inquisitive, naughty little Flip. He lagged behind and wanted to know, 'Why can't we, mother, and why must we stay near you?' 'Because I say so,' said Mrs. Killie-Fish, heading for deep water across the rapidly receding tide with all her many, many children swimming after her; all, that is, but Flip, who, straying off among eel-grass, pickle-weed, and pebbles, soon found himself going round and round in a small (and, alas! rapidly growing smaller) pool. 'What fun!' he giggled; 'this surely must be one of those merry-go-rounds one hears so much about.' But when, in a very little while, the puddle had soaked entirely into the sand, he laughed no more, poor foolish little fish! but lay high and dry upon the gray sands panting and gasping for the breath that was beginning to fail him.

"Now, if little Sallie Sanders had not happened to catch sight of him, or if Sallie hadn't been just the very softest-hearted of small girls, this sermon and poor Flip would have come to an end together. But as Sallie did happen along and was so merciful, she picked Flip up very tenderly and, wading into deep creek-water, dropped him into safety in two feet and a half of surf; and just as soon as he got back a bit of breath he swam like a streak toward home and his mother; and it's safe to say that ever since then he's the best and most obedient member of Mrs. Killie-Fish's big fish-family."—Kate Hudson.

SPARKLETS.

The Nervous Guest (asked to sit next to his hostess and opposite the goose)—Am I to sit so close to the goose? (suddenly feeling this may be misunderstood) — er — I mean the roast one.—Western Christian Advocate.

"Do moind yez don't git hur-rt, Pat," said Bridget. "It's dangerous a-workin' in that quarry." "Thot's ahl roight, Bridget," said Pat, "Oi've borryed two dollars frim th' foreman, and he don't let me do any dangerous work anny more."—Onward.

"Do you think that the automobile will displace the horse?" asked the conversational young woman. "It will," answered the nervous young man as he gazed down the road, "if it ever hits him."—Sacred Heart Review.

Replace Your Old-fashioned Plumbing Fixtures

The added convenience of modern plumbing fixtures will more than compensate you for the slight cost involved in replacing them for your present fixtures.

The attractive designs of Pacific Plumbing Fixtures will make you proud of your bathrooms.

Pacific Plumbing Fixtures are guaranteed forever against any defects in workmanship or materials, and although their quality is higher, cost no more than any other reputable brand.

PERFECTION OIL HEATER

Agricultural Summary

Eggs Close to the $1 Mark.

At this writing "extras" in San Francisco are retailing at 96c. It looks as though the dollar egg is a near reality and no longer a joke. This new record price is causing considerable comment and some concern in egg circles. There are those who charge "profiteering" on the part of dealers and suggest the formulation of some plan for fixing a maximum price or otherwise regulating egg prices. The fact is that prevailing egg prices, though high, and to some would-be consumers prohibitive, are economically legitimate and are simply the result of an abnormal, extreme scarcity of the commodity on the one hand and an unusual demand, coupled with unusual buying power, on the other. These two conditions of under-supply and over-demand are country-wide, and not susceptible of remedy by redistribution. Furthermore, if these two conditions of low production (whatever the causes) and heavy demand persist, the dollar egg will arrive, and that very shortly. There is a limit, however, to the price which the general public will pay for any commodity, and to the onlooker it would appear that that limit has been about reached in the present egg market. When that limit has been reached, housewives begin to rigorously exclude the egg from the household bill of fare; and the unfortunate fact is that when the habit of doing without a thing has once been acquired it is likely to become confirmed. On this phase of the subject George H. Croley, the well-known poultry expert, wrote this paragraph some years ago in the Pacific Rural Press: "It is our contention that if prices in the fall, which is the period of low production, could be kept nearer to an average yearly price, the public would consume more eggs per year, become better acquainted with the value of properly handled storage eggs, and this would ultimately result in a higher average yearly return to the producer for his crop of eggs." Extreme fluctuations are bad for both producer and consumer.

Government Will Buy Beans.

The army consumption of beans averages about 125,000 pounds per day, as announced by the Committee on Public Information. This ought to encourage those bean growers who are unable yet to dispose of their crops. All army, navy, and allied requirements for beans for the coming year will be filled through one purchasing agent, the U. S. Food Administration. H. Clay Miller, at the Lachman building, San Francisco, is the purchasing agent for the California Food Administration. He is wiring to Washington at this writing to inquire how many California will be called upon to supply and what will be the price. All beans will be bought on specifications which will require recleaning and probably hand picking of the rain-damaged crop. Anyone who can sell suitable beans to the Government with convenient arrangements is eligible as a seller. The U. S. Bureau of Markets, under date October 30, says the bean market is weak. "California limas declined quite sharply at shipping points, ranging from $10 to $10.50 per cwt. to growers. California small whites ruled $10 per cwt. to growers." G. A. Turner, president of the Bean Growers' Association, advises bean men not to lose heart.

San Francisco Butter Market.

Except for outside business, the market was extremely quiet today (October 30). A number of shipping orders were filled, most of them for the North, and these sales caused prices to advance 1c. Dealers are having to quote closely to get this business. Outgoing shipments help in a small way in reducing stocks, but with receipts so much in excess of local requirements stocks on dealers' floors are showing unusually heavy accumulations this week, compared with previous weeks. Storage holdings were increased about 12,000 pounds yesterday, says the U. S. Bureau of Markets.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, October 30, 1918.

WHEAT.

The following are Government prices per bushel for wheat in bulk at San Francisco. The quotation for recleaned is the price per hundred and the charges are strictly regulated by the Government. Per carload the quotation is $4.15. Less than carload lots is $4.25.

Per bushel—
No. 1 hard........$2.20
No. 2........2.17
No. 3........2.13
No. 1 soft........2.18
No. 2........2.15
No. 3........2.11
Club or Sonora, No. 1........2.16
do, No. 2........2.13
do, No. 2........2.09

Recleaned for seed, per ctl.—
California Bluestem........$4.15@4.25
Early Baart........4.15@4.25

BARLEY.

It is reported that only a few thousand tons of barley have been contracted for for shipment from Port Costa, in accordance with the recent request of the Grain Corporation. This is explained on the street by the statement that most of the California barley is suitable only for feed and very little of it is of the standard called for. The marketing of the crop is still an unsolved problem, according to best informed traders.

Choice feed, per ctl........$2.05@2.12½

OATS.

Oats are very quiet, but there has been some inquiry for red and black oats for seed, especially for the recleaned article.

Red feed, per ctl........$2.30@2.40
Red for seed........2.80@3.00
Black for seed........2.80@3.00
Recleaned Red or Black for seed 3.35@3.50

CORN.

Some of the local dealers do not believe that a quotable price can be made on corn before the end of November. The old stock is about cleaned up.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked........Nominal
Milo maize........"
Egyptian........"

HAY.

Receipts of hay for the past week were 852 tons. Most of the receipts continue to be of damaged stock, and some of this has sold as low as $6 to $7 per ton. To this, of course, cartage charges, etc., are added. The arrivals which have been in good order have sold well, considering conditions existing here at this time. The influenza epidemic is seriously affecting the hay market and sales are consequently light.

Wheat No. 1........$26.00@28.00
do. No. 2........20.00@24.00
Choice tame oat........25.00@27.50
Wild oat, new........20.00@22.00
Barley, new........20.00@22.00
Alfalfa........18.00@22.00
Stock........18.00@21.00
Barley straw........50@ .80

FEEDSTUFFS.

The north winds have done some injury to fresh feed, while helping to cure late crops of alfalfa.

New alfalfa meal, per ton........$35.00@38.00
Coconut cake or meal........Nominal
Cracked corn........$86.00@88.00
Oilcake........Nominal
Rolled barley........$46.00@48.00
Rolled oats........56.00@57.00
Bran, carload lots in S. F........None offered
Mixed feed, do. do........None offered
Middlings, do. do........None offered

POTATOES, ONIONS, ETC.

The whole commission district shows the ill effects of the prevailing epidemic. Most quotations are unchanged and receipts are reported light. Garlic has taken an upward turn and fancy sold at 20c. Some fancy summer squash sold at $1.25 and Livingston eggplant brought the same price. Wax beans were 2c higher.

String beans........4@5c
Wax beans, per lb........6@7c
Pole beans........4@5c
Carrots, per sack........85c@$1.00
Rhubarb, San Jose, per box........$1.00@1.25
Summer squash........50c@$1.25
Pumpkins........$1.00
Cucumbers, Alameda, lugs........75c@$1.25
Eggplant, per box........75c@$1.00
Livingston........$1.25
Lettuce, Sacramento, doz........15c
Celery, bunch........20@25c
Tomatoes, per crate—
Bay........$1.00@1.50
Potatoes—
Garnet Chile, on street........None
Whites........$1.65@1.90
Sweets, per sack........3.25@3.50
Onions—
River Reds........None
Yellows........75c@$1.00
Australian Browns........75c@$1.00
Garlic, new........15@20c
Green corn, Alameda, per sack........Nominal
Okra........5@7c

BEANS.

Beans continued weak. The new crop is now coming on the market in full swing, with little demand. The poor demand is due to some extent to the epidemic. Improvement is not looked for until the present scare is entirely over.

Bayos, per ctl........$7.60@7.75
Blackeyes, new crop........6.25@6.40
Cranberry beans........9.00@9.25
Limas (south, recleaned), new crop........$10.90
Pinks........$6.90@7.00
Red kidneys........Nominal
Mexican Reds........$7.00@7.25
Tepary beans........6.25@6.50
Garbanzos........8.00@8.75
Large whites, new crop........8.25@8.50
Small whites, new crop........9.75@9.90

POULTRY.

Receipts continue light this week and the principal demand is for hens. The number of invalids demanding chicken broth is one of the reasons for this. One crate of hens was auctioned off on the street during the week and brought 45c a pound. Turkeys are weaker, especially the live birds. The scarcity of pickers in this city makes live birds somewhat of a drug.

Turkeys, live, young spring, lb........32@35c
do, old........32@33c
do, dressed, old........40@42c
Broilers, 1½ to 2 lbs........39@42c
do, 1¼ lbs........45c
do, ¾ to 1¼ lbs........48c
Fryers........32c
Hens, extra, per lb., colored........40@42c
do, Leghorn........40@42c
Smooth young roosters, per lb. (3 lbs. and over)........36@37c
Old roosters, colored, per lb........24c
Geese, young, per lb........27@28c
do, old, per lb........25c
Squabs, per lb........55@60c
Ducks........29@30c
do, old........25@27c
Belgian hares........24@21c
Jack rabbits........$2.50@3.00

BUTTER.

A price of 60c, 59c and 58c was established on Monday of this week for extra, prime first and firsts. The system of making a weekly butter price on the exchange has not proved wholly satisfactory to the members and an amendment was adopted October 25 to the effect that "on every day except Monday members may trade in butter without price limitation, sales and purchases to be recorded in the usual way. It is further understood that such transactions shall in no manner interfere with or vacate the price established for the week." It is said that this resolution does not interfere in any way with the stabilizing influence of the original resolution, but merely permits members to transact business on the floor of the exchange instead of on the street.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	61	61	61	60	60	60
Prime first	..	..	..	59	59	59
Firsts	..	..	..	58	58	58

EGGS.

Extras continued on their upward path throughout the week. It is said that the great demand of invalids for eggs is responsible for their present price. On October 29 the exchange adopted the following resolution: "All sales of eggs on the exchange shall carry a trade discount of 8 per cent up to and including 60c. All trades at 60½c per dozen and upward shall carry a trade discount of 6 per cent." This rule becomes effective November 1. Figuring on the present discount of 8 per cent, eggs, for the purpose of comparison with last year at this time, are fully 25c a dozen higher for extras and 32c for extra pullets.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	83	85½	86	88	88	88
Extra 1sts			Nominal			
Firsts			Nominal			
Extra pullets	76	74½	76	76½	77	78½

CHEESE.

Oregon triplets were slightly weaker this week, but both fancy California flats and first California flats showed strength and were advanced in quotations on the exchange. The price of these two latter were 23½c and 21c respectively a year ago.

California Cheddar, flats, fancy........None
Fancy California flats, per lb........32c
First California flats, per lb........30c
California Y. A. fancy........Nominal
Oregon triplets, fancy........37c
Oregon Y. A. fancy........Nominal
Monterey cheese........24@27c

FRESH FRUITS.

The fresh fruit market is rapidly becoming restricted to strictly winter fruits. Alligator pears were somewhat cheaper and this fruit from California came on the market in good quantity. Both strawberries and raspberries continue to arrive, but their quality is not of the best.

Apples........$1.50@2.50
Peaches, 4-box crate........None
Figs, black, per box........None
do, double layer........Nominal
do, Single Row Whites........Nominal
Strawberries, per chest........$10.00@13.00
Blackberries, per chest........None
Raspberries, per chest........$9.00@12.00
Plums........Nominal
Cantaloupes, flats........None
do, ponies........Nominal
do, standard........Nominal
Watermelons, per lb........Nominal
Pears, Bartlett, per box........$1.50@3.00
Grapes, Tokay........2.00@2.50
do, Muscat........2.25@2.50
Persimmons........1.00@1.50
Alligator Pears........3.50@4.00
Cal.........1.00@1.25
Pomegranates, per box........$1.50

CITRUS FRUIT.

There is practically no new stock oranges on the market and the old stock is held very firmly. New grapefruit has appeared and sells from $4 to $6. Lemons are strong and still sell for $9 for the best.

Oranges........$12.50
Lemons, fancy........9.00
do, choice........7.50
do, standard........6.50
Grapefruit........Nominal
Grapefruit, new........$4.00@6.00

DRIED FRUITS.

The market for dried fruit is quiet but steady. Prices are well maintained.

RICE.

Paddy rice, 1918 crop........$4.32
Clear No. 1, 1918 crop, at mill........7.00

HONEY.

Some honey is arriving from Hawaii and is being taken over by the bakers and candy makers. As a whole, the honey market is weaker, although prices are quotably the same.

LOS ANGELES

Los Angeles, October 29, 1918.

BUTTER.

The demand holds up well for what is coming in. Receipts the past week were not heavy, 280,300 pounds, against 314,300 pounds the same week last year. Yet at the high prices the supply met all requirements. There has been a little Eastern butter in since our last and there was taken into cold storage during the week 16,767 pounds, against 10,046 pounds the same week last year, making the cold storage holdings now 250,098, against 208,934 pounds this time last year.

Daily quotations—

	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
1918—						
Extra	60	60	60	60	60	59
1917—						
Extra	46	46	46	45	45	45

EGGS.

There was a further sharp advance in this market the past week under scarcity. The supply of fresh ranch eggs for the week was even lighter than the week before. Receipts of fresh ranch eggs for the week were 1650 cases, against 2035 cases the same week last year. Under this showing, what few eggs offered on 'change were snapped up and extras and case count advanced, up to Monday, 2c and pullets 3c, making extras 20c higher than this time last year, case count 13c and pullets 18c higher. There were withdrawn from cold storage during the week 1719 cases, against 3008 cases the same week last year. The cold storage holdings now are 52,156 cases, against 38,309 cases this time last year.

Daily quotations:

	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
1918—						
Extra	76	76	76	76	76	78
Case count	68	68	68	68	68	70
Pullets	63	63	63	63	63	66
1917—						
Extra	56	57	57	59	58	58
Case count	54	54	54	57	57	57
Pullets	44	45	45	45	46½	48

POULTRY.

Receipts of broilers were light in weight and poor condition and the market for them showed less life than the week before. Fryers in light supply and very good demand and little higher. Heavy hens also sold very well. Light hens were dull and so were roasters. Turkeys coming in more freely and slow sale and weak. No ducks and geese in and the market for them was dull.

The following prices were agreed upon last Friday, October 25, and held good until the coming Friday:

Broilers, 1@1¼ lbs........41c
Broilers, 1¼@1¾ lbs........41c
Fryers, 2@3 lbs........33c
Roasters (soft bone), 3 lbs. and up........30c
Stags and old roosters, per lb........20c
Hens........26@30c
Tom turkeys........31@34c
Ducks........22@28c
Geese........15c

VEGETABLES.

Potatoes were in good supply and fancy stock brought a little more money. Poor lots, however, were dull. Onions were in lighter supply and fair demand. Sweet potatoes were dull and lower. Cabbage slow sale and lower. Tomatoes firm and the best in good demand. String beans higher. Lima beans unchanged. Peppers slow sale but steady.

We quote from growers:

Bell peppers, per lb........2½@3c
Chile peppers, per lb........2½@3c
String beans, per lb........5@6c
Lima beans........3½@4c
Potatoes, northern, per cwt........$1.75@2.25
do, Idaho Russets, per cwt........2.00@2.10
Sweet potatoes, per cwt........1.25@1.40
Garlic, per lb........20c
Onions—
Australian Brown, per cwt........$1.20@1.35
White Globe, per cwt........1.50@1.65
Cabbage, per 100 lbs........1.00@1.25
Celery, crate........3.00@3.25
Tomatoes, No. 1 lug........65@75c
do, No. 2 lug........25@35c

FRUITS.

Offerings were lighter and fancy stock was in very good demand. Apples attracted most attention. Peaches are out of the market. Pears are getting scarcer. Grapes are also selling better; Muscat, Liberty and Black Morocco are out of the market and other varieties are higher. Figs are getting scarcer and bring little more money.

We quote from growers:

Figs, Black Spanish, per lb........5@7c
do, White, per lb........5@7c
Pears, local, per lb........4@5c
Pears, Mountain........4@6½c
Grapes—
Malagas, per lb........4½@5c
do, Rose Peru, per lb........6½@5c
Tokay, per lb........4@5c
Cornichon........4@4½c
Apples—
King Davids, 4-tier........$2.75
Black Twigs, 4-tier........2.75
Baldwins, 4-tier........2.00
Red Pearmains, 4-tier........1.75
White Pearmains, 4-tier........1.75
Rhode Island Greenings, 4-tier........1.50
Yellow Newtown Pippins, 4-tier........1.75
Apples, Bellefleur, 4-tier........$1.65@1.75
do, 3½-tier........1.70@1.80
do, Gravenstein, 4-tier........2.25

do, do, 4½-tier 2.00
do, Bellefleurs, local, per lb......2½@3c

BERRIES.

Few coming in and market higher under scarcity. Demand, however, light at the prices.

We quote from growers:

Strawberries—
Fancy, per 30-basket crate.....$3.50@4.00
Poor to choice, 30-basket crate. 2.50@3.00
Raspberries, 30-basket crate..... 5.50@6.50

MELONS.

Not much good stuff coming in. Watermelons were slow sale and lower. Casabas and Honeydew melons were unchanged.

We quote from growers:

Casabas, per lb........................1@1¼c
Watermelons, per 100 lbs...........50@75c
Honeydew melons, jumbo crate..$2.75@3.00

WALNUTS.

But few offering the past week and they by independent growers. Demand fair and prices quoted below were well sustained. The association is still moving on contract about 25 cars a day. They have no nuts for sale.

We quote f. o. b. California points:

	1918	1917
Fancy budded	34½c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

BEANS.

There was a further break in this market the past week and sales were slow. Now that threshing is pretty well along the offerings are more liberal and buyers are disposed to hold back and bear prices. Limas in fair demand and steady, but small whites, pinks, and tepary were both dull and lower. Blackeyes quiet and unchanged.

We quote from growers—

Limas, per cwt. $10.50
Large white, per cwt. 9.00
Small white, per cwt. 9.00
Pink, per cwt. 7.00
Tepary, per cwt. 5.00
Blackeyes, per cwt. 6.00

HAY.

The market is a little better. Prices not quotably higher. Alfalfa was in fair demand and there was some little movement in the best grain hay.

We quote f. o. b. Los Angeles:

Barley hay, per ton...........$23.00@24.00
Oat hay, per ton .... 25.00@27.00
Alfalfa, northern, per ton...... 20.00@21.00
Alfalfa, local, per ton......... 21.00@23.00
Straw, per ton .... 9.00@10.00

COTTON.

It was a cautious market the past week. As the ginning returns were more bullish than expected the market firmed up a little on its being made public. It showed that the number of bales ginned up to October 18th were 6,790,002 bales, compared with 5,375,606 bales the same time last year. The trade was looking for over 7,000,000 bales. On Monday the market opened the current week quiet. It being near the end of the month traders were inclined to keep close to shore. December closed in New York at 29.70c and January at 29.25c.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, October 28, 1918.

There was quite a noticeable advance in all markets this past week over the week previous, in some instances the sales realizing top prices for the season.

Wine grape shipments have practically discontinued, though there are several cars in transit, and if these arrive in Eastern markets before the extreme cold weather they will sell to good advantage, as the demand is particularly acute.

Quite a few carloads of Malagas and Tokay strippings, unfit for table use, have been shipped this season, and where the fruit arrived in condition suitable for wine sold to good advantage and realized prices for the growers that compensated them in a great measure for the losses they received on account of the damage from rain, which prevented the different varieties from being sold for table purposes.

Quite a few carloads of Red Emperors are en route and in most instances arriving in good condition and are bringing even higher prices than was anticipated earlier in the season.

There is an unusual demand for late winter pears for storage and for export. Shipments are light, but fortunately those favored with late varieties are realizing exceptional prices.

Averages for the week:

New York: Grapes—Malagas, $1.83; Emperors, crates $2.42, drums $5.66; Tokays, $1.84; Cornichon, $2.30; Muscat, $1.67; Alicante Bouchet, $1.86; Zinfandel, $2. Pears—Winter Nelis, $3.15; Glout Morceau, $3.42; B. Clairgeau, $4.09; Easter Buerre, $3.25; Bartletts, $2.55.

Boston: Grapes—Tokays, $2.11; Cornichon, $2.28; Emperor, crates $2.71, drums $5.15; Malaga, $1.92; Zinfandel, $1.62; Petit Bouchet, $1.59. Pears—B. Clairgeau, $4.65; Easter Buerre, $3.50.

Chicago: Grapes—Mission, $1.50; Cornichon, $2.15; Malaga, $1.70; Emperor, crates $2.19, drums $5; Tokay, $1.44; Zinfandel, $1.15. Pears—Winter Nelis, $2.22; Glout Morceau, $2.30.

Shipments from October 19 to 25, inclusive: 59 pears, 1984 grapes. Total shipments to date, 1918: 23,135 cars (not complete. Total shipments to date, 1917: 21,124 cars.

Special Livestock Market Report

San Francisco, October 30, 1918.

CATTLE—There is very little change in the cattle market this week. Shipments from Oregon have about closed for this season. Slaughterers are getting the bulk of the supplies from Nevada and California. The cattle coming in are running rather light in weight, but are fair to good in quality, with very few choice steers.

Grass steers—
No. 1, weighing 1000@1200 lbs.12¼@12½c
do, weighing 1200@1400 lbs.....12@12¼c
do, second quality ....10½@11c
do, thin ....8@9c
Cows and heifers—
No. 1 ....8@8¼c
do, second quality.....................7@7½c
do, common to thin....................5@6c
Bulls and stags—
Good ....6@7c
Fair ....5@6c
Thin ....4@5c
Calves—
Lightweight 11c
Medium 10c
Heavy ....8@8½c

SHEEP—Ewes are very plentiful; wethers are rather scarce, while lambs are in fair supply. In the East live mutton is gradually recovering from the recent heavy slump.

Lambs—
Yearlings ....12@12½c
Milk ....14@14½c
Sheep—
Wethers ....11½@12c
Ewes ....9@9¼c

HOGS—Hogs are offered very freely at the present time, but the packers have not been able to handle them on account of their hog- and cattle-killing gangs being much reduced in number through the influenza. Packers are optimistic, however, and expect conditions to improve sufficiently to permit them to buy hogs freely next week. Heavy hogs are regaining favor again in the East.

Hard, grain-fed, 100@140 ....16c
do, do, 140@250 ....16½c
do, do, 250@325 ....15½c

Los Angeles, October 29, 1918.

CATTLE—There is a scarcity of really good fed steers and they are in very good demand and steady. An abundance of poor and medium stuff, however, is being forced upon the market by the scarcity and high price of feed. Such cattle continue dull and weak.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers........ 8.00@ 9.00
Good cows and heifers.......... 7.00@ 7.50
Canners, per cwt................ 5.50@ 6.00
Calves, per cwt.................. 8.50@10.00

HOGS—Few hogs came in the past week. Yet, in sympathy with further declines in the Central West, the market broke 50c a cwt. on the best packing hogs and demand is only fair. Since the breaking out of the influenza there is a noticeable falling off in the demand for fresh pork.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs..$15.00@16.00
Mixed, 225@275 lbs............ 15.50@16.50
Light, 175@220 lbs............. 16.00@17.00

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—The demand for both sheep and lambs continues light. What few coming in, however, are bringing steady prices.

Per cwt. f. o. b. Los Angeles—

Prime wethers ....$9.00@10.00
Prime ewes .... 8.50@ 9.50
Yearlings .... 9.50@10.50
Lambs ....15.00@16.00

What's the News Out Your Way?

"I want the help of every farmer in the land," says Uncle Sam. But you as one of these farmers can do more than simply raise bigger and better crops. You can tell others how you did it.

Did you ever attend a convention and notice people gathered together in groups telling their experiences? The speeches may have been good, but the most helpful part of the gathering came from this swapping of experiences—this interchanging of ideas.

It is impossible for us to hold a convention of subscribers, but we can have a continuous correspondence convention—a regular mutual benefit association. Don't be over-modest and think that nothing you do will interest our readers. We don't want unusual experiences. We want to know how you solved the problems that are puzzling other farmers.

You have raised a big crop of some kind. You have built a new style building, a gate that won't sag, a trough that is easily cleaned. You have cured a certain disease. You have worked out plans that have proved winners. Write us all about them. Give us news items, too. Don't wait for a $10,000 sale or a 40-pound record. Tell us the everyday happenings—they are what make a paper interesting. Just write us the facts; we'll do the rest.

Don't look at the matter in a narrow light and feel that you can't take the time to write these things. Franklin compared his brain to a razor, and said that he kept it fresh-edged by stropping it on other men's minds. You need to do the same. Hundreds of others are willing to contribute and you will get the benefit of their successful experiences, but they in return need a little stropping and want to know what you are doing. That's fair enough, for you'll always receive a hundred times more than you give.

What's the latest? May we hear from you real soon?

MISCELLANEOUS.

WANTED, USED IMPLEMENTS—Three or four gang, 12 or 14-inch mouldboard, light tractor plow; 7 or 8-foot double disc harrow, corrugated pulverizing roller. Give full particulars regarding price, age, location, make. Box 175, Hopland, Cal.

CROLEY'S BALANCED DAIRY FEED—The cheap milk producer; and Croley's Calf Meal, the best California calf raiser. Geo. H. Croley Co., Inc., Eighth and Townsend streets, San Francisco, Cal.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Weissbaum Pipe Works, 160 Eleventh street, San Francisco.

APPLES FROM GROWER, bulk pack, Bellflowers; first grade, $1.25; second, $1 per box. Edward A. Hall, R. F. D. 1, Box 39, Watsonville, Cal.

TRACTOR FOR SALE—Bean TrackPULL tractor. Nearly all improvements attached. Perfect order. Very little used. Price one thousand dollars. A. Ryder, Loomis, Cal.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

NORWICH CANARIES FOR SALE.—Mrs. Geo. Thayer, Route 2, Healdsburg, Cal.

FOR SALE—Flemish Giant rabbits—young stock. M. Garrison, Dos Palos, Cal.

COUNTRY LANDS.

FOR LEASE—SUMMER SHEEP RANGE—Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the Diamond Match Company, Grazing Dept., Chico, California.

FOR SALE—160 acres good land in alfalfa, near Bakersfield, equipped for hog and stock raising. Will sell in forty-acre tracts if desired. Owner, Drawer J, Fellows, Cal

SEEDS AND PLANTS.

BUY ALFALFA SEED NOW—Owing to heavy rain damage, alfalfa seed is scarce and prices will very likely be high later. Get your season's supply now from our stock of carefully selected seed. There are seven kinds of Green Gold brand seed. One is particularly adapted to your soil and moisture conditions. Write for our booklet describing each kind and its adaptability to certain conditions. Do it now before prices go higher. Bomberger Seed Co., Desk B, Modesto, Cal.

BUDDED AVOCADOS — Fuerte, Sharpless, Lyon, Dickinson, Blakeman, Spinks, Taft, Linda, Rey, Queen, Knight, and many others. A fine stock of field-grown trees. $2.50 for one. $2.00 each by the 100. Better order now. Newbery-Sherlock, R. D. No. 2, Pasadena. Nursery, Rose, and Palm, Altadena, Cal.

WANTED.

WANTED — Position as ranch manager. Married; 32 years old. Exempt. Capable of taking entire charge. Born and raised on ranch. Address: G. A. B., Box 386, Santa Cruz, Cal.

VICTORY OIL MOTORS

Are the cheapest form of Power for Irrigation

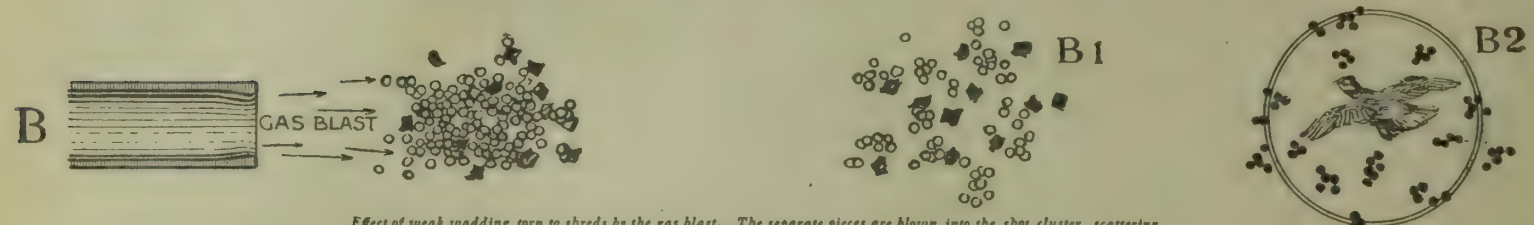
Largest exclusive engine factory in the world selling direct to user. Terms: Cash or payments as arranged for. Don't make a deal until you have investigated my offer.—Ed. H. Witte, Pres.

WITTE ENGINE WORKS
2861 Oakland Ave., Kansas City, Mo.
2861 Empire Bldg., Pittsburg, Pa.

Effect of hard wadding that fits the barrel loosely. Unchecked by friction or muzzle choke, it is blown through the shot cluster, scattering the shot charge. Actual test target, 221 pellets out of 431 or 51% of the shot charge (1¼ oz. of 7½ chilled) inside a 30-in. circle at 40 yds



Effect of weak wadding torn to shreds by the gas blast. The separate pieces are blown into the shot cluster, scattering the pellets in all directions. With no resistance to the explosion, the pressure is low and penetration poor. Actual test target 178 pellets out of 431 or 41% of the shot charge (1¼ oz. of No. 7½ chilled) inside a 30-in. circle at 40 yds

The Winchester system of wadding. The wadding expands evenly, sealing in the gas blast all the way to the muzzle, where it is checked by the "choke" or constriction. Shot cluster travels on ahead unbroken. Actual test target, 320 pellets out of 431, or 74% of the shot charge (1¼ oz. of 7½ chilled) inside a 30-in. circle at 40 yds

Effect of wadding construction on shot patterns

Poor wadding responsible for more faulty patterns and lost birds than all other gun and shell troubles combined

A strong uniform shot pattern depends upon how perfectly the *wadding* in your shells controls the five-ton gas blast behind it.

The wadding, like the piston head of a gas engine, must give the explosion something solid to work against so that the shot may be *pushed* out evenly.

It must expand and fill the tube of the barrel, completely sealing in the gas behind it. No gas must escape to scatter the shot.

It must offer just the right amount of resistance so as to develop uniform pressure and high velocity without danger of jamming the pellets out of shape at the "choke" or muzzle constriction.

The illustrations at the top of this page show actual test patterns, 50% to 70% faulty, the result of poor wadding.

The Winchester system

Winchester wadding is the result of repeated experiments to determine the most efficient control of the gas blast.

The special construction of the *Base wad* gives what is known as *Progressive Combustion* to the powder charge.

Combustion spreads instantly through the powder charge. By the time the top grains of powder become ignited the *full* energy of the burning powder behind is at work. Though the explosion is almost instantaneous, it is none the less *Progressive,* the final energy and maximum *velocity* of the completely burned powder being developed at the *muzzle*, where it is most needed.

Meanwhile, under the heat of combustion, the tough, springy Winchester *Driving Wad* has expanded to fill the barrel snugly all around. No gas escapes. It is completely sealed in. The wadding *pushes* up the shot evenly.

At the muzzle the shot pellets slip out without jamming, while the wadding is checked for a brief interval by the constriction of the muzzle. *It follows some distance behind the shot pattern.*

The shot cluster travels on unbroken by gas blast or wadding and makes the hard hitting, uniform pattern for which Winchester shot shells are world famous.

Fish Tail Flash All Winchester smokeless shells are made with the new Winchester Primer—the quickest and most powerful shot shell primer made. Its broad *fish tail* flash gives even and thorough ignition. Every grain of powder is completely burned up before the shot charge leaves the muzzle.

The Crimp The required degree of pressure necessary in seating the driving wads is worked out in combination with the *hardness* or the *softness* of the *crimping* required for any particular shell.

Water-proofing and Lubrication In the cold, damp air of the marshes, or under the blazing sun at the traps, Winchester shells will always play true. Winchester water-proofing process prevents them from swelling from dampness. Special lubrication of the paper fibres prevents brittleness and "splitting" in dry weather.

Uniform Shells From primer to crimp, Winchester shells are constructed to insure the maximum pattern possible from any load and under all conditions. $100,000 is spent annually in the inspection and testing of finished shot shells. 25,000,000 rounds of ammunition are fired every year in testing guns and ammunition.

Clean hits and more of them

To insure more hits and cleaner hits in the field or at the traps, be sure your shells are Winchester Leader and Repeater for Smokeless; Nublack and New Rival for Black Powder. Write for our Free Booklet on Shells. **Winchester Repeating Arms Co., Dept. Y-41 New Haven, Conn.**

California's First Exclusive Livestock Show

Written for Pacific Rural Press by R. H. Whitten

IT IS SAID that everything great in this world is born of necessity. If so, the California International Livestock Show, to be held in San Francisco November 16 to 24, is entitled to a high place in the Hall of Greatness, for certainly there has long existed a pressing need for such an event. And that need has been increased by the war-time demands for greater production and conservation.

As evidence that livestock shows are more necessary now than ever, we find that, as hard pressed as England has been, the Government has insisted that livestock shows should continue as usual. Our own Government has taken the same attitude, realizing not only the present importance of the industry to the nations at war, but also its absolute necessity for a permanently profitable agriculture.

A realization of the importance of the industry is needed in California even more than in the States east of the Rockies, for, although our State is one of tremendous livestock possibilities, the benefits of breeding purebred stock and our vast resources in connection with stock raising have never been properly brought to the attention of our people. No development will add more to the prosperity of the State than an increased output of meat- and milk-making animals, and no other method will do as much to develop the industry as livestock shows.

True, we have had fairs and fairs this fall—more large ones than ever before. But we have not had a show for livestock alone; in fact, no such show has ever been held in this State. Yet that is what we have needed—a show where the spectators' interests would not be diverted by exhibits of different kinds, sideshows and other attractions.

The importance of establishing on the Coast—of which San Francisco is the logical center—a livestock show to encourage the breeding of high-class stock was realized by several of the State's most prominent and influential men. They banded themselves together under the name of the California International Livestock Show Corporation—a non-profit institution, having solely for its purpose the elevation and development of the livestock industry. And, true to the slogan originated by former President Taft, "San Francisco knows how," they have planned a show along such elaborate lines and have met with such generous co-operation that its complete success is assured in advance.

First of all, they secured the backing of the San Francisco Chamber of Commerce, and were able to offer such liberal premiums that they induced many of the leading breeders of the North and Middle West to exhibit. Consequently, it is expected that competition will be much more keen than it was at the Panama-Pacific Exposition, where so many Middle West herds were prevented from showing on account of the foot-and-mouth disease.

Prize winners owned by breeders who will exhibit at San Francisco. Top, the $6,500 Holstein bull owned by W. J. Higdon, Tulare. Center, junior champion Aberdeen-Angus cow at Chicago International, 1917; Congdon & Battles, Yakima, Wash. Bottom, Shorthorn cow, winner at 1918 State Fair; T. S. Glide, Davis. Sheep, International prize winners; Bishop Bros., San Ramon. The Happy Hampshire, a State Fair prize winner; L. A. Denker, Saugus.

Nation-Wide Competition.

"International"—did you get that word in the official name of the corporation? Entries are open to the world, and while there will be no foreign exhibits on account of war conditions, we shall see some of the finest show herds in the United States and Canada, including animals that have been prominent winners at the leading Eastern shows.

We want to see these noted herds — these wonderful individuals. We want to compare them with our own. If we are raising just as good stock as Eastern breeders, we want the world to know it. If not, we ourselves want to know it so that we can buck up and breed better stock.

A livestock show is always valuable to the exhibitor as well as the spectator, because he has an opportunity to compare his stock with that of other breeders and see whether or not in the opinion of an expert—the judge—he is making satisfactory progress, and is breeding animals of the preferred type. At this show he can compare his animals, not only with others raised in this State, but also with the crack Eastern

DATE OF LIVESTOCK SHOW STILL UNCERTAIN.

As the last form of our paper goes to press, the date of the California International Livestock Show is still uncertain, for reasons well known. It is with deep regret that this announcement is made. As we pen these lines a letter is laid on our desk stating that a special meeting of the board of directors of the Livestock Show Corporation will be held November 7, at 3 p. m., to consider the situation of the show in connection with the untoward health conditions prevailing in the city. (Later—The board of directors decide to postpone show to Feb. 8 to 16, 1919.)

THE EARTH'S DUTY TO MAN.

THE EARTH needs no exhortation: it received its high commission from the Creator and has never forfeited it. Those who know plants assure us that four-fifths of the earth's verdure is grass and that possibly means that if you order all the trees into line and march them away to Mars, and if you gather up all inedible herbs and shoot them into the helial furnaces, this planet will still have four-fifths of its greenery in place and will still flash an emerald gleam in the eyes of the angels. According to our best conception of creative design, the earth was made for man—for every man, not for such as the kaiser and his servile sycophants. The lower animals were made for man—to live and to die in his service and nourishment. Four-fifths of the plants were made for animals—to enable them to render their dutiful service to man. Man was made for the soul that is in him and given speech that mankind could advance by communicable and progressive thought nearer and still nearer to that sublime estate in which mankind will "glorify God and enjoy Him forever." All through time and space the earth will be efficient and true to its duty to creative design—to sustain and advance mankind toward godliness in their relations toward each other and the Infinite. In the discharge of its duty the earth is no slacker nor passivist!

MAN'S DUTY TO THE ANIMAL.

THE EARLIEST recorded thoughts of man were of his co-operation with the several agencies of his environment. Out from the Infinite there came to him flashes from the far beyond. As he strolled on the shore of a boundless spiritual ocean he felt his soul fanned by zephyrs until a great storm arose and he found himself dashed hither and thither—as a babe may be tossed and rolled by breakers on the pearly beach of a sunlit sea. Then there dawned upon him the consciousness of his soul's duty in co-operation with the Supreme Power which had called him into being—but of that the priests and poets have amply spoken all through the ages and will hold forth until the end. It is nearer to our present purpose to emphasize the duty of man in co-operation with the forces and agencies of his material environment toward which there was given to him the primal order to "be fruitful and multiply and replenish the earth and subdue it and have dominion over it * * * and over every living thing that moveth upon the earth." It is then obviously the duty of man to co-operate with the earth in enabling it to discharge its full God-placed duty—which is to turn its idle wealth of nourishing plants to the sustenance and increase of animals, to the end that multiplied mankind shall be well fed and clothed and sped along toward higher manhood of soul and substance, to free themselves from the oppression and robbery of over-lordship, and stand forth in the nobility and God-likeness which is the birthright of mankind in the world. Not less than this is the ultimate purpose in the full discharge of man's duty to the animals over which he was given dominion in the creative design, as first revealed to the race.

MAN'S DUTY TO MAN.

MAN'S duty to man through the development of the very best in animal capacity to serve mankind is involved in man's duty to the earth and to the animal that each may itself be true to creative purposes, which have just been cited. The resultant of such forces is prosperity in all the forms which the word implies, and its motives may be short-sighted and called "personal" or far-sighted and called "patriotic"—but these two are but parts of a single motive. If a personal motive is true and noble, its extension is patriotic, just as every straight line leads to infinitude—but the line must be drawn straight. In the development of animal capacity to best serve mankind all lines must be straight; straight in conception of utility; straight in breeding toward that utility; straight in feeding toward fullest producing power; straight in financial phases of producing enterprises; straight in marketing products, and so on. Such lines will, if well drawn, converge in personal prosperity and the extension of personal prosperity of that kind is patriotism. Man's duty to man, in this connection, is simply to co-operate with the earth and the animal in enabling them both to render their best service to mankind.

THE OBJECTIVE OF SUCH SERVICE.

WE HAVE placed in an adjacent typographical corral what we conceive to be the relation of all such considerations to the development of California—the key to such development: the anchor to make it secure. We honestly believe both these things are true, but how a thing can be both a key and an anchor at the same time, or how a key can turn into an anchor, the brass-founders' and iron-founders' unions must explain. But passing such baffling metaphorical problems, we come to the real truth of the matter which the large type conveys: that it is the duty of Californians to give more thought, effort and money to advancing our livestock industries which during the last few years have manifested such quickened and increased interest and demonstrated such expansiveness in production. It is in its relation to such re-awakening of enthusiasm in California agriculture that other writers on other pages of this issue set forth in detail the purposes and motives of those who have been working for several months to secure the success of the California International Livestock Show, which may open in this city on November 16. We give this issue of our journal largely to this exposition because of the opportunities and advantages it offers to those who desire to know what is good for the State and how can be secured; also how the individual seeking such good, both for his own prosperity and for the State, cannot only learn the ways and reasonable results of the effort, but may get new inspiration and joy in the pursuit of it. Livestock shows are destined to be far-reaching events. As we have already shown in this discussion, their significance extends far backward to the time when Abel brought the firstlings of his flock as an offering to the Lord—and we are hoping no influenza will raise Cain with them. We believe also that the significance of these expositions will reach far forward and that a series of which will prove a constantly recurring force for the enrichment and permanence of California rural industries until the State becomes in the eyes of the world first in the possession of diversified agriculture, because California's natural resources are the endowment of California's citizenship.

WHO SHALL ACTUATE ACTIVITY?

CITIZENS of San Francisco, will you lead forward in the development of the animal industries which present conditions justify and invite? You own much of the idle land of the State, either personally or through the corporations you have organized. Will you still persist in holding that land idle so that you may enrich your children with its unearned increment? Perhaps you got it for a song, or was it from the groan of some poor devil who soaked it with you as collateral? But never mind about that: let bygones be bygones. What are you going to do with it now and henceforward? Will you let it lie idle, doing nothing to justify its place on the planet, until the single-taxers get a chance to try out their dreams upon it? Or are you holding your land in rented service that you and your returning sons may get club dues from what landskinners will pay you? Your sons are at the front. Do you think they will return to follow you in your city juggling with rents and shares? All accounts seem to agree that those boys have seen visions and dreamed dreams at the fronts

THE KEY AND ANCHOR OF CALIFORNIA'S COMING GREATNESS!

Only one of the three great subdivisions of agriculture has the power to assure us that all California lands can be made profitably productive. Our horticultural industries will extend and multiply until fruits and vegetables in all commercial forms reach an annual output-value of several hundred millions of dollars: our arable lands, which horticulture will never require, may produce cereals, legumes, sugar, textiles and other field crops which will also be counted in many millions of output, if a teeming local population and an expanding world-commerce can use them, but the utmost conceivable expansion of our direct-product agronomy will only employ a fraction of our productive area. The only branch of agriculture which can make practically all of our remaining area busy and can in addition save the wastes and by-products of our horticulture, give profitable value to the products of our expanded agronomy and in turn yield to horticulture an agronomy the assurance of indefinitely prolonged soil-fertility for their purposes, is the third great subdivision of agriculture—the animal industry. From the periodically submerged lands of our valleys which may always resent reclamation from floods, to the backs of our loftiest mountains, whence the rock-cones spring sheer into the blue, there will always remain areas from which only the cropping muzzles of grazing animals can secure productive value—areas which on the whole will preponderate all others in product value when brought under tribute by the only agency which can compel them to nourish the bodies of our coming millions while their natural beauty of sunken plain or towering mountains uplifts the souls of them! It is the Animal Industry which alone can make California a 100% institution: it is the Animal Industry which every Californian, no matter what his personal activity may be, must endeavor to understand and promote—for the general good of his state and for the prosperity of his children.

and that they will return in no humor to tread the carpets of the counting-houses and clubs nor to jump the counters of the metropolis. They say, if their reporters speak truly, that it must be a life in the open for them: a life in the making and doing of real things: a life in rounding out one's self, not a life in pinching others. Why don't you take the hint from what you read about young Americans made over by the war and get your land ready to make a place for action and a home for a man of action—your own son or another's: it matters not which. Such returning Americans will demand a place under the sky: an enterprise which has creative attributes: an opportunity which befits a man. It is the duty of the owners of California land and money to develop it, to see to it that no slacking of theirs forces our returning heroes to lapse into urban thimble-rigging and penny-pitching because no real work in mining, manufacturing or food production is open to them. Keep the land idle and you condemn to idleness those boys whom the world honors as fit to achieve the very greatest things.

LESSONS OF THE SHOWS.

OF COURSE, we believe that the service of livestock shows, through their assembling of the best in animal improvement and adaptation to the needs of man, are of immense value to our people who are now on the land and in the lines of animal production. They enable all who participate in them to do better and to do it more profitably, as our associate writers have amply shown on other pages. And these things are a great gain for the State. But that which impresses us most is the influence which such events have upon the development of the State through the awakening of those who have the deadly idea that the land must work for them and not they for the land. The land is a great co-operator and has been since creation, but it can be made a great slacker also. If you hold good land idle you are robbing your fellow men and in most cases impoverishing yourself also. Study those royalties of the animal kingdom—the only royalties which the war has not brought low! See how man has bred them to his conception of most productive form and temperament and supreme adaptivity to the conditions he wills them to utilize in their service to him and to his fellow men. If there is anything left in a city holder of country land beyond the little professional financial or mercantile grooves into which he has ground himself and to the service of which he would also bend the sky-covered fraction of his wealth, a study of noble animals and their relations to individual prosperity and State development will surely awaken new interest in living and disclose lines of enjoyable thought and action of which he had not dreamed himself possessed.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Transplanting Cypress Trees.

To the Editor: I have several cypress trees in a very awkward situation. Is it possible to transplant them if I do it on a rainy day this winter? The trees are eight or nine feet high and I dislike to cut them down if they can be transplanted.—E. E. L., Livingston.

Trees of that size are not difficult to transplant if it done in the right way and at the right time. Evergreen trees should not be moved when the ground is cold or water-soaked. They should be transplanted just before their usual time for making new growth—which may be early in the spring in the interior and later in the spring nearer the coast. When the cold air and water are over—probably in February in your case—draw up the lower branches and make the tree into a neat bundle by running around with hay rope. This gives you a good chance to get at the base of the tree. Trench around with a spade about two feet deep—leaving the tree standing in a ball of earth about two feet in diameter. Remove some surface earth in which there are no roots carefully, to reduce the weight of the ball, then cut under the ball with a sharp spade to sever outrunning roots. Open out grain sacks lengthwise to get long strips of burlaps and draw them around and under the ball tightly to hold it from cracking. Tip the tree on its side. Take a piece of scantling about three feet long and cover the central part with a folded sack. Put this under the trunk of the prostrate tree close to the ball and get two strong men to lift and carry the tree carefully and set it upright in its new hole—which has been previously prepared. Keep the soil reasonably moist but not wet. When new growth starts, use water more freely, but be careful not to drown it if the soil is heavy.

Growing Almond Trees.

To the Editor: I am thinking of planting some bitter almonds and if I cannot get them will sweet almonds do? Are sweet almonds those used on the market? What time should I plant and graft them? Where can I get a book on care of young almond nursery, planting, budding, etc.?—W. S. J., Chowchilla.

Bitter almonds are often advocated but have never been demonstrated to be better than sweet almonds as nursery seedlings. Sweet almonds are those which have no bitter taste in the kernel. This includes both the softer shell varieties, which are popular commercially, and the hard-shell varieties, which are free from bitterness. The latter are reasonably commended for growing seedlings: they may be better: they can be bought for less money. Almonds should be sandwiched with sand now or sooner (as described for peach pits in our issue of October 26) and planted out in the same way and under the same conditions of soil. Seedlings started this winter should be budded next summer. There is very little grafting of almonds except in working over old trees. The fullest account of California nursery methods with almonds as with other fruits is to be found in our book, "California Fruits and How to Grow Them." "Three dollars, please"—"thank you!"

Growing Seedling Walnuts.

To the Editor: How shall I handle California black walnuts from the time they are picked up (say now) until time to plant? Also, how shall I plant them in nursery? Would it be advisable to plant several nuts in place where we want the trees to grow, leaving the best tree when a year old instead of planting in nursery? Also, when is best time to plant, and how deep? The land is sandy and well drained.—Constant Reader, Paicines.

Walnuts for growing seedlings should be put down at once in a sandwich, as described for peach pits in our issue of October 26, and when conditions are right the sprouting nuts should be set in nursery rows as described for peaches—except that in your light soil the nuts should be set not less than three inches deep. You do not speak of grafting-over and we infer you intend to grow them as black walnuts. If you are willing to look after so much ground for two or three years, you can plant the nuts from the sprouting-bed in places where you wish the trees to grow. As seedlings thus isolated are open to many dangers, it is wise to plant several in a place and keep the best after one season's growth—destroying or transplanting the others.

Planting for Contentment.

To the Editor: I have land that I propose to plant to fruit trees this coming season. I come to you for information as to what kind of trees the land is best adapted to. The land is upland, mostly of the red color; a small piece is gray adobe. I have been advised that prunes or plums would do well. The land is nearly level; the hardpan is about two to three feet deep. I am rather inclined to plant prunes or plums or both.—W. J. R., Sacramento county.

It is a mighty good thing for a man to plant the kinds of fruits he wishes to plant. No one but his wife ought to take the risk of advising him otherwise. In your case it is easy for us to insist on the application of the fourteen peace principles which we have in mind but need not state. Your land is safer for prunes and plums on myrobalan roots than for any other fruit we can think of—if you will have such irrigation as they will require on such shallow upland, increasing in amount as they come into bearing. We hope your land is really red and not some of that yaller-dog hardpan upland which grows in your part of the State to some extent.

Fuller's Rose Beetle.

To the Editor: I am sending some bugs or beetles which are eating the leaves of honeysuckle, rose bushes, etc. What are they and how can I get rid of them? They seem to collect in bunches through the greater part of the day, then scatter out in the evening, eating the leaves of almost everything.—W. H., Sebastopol.

You have to deal with "Fuller's rose beetle" (Pantomorus fulleri), a grey to brown beetle about half an inch long, with white stripes on its sides. Its larvae feed on roots of plants and the beetle on the leaves, as you describe. You do not exaggerate the voracity and variety of its appetite. You can poison it by spraying with lead-arsenate, just as you do the apple worm, but it is quite a job to poison a whole garden and a little dangerous perhaps. These beetles cannot fly and you can protect the plants you care most about by tying a loose band of cotton around the stem, because they cannot crawl over it. Band your best plants and knock or shake the beetles off onto the ground. Give the hens the run of the garden and see if they will not clear off the ground.

We Need You

to represent us in the field in place of those who have been called to the "colors." The work of securing new subscriptions and collecting on renewals is pleasant, dignified and healthful, and the salary is ample.

Experience is neither essential nor objectionable. If you have an automobile and are not afraid of hard work, we can use you.

No objection if you are along in years, provided you haven't lost your pep. If you really like the paper and think you can convince others of its merits, your first step toward Greater Success will be to write us a little about yourself and give us an opportunity to tell you what we have to offer.

Only a few positions open. Better write today.

Boll-worm of Corn and Tomato.

To the Editor: What causes so many worms in tomatoes and sweet corn? We lost an awful lot of tomatoes this year. Is there any spray we could use?—H. A., Groveland.

You refer, of course, not to the finger-large worm with a horn or periscope on his rear elevation. That monstrous worm eats only the foliage and is best caught up with by picking off. The worm which eats into the tomato and causes rot and the worm which you find in the tip of the corn ear are larvae of the same insect, commonly called the "boll-worm of cotton" because it first attracted attention by its cotton depredations. It has always been a hard worm to get even with. It has, however, been recently shown that dusting the corn silk, as soon as it appears, with lead-arsenate powder largely saves the ears. It is harder to get the worm on the tomato because the green tomatoes which it attacks are more difficult to find and get at with the poison than corn silk is. However, there are only two recourses so far as we know. One is to spray the green tomatoes with lead arsenate (1 pound to 25 gallons of water), which is considered safe, because practically sure to be dislodged before the tomato is ripe; the other is to keep watch for infested tomatoes and smash them—thus killing the worm before he has a chance to arrange for his posterity.

Do Not Wait for Peanut Vines to Die.

To the Editor: Do peanut vines die and dry up when the peanuts are matured?—Subscriber, Lathrop.

Peanuts require a long growing season (about six months) and they usually get a touch of frost, which knocks them out, but where frosts are shy and soil moisture ample the vines may keep on growing and trying to develop later settings of nuts after the main crop is mature. In such a case they should be pulled out before they dry up. The late settings are usually small and poor and the continued activity of the vines makes the main crop less desirable in color and otherwise. When you get a good crop of good nuts properly filled, pull them out.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., November 5, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	2.23	5.13	4.54	60	40
Red Bluff	2.04	10.13	2.76	84	40
Sacramento	.46	5.44	1.63	82	42
San Francisco	1.88	4.59	1.81	80	45
San Jose	.62	7.12	1.42	82	40
Fresno	.36	1.00	1.04	84	42
San Luis Obispo	.20	1.75	1.97	94	42
Los Angeles		.71	.91	96	50
San Diego	.22	.83	.60	90	58

Pruning of the "Sultanina" (Thompson)

[Written for Pacific Rural Press by John J. Fox.]

THIS does not pretend to be a dissertation on pruning from the start of the young vine — recent articles and a circular (No. 191) having been published by Prof. Frederic T. Bioletti, viticulturist of the University of California. It is, however, a summary of results observed by the writer under different methods of pruning and training the Thompson Seedless and deals with vines in their third year and upward, when they are producing full crops of fruit.

This vine has been defoliated to show the hang of Thompson Seedless grapes on vine trained on two wires. Less than half the vine appears in cut.

Districts visited included the Kingsbury, Selma, Fresno and Hanford districts, where we entered many vineyards just before harvest commenced, and we were therefore able to note for ourselves the quality and extent of the crop, the facility with which both crop and vine could be handled, protection afforded and the vigor of the wood, making due allowance, of course, for adverse conditions, in cases where leaf hopper, Johnson grass or leaf shrivel had injured foliage in the various ways.

A COMPARISON OF THREE ADJACENT VINEYARDS.

Three vineyards, close together, will be compared, because they represent three different systems of training and two of pruning, and all are on the same class of soil and have been handled with care by the owners.

The first to be visited was P. M. Peterson's vineyard at Kingsburg, just west of the town, who has six acres of three-year-old vines (which I saw last year when they were only staked) and six acres of four- and five-year-old vines. The three-year-olds yielded 11 tons of raisins this year and the older vines yielded 2¼ tons to the acre last year. The vines are set 8 feet apart by 12 feet between rows. They are trained on two wires, the first being about 30 inches from the ground and the second 4 feet. Three to four canes are left to a vine and these are cut clear back and renewed each year from spurs left the previous winter and from which canes have been prepared. Mr. Peterson likes this system of pruning the best for the following reasons: (a) It is less of a shock to the vine to cut back each year than to allow a two or three years' growth before renewing. (b) The yield is considerably larger on a five-year average and the vine more vigorous. (c) Training on the two wires makes picking easier—not so many bunches spoiled in disentangling. (d) Spring and summer handling of the vine is made easier. His vines used to be tied to stakes entirely, but he says the crop is larger on the trellis and far more easily handled—the only advantage of the stake system being the possibility of cultivating the vineyard both ways and having the vines equidistant. Mr. Peterson prunes in February and March, gives young growth two ties and only hangs canes over wires. Then they are not difficult to remove when pruning takes place. If one twist over the wire be given instead of draping, a cut is necessary to remove the old wood.

The utmost care was apparent in this vineyard and the reasons for all handling were convincing.

OLD WOOD KEPT.

The next vineyard was one of 15 acres, belonging to A. A. Satterberg, where old wood was used instead of renewals from the base. So far as fruit is concerned, there was nothing on until new wood from the top was reached. Including the old wood there were eight or nine canes here and the vines did not show the same vigor. The fruit was scattered in the top area, the bunches were smaller and the crop probably 20 per cent less than Peterson's of about the same age. Some of the grapes had been picked in this vineyard, though we could not see that they were in a more advanced stage of ripeness than the others.

BOTH PAIRS OF CANES ON LOWER WIRE.

A. H. Duval's vines are all hung on the lower wire, some of the laterals reaching for the upper one. He has a fine young seven-acre vineyard of Thompson Seedless (six years old), which was estimated to be carrying enough grapes to produce two tons of raisins to the acre. There may have been more. The grapes on the lower wire were one mass, beautiful large clusters, but more difficult to gather than Peterson's because of their massed condition. We thought also that many of them were too close to the ground and if that system is followed the lower wire should be a little higher and have more supports. Also from the appearance of the canes it looked as though there would be more work in getting them clear of the wires at pruning time than if they had been draped on both top and bottom wires.

Wishing to verify the result of our observations in this district, we consulted Professor Bioletti on our return. He says that the chief advantages of both canes being tied to the lower wire are that the fruit and vine are better protected from the sun by this method and sulphuring can be more cheaply and thoroughly accomplished than if the vines are spread over the two wires, also the grapes ripen more evenly on one level, which is, of course, a very important consideration. Then they are better protected from the wind. The professor also thinks the wires should be trained as follows: The first one 30 inches above ground and the second one 4 feet—in heavy ground both perhaps a little higher. The first strong shoots from the fruit canes should be pinched back as soon as the little blossom bunches can be seen. This will start new fruiting buds and strengthen the weaker shoots. He also recommends no wrapping of cane over the wire, but just hanging over and tying. The new shoots from spurs for the ensuing year are pinched when they are two or three feet along, according to the strength of the vine to force the growth of laterals which produce good fruit buds.

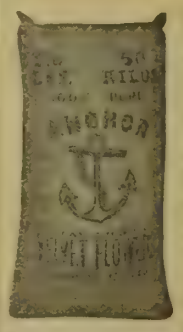
CHOICE OF STOCKS FOR PRUNE AND APRICOT

Apricot trees on myrobalan rootare used on heavy soils only or if the land is not very well drained or keeps wet too long. On apricot ground the tree does not make the growth that one on apricot root does. This latter is the best root of all for apricots, because it is a voracious feeder and is more free from root knot than any of the other varieties. It is, though, the root preferred by gophers. On good deep 'cot land then, the 'cot root is preferable, and for thin land the peach root can be used to advantage.

Apricot on almond makes a poor union and is not used.

Prunes on the peach root are coming back into vogue again, and on good, well-drained prune land it is hard to beat. The myrobalan is also a good, thrifty root and does better than the peach on stiff clay loams and adobe soil. The almond root is a favorite in lighter, sandy loam soil, where the almond does well.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste —(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

To Win the War

The consumer of Food
Must Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.
While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.
Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR

FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

CAUSTIC SPRAYS FOR MOSS AND LICHEN.

[Written for Pacific Rural Press.]

J. F. Nichols of Santa Clara county is an advocate of lye spray for cleaning off moss and lichen and says it is better than crude oil emulsion and caustic soda for this purpose. He says that his trees were pretty badly mossed, but on the day after spraying with lye (Red Seal), 25 pounds to 200 gallons, he could see that the moss and lichen had been killed. He was told that the buds would suffer from the corrosive action of this strong solution, but the trees bloomed all right afterwards. Some trees sprayed with 12½ per cent crude oil emulsion, with 5 pounds of caustic soda per 200 gallons, did not seem to have been cleaned so well.

The writer used caustic soda and common salt as a spray for heavily mossed prune trees some eight years ago—24 pounds of each to 200 gallons, using about three gallons to the tree. It killed the moss all right and a good set of prunes was obtained afterwards; but we did not like the appearance of the bark and young wood afterwards—it looked dried and harsh. Five growers in the neighborhood used the same spray and we decided that we would not repeat it. So far as I remember, we afterwards got equally good results by using 30 pounds of good stone lime and 16 pounds of salt to 200 gallons of water, and the bark came out in good shape, all the moss except some of that flat stuff that sticks close to the tree like a piece of paper being killed. We would never use this cheap spray for any other purpose than to clean up a mossy old orchard and after it was once done we should say "there ain't goin' to be no moss." For we should use the commercial varieties of approved sprays whenever the trees needed it, to keep down San Jose scale or thrips and not otherwise. If it is effectively done, the writer is of the opinion that a general winter clean-up spray is not necessary, if properly done, more than once in two or three years on prunes. Of course, if an infestation of thrips or red spider or any other pest appeared, that is a different matter. If half the orchard is sprayed each year for a winter clean-up, it is not so hard, either, on the man who is doing his own work.

HOW TO START AN ORCHARD RIGHT.

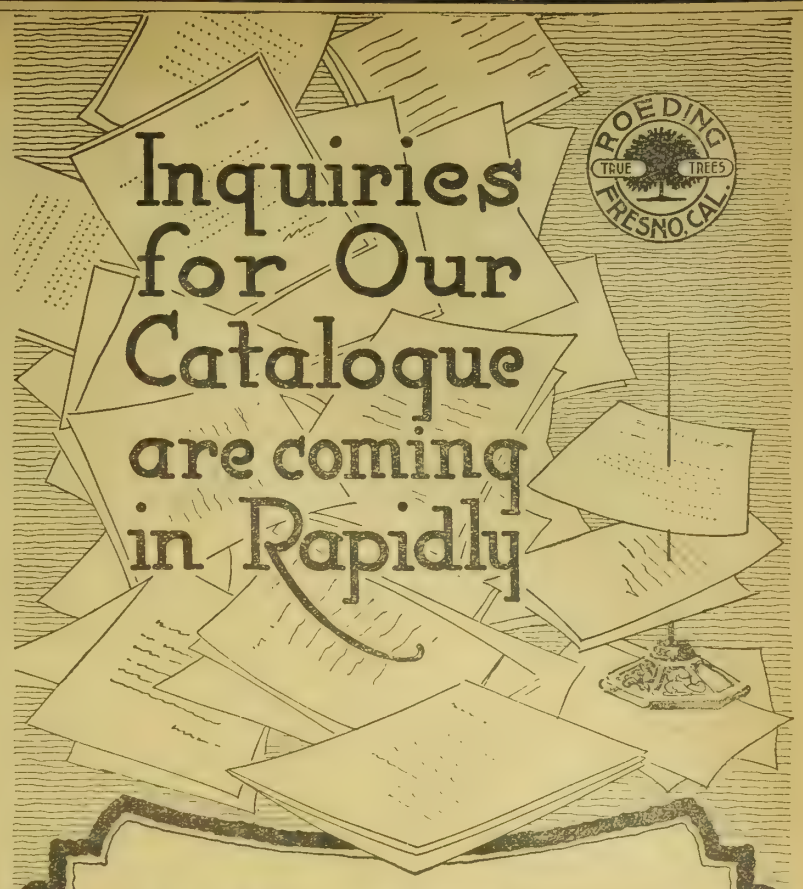
[Written for Pacific Rural Press.]

Where irrigation is practised, either in orchard or vineyard, it pays to grade the land before planting. Not only because of the annoyance and extra labor involved in trying to get the water on the high spots, but the moisture supply to the trees is going to be uneven and lead to a spotted condition of fruit and growth.

We lately visited the P. T. Hincks place at Live Oak, on the highway to Marysville — 110 acres set to peaches, plums, prunes and cherries that is worth seeing. This land runs down to the Feather river levee and it was all carefully graded, wells and irrigation pipe dug and laid before the young trees were planted. It is only 11 feet to water in unlimited quantities and centrifugal pumps furnish all the water needed. There is therefore no difficulty in getting the water onto any section of the orchard at any time.

Each row of trees in the avenues is mapped and tagged so that if a tree needs attention of any kind it can be found by description on reference to the map. All the young trees looked thrifty and strong with their third year's growth, indeed it is the finest young orchard in the vicinity and easily handled because of preliminary work.

On the other side of the levee Mr. Hincks has about 100 acres more on which it is his intention to plant pears—on the new Manchurian root, when it can be obtained. When we were there we found the men pulling a fine crop of Mexican Red beans, which we judged would run 25 sacks to the acre. No irrigation is needed or practised on this river bottom land.



"A Real Help to Fruit Growers"

Our fine big illustrated catalogue is a practical planter's guide—useful to both beginners and experts, tells what to plant and how to make fruit growing more successful. Lists and describes hundreds of tried varieties of deciduous, citrus and ornamental trees, vines and roses. Gives information that you should know before planting.

State Gains Four Points in Apple Drive

Twenty-ninth of the Editor's series of Historical and Analytical sketches of California Agriculture

LATEST FROM THE U. S. APPLE FRONT!

By the U. S. Census of 1910 California stood Ninth in the list of commercial apple-growing states. By the commercial crop of 1917 California advanced to Fifth place! In testimony whereof we cite the 1917 commercial apple crop in the ten topmost states, as reported by L. M. Estabrook, chief of Bureau of Crop Estimates, U. S. Dept. of Agriculture, viz.:

States.	Barrels.
Washington	4,620,000
New York	2,380,000
Virginia	1,650,000
Illinois	1,474,000
California	**1,174,000**
Missouri	1,128,000
Pennsylvania	911,000
Idaho	906,000
Oregon	713,000
West Virginia	702,000

The boxed-apple crops of Pacific Coast states are reduced to barrels for comparison (three boxes to one barrel).

How long will it be before the New England deacon will draw his traditional pan of apples and jug of cider, not from his own product cellar, but from the superior soils and climates of the Pacific Coast?

Not long, surely, for the adjacent tabulation shows that last year more than half of the product of the ten leading States came from the Pacific Slope group. If we should pursue the product farther, including all States, it would appear that of the total United States commercial apple product of 1917, which was twenty-two and a half million barrels, eight and a half million barrels came from the Rocky Mountains westward to the Pacific—more than one-third last year from our side of the Great Divide, and we still going! Evidently the New England deacon must keep his cobbles turning over lively in the hope of finding money under them to buy his coming apples from us!

A LONG LANE WHICH IS TURNING.

It is interesting to remember that in the apple lay the first great pomological hope of California. It was natural that the emotions of the pioneers "of '49 and the spring of '50" should gently turn to thoughts of the apple. The apple was king of the fruits known to them and dreams of their far-away homes, while they soaked in their rain-filled mining trenches, were of winter paring-bees in the fragrant Eastern farm-kitchens—in the course of which they threw unbroken films of red over the golden curls of country belles and stole kisses as the rewards of such expertness and gallantry! In those days girls were not "peaches"—they were "pippins," and the homeless, argonautic youth of California longed for the ruddy cheeks of seventy years ago with as deep a thrill as the memories of the paler beauties of today are awakening under the tunics of our heroes, somewhere in France, two generations later!

But there was another reason why the pioneers were eager to grow apples. In 1853, 12,000 barrels of dried apples were imported at a cost of $12 per barrel—a local orchard might be more productive than a gold mine! It was on this confident expectation that hundreds of pioneers bought apple trees as did Mrs. Bennett of Grass Valley, "paying $3 each for a dozen little switches of apple trees which came from Oregon," and not a few of them realized, as also did Mrs. Bennett in 1860, "more than $100 from each of the trees grown from those little switches." At first, then, growing of apples seemed very easy and more kinds of apples were planted during the first decade of California's pomology than in any following decade.

THE LANE LEADS INTO A SWAMP.

It seemed to be a highway to the heights of affluence, but it quickly ducked into a marsh. When apples of well-known varieties grew to such size as to be unrecognizable and when a grower could find "fine Rhode Island greenings lying under his trees in April, perfectly sound and of excellent flavor," it seemed reasonable to announce that California could teach all mankind something about apples—but they struck it nearly as badly as Eve did in the Garden of Eden. They apparently considered California as pomologically a single State, not discerning that as they passed eastward from the coast to the Sierra foothills they crossed natural equivalents of three States, and as they ascended the mountains they crossed one State more for each thousand feet of elevation. They did not realize that in traversing about 150 miles of California geography they had encompassed apple conditions diverse as those from Canada to South Carolina. What did it advantage them to have all the varieties the world found worth while? Simply this: in planting all the varieties they could get hold of, in all the places to which they gained access, they probably did the very best thing they could do to ultimately demonstrate which should be chosen to meet each of the different sets of natural conditions in each of the several pomological States of which California is comprised. But none of them knew this. In all places the varieties which failed so largely preponderated over those which succeeded that the unavoidable conclusion was that California apples were a failure: overgrown, punky, flavorless, no keeping quality, etc., etc.

EMERGING FROM THE SLOUGH OF DESPOND

About thirty-five years ago light began to break through the dark jungle into which apple-avenue had plunged and the edge of a clearing was disclosed so that travelers could read the signboards of experience—some of which may be thus interpreted:

1—In California certain sets of natural conditions are peerlessly adapted to specific types of apples—summer, fall and winter, if you please—and it is commercially disastrous not to properly match conditions and types.

2—When types are well understood and rightly placed, commercial success still depends, not only upon the choice of varieties which can best use the conditions which their types accept, but upon perfection of style, finish and quality which they embody in their consciousness the requirements of their type.

3—When conditions and types a definitely matched and varieties d criminatingly chosen, commerci success still depends upon purs of culture and protection agai pest and diseases which meet lo requirements. Tillage, irrigatio fertilization, pruning and pest-figh ing are all variables, changing with narrow limits. A man cannot blind follow the methods of his neighb on the other side of a hill. It i wise man who knows and does wh is clearly best for his own trees.

4—And when the best varieties the best type are grown to the hi production under the best natur conditions for the type, there great advantage in alliance wi whatever growers' co-operation available in order that advantag of association, in all the requir ments for grading, inspecting a marketing, be fully realized.

ON THE PLATEAU OF THE FUTURE

All these things were unknow to the pioneers, but they are t outgrowth of the diligent gropi which they did to find the gatewa to the future. So far as we c now see, they are the solid grou upon which the development of a ple growing in California must a vance toward attainment beyond t reach of other States. No oth State can swing through the se sonal gamut of the apple with Ca fornia, and no other State can su pass our product of any type wh properly placed to meet its requir ments of natural conditions and cu tural treatments. There are at lea five fruits which are commercial greater than the apple in Califo nia, but that is no reason why t apple in California should not greater than in any other State!

The above illustration shows a model stand of young apple trees under intelligent care..

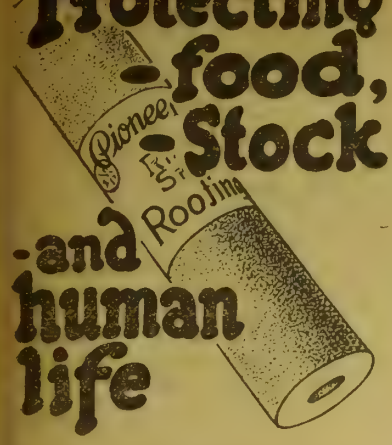
MORE THAN A MILLION PER YEAR FOR CALIFORNIA PLANTERS

Kirkman Nurseries, Incorporated $100,000

Established 1888

FRESNO : : : CALIFORNIA

Protecting -food, -Stock -and human life



In these days of conservation it is highly important that all buildings be weather proof.

Losses that are irreplaceable may easily occur from defective roofs.

Repairs to buildings should be made while it is possible before costs mount too high.

Pioneer Roofing

This old reliable brand of ready roofing has been used in California since 1888. Thousands of farmers, manufacturers and merchants—as well as home lovers everywhere—use it because of its intrinsic worth.

—because of its long life and reliability.

—because of its comparative low cost.

There is a dealer near you who handles Pioneer Roofing and can supply your orders. If you experience any difficulty in securing it—

—write us for samples and information.

Horticultural Jottings

Grapes Shipped Loose.

R. L. Niemann, manager of the Winters Dried Fruit Company, reports shipment of green fruits from that section being better than last year, excepting apricots, which fell short. A new departure in the green fruit business was shipping grapes (Tokays) loose in Los Angeles lugs without tops, the boxes being kept in place by means of wooden trips nailed across on the outside to keep the shipment from shifting. This experiment, prompted by labor conditions, has met with unexpected success, as it reaches the home in the East in good condition for canning and in amounts that can be dealt with by the individual housekeeper. Easterners prefer the packages in this shape and cost of crating is saved. Other fruits have also been sent forward loose in the lug, only they have been topped and nailed down.

A Message Worth Quoting.

H. G. Coykendall, president of the Prune and Apricot Growers' Association, says: "'Quality of fruit' is our message to the world. We must not put on the market, or attempt to put on the market, fermented spoiled prunes. Such salvage is permanent destruction to us and to you. It would work a harm, compared with which the ravages of the storm is as naught. We must stand our loss bravely and not try to save that which is unworthy of salvage. We must bear with fortitude a temporary evil such as this is in its very essence." And the majority of growers will respond to this message which places their profession on a very lofty footing.

Worms in Walnuts.

In the last issue of the Diamond Brand News of the Walnut Growers' Association Prof. R. E. Smith writes of the worm which is destroying from 20 to 50 per cent of the walnut crops in some localities at the South. We understand that investigation of the activities and habits of the worm is also being carried out by Harry S. Smith, secretary of the Insectary Division, State Commission of Horticulture, in co-operation with entomologists of the University of California. Some publicity matter will probably soon be issued with regard to the pest.

Pear Blight in Nevada County.

Nevada county was visited with a rather severe infestation of pear blight this year—the first in the history of the county, according to D. F. Norton, the Horticultural Commissioner, who, in addition to his work in the pear orchards, cut out over 2000 old apple trees that were infected with "fire blight." Mr. Norton said that he had to let up on the squirrel campaign this year in order to take care of the blight, wherein he had the fullest co-operation among the leading pear growers.

No Embargo on Dried Apples.

All dried fruit exports from the United States have now been forbidden, with the exception of dried apples. This is owing to heavy Government purchases and uncertainty as to the supply until full deliveries have been made and it may lead to an increased quantity of apples going to the evaporators in New York State.

Mealy-Bug Control.

Proposed control methods for the grape mealy bug is being set forth and discussed at Farm Centers in the south by Professor R. L. Nongaret of the U. S. Department of Agriculture. Dr. Nongaret has made an exhaustive study of this family of insects for years in this State and all grape shippers will be interested in his subject.

Prunes and Raisins Helped.

The light north and drying winds and bright weather during the week ending October 26 resulted in large quantities of fruit being saved and sent to the warehouse. Raisins and prunes in the northern counties that are soft now will need artificial means to fit them for the bin. For the sun is losing its power and humidity increases.

Loss on Thompson Seedless.

The loss on Thompson Seedless raisins in Yuba and Sutter counties will probably be 80 per cent of the crop. Owing to weather conditions it has been difficult to pass them through the stemmer, and no capstemming will be attempted in this section.

Pomegranates Selling Well.

W. E. Vinson of Porterville sold pomegranates in an Eastern market at $2.75 per 40-pound box.

BLIGHT---The Pear-Growers' Nightmare

Several years since, it was our privilege to first make known to California orchardists the many advantages of the Jap root for pears, with the result that nearly all nurserymen now bud most of their pears on this stock, which is so much more blight-resistant than the French seedling or the quince root.

This season it is our great good fortune to announce one of the most important discoveries ever made in connection with blight control. If you are interested in pears, you must write now for our new booklet, which describes

U-SU-RI-EN-SIS,

the new, practically blight-proof, Chinese seedling—incomparably superior to the Jap root—by use of which orchards are going to be made 75% blight-proof.

Professor Reimer of Oregon, the highest authority on blight-resistance, recently stated that he believed the least resistant variety of this species more blight-resistant than the most resistant of any other known!

The only stock of U-su-ri-en-sis in an American nursery today is our own limited supply, from which we are reserving enough to plant 60 acres of our own orchard in the spring.

Because we do not know when we can again offer Usuriensis (owing to an uncertain seed supply) and because we desire to supply the requirements of as many orchardists as possible, in order to bring about a wide distribution of this most desirable species, we urge intending planters to send TODAY for the booklet, informing us of their probable planting for 1919.

The booklet may be worth thousands of dollars to you, if you intend to plant a large orchard. It's free, of course, but if you will take the trouble to give us the addresses of a few friends who will plant pears we will certainly appreciate it.

In addition to Usuriensis we have our usual fine stock of pears on Jap root, and a moderate quantity of superb apples and other stock.

How One Ranch Handles Bulk Grain

[Written for Pacific Rural Press by R. E. Hodges.]

Over forty-three thousand dollars' worth of grain sacks were saved this year on Moreing Bros.' ranch in Sacramento county by handling wheat and barley in bulk. Last year the acreage and yield were greater, so bulk handling saved about 294,000 sacks. The year previous to that sacks were used and that system committed suicide on this ranch, both because of the extra cost of sacks and the cost of extra labor to harvest the grain in sacks.

HOW THE MACHINERY WORKS.

Bins of 4½ tons capacity were built onto the sides of the big 34-foot combined harvesters, as shown us by A. E. Denton, who has direct charge of the ranch. The bucket elevators which formerly carried grain to the sacking spouts were extended to empty into the bins. The latter were dumped by gravity in a minute into some of the forty-five four-horse wagons of three tons capacity each, and these were dumped by gravity into hoppers whence bucket elevators and horizontal conveyors distributed the grain into square bins simply and cheaply built. This year the horses and wagons were replaced by motor trucks with great satisfaction.

MUCH LABOR SAVED.

Bulk harvesting on this ranch requires five men per machine, including the engineer of the 75-horsepower steam tractor which pulls it. The engineer this season received $8 per day. The fireman received $4 per day, using a low-grade oil burner. One man hauled water for each outfit at $3 per day. Firing and water hauling would be reduced with gas tractors, but the old steamers have seen long service here and will be kept in use until the war conditions are past, probably. The separator man received $8 per day and the header man $4, making a total for each outfit of $27 per day. With sack handling, two sewers would have been required at $5 each and one "jigger" at $3.50, which would increase the cost of harvesting by $13.50 per day, or just 50 per cent. At the storage elevators as much labor was saved over what would have been required to warehouse the same grain in sacks. The headquarters elevator kept an engineer and helper busy at $11.50 per day operating the gas tractor which kept the bucket elevator and a barley crusher busy at the same time. Probably not more than two men were needed at each of the two similar elevators located on the river levees. In a year of labor shortage not only was a heap of money saved, but a heap of effort hunting for help was avoided.

SQUARE STORAGE ELEVATORS.

Most Western bulk-grain elevators are cylindrical. Moreing Bros.' bins are all square, cheap, and durable. They have shown no signs of weakness or bulging, according to Mr. Denton. Long buildings were built plenty strong to hold the load, and were partitioned off into bins. The headquarters storage elevator has ten bins about 16x20 feet and about 20 feet high. Each of these is held from bulging by a couple of ⅞-inch rods each way across.

At the end of the building a pit was dug and lined hopper fashion with plank. It was covered with a platform and trap door. All dirt was thrown on one side to make a mound onto which wagon or truck front wheels would rise high enough while the rear end is over the trap door, to let the grain slide into the pit. Horizontal conveyors and the bucket elevator did the rest. When crushed barley was needed, part of the elevator stream was diverted into a spout leading to the crusher. This outfit could handle 200 tons per ten hours.

The storage elevators on the levees contain a dozen bins 20x30 feet. Each elevator has a gravity shaking-sieve cleaner through which the grain passes before being distributed to the bins. The present system of getting the grain out is hardly satisfactory, being a series of broad belts running in troughs across the level floor. They are protected from weight of grain by removable boards. They dump into a conveyor running along the foundation of the building and thence to barges in the river. A trap door in the side of the bin is opened to empty into the conveyor until a board section can be removed from over the belt. This will then be started, taking out enough grain so another section can be removed. A 25-horsepower motor could run this and the conveyors, elevators, and cleaner receiving grain from the harvesters at the same time, according to P. F. Ruman, who had charge of one of these elevators last season. As it is, a 15-horsepower motor is used to run all conveyors and elevators except the unloading belts, which are operated by an individual 10-horsepower motor which is movable to any bin desired. Improvements are to be made in harvesting, handling and storing; but the present imperfect conditions are far preferable to the sack system.

WITHSTANDS *the* TESTS *of* WAR *and* PEACE

The terrific tests withstood by the "Caterpillar" Tractor in four years' work in the war zone simply serve to emphasize in a spectacular manner two facts already established through many years of world-wide use in the agricultural field—

First, *the superiority and soundness of the principle employed in the "Caterpillar" Tractor* — which substitutes a continuous track of enormous traction surface for the limited traction of the wheel tractor, and—

Second, *the efficiency and durability of the "Caterpillar" Tractor*—due to more than three decades of Holt manufacturing experience, the perfection of Holt design, and the high grade of Holt materials.

The "Caterpillar" Tractor effects a big saving in man and animal power, and by giving longer and better service, lowers operating and up-keep costs, and increases profits.

Farmers Union Will Try to Get Together

[Written for Pacific Rural Press by Mrs. C. E. Whitmore, Modesto.]

The editor of the Rural Press has spoken in the issues of September 28 and October 19 about the national convention of farmers which was held at Washington in August.

J. J. Hardie of Modesto, State president of the California Division of the Farmers' Union, attended that convention and since his return has been giving some interesting reports to the several "locals" in Stanislaus county relative to the work planned at that remarkable gathering of farmers.

Mr. Hardie states that the great objective in every speech made before that convention was the need of concerted organization for farmers. And this organization should not consist merely of independent small units, too feeble to have their demands recognized, but there should be a strong central head with each smaller unit, working in perfect cooperation.

Washington said: "We are one nation today and thirteen tomorrow." The same principle applies today in the agricultural organizations. If the farmers want anything done, they must organize. Again, every prominent man who addressed that farmers' convention emphasized his recognition of the efficiency of the farmers as farmers and their inefficiency in ability to demand justice for themselves.

Chas. S. Barrett, national president of the Farmers' Union, was unanimously elected chairman of the convention. Mr. Barrett is a member of the executive committee of the Federal Board of Farm Organization and has been the national head of the Farmers' Union for 15 years. His ability is unquestionably recognized even among a gathering of able men.

It was chiefly due to his efforts that the Federal Board of Farm Organizations was effected, and this organization is today the only foothold in the Capital City from which the farmers of this great United States may present their grievances. There is but one reason for this nonrepresentation in governmental affairs for agriculture—the farmer.

In contrast to this, Mr. Hardie tells us the labor unions have a temple in Washington costing one million dollars and their representatives are "on the job" all the time. It is possible for every member of the federated labor union to secure reliable data on the work done by each member of Congress relative to labor's interests at any time.

Capital is in Washington with the best brains they can hire; capital is there all the time. But the farmer only goes by invitation.

Mr. Hardie thinks the big idea promulgated at this convention is the plan to build, maintain and endow an American Temple of Agriculture at Washington, to be general headquarters for all organizations pertaining to agriculture. The cost of this building will be one million, with a two million dollar endowment fund. Hon. C. C. Elmore of Washington (State) is the chairman of this work and J. J. Hardie is the committeeman for California.

While in Washington Mr. Hardie had the privilege of an interview with Mr. Hoover, whom he says "has the biggest job a man ever tackled." Mr. Hardie personally presented to Mr. Hoover a resolution endorsed by the California Farmers' Union protesting against the discrimination in the price of hogs in the San Francisco market as compared with the Chicago market. A condition existing because of a "gentlemen's agreement" among packers. Just what has been accomplished by this protest is already producing results, and proves again that farmers must organize for self-protection.

The State convention of the Farmers' Union will meet at Modesto, Cal., on December 3-4-5. Arrangements are made to ask all farm organizations in the State to send delegates to a conference with a view of affiliating in the State, as is now done nationally through the Federal Board of Farm Organizations. National President Charles S. Barrett will be present at this convention, also other able men.

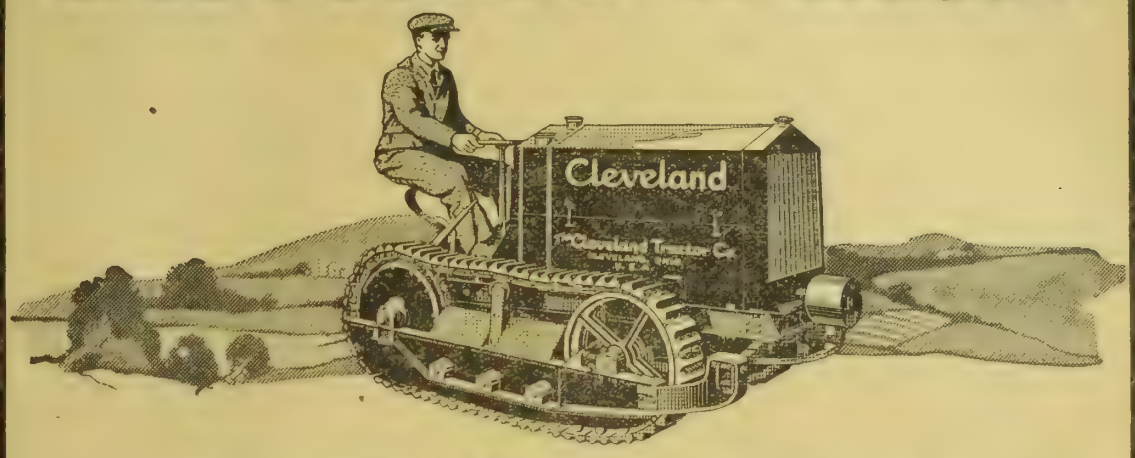
As a result of charges of profiteering in the selling of oranges and lemons in New York City, the Federal Food Board announced last week that retailers' profits must be limited hereafter to 2c on small and 3c on large oranges. A schedule of profits for lemons and other fruit was fixed. Following the investigation oranges dropped $3 to $4 a box at public auction.

Delta Asparagus Work

[Written for Pacific Rural Press.]

After asparagus tops have had the full growing season to store food in their roots for heavy sprouting next spring, frost deadens them and they are mowed off close to the ground. The tops are then burned and the field is ready for shoots to grow and to be harvested next March, as described in a recent issue. During the cutting season, March to June, inclusive, the rows have to be ridged up about every three weeks because the daily cutting opens the ground too much. Disk cultivators are used to work the dirt back over the plants. In July, when the cutting season is past, the first move is to harrow the ridges down as level as possible, running both lengthwise and crosswise. During the first year after planting, the rows are in depressions which are filled up by the harrowing or by cultivation of beans, gyp corn, etc., which are generally grown between them. Little attention is paid to the sprouts, for "you can't keep them from growing." "Joint grass" has to be dug out wherever it gets started, for it and asparagus can't grow together and it will grow unless carefully dug out by the roots.

Cleveland Tractor



Machinery Must Replace Muscle

Man-power is at a premium on our farms.

War has taken several million men into the service.

And in spite of these conditions, which are steadily growing worse, there must be *more* crops produced than ever before.

Machinery *must* replace muscle.

Thousands of Cleveland Tractors are successfully meeting the labor shortage and the demand for increased production.

The Cleveland Tractor, pulling two 14-inch bottoms in medium soil, plows 3½ miles an hour—eight to ten acres a day. That is all you can expect from *three* good men with *three* good 3-horse teams.

The Cleveland travels on its own tracks, laying them down and picking them up again like the famous battle "tanks." It turns around in a twelve foot circle. It gives you 12 horsepower at the drawbar for pulling, and 20 horsepower at the pulley for stationary work. It has 600 square inches of traction surface continually on the ground and will go almost anywhere. It weighs less than 3200 pounds.

But in spite of its power, the Cleveland Tractor is so small that it can easily go under and among small trees.

It will go through ditches, gumbo, sand and gravel, over unused roads, plowed fields and stubble. It will not pack the soil, will not mire or flounder.

Rollin H. White, the famous automotive engineer, is the designer of the Cleveland Tractor. It is produced under his supervision.

He has used only the best materials. Gears are protected by dust-proof, dirt-proof cases.

The track is designed for long service. The sections are joined with hardened steel pins which have their bearings in hardened steel bushings.

You must replace muscle with machinery on *your* farm.

The Cleveland Tractor offers the means of meeting the emergency.

Write us for detailed information and name of the nearest Cleveland dealer.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Better Seed Would Make More Corn.

"Three things the Indian corn grower wants," says Manager Carson Cook of the Rindge Land and Navigation Co., who planted over 200 acres in 1915, 1500 acres in 1916, 4000 acres in 1917, and 9000 acres this year on San Joaquin county delta lands. "Big yield, early maturity, and suckerless stalks are the great needs. Our worst feature is lack of seed selection. Big yields depend on a good stand of desirable stalks, maturing before frost at least one big ear, well set with deep, uniform kernels on a cob of small diameter, which dries out readily to avoid spoiling in the crib. The kernels should be set close together at the top, leaving no pig troughs between the rows. Illinois experiments have proved that any reasonable quality may be greatly increased in Indian corn by a very few generations of selection. To get the sort of ears that make big yields on the sort of stalks that are most convenient for picking, that are least wasteful of their own energy in leaf production, that bear only large ears, and do not sucker badly, the seed corn must be picked from the stalks in the field separately from the main crop. This can be done all the better because, early maturity being one of the essentials, the seed corn is ready for picking before the rest.

Broom Corn Situation.

To the Editor: Please send me a buyer for my broom corn. I have three tons to sell either in the bale or loose to make up here on shares. —R. D. N., Chowchilla

[Broom corn harvest is progressing. The straw is of equal or better quality than last year and the tonnage is about the same, but the market is somewhat draggy. Manufacturers still have on hand some of last year's crop and are at present unwilling to meet the growers' asking prices, which are around $275 per ton. Some rain-damaged broom corn recently sold in San Francisco at $200, but good bright stock would readily command $225 f. o. b. San Francisco. Prices may drop a little if too many growers force their crops on the market at harvest. Then the question will be whether to figure interest on the value of the crop and whatever storage charges there may be as an investment to permit holding for higher prices later. At Chowchilla you are compelled to use rail transportation, which is high on less than carload lots, while Colusa the chief broom corn district of California, has cheap water transportation. If any of our readers want to make up this crop on shares, we will supply the address.]

Whitewash—Preserve This Recipe.

To the Editor: I would like to know how to mix whitewash to paint fence posts so it will stay good.—J. C., Highline, Imperial county.

[The most durable we know is that made in the following way, as told in the "Second Thousand Questions." This book is a compilation of questions asked by our subscribers and answered in the Pacific Rural Press. Slake 62 pounds of quicklime thoroughly in 12 gallons of hot water. Dissolve two pounds of common salt and one pound sulphate of zinc in two gallons of boiling water. Pour the dissolved salt and sulphate into the slaked lime and add two gallons of skimmed milk. Mix thoroughly. The sulphate of zinc will now cost about 20c per pound, or 10c per pound in barrels of 375 pounds f. o. b. San Francisco or Los Angeles.]

Santa Cruz Farm Picnic.

The Santa Cruz County Farm Bureau is to hold a novel picnic, November 16, at the Capitola picnic grounds or at the skating rink, according to weather. Each unit will have a display of farm products to be judged by University judges. Prof. F. T. Bioletti will be there with a cider press to demonstrate with 100 pounds of grapes the methods worked out by the University to make syrup from wine grapes as a substitute for canning sugar, etc. W. W. Mackie will be there with a Ford equipped to actually dip grain for smut prevention. A field has been engaged near by for a tractor demonstration in which several dealers have agreed to participate. Other speakers will be there and a profitable recreation day is assured, according to Farm Adviser H. L. Washburn.

Seed Potatoes Scarce.

Potatoes for seed are scarce, according to H. A. Hyde of Santa Cruz county, who has just returned from Oregon. Many seed potato growers were discouraged last spring. California farmer demand was very slow and Oregon seed growers did not feel like planting heavily. Mr. Hyde believes that the Oregon seed crop is not over 40 per cent. The quality, however, is better and smoother than last year in most fields, especially where there was plenty of moisture. Very little either in California or Oregon was certified this year.

Don't Give Your Beans Away.

G. A. Turner, president and manager of the California Bean Growers' Association, exhorts farmers to stand pat and demand fair prices for their product. He says there never was a time when the bean grower has had less warrant to get panicky. There is positively no indication of over-production, and the most important bean-producing sections are below last year's averages. If you want to stimulate the trade, he adds, "don't slump; stand firm for a living price and you will get it."

Wheat on Peat Not Good.

Wheat does not work on the peaty soil of Delta islands except where it is mixed with a large proportion of sediment, according to J. D. Happy of the Brack Tract. The high nitrogen content makes rank growth which the light, fluffy soil does not hold upright. Both barley and wheat fall down. They can be harvested by running the sickle-bar flat on the ground, but there is always a heavy loss. Wheat loses not only by shattering but by the rust which these conditions encourage.

Planting Alfalfa on Light Soil.

A disk drill for planting alfalfa seed on sandy soft soil was tried and remodeled by A. S. Bomberger of San Joaquin county because it put the seed too deep, especially on the ridges. He quit drilling it in but just dropped the seed on top of the ground, dragging a chain behind each boot. Twelve pounds of seed per acre made a good stand.

Thompson Seedless on Old Vines.

Dr. R. M. Squier, who owns the old F. M. Stone place at Franklin Corners, five miles from Yuba City, has 68 acres of old Thompson Seedless vineyard from which he expected 75 tons of raisins this year. The crop will reach about 40 tons. Dr. Squier has planted out 43 acres more on the strength of the bearing of the old vineyard.

Fence Post Preservative.

Whitewash is not the cheapest nor the best preservative for fence posts. M. B. Pratt, in a recently issued University of California bulletin on the use of lumber on farms, recommends high-grade creosote oils, use of which at double the first cost of the post in the ground reduces the cost per year to less than half the annual cost of untreated posts.

Orange Trees in Full Bloom.

We noticed two large orange trees in full bloom at R. L. Niemann's home at Winters on October 11. Pears and cherries have shown bloom in various sections from the warm weather following early rains.

Rice Harvest Shows Good Conditions

[Written for Pacific Rural Press by M. S. Cowen, San Francisco, Oct. 30.]

The California rice crop, consisting of 100,000 acres of matured rice, is now in course of threshing, and provided the present weather conditions continue for a fortnight, it will prove to be the banner crop of California rice ever grown. Lack of water some two months ago caused considerable consternation to the growers—this was caused by some water companies closing their canals by order of the Railroad Commission. This resulted in lack of irrigation to a considerable acreage, but a large portion of same was rescued before it had gone to utter ruin, as other ways and means for securing water were obtained, but at a great expense. The major portion of the crop was not affected, however.

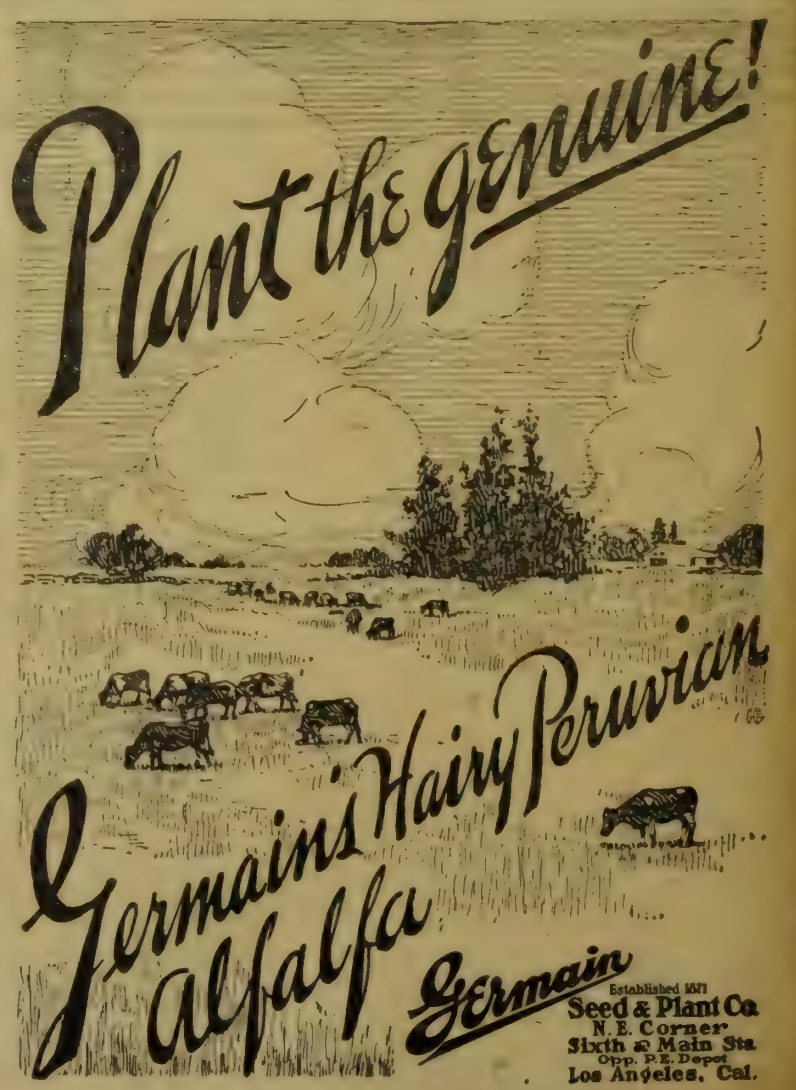
The result is that today 500,000 bags of a 3,000,000 bag crop of California Paddy has been threshed and now has been placed in the country warehouses. The entire crop will be threshed and stored within the next two weeks, provided that present weather conditions continue. The prevailing north winds in the upper Sacramento Valley have been nothing less than wonderful for the drying of the crop. In past seasons this has been one of the greatest difficulties encountered. Rains after the crop has been cut have done material damage, but the slight rains ten days ago, being so slight, caused no damage and the farmers are more than pleased with the climatic conditions.

The California Rough Rice Committee appointed by the Food Administration to handle the selling of the Paddy Rice to the millers, has been working strenuously the past two weeks, but the large crop and the details connected with the handling of same have caused considerable delays. It is for this reason that, although a portion of the crop was harvested two weeks ago, this is just now beginning to leave the millers' hands. Farmers are receiving $4.32 per 100 lbs. for No. 1 Paddy—and No. 2 and No. 3 grades in proportion, but have been slightly handicapped in disposing of the crop immediately by delays caused by the committee, which, as already stated, are unavoidable. Instead of dividing the rice into grades, the Committee on Allotments to date has merely sold the round lots as a lot—and the prices have ranged from $4.22 to $4.30 for the lots, as they stand. This, of course, consists mostly of No. 1 grade—but in this will probably be found No. 2 and No. 3 Paddy.

The first clean rice shown on the San Francisco market was on October 29—and same proved far superior to what had been expected. The color is extremely good and the rice fairly well hardened.

The demand for clean rice is greater than the supply today and will be for months to come. All the wholesale grocers in the United States are clamoring for rice. The Government is commandeering large quantities of clean rice as quickly as the mills can furnish it and it is predicted that the California crop will be entirely disposed of within five or six months, without any difficulty whatsoever. The Government has protected farmers by refusing to allow the importation of foreign rices into the United States until the domestic crop is entirely disposed of.

The demand for clean rice having increased during the past year, and all wholesalers being absolutely sold out of every bag available—even without the Government commandeering a large part of the crop, it will not even supply the domestic demand. From present conditions, and with Government regulation of price, the future of California rice industry knows no limits and a decided increase in acreage is looked for next season.



CALIFORNIA VEGETABLES IN GARDEN AND FIELD
525 Market St. $2 postpaid. San Francisco

OUTCROPPING OF ODD BEANS.

To the Editor: How do you account for the appearance of these odd beans in my field of carefully selected small whites?—P. L., Denair.

[Answered by Prof. G. W. Hendry, University Farm.]

The circumstance of odd color beans appearing in a field of small whites has been brought to our attention in the past on several occasions.

It is the general opinion of farmers that such anomalous seed is a result of reversion. In several instances in which we have planted the so-called reverted seed, we have found that it always produces seed of exactly the same character as that which we planted, and under these circumstances we are compelled to believe that these off color seeds are a distinct variety which has been accidentally mixed in the regular seed and overlooked at planting time. If the seed were a reversion, it would be only natural to expect that when planting it would show some tendency to produce white seed.

The black beans which you have submitted have all the appearances of being a variety of the black wax string bean. The small light brown seed is in all respects similar to the variety known commonly as the small bayo or bayo Chico, formally cultivated in limited quantities in this State and originating in Chile.

WHAT IS MANGANESE STEEL?

When a tractor salesman impressively tells you that the tracks or other parts of his machine are made of manganese steel, what does that mean to you? Manganese is a metal found in various combinations in many of the mountain districts of California and elsewhere and now being mined as never before on account of its peculiar properties. Most of it is now used in the manufacture of steel for the Government. In the form of spiegeleisen it is combined with 4 or 5 per cent of carbon and 75 to 80 per cent iron. In ferro-manganese the iron content is reduced and the manganese content increased. Manganese steel castings are alloyed with 12 to 14 per cent of ferro-manganese. When properly compounded by specialists, such a casting is extremely elastic, making it resist breakage due to shock. It is strong enough to stand a tensile strain of 92,000 pounds. It may be bent badly out of shape without cracking. Such castings are becoming popular with tractor manufacturers for bull gears, pinions, sprockets, shoes, rollers, pins, bushings, lags, chains, and other parts subject to special strain or wear.

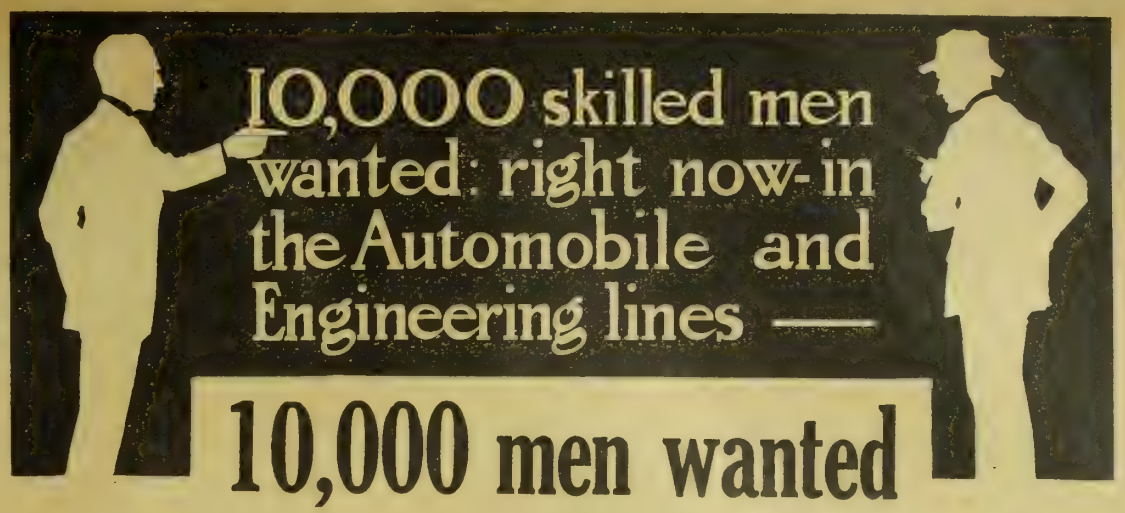
A NEW CALIFORNIA FRUIT INDUSTRY.

The Prune and Apricot Growers' Association is converting 400 tons of small dried apricots into jam at its new plant for by-products at San Jose. A bottle was opened for us by the manager and, though it lacks a little the clearness of color obtained from fresh fruit jam, it has more nearly the flavor of the fresh fruit than any we have ever tasted.

The plant has only been opened a few weeks. Besides the apricot jam, large quantities of syrup and cooked prunes are being canned. The association now has orders from the Government for 4,000,000 pounds of canned stuff which it is now putting into execution, running the plant to its full capacity.

This is a new departure and it has unlimited possibilities for future development, to which the association is very much alive. Jam-making in California and fruit-pulp for European jam-makers is an industry that can be seen in embryo at the San Jose by-products plant of the California Prune and Apricot Growers' Association.

O. H. Stevens, for many years Los Angeles manager for the Holt Manufacturing Company, died Saturday morning early with Spanish influenza.



—To operate and repair Automobiles, Auto Trucks, and Farm Tractors—right now—in California alone—Thousands more wanted as Lathe hands—Oxy-Acetylene Welders—Ship Draftsmen—Ignition Experts—Mechanical Draftsmen—Industrial Chemists — Gas and Marine Engineers—THESE WILL BE THE BEST PAID LINES FOR AT LEAST 10 YEARS AFTER THE WAR.

Are You Paying Taxes On Your Stump Land?
Clear It and Make Money.

Increase your acreage and you will increase your bank account

Clear your stump land cheaply no expense for teams or powder

ONE man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48 ton pull on the stump. Made of the finest steel—guaranteed against breakage. Works equally well on hillsides and marshes where horses cannot operate. Endorsed by U. S. Government experts

Write today for special offer and free booklet on Land Clearing

WALTER J. FITZPATRICK

Box 12 182 Fifth St., San Francisco, Cal.

Your opportunity is here to-day

STOP paying taxes on your stump land turn it into ***money.*** Never in the history of the World was there such a demand for the product of the soil.

HAND POWER **K Stump Puller**

Man or woman single handed can pull from 50 to 150 stumps a day. Weight without cable 171 pounds. NO STUMP TOO BIG.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Schmeiser Manufacturing Co.

12 Mechanic Street DAVIS, CAL.

Manufacturers of

Sure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

UNCLE SAM DEPENDS ON YOU!

Is your soil producing the maximum?

"BYRON JACKSON" PUMPS are built to meet every condition of "supply and demand" on your ranch.

The present shipbuilding program calls for 2300 steel ships using 4,500,000 tons of steel.

The International two-row corn cultivator demonstrated at Los Angeles pushed its shovels ahead of the engine and drive wheels.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

CALIFORNIA EMERGENCY TRACTOR CLASSES.

[Written for Pacific Rural Press by J. B. Lillard, State Supervisor of Agricultural Instruction.]

The State of California will this year operate genuine tractor schools, graduates of which will be their own trouble finders and repair men, as well as expert operators. To quote John C. Beswick, director of this work: "It is one thing to know about tractors, but quite another thing to know them. At these schools, in your working clothes, you learn to know them by working with them."

The course is designed to meet the needs of farmers and tractor operators and will be valuable training for prospective tank operators and mechanics of the battlefield.

The sessions will be four weeks in length. For day students the class will be six hours daily, six days in the week; for night students two and one-half hours an evening, three sessions a week.

The first two weeks' work will consist mainly of assembling, disassembling and repairing gas engines. The last two weeks will be devoted to tractor assembling, disassembling, repairing and operating in the field. The instructors are men who have had long and successful experience as tractor and engine mechanics and operators.

The classes are divided into three units, each unit consisting of ten schools each, and tentatively distributed over California as follows:

Unit No. 1—Madera, Reedley, Lemoore, Tulare, Delano, Brawley, El Centro, Hemet, Ontario, Van Nuys.

Unit No. 2—Merced, Patterson, Oakdale, Lincoln, Gridley, Chico, Corning, Willows, Williams.

Unit No. 3—Saticoy, Santa Maria, King City, Salinas, Hollister, Santa Clara, Livermore, Concord, Napa, Santa Rosa.

In each center are five tractors and a full complement of farm machinery, together with used local tractors, gas engines and special tools. The tractors are of several sizes, to meet the different uses they may serve in the community. This undertaking is financed by the State Board of Control and the Controller out of their emergency fund and administered by the State Board of Education, through its Department of Vocational Education.

DISK ORCHARD TRACTOR PLOW.

To the Editor: I am going to get an orchard tractor and a two-gang plow. Which will give more satisfaction—a moldboard or disk plow? —Subscriber.

[A. G. Beaulieu of Santa Clara county has a Bean tractor and says he wouldn't use any but a disk plow for orchard work; and he says it should be a three-disk gang. He is now using three-disk John Deere gang plow where trees have just been pulled out. Last spring a melilotus cover-crop "actually" 3½ feet tall was turned under in a prune orchard with the little tractor and the same plow, using all three bottoms and no chain. It turned the melilotus under so you could see scarcely any of it. The three-bottom plow is better because in the make he is using he can plow closer to the trees, and if it pulls too heavy for deeper plowing or harder soil, take one off. To avoid barking trees, Mr. Beaulieu leaves two furrows to be plowed with horses next to tree rows when throwing dirt away from them. He showed us where the disk had cut a good-sized root as clean as the shears could have done, and pointed out that with a moldboard the root would have been broken, leaving a rough end for root knot or disease to enter because it could not heal quickly, if at all, and the stub would be loosened, too. In cherry trees, many of whose big roots run close to the surface two or three feet before dipping downward, a moldboard would do something violent while the disk would roll over them. Mr. Beaulieu's dead furrow was as pretty as anyone could look at, not exposing any hard ground. He had run back along the dead furrow after finishing his land.]

CABLE TRACTOR PLOWING.

There are several cable-plowing outfits in California which eliminate the tractor running back and forth over the stubble field and save all the power required to propel them, but lose some by friction of the cable on the ground and require two engines, two engineers, and one or two plowmen to keep one gang plow busy. One recently observed on the J. P. Sargent ranch in San Joaquin county was using two steam tractors of unknown horsepower and 180 pounds steam pressure to pull five 10-inch moldboards about a foot deep in heavy land to be planted to beets. There were two five-gangs on the same frame facing each other on opposite sides of the axle between two big wheels. The frame was angled so when one gang was in the ground the other was in the air, balance being changed by screwing the frame forward and backward over the axle. The furrows were several hundred yards long.

WORKING PARTS NOW ENCLOSED.

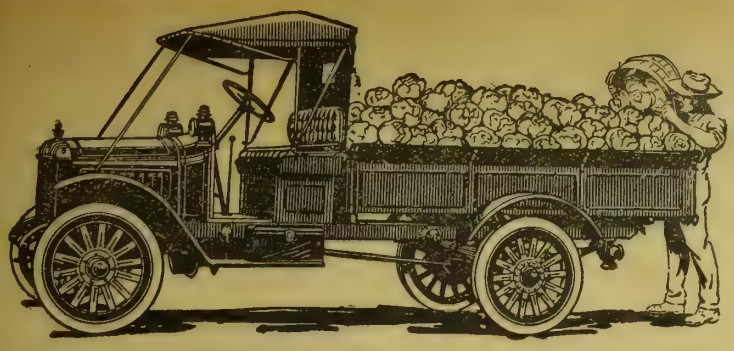
The cut used to illustrate the advertisement of the Cleveland tractor in the issue of October 26 is that of an old style tractor which has been discarded. Its insertion was an inadvertance. The Cleveland tractor of today is much refined over previous models. The working parts have been so enclosed that it gives perfect protection from dust, thereby lessening the wear on bearings and all moving parts.

University Tractor Course

One hundred and sixteen people had registered October 31 for the University Farm Tractor Short Courses at Davis, November 11 to 19, and November 20 to 22, inclusive. Enrollments are limited to 200 in the first course, the latter dates being reserved for owners and experienced operators and for those who have taken the beginners' course, November 11 to 19. As advance registration is usually slow a lot of people are going to be disappointed when they try to enroll at the last day. The courses will be similar to the ones held at Davis last year and the year before, and at Riverside last year. They will cover principles and construction of all parts. Fourteen tractors will be used in the instruction, including Avery, Bean, Best, Case, Cleveland, Emerson-Brantingham, Fageol, Holt, I H C, Moline, Samson, Sandusky, Wallis, and Yuba. Practice with these machines in the field will begin November 15 after the lectures and demonstrations with gas engines and tractor parts on preceding days. Two periods of tractor operation will follow each day.

OWNERS AND OPERATORS' CONFERENCE.

November 20 will be special "Owners' Day," writes Prof. J. B. Davidson, who has had charge of these courses from the beginning. November 21 will be Field Day for owners and experienced operators. These days and November 22 will be largely in the nature of a conference and question-box discussion of any and all problems that affect tractor men.



REPUBLIC TRUCKS Modernize Farming

WITH a Republic Truck on your farm, you can get the same speed and efficiency in your hauling that are making profits for successful business men in every other line.

The Internal Gear Drive is simple as well as powerful. Owners say that it is practically trouble proof.

Republic Trucks are built by the largest manufacturers of motor trucks in the world, who build nothing but motor trucks and know just how to build them to insure their giving constant dependable service at a minimum cost. Last year more than twice as many Republics were produced and sold as any other make.

The Internal Gear Drive used on all Republics, gains extra leverage by applying the power near the rim of the wheel. That gives greater pulling ability under all conditions. The load is carried on a separate I-beam axle of solid forged steel and the driving mechanism has nothing to do but to drive the truck.

45% greater road clearance makes this the ideal truck for country roads and there is less unsprung weight which means a big saving in tires, gasoline and all upkeep expense. Republics are also remarkably easy riding.

More than 1300 Republic Service Stations, distributed all over the United States, make quick service everywhere available.

Seven Models 3/4 ton to 5 ton

Investigate Republic Trucks now. Find out their reputation for uniformly dependable service and ask the nearest Republic dealer which Republic will best do your work.

When You Buy a Tractor—

REMEMBER, it's the plows, disks, drills, binders, ensilage cutters, feed grinders, threshers and the like that do your farm work. The tractor is useful only as it furnishes cheap, dependable power for **all** the other machines.

That's why we say, if you need a tractor, you can't make a mistake in buying an **International kerosene tractor.**

We have had over 75 years' experience with farm machines. We know the kind of power they require—all of them. For over twelve years we have sold tractors that supplied that kind of power. We know from experience that the sizes and styles of tractors we sell today will work with the machines you depend upon for your success and prosperity. And—our tractors all operate successfully on cheap kerosene.

When you buy an International kerosene tractor you buy with it the benefit of our long farm machine experience and all the advantages of dealing with a service organization which brings a well stocked branch house or a live, wide-awake retail dealer within telephone call of you. It may surprise you to know that an International tractor, plus these advantages, which no one else can give, costs you less per year of active service than any other tractor sold in anywhere near the same numbers.

NISCO MANURE and STRAW Spreader

Straw Worth $8 a Ton---Don't Waste It

(All statements approved by Experiment Stations, Departments of Agriculture and progressive farmers).

Science and the experience of many up-to-date farmers prove that your straw stack contains tons of humus and much phosphorus, potash and nitrogen. At present prices, straw has a fertilizer value of $8.00 a ton—too valuable to burn or sell at a low figure.

In addition to that, it prevents the winter killing of wheat, soil blow or washing, conserves moisture and makes tough, sticky soil much more friable.

But you can't get these results by haphazard, wagon-tail distribution. The straw must be well shredded, well distributed and put on evenly. The one sure way of getting all these results is to use the

NISCO ONE MAN Straw Spreading Attachment

You can put this attachment at small cost on your trusty Nisco—the original wide spreading spreader, and make it a perfect machine for both manure and straw—two machines in one. Spreads straw evenly 8 to 10 feet wide.

The Nisco has always been the bellwether of spreaders. It is always in the lead with new improvements and is built for a life-time of service. "Not a cent for repairs" is the statement of thousands of farmers who have used the Nisco for years.

See your Nisco dealer and have him show you the advantages of both the Nisco and the straw attachment. Don't wait for him to call on you as he is short of help now. Insist on the Nisco. Don't take some other machine or you will regret it later on. Ask the dealer or write us for illustrated circular and book on manure. Act now and be prepared for the spring drive of 1919.

General Agricultural Review

Field Crops.

Some success is being attained in hemp growing in the delta district of the Sacramento river.

Bean growers of Santa Barbara county believe that the crop this year will amount to $1,500,000.

Henri Bernier, manager of the Sunical Packing Company, is endeavoring to have hop land owners plant tomatoes.

O. E. Lambert, a Wood Colony rancher, asserts the crop of alfalfa seed in Stanislaus county is only 20 per cent of the normal yield.

The Anheuser-Busch plant of San Francisco will henceforth dehydrate vegetables instead of brewing beer. The company already has a $50,000 Government contract.

The sugar companies of Utah and Idaho have decided to pay the farmers $12 per ton for beets next year, instead of $10, the price now prevailing. Last year the rate was $7 per ton.

Alfalfa prices are lower and not much hay is changing hands. Prices have declined about 20 per cent. The grazing in many parts of the State is good and the demand for hay shipment is light.

The 1050-acre sweet potato field farmed by Owens Brothers and Arkalian Brothers, five miles west of Atwater, is said to be the largest single sweet potato field in the world. A forecast of 100,000 crates is made.

"I can sell my small white beans at 9½c now," recently said a grower of 650 acres of that variety. About 30 per cent of his were lost by the rain and the rest have to be hand-picked to get rid of discolored ones.

Fifty-four men arrested in Los Angeles under the work or fight order have been sent to the Ventura bean fields to pick beans at $4 a day. They are under suspended sentences of 180 days, which will be enforced if they quit their jobs.

A rancher near Sanger has demonstrated that cotton can be grown successfully in the Sanger district. He has completed picking for the first time thirty acres of this staple, which was planted near Sanger in May. He expects to get twelve bales from the thirty acres.

"I will raise nothing but sugar beets next year," says M. Fortes of Monterey county, who is unable to sell his beans and barley but who is getting about $10 per ton for his beets on the basis of $9 for beets testing 15 per cent sugar and 50c additional for each additional per cent of sugar.

According to the report of County Commissioner of Horticulture Earl Mills, the 1500 acres of cotton on the Dodge Land Company's holdings in Butte and Glenn counties will take a yield of one bale to the acre. The average for the United States is said to be little more than half a bale.

While large potato growers have found the markets dull, G. E. Nicholson of Santa Clara county has been selling his crop from a small acreage at $3 per cwt. on his own ranch. They are bright, smooth, uniform, good cookers, and good keepers for six or eight months. Mr. Nicholson lost two-thirds of his crop due to the rain.

The army consumption of beans averages 125,000 pounds per day. The army, navy and allied requirements of beans for the coming year will be placed through one purchaser, the Food Administration Grain Corporation, which has made arrangements to inspect and pay spot cash for beans in the producing fields.

Word comes from Stockton that the Spreckels Sugar Company has announced that the price set for next year's crop is $10 per ton for beets of 15 per cent sugar content, with an additional 60c per ton for each 1 per cent sugar above the 15 per cent basis. There will also be a reduction of 60c per ton for each 1 per cent below 15. This is an increase over the price paid for beets last year, when $8.25 per ton was paid on the 15 per cent sugar basis, with a variance of 55c from the differential.

From Santa Ana word comes that in the beet-growing sections of Southern California a big increase in the price for beets is offered, being 50 per cent over the price under which contracts were made last year. Against the price of last year of 50c a ton for each per cent of sugar quality above 15 per cent, the companies this year will give 80c, when the price of sugar is 9c, the price prevailing this year. The increase will go still higher in the event sugar nets the factories above 9c. The average paid a ton this season has been $9.25 and the same beets next season will bring $14.40 a ton.

Deciduous Fruits and Nuts.

Windfall Newtown Pippins at Watsonville are bringing $23 per ton at the driers, which are now running.

Apple harvest is proceeding steadily in the Watsonville district and three-fifths of the crop has already been garnered.

The Oregon prune crop this year was heavy and well dried, thanks to their system of artificial driers. Hungarians are the chief variety.

A ton of fruit pits was recently placed at the disposal of the Government by O. A. Knold of Ontario, for use in the making of gas masks for soldiers.

Nursery stock in California and Oregon is rather short, according to H. A. Hyde of Santa Cruz county. Prunes especially are in heavy demand and the supply will be sold early.

Fruit men in California are warned that there is a quarantine in force against importation of certain scions from Eastern States. The following may not be imported: Peach, apricot, or nectarine trees, or trees grafted on these roots, from any State bordering on or east of the Mississippi river, on account of peach yellows and contagious peach rosette; chestnut trees from east of the Rocky Mountains, on account of the chestnut bark disease; all citrus stock from any State except Arizona, on account of the citrus canker and melanose; all five-leafed pines, goose berries, and currants from all States bordering on and east of the Mississippi river, on account of the white pine blister rust; and all strawberry plants from Oregon or Washington, on account of the strawberry weevil. They will be condemned on arrival under the State quarantine law.

Citrus and Semi-Tropical.

The Woman's Land Army announces that that organization is prepared to send women workers out to aid in picking and packing the early orange crop.

C. H. Doyle, horticultural inspector for the Porterville district, has opened offices for the orange season and installed a chemical equipment with which maturity tests of oranges will be made.

Preparations for the Ninth National Orange Show at San Bernardino, which will be held February 14-23, 1919, now are well under way. Displays will be representative of all citrus fruit sections of California.

Lemon picking in the Porterville district is under way. The quality of fruit is good. Estimates place the probable output for the season at double that of last year. The average price to date has been around $6 per box net.

Refrigerator cars of both the Santa Fe and Southern Pacific railroads will be pooled for the coming season, according to railroad officials. Present indications are that all oranges for the East will be handled over the Santa Fe.

The olive crop of Placer county, while not heavy, is large size. About 20 tons of the olives from the Roseville district have been shipped East to Boston and New York City in lugs by express. The grower received $200 per ton.

The Lindsay-Merryman Citrus Exchange of Lindsay shipped two cars of Thompson Improved navels to New York City, November 2. This fruit tested over 10 to 1. The shipment is ten days earlier than the first shipment out of the State last year.

Reports from the large orange orchards of Placer county indicate that a crop of 80 per cent normal will be picked. The old Whitney orchard, near Rocklin, will produce from 30 to 40 carloads of navels and picking will begin about the 12th of this month.

Careful tests are being conducted in the citrus orchards around Woodlake, Tulare county, and these show the fruit keeping up well with the 8-to-1 acid test. Heavy demands of the Eastern markets will bring about earlier harvesting. It is estimated that the crop will be fully 40 per cent of normal.

Grapes.

Not all grape men, it is reported, are planning to dig out their vineyards when the nation goes dry, but rather express themselves as optimistic that there will be some remedy for the situation which will leave the grape industry a profitable one in our State.

In all sections of the Livermore Valley there has been this season a lack of sugar in the grapes due to the damp, foggy mornings and the dampness in the soil. The vineyard men have been getting about $45 a ton for their grapes. Growers and winery men alike think that this is the valley's last vintage.

The California Associated Raisin Company recently issued a statement to the growers, asking them to hold back their deliveries for a day or two or longer if necessary. The request calls attention of the growers to the shortage of packers owing to the influenza and the impossibility of operating the plants at full capacity.

The Eastern demand for California raisins is heavy. Growers are assured of selling their entire crop. The Associated has notified jobbers that only Thompson Seedless raisin orders are to be delivered in full; fancy seeded Muscat orders will be filled 50 per cent, and layer raisin orders only 25 per cent. Orders for bulk seeded will be delivered in full.

Exports of Valencia raisins to the United States decreased from 586,096 pounds in 1916-17 to practically none this season. This decrease was due to lack of tonnage, the import restrictions of the United States Government, and the growing control of the American market by the California raisin industry. Exports of Valencia raisins to the United States show a steady decrease during the past ten years, coincident with the falling off in the size of the crop itself and with the growth of the California raisin industry.

Miscellaneous.

Russian thistles have made their appearance in Porterville for the first time.

During September 653,619 acres of Government land were rendered available for entry in tracts of 640 acres or less under the stock raising homestead act.

CAN'T PUNCTURE NOR BLOW OUT

DAYTON AIRLESS TIRES in the past 6 years have been used by thousands of owners of light passenger and delivery cars in all parts of the civilized world, and have conclusively demonstrated:

1st—They can't puncture nor blowout.
2nd—They ride as smoothly as pneumatics.
3rd—They give much longer wear than the average pneumatic.
4th—They absolutely will not injure the car.

They have been endorsed by 50,000 or more satisfied users including the late George Westinghouse and Edward Grey, formerly Chief Engineer of the Ford Motor Company.

Piers of live, elastic rubber built about one inch apart inside the casing and vulcanized or welded to it take the place of an inner tube.

Nothing can happen but wear.

We have standardized on 30 x 3 and 30 x 3½ and the price is right.

We sell direct where we have no dealer.

We want an exclusive dealer in every county—tire experience not necessary. Excellent chance to build up in a protected territory a very profitable business either by itself or as a side line.

Spalding-Robbins Disc Plow Co.
625 MARKET ST. SAN FRANCISCO, CAL.

The Boy Scouts of Modesto are organized for an effort to collect black walnuts for Government gas mask purposes.

Farm loan bonds in the future will bear only 4½ per cent interest instead of 5 per cent, carried by the last block of more than $50,000,000 offered last May.

Tractor school instruction and demonstration have been seriously interfered with and in some cases indefinitely postponed by the prevalence of the influenza.

Through the installation of an irrigation system which will include six 42-inch centrifugal pumps, the Sutter Basin Co. expects next year to have its entire area under cultivation.

Carloads of fruit pits and nut shells, utilized as carbon for gas masks, are en route from a number of cities in the United States to the gas defense division in New York City.

The annual convention of the California Farmers' Union will be held in Modesto, December 3 to 5. Representatives from every farm organization in the State are expected to be in attendance.

Estimates on the 1918 production of honey in California indicate there will be about 200 carloads or nearly 12,000,000 pounds. At an average of 20c a pound, the crop will be worth about $2,400,000.

Federal farm loan bonds will not be offered for marketing in the near future, it is announced by George W. Norris, Federal Farm Loan Commissioner. He says: "The proceeds of the bonds sold in June will take care of the loaning requirements of the Federal Land Banks until nearly the end of the present calendar year."

Cornell University of New York has again come to California to get one of our farmers as the head of its Agricultural Extension Department for the winter campaign. This makes the third or fourth time Dr. Leroy Anderson of Santa Clara county will have served in that far-away office.

Three hundred and fifty convicts in the State prison at San Quentin are members of the San Quentin Agricultural Club, which is conducted in co-operation with the University of California Extension Division of Agricultural Education. The average attendance at 11 lectures given by members of the university staff during the year was 570.

HANDY BEET UNLOADING.

No attendants at the cars and no high trestle for dumping purposes are needed by Monterey county sugar beet growers, most of whom use rope nets with which they can put a four- or six-horse load onto the cars in five minutes or less. Separate nets are used on the forward and rear halves of each wagon. They are of 5-inch mesh, ⅜-inch rope with inch rope around the edges, and fixed to hook a team onto their edges. Nets having been laid on the wagon bed, the beets are piled on in the field, the load is hauled close beside the cars, the beds being level with the tops of the cars due to a dirt dump alongside the track. On the opposite side of the cars and about 20 feet from the track big posts have been set and guyed, about one for each car on the side track. Cables around them about eight feet up are ready for the single-single block and tackle which reaches across the car to the net at the opposite side of the load of beets. A pair of horses from the wagon pulls the block and tackle, simply rolling the net over and tumbling the beets into the car.

THE BIGGEST AUCTION SIGNBOARD.

What is believed to be the largest painted sign ever used to advertise an auction sale in the West now greets the eye in red, yellow and black at Tagus Ranch, Tulare. The sign itself is 200 feet long by 20 feet deep, nearly covering the entire side of a mammoth 240-foot warehouse facing the highway and railroad. This monster sign is only one of the minor advertising features that will be used to let the public know about the tremendous four-day auction sale that will be held on the ranch, December 10-11-12-13, when the herds of cattle, hogs, and horses will be completely dispersed, and more than $50,000 worth of implements will be sold at auction. C. L. Hughes, Sacramento, will have entire management of the sale.

REPELLING RABBITS.

To the Editor: Seeing in your issue of October 12 the hard luck that M. M., Turlock, had with jack rabbits, you may publish my experience. This year, after the rabbits had eaten one-fourth of my cucumbers and melon vines, I stirred about one-half teacup of coal tar to a bucket of water, strained it and sprayed the vines. Mr. Jack did not molest them again until about the time the melons began to ripen, then he went for the melons. I sprayed again and did not find any more of his work. I keep the rabbits from my small fruit trees by rubbing them over in the fall with bacon rinds or a greased rag. Any blood rubbed on will keep them away all winter.—I. L. Schermerhorn, Placerville.

GOVERNMENT MOTOR VEHICLES.

Contracts for $130,000,000 worth of motor vehicles have been placed by the U. S. motors and vehicles division to supply requirements of the Motor Transport Corps. They include 800 3½-ton motor trucks, 202 2-ton trucks, 500 1½-ton trucks, 600 5-ton chasses, 1020 3½-ton chasses, 6250 3-ton chasses, 2100 2-ton chasses, motor cycles, bicycles, and other equipment of this nature.

THE APPLE CROP.

Late apples have been improving in condition right along and the crop will apparently approximate that of last year. Though some States are shy, New York has a bumper crop.

California's First Exclusive Livestock Show

(Continued from first page.)

animals. If he can win over them it will be a feather in his cap. If he cannot, but will take his defeat in the proper spirit, it will be worth hundreds of dollars to him, for he will find out the deficiencies in his own stock, revise the standard toward which he is breeding, and in a short time have the kind of stock that meets the popular favor.

BENEFITS TO THE SMALL BREEDER.

For the same reason, the show will be of inestimable value to the small breeder who attends merely as a spectator. Heretofore he has seen only local stock, but at this show he can see the pick of the land. He will have an unequalled opportunity to study size, type, conformation, finish and breed characteristics, and to establish in his mind an ideal toward which he should breed. He will go home with a new vision and a determination to breed his herd up to a higher standard—perhaps buying some new stock to accomplish this.

AIM TO START NEW BREEDERS.

But as much as this show will benefit the exhibitor and the small breeder who does not exhibit, it can prove of even greater value to the one who is not at present engaged in livestock raising. This includes both the farmer who does not raise livestock and the city man who should be engaged in farming and livestock raising. In the latter class are many wealthy men who are always glad to invest money in profitable enterprises, and they should be convinced of the commercial possibilities in the raising of high-class stock.

As has been said, we must return to the days when the pioneers brought to this Coast the best purebred stock that could be purchased at any price. There is a dearth of livestock in the world now. We of California owe it to our State to develop this wonderful but latent industry, and our wealthy men should be educated along this line.

GREAT FUTURE FOR LIVESTOCK INDUSTRY.

Yes, the world is facing a livestock famine that it is almost impossible to comprehend, yet after the war is over livestock raising will not drop like "war stocks," for it is not a war business. It is essentially a peace business, and when peace comes the reorganized, revitalized livestock business will grow by leaps and bounds.

After the war is over the fires of many furnaces will die out. The makers of machinery and munitions will cease to fatten. People will instinctively turn to the soil as the source of natural wealth, and the farm will be the cornerstone upon which will be builded a new nation with new ideals of living. The meal-ticket grower will have a front seat and will be in the limelight as never before. So the one who ties to the farm, takes up livestock raising—the most profitable branch of farming—and starts now to raise stock to supply this demand which is surely coming will reap a rich harvest.

In this State are twelve million idle acres that ought to be under cultivation and covered with livestock. We can raise stock here cheaper and better than in any other State in the Union, and it is almost a crime that we are not doing more along this line. So if the San Francisco show will but kindle the fire of ambition in the hearts of men who can and should go into the business of livestock raising it will have fulfilled its mission.

The late President McKinley, in his memorable speech at Buffalo a few hours before his assassination, said: "Expositions are the timekeepers of progress." Let us hope that this first annual livestock show on the Coast will mark the beginning of a new epoch in the breeding of high-class livestock. The future is full of promise. Let us hope that our big men will have the vision to see it.

ONLY HIGH-CLASS ANIMALS ALLOWED.

The policy of the show is to permit the exhibition of only such animals as have breed type, individuality, finish and unquestionable quality. Even though registered, they cannot be shown unless they are worthy of the breed represented, and a competent committee will pass upon all animals intended to be shown.

California breeders have made heavy entries, evidently being eager to show their animals against those from other States, of which there will be a large number, particularly in the beef cattle classes. There will be famous herds of Shorthorns, Herefords and Aberdeen-Angus from Illinois, Missouri, Colorado, Wyoming, Montana, Washington, Oregon, Nevada, and Calgary, Alberta.

All breeds of dairy cattle, hogs, sheep and draft horses, as well as goats, rabbits and poultry, will be represented by the best specimens on the Coast. The poultry show will be the largest of the year in this end of the State, and from an educational standpoint the best ever held in San Francisco.

There will be a special class for thoroughbred horses, which will bring together some of the greatest animals in the country, including Friar Rock, the English stallion purchased for $60,000 by John H. Rossiter of Santa Rosa; Liberty Loan, the $25,000 Derby winner, recently purchased by A. Kingsley Macomber of Paicines, and Hesperus, the noted stallion owned by H. P. Renthaw of Hollister.

The University of California will make its customary instructive exhibit, which is almost as good as a short course in animal husbandry.

In addition to the breeding classes, there will be fat classes for single animals, pens and carload lots.

VALUABLE EDUCATIONAL FEATURE.

An entirely new feature will be the slaughter tests, which will emphasize the commercial end of livestock raising and show how animals should be bred and fed for market purposes. Animals entered in the carcass contest will first be judged on hoof and afterwards slaughtered, then judged in carcass and on the block.

This will prove of great educational value, as it will demonstrate the quantity and quality of edible meat produced under certain conditions and feeds, the character and type of animals furnishing the best carcasses in the shortest time, the best feeds, etc. This method will put the judge to the supreme test in judging on hoof, because the slaughter records, with the per cent of dressed carcass to live weight, will be indisputable evidence to either support his decision or show up his mistakes. The housewife who does not know how to buy economically, or which cuts of meat are the best for certain purposes, will have an opportunity to profit by the lectures, practical and illustrated, which will be given in connection with this demonstration.

CHANCE TO BUY GOOD STOCK.

At the conclusion of the awarding of premiums there will be a sale of fat cattle and the leading packers have promised to make high bids. Also on Thursday, November 21, a sale of registered Shorthorns will be held and on the following day a similar sale of Herefords.

NIGHT HORSE SHOW.

The night horse show promises to be a brilliant affair, and will provide high-class entertainment. There will be gaited, harness, combination, jumping and high school classes; also polo features, parades of livestock, band concerts and military spectacles. In connection with the latter, officers from the remount station at Camp Fremont will bring some of their best mounts, which will be put through their paces, and the qualities required for army purposes will be explained.

The man at the heart of the show, Joseph E. Painter, who is a past master along this line, has planned a wonderful event. It will be held on a five and a half acre tract at Twelfth and Market streets and will be the largest show ever held in the United States under canvas. Every possible comfort has been provided for spectators, and there will be plenty of entertaining as well as educational features.

You've seen the rest; now attend the best. Knock off for a few days. The rush work of the season is over and the change will do you good. You will return to your work refreshed and strengthened in spirit, muscle and brain power, with an abundance of priceless seed thoughts to grow and ripen into use for your future work. Let's go—sure. Let's make this First International a hummer.

Specialist —in— Registered Beef

CATTLE

I am a firm advocate of the use of better sires—Registered Bulls—reflecting through correct breeding a high standard of early development in weight, quality and finish, insuring most satisfactory results.

I devote my entire time keeping in touch with the Registered Beef Trade, much of it among the most expert and reliable Eastern breeders, which enables me to save time and other expenses when buying.

I will deliver at this end for less money than a stranger to the trade can buy at the other end, so let me quote you prices on Registered Beef Breeds Delivered.

I was born among Shorthorns and have been among Beef Cattle ever since. My thirty years' experience in California has shown me just what the State needs in

Registered Beef Cattle

and any one of the following list of a few of my customers—all experienced Beef men—will tell you I deliver the right kind:

MAYO NEWHALL, San Francisco — HOLT & GREGG, Redding — H. H. GABLE, Esparto
SIMON NEWMAN CO., Newman — HOWARD TILTON, Gilroy — B. F. RUSH, Suisun
WM. BEMMERLY, Woodland — STANFORD UNIVERSITY FARM

R. M. DUNLAP, Hotel Land, Sacramento, Cal.

Hill Crest Stock Farm

KING LANCASTER.

Shorthorn Cattle

Shropshire and Merino Sheep

I have used more grand champion bulls in my range herd than any other California breeder has used in his foundation.

My offering of range-raised bulls for the coming season is exceptionally good. Will show at the California International and have consigned some good ones to the Shorthorn sale.

T. S. GLIDE, Prop. - Davis, Cal.

Our consignment to the Shorthorn Sale to be held at San Francisco, November 8, includes one of

The Greatest Shorthorn Bulls on the Pacific Coast

ROSELAWN CHOICE

408816

Senior Champion at State Fair 1916-17

His get won first and second prizes in their classes. He is not only a great show bull but a proven great sire.

We have also entered for the sale a yearling son of Roselawn Choice, out of an exceptionally good cow, and three good females.

GLEN ELLEN, CAL.

Eliza Shepard, Mgr. — Walter D. Bunnell, Herdsman.

CARRUTHERS FARMS

LIVE OAK, CALIFORNIA

Shorthorns and Berkshires

Our second annual sale of Shorthorns will take place in January. Demand is very good for Berkshires, but we can supply your wants.

Shorthorn Bulls

Four Head—Two to three years old.
Six Head—Ten to twelve months old.

BRIGHTON FARM HERDS.

H. L. & E. H. MURPHY — PERKINS, CAL.

Judging Program for San Francisco Show

[Written for Pacific Rural Press.]

The show will be held from November 16 to 23, inclusive. The big tents are now up and everything is ready for the reception of stock. Breeders who desire to ship their animals in advance may do so and they will find every convenience at their disposal for caring for their stock.

The judging will begin Monday morning, November 18, and will be conducted every day until completed, from 9 a. m. to 5 p. m., except the noon hour.

The judges will be requested to explain the reasons for placing awards and in this way the judging will be made both interesting and educational. All those attending the show should make it a point to see the judging done so that they can learn the good points of the different breeds.

Because of the postponement of the fair from the original date, some of the judges first selected will be unable to serve and it is impossible to give a complete list at this time. However, they will represent the best talent in the entire United States.

Starting Monday morning the judging of fat steers will commence; also dairy cattle, some of the draft breeds of horses and some of the breeds of sheep and swine.

There will be a horse show every night, commencing Monday; also two matinees. Other features will be provided at the evening shows.

Thursday morning there will be a sale of registered Shorthorns and on Friday morning a sale of registered Herefords. There will also be auction sales some time during the week at which fat cattle, swine and sheep will be sold. This will give people a chance to find out how blue-ribbon meat tastes.

Saturday morning from 10 to 12 has been reserved for school children and a large attendance of youngsters is expected.

Something doing every minute. Always interesting; always instructive. Plan to come early and stay late. You will enjoy every minute.

FEED FOR 100 POUNDS GAIN.

To the Editor: How much feed does it require for growing pigs to make 100 pounds gain?—H. H. R., Ukiah.

[Answered by Livestock Editor.]

Experiments show that the younger the pigs are the less pounds of feed it requires to produce 100 pounds of gain. Pigs between 15 and 50 pounds consumed 293 pounds of feed, or nearly three pounds for one pound of gain. Pigs from 50 to 100 pounds required 400 pounds of feed; those from 100 to 150 pounds required 437 pounds; those from 150 to 200 pounds required 482 pounds; those from 200 to 250 pounds required 498 pounds; those from 250 to 300 pounds required 511 pounds, and those from 300 to 350 required 535 pounds.

AN IDEAL WINTER SILAGE FOR SHEEP.

An ideal winter feed for ewes in lamb is from 2 to 3 pounds per day of good corn silage, and what alfalfa they will clean up. One lot of sheep fed 2.9 pounds corn silage and 2.1 pounds hay gained .16 pound daily, while another lot fed 2.9 pounds roots and 2.6 pounds hay gained .18 pound daily. The gains were about the same, but when the sheep were fed silage they required one-half pound hay less than when fed roots.

If there is no alfalfa or other protein roughage they should have some oil meal or coconut meal. Never feed hay day after day in the same place on the ground. Sheep do not like to eat from a place where they must muss over the feed. A rack will soon pay for itself.

Santa Anita Rancho

ANOAKIA BREEDING FARM

PERCHERON HORSES—No expense has been spared to place the Percheron stud at Santa Anita Rancho in position to breed Percherons equal to any in America. Young stock for sale.

THOROUGHBREDS—In this stud abounds the blood of world famous horses. Some two- and three-year-olds by REY EL SANTA ANITA for sale.

ARABIANS—This stud is headed by the famous Ibu Mahruss, imported Arabian stallion. A number of his get are offered for sale.

HOLSTEIN CATTLE—Breeding animals in the registered Holstein herd at Santa Anita Rancho, headed by MERCI LAD KORNDYKE BURKE, are the result of careful selection in which the requirements are high individual quality, heavy and persistent production, and proven transmitting ability. All females are placed on official test as they freshen. A few splendid young bulls out of A. R. O. dams for sale at prices well within their value.

BERKSHIRE HOGS—The herd of registered Berkshires is composed of a group of sows and gilts representing the most desirable blood of the breed, headed by KINTYRE LAIRD, first prize senior yearling and reserve Senior Champion boar at P. P. I. E. A few good boar pigs are offered at this time. We are prepared to fill carload orders.

POLAND-CHINA HOGS—Prize winning sows and gilts backed up by many generations of famous prize winners form the breeding basis of the herd. Heading these splendid females is BANKER'S BOY, Junior Champion and Reserve Grand Champion at P. P. I. E. We are prepared to fill carload orders.

MAMMOTH JACKS—The grand group of registered jennets in this stud is headed by KING BERSHEBA, Grand Champion jack of Kentucky. He is one of the greatest individual jacks in America. A few young jacks for sale.

Exhibitors at the San Francisco Show

Beef Cattle.

Entries of beef cattle total 263 head and include some of the most noted herds in the country.

The Hereford Corporation of Wyoming, owners of the largest herd of registered Herefords in the world, will show the pick of their 1600 head, including Miss Rialto II, who has won grand championships wherever shown.

The Ormondale Co., Redwood City, will show 12 fine head out of their superb herd, which is headed by Golden Goods, Jr., a grandson of Choice Goods.

J. H. Cazier & Sons of the Nevada Hereford Ranch, Wells, Nevada, will bring along 23 head, including the young herd that made such a sensation at Sacramento. Most of the animals will be the get of Harris' Standard 2nd.

T. S. Glide of Hill Crest Stock Farm, Davis, who has used more grand champion bulls in his range herd than any other California breeder has used in his foundation stock, will show 9 head of Shorthorns.

Wm. Henn of Denver and Kansas City will show both Shorthorns and Herefords. Mr. Henn's stock stands high in the Middle West and he expects to make a good clean up out here.

T. B. Dibblee Estate of Santa Barbara will show 11 Shorthorns from their high-class herd.

Jack London Ranch, Glen Ellen, has entered 9 head, mostly young stock, but great prospects for prize winners.

J. A. Bunting of Mission San Jose has entered 8 head of Herefords and will endeavor to duplicate his wonderful performance at the State Fair.

W. M. Carruthers, Live Oak, expects to take home his share of the Shorthorn awards with the 8 head that he has entered.

T. T. Miller will bring up 13 head of his famous Shorthorns from Los Angeles and will furnish lively competition.

Hopland Stock Farm, Hopland, has entered a good string of 10 Shorthorns that will be able to hold their own in the hottest competition.

Other exhibitors include Maxwell-Miller Cattle Co., Steamboat Springs, Colo.; Roselawn Stock Farm, Woodland; Pacheco Cattle Co., Hollister; J. H. Rosseter, Burke; and University of California, Davis, all of whom will show Shorthorns; H. M. Barngrover, San Jose; Curtice Cattle Co., Calgary, Alberta; Chas. Rule, Jenner; and W. D. Duke, Likely, all of whom will show Herefords; and the famous Aberdeen-Angus herd owned by Congdon & Battles of Yakima, Wash.

Dairy Cattle.

There will be 194 head of dairy cattle shown, and while no herds outside of the State will be represented, many of the best animals in California have been entered and keen competition is assured.

In the Holstein class Toyon Farm Association, San Jose, heads the list with 23 entries.

W. J. Higdon, Tulare, whose stock made such an excellent record at the State Fair this year, will be on hand with 14 head.

Palo Alto Stock Farm, Palo Alto, will show 12 head of great breeding and quality.

R. F. Holmes, Modesto, who made such an excellent start in the show ring at the State Fair this year, will bring 7 head that will be hard to beat, including his new 29-pound herd sire, Chimacum Wayne Woodcrest.

H. E. Cornwell, Modesto, expects to win his share of the ribbons with the 7 head that he will show.

In Guernseys, A. J. Welch, Redwood City, leads with an entry of 18 head from his herd of heavy producers.

L. D. Smith of Berkeley comes next with 15 head that promise to make lively competition.

A. B. Humphrey, Escalon, has entered 10 head from his fine herd that has been such a consistent winner at the fairs for several years.

Palo Alto Stock Farm, Palo Alto, and Calla Grove Farm, Manteca, will also show Guernseys.

In the Jersey class, J. B. & J. E. Thorp, Lockeford, will show 16 head and Guy H. Miller, Modesto, 14 head. Both of these herds have been winning prizes galore at the different fairs this fall. The University of California will also show Jerseys.

In Ayrshires there will be stiff competition between E. B. McFarland, San Mateo, and J. Henry Meyer, Elkhorn Farm, Watsonville. Both of these herds are too well knowm to need any comment.

In Milking Shorthorns there will be similar competitions between Alexander & Kellogg, Suisun, who will show 15 head, and Thomas Harrison of Glen Ellen, who will show 11 head. In these herds are to be found some of the finest individuals of the breed.

J. Irvin Burk of Gilbert, Ariz., has entered his noted herd of 17 Brown Swiss cattle.

Swine.

Duroc-Jerseys lead with 87 head entered.

Conejo Ranch, Newbury Park, will show 21 head of Durocs, also 24 Hampshires. These will include the animals that have been winning so heavily at the different fall shows.

Other exhibitors of Durocs will include J. E. Thorp, Lockeford; Harvey M. Berglund, Dixon; Clarence T. Thompson, Bishop; Jersey Queen Farm, San Jose; C. W. Smith, Willows; C. W. Scott, Glenn; W. H. Manis, Willows; and W. V. Bennet, Nord.

There will be 67 head of Berkshires shown, the James Mills Orchard Corporation being the largest exhibitors with 31 head entered.

A. B. Humphrey, Escalon, will show 17 head from his famous prize-winning herd.

The Sandercock Land Co. of San Francisco and Sacramento will show 10 head from the very fine herd that they have recently established.

Other exhibitors of Berkshires will include W. B. Carpenter, Red Bluff; Geo. M. York, Modesto; Frank B. Anderson, Sacramento, and the University of California, Davis.

Mark Bassett of Hanford will be the heaviest exhibitor of Poland-Chinas. He will show 14 head from his wonderful herd and his son, A. L. Bassett, will bring along 8 head.

A. Buckland & Son, Fresno, will show 5 head of Poland-Chinas that will make some of the old-timers sit up and take notice.

A. D. McCarty of San Francisco will make his initial bow in Poland-China circles by showing 8 head from his Riverina Ranch at Modesto.

Sheep.

One hundred and twenty-eight head of sheep are entered, aside from carload lots, these including Shropshires, Hampshires, Southdowns, Rambouillets, Corriedales and Lincolns.

Bishop Bros., San Ramon, will show 24 head of Shropshires from their herd of international prize winners.

Bullard Bros., Woodland, whose pen of Rambouillet range rams brought the highest price ever paid in America at the recent Salt Lake Sale, will show 15 head.

J. J. Bidegary, Fresno, who has been making such extensive purchases recently, will show 5 very fine head of Rambouillets.

Ellenwood & Ramsay, Red Bluff, whose 25 unregistered Corriedale range rams sold at Salt Lake for $160 per head, have entered 9 registered Corriedales.

Other exhibitors of sheep include A. H. McInnes, Red Bluff; J. G. S. Hubbard, Monroe, Ore.; Calla Grove Farm, Manteca, and the University of California, Davis.

125 Registered Holstein
Cows, Heifers and Bulls

Among the females to be sold is the highest record junior 2-year-old ever offered in the West; great cows and heifers with records up to over 26 lbs. butter in 7 days; daughters of cows with records up to over 31 lbs. butter in 7 days; daughters of King Mead of Riverside; King Korndyke Sadie Vale; King Korndyke Sadie Vale 22nd; King Korndyke Sadie Vale 27th; Sir Aaggie De Kol Acme; Sir Veeman Korndyke Pontiac; Sir Skylark Ormsby Hengerveld; King Segis Pontiac; King Segis Pontiac 13th; Spring Farm King; Spring Farm King Pontiac 6th; Segis Pontiac De Kol Burke; King Segis Pontiac Jannek; Mutual Fobes Longfield De Kol.

Some of the Greatest Young Bulls that have Appeared in any Public Sale in this State

Among the bulls to be sold are: **KING IGNARO MEAD**, by King Mead of Riverside and out of a daughter of Ignaro De Kol that made over 29,000 lbs. milk and 1077 lbs. butter in one year; a son of King Segis Alcartra Prilly, twice grand champion at California State Fair, out of a 31-lb. four-year-old daughter of Judge Hengerveld De Kol; a son of King Segis Alcartra Abbekerk, 30-lb. son of the $50,000 bull, out of a great 30-lb. cow; a beautiful, nearly white son of Prince Gelsche Walker, out of a 29.67 lb. daughter of Korndyke Queen De Kol's Prince; a son of King Korndyke Pontiac out of a daughter of King of the Pontiacs that made 714 lbs. butter in one year as a senior two-year-old; a son of the 31-lb. cow Fidessa Helena; and many others of splendid breeding and type.

You Can't Buy Better Holstein Blood Anywhere in the World

The very best families of the Holstein breed are represented in this sale, and the splendid cattle tell their own story as to individuality. Every animal in this sale is positively guaranteed to be a breeder; every animal over six months of age tuberculin tested and sold subject to tuberculin test by the buyer.

The Ten Consignors

A. W. Morris & Sons, Woodland; Bridgford Company, Knightsen; R. F. Guerin, Visalia; W. F. Mitchell, Visalia; Charles Yocum, Tulare; R. C. Sturgeon, Tulare; E. G. Wharton, Tulare; Alex Whaley, Tulare; W. J. Higdon, Tulare; C. L. Hughes, Sacramento.

HOLSTEIN Bargain Day

Tuesday, November 12, will go down in California Holstein history as a red-letter bargain day, and more than one breeder will unquestionably date a new success from that day if he is fortunate enough to be one of the buyers at

A. W. MORRIS & SONS CORPORATION SALE
90 Registered Holstein Cows
15 Registered Holstein Bulls

It is entirely out of the question to attempt to give a full list of the splendid animals to be sold, within the space of this announcement, but the catalog which is now being distributed gives full information about each animal.
As a broad outline, it will serve to state again that there are in this sale

THREE COWS WITH RECORDS FROM 30 TO 33 POUNDS BUTTER IN 7 DAYS.
THIRTY COWS WITH RECORDS FROM 20 TO OVER 29 LBS. BUTTER IN 7 DAYS.
THIRTY COWS WITH YEARLY RECORDS UP TO OVER 24,000 LBS. MILK AND OVER 1000 LBS. BUTTER.

THINK OF THIS!—At least 75 cows in this sale are bred to King Mead of Riverside Prince Gelsche Walker, Segis Pontiac De Kol Burke, King Moreo Alcartra Sir Aaggie De Kol Acme, and King Korndyke Pontiac 20th, EVERY ONE OF WHICH HAS SIRED A WORLD'S RECORD DAUGHTER OR HAS FOR A DAM A COW THAT MADE ONE OR MORE WORLD'S RECORDS.

TWENTY-FIVE COWS IN THIS SALE ARE FRESH, and a large number of others ARE DUE TO CALVE FROM ONE WEEK TO TWO MONTHS FROM DATE OF SALE.

DAIRYMEN—We confidently believe that these great cows are going to sell at surprisingly low prices, in fact no higher figures than you would expect to pay for common cattle. It looks like the best sort of business judgment for you to be on hand to buy some of these cows, and there will be

15 Registered Bulls

ready for service, some of them good enough to head registered herds, and any of them good enough for a high class grade dairy herd.

EVERY ANIMAL IN THIS SALE IS POSITIVELY GUARANTEED TO BE A BREEDER.
NO ANIMAL IN THIS SALE IS TUBERCULIN TESTED.

REMEMBER THE DATE—**Tuesday, November 12, 1918**

on the Morris Farm, 4½ miles northeast of Woodland, California, beginning promptly at 9:30 A. M.

W. F. YOUNG, P. D. F., 86 Temple Street, Springfield, Mass.

WHEN HORSES GET THE "FLU."

Although the serious epidemic of influenza now affecting the human family has no relation to the disease of the same name which affects horses, specialists of the U. S. Department of Agriculture point out a resemblance of symptoms and course of the disease.

The symptoms are those of fever, in some cases preceded by a chill. There is great prostration of muscular force, and an inflammation of the membrane of the eye, which becomes a deep saffron, ocher or violet red color, from which fact the term "pink eye" has been given the disease.

There is great diminution or total loss of appetite and a rapid loss of flesh, which frequently reaches 30 to 75 pounds for each 24 hours. In uncomplicated cases the fever abates after six to ten days, and there is a general restoration to health. The complications are many and sometimes serious. Among such are those of the intestines and lungs. Pneumonia, one of the frequent complications, is always serious, as it affects the animal when reduced in strength and resisting power.

To guard against an unfavorable termination or the development of one of its numerous complications, horses, upon showing evidences of influenza, should be relieved immediately from work. Most careful nursing is also essential for horses affected with influenza and, likewise, skilled medical treatment, which can be best assured by placing affected animals under the care of a qualified veterinarian. The spread of the infection should be prevented by segregating the diseased animals and thoroughly cleaning and disinfecting the contaminated premises. Plenty of sunlight and good ventilation are also highly desirable.

SOUTHERN COAST PASTURES.

More rain is needed by cattlemen of San Luis Obispo county, where the September rain sprouted much of the seed, and the grass and filaria are already turning yellow or brown. Well known cattlemen say there is no reserve of seed in the ground, and if this is so later rains will not help much.

Monterey county, which got more rain, is in better shape. The new grass has generally been reserved for cattle after they are moved from stubble on account of plowing, or from beet tops on account of mud. If rains hold off long enough in Monterey county many cattle will be fattened entirely on beet tops, but hauling them to cattle, as is necessary after rains begin, has been found too much bother for the big cattlemen.

Cattle conditions at present are good in Monterey and San Luis Obispo counties. Beef stock has been sold off close and only producers and calves have been kept. South of these counties the light rain did not sprout enough seed to add much feed or to prevent good pasturage after later rains.

PORTLAND HOLSTEIN SALE.

At North Portland, Friday, November 22, in connection with the Pacific International Livestock Show, will be held the sixth annual sale of Holstein cattle. Consignments will be made by the leading breeders in the Northwest, including Carnation Stock Farms, Hollywood Farms, E. B. Marks, Wm. Todd & Sons, Wm. Bishop, and J. Von Herberg.

Seventy head of cows, heifers and bulls will be offered. Nearly all of the cows are just about to freshen or have just recently freshened. The finest lot of cattle ever sold at North Portland will be offered and it will pay all interested to attend.

BARON DUKE 201ST, GRAND CHAMPION AT OMAHA NATIONAL

A great boar—the result of 40 years of constructive breeding. Big all over—long, deep, great spread of rib, smooth, heavy boned, vigorous and probably the best hammed Berkshire boar in the world. See his pigs at the livestock show. They are for sale at prices usually asked for ordinary pigs. Study the picture of this great show and producing boar and you will know his pigs anywhere—they have the good points that made their sire a National Champion. It would be hard to find a better lot of brood sows than Princess Leader from two world champions, Silberfa Lustre 3rd, Grand Champion Oregon State Fair, Riverby Princess 2nd and 3rd, litter mates to world champion sow. These and many other equally fine prize-winning 600-pound sows, with Baron Duke 201, purchased for $1100.00 before winning Grand National Championship, are on the

NATOMARIO RANCHO
NATOMAS LANDS

that produce as much as 12 tons of Alfalfa an acre a year. A crop of barley followed by a crop of milo maize can be grown on the same piece of land the same year. Hundreds of acres of this new river bottom land produced 4200 pounds of wheat this year. Five tons of oat hay an acre, followed by a crop of beans averaging 22 sacks an acre, have been harvested the same year. Grew thousands of acres of beans this year. Latest on the Hog Market Situation

[Written for Pacific Rural Press.]

At a recent conference between representatives of the swine industry and the Food Administration it was decided that failure to maintain the October price basis determined upon at the September conference was due to the lower range of corn prices, which caused feeders to rush their hogs to market in large numbers. Another factor was the influenza epidemic, which sharply curtailed the consumption of pork products and decreased the labor staff of the packers about 25 per cent.

However, the unfavorable market conditions existing in October afford no fair index of the aggregate supply and demand, and the increase in export demands appears to be amply sufficient to take up the increase in hog production, which is estimated at 15 per cent over last year. The exports for October were 130,000,000 pounds of pork products, as compared with 52,000,000 pounds for October last year. The export orders placed by the Food Administration for November amount to 170,000,000 pounds, as contrasted with exports of 98,000,000 pounds for November, 1917.

It appears that there will be even a stronger demand for pork products after the war, as the enormous shortage of feeds in the Central Empires and neutral countries will immediately result in additional pork products, which, on top of the heavy shipments to the allies, will tend to increase our exports, inasmuch as no considerable reservoir of supplies exists outside of the United States.

The Food Administration will join with swine representatives and packers in determining each month the price at which controlled export orders shall be placed, and the influence of these orders will be directed to the stabilization of the price of live hogs, so as to secure fair returns to the producers and the assurance of an adequate future supply.

For the month of November packers will endeavor to purchase no hogs for less than a daily minimum of $17.50 on an average of packers' droves, excluding "throw-outs"—this price to be based on the Chicago market.

It is believed that the plan should work out close to an average of $18 at Chicago. This should mean $17 at California terminals.

Sandercock Has Noted Berkshires

Six Berkshire litter mates, grown to an average weight of 426 pounds at a year old, by W. F. Sandercock, owner of the Natomario Rancho, near Sacramento.

No success can possibly be made in the breeding of purebred swine unless the man knows what a really good hog is. And that W. F. Sandercock can pick the best is proved by the foundation herd he has established at the Natomario Rancho, near Sacramento.

Heading the herd is the great boar, Baron Duke 201st, grand champion at the National Swine Show in 1917, and it would be hard to find a better lot of brood sows. They include the only daughter of the world's grand champion sow by the world's grand champion boar, and several litter mates to the world's champion sow; also the grand champion at the Oregon State Fair.

Mr. Sandercock is a constructive breeder and a scientific feeder. It is his desire to show the farmers of this State that well-bred stock of high individuality, properly fed and cared for, will bring the maximum of profit from ranching, and the success that he has already attained is sufficient proof of his contention. When the average farmer of California can develop his hogs the way Mr. Sandercock grew those in the accompanying illustration he will about double his profits.

Balanced Rations of Sound Advice

Don't Overfeed Cows with Protein.

A subscriber writes that he is feeding his cows alfalfa hay, bran and cottonseed meal and cannot understand why these high-priced feeds do not increase their production.

He is too good to his cows, for while these feeds are excellent in themselves all are extremely rich in protein and do not make a good combination. As alfalfa is high in protein, he should add feeds that are high in carbohydrates, such as corn silage, beet pulp or barley. If he does not have silage, then instead of buying bran and cottonseed meal he should get beet pulp and barley, using a mixture of about two-thirds beet pulp and one-third rolled or ground barley and soaking it for 12 hours before using.

Try This for Moon Blindness.

A subscriber at Sebastopol has a mare that has an inflammatory affection of the interior of the eye, recurring periodically. This results in cataract formations and eventually causes blindness if not given attention. Some hold that wolf teeth cause moon blindness, but this is ridiculous. It is claimed that the disease is hereditary.

Treatment: Keep the animal away from whitewashed surfaces, as the glare of white aggravates and increases the attacks. Purgatives at the time of an attack may shorten or abort it. Use the following ointment: Yellow oxide ointment, 20 grains; lanoline, 2 drams; white vaseline, 4 drams; boracic acid, 30 grains. Mix and smear into the eyes once daily.

Beets for Fattening Hogs.

Are beets good for fattening hogs? Well, their value lies not in any increase in the rate of gain but in lessening the amount of higher-priced feeds; also they aid in maintaining health. Experiments show that 7.5 pounds of mangels or 4 pounds of sugar beets are as useful as 1 pound of ground barley in fattening hogs, but only when combined with skim milk, tankage or some similar addition. However, we advise you to go slow on using beets for fattening, as they are more desirable for growing pigs. For fattening they should be used as a supplement rather than an exclusive feed.

Curing Self-Sucking Cows.

Heartless dairymen say that to split a cow's tongue will break her of this vice, but we don't like to recommend such a brutal method. A subcsriber at Palo Alto asks for a cure and we advise a more humane method that we have found will do the trick. It consists in putting a bull ring in the cow's nose and hanging a second ring from the first. These rings dangling down in front of the cow's mouth bother her to such an extent that she cannot suck successfully and she soon gives up.

Ever Sneeze While Milking?

A subscriber at Lompoc found himself sneezing while milking. This is because the cows while lying down in the field got an irritative vegetable substance on their udders. The udders should be washed with a very mild disinfectant before milking. Persons so affected are generally predisposed to such an irritant owing to a little nasal weakness, and it is well to keep the nostrils stuffed with antiseptic cotton while milking. sary.

To Expel Tapeworms.

Tapeworms have been stunting the growth of calves owned by a Fresno subscriber. Dissolve 4 ounces of Epsom salts in 1 pint of water and give as a drench. After two hours give 1 dram of fluid extract male fern and two drams of powdered areca nut. Mix with a teacup of milk and give also as a drench. Repeat treatment as often as is neces-

Foot Rot in Cows.

A cow went lame in her front feet, above the hoofs. There was soreness but no fever. When grazing she often got down on her knees. She ate well but lost flesh.

Treatment prescribed: Clean the entire foot thoroughly, especially the bottom and the space between the claws, and paint with pure tincture of iodine.

Cure for Garget.

To the Editor: What is the trouble with my cow, whose milk comes in clots periodically?—G. W. H., Stevinson.

[Answered by Livestock Editor.]

There are two forms of garget—acute and chronic—and your cow has the latter. It is an inflammation of the lining membrane of the milk-well and if treated properly is not very serious, although if a cow of this kind goes without treatment she may develop acute garget. The ordinary treatment consists in irrigating the affected quarter or quarters with a saturated, warm solution of boric acid. Dissolve just as much of the powder in warm water as will go into solution. Let it stand so that if any powder does not dissolve it will go to the bottom and you can use only the clear fluid. Inject as near body temperature as possible. Milk the quarter dry first, then wash it off with an antiseptic solution and then inject a pint or more of the warm boric acid solution with a teat tube with a rubber hose and funnel attached. See that the instruments have been previously boiled. After the solution has been injected, the quarter should be thoroughly kneaded and massaged so as to break up the clotted milk, and then milked out. This can be repeated morning and evening until the symptoms disappear. It is advisable to give your cow at the same time a physic of one pound of Epsom salts in the form of a drench, and follow this with a tablespoon of saltpeter once a day. If the cow has been receiving much grain, it should be reduced for a few days. If it seems desirable, use a salve on the udder in kneading it. Probably the best is one part fluid extract of poke root, one part fluid extract of belladonna and six parts of melted lard. This preparation should be thoroughly rubbed into the udder after milking.

Calf Has Heart Trouble.

To the Editor: I have a heifer calf which has been affected since birth with hard breathing on the slightest exertion. It will run for about 50 feet and kick up its heels and then breathe with mouth wide open and almost choke. A few times I have noticed it cough when perfectly still and then begin breathing hard. Will this trouble leave or increase with age? Also, why is the mother's milk not nearly as rich as in previous years? She has all the alfalfa she wants and is very fat. She had milk fever following the birth of this calf and, although I tried all the remedies I could hear of, she lost one-quarter of her udder. —W. H. H., Caruthers.

[Answered by Dr. E. J. Creely, San Francisco.]

The calf's trouble is due to heart affection. The foramen ovale, an opening between the auricles, should close after birth, but has not done so. The calf will outgrow the affection. Probably you have ruined one-quarter of the cow's udder by using an unclean milk tube during the milk fever treatment. Change the cow's diet occasionally and you will find an improvement in the quality and quantity of the milk.

Treatment for Cough.

To the Editor: I have a cow that coughs a great deal. She passed the tuberculosis test a short time ago and looks healthy. I noticed her cough six months ago and she has coughed a great deal since. What is the trouble and its remedy?—E. M. R., Parkfield.

[Answered by Dr. E. J. Creely, San Francisco.]

I am very suspicious of coughing cows and would suggest the intradermal test for tuberculosis. A cow may be fat, have a glossy coat and yet be tubercular. A cow in the last stages of tuberculosis may not respond to the test.

Treatment for cough in cows: Avoid dry hay, especially dusty or musty hay. Thoroughly moisten hay and feed with water sweetened with molasses. Apply a good liniment to the outside of throat and under the jaw. Give the following: Raw linseed oil, 10 ounces; oil of eucalyptus, 1 ounce; kerosene, 4 ounces; fluid extract belladonna, 1 ounce. Mix and give 1 tablespoonful three times daily, syringed down the back part of mouth.

Removing Warts.

To the Editor: I have a mule that has a wart on his nose. Please tell me how to remove it.—R. L. L., Lindsay.

[Answered by Livestock Editor.]

The treatment of your mule's wart will depend upon whether it has a narrow or a broad base. If the former, it may readily be removed by cutting close to the skin with a pair of scissors. If it has a broad base, it is more difficult. The

During the last shearing season a California sheep shearer earned $800 in 27 days. That beats going to Congress.

best way is to sprinkle it daily with powdered sulphate of copper, then applying a layer of cotton, and fasten the cotton in position by means of adhesive tape. Such treatment should reduce the size of the wart materially in a week or ten days. After it is down to the level of the skin, a piece of cotton should be saturated with a 5 per cent solution of formaldehyde and applied to the wound for five or ten minutes. This will cause the formation of a hard scab in the course of twenty-four hours. No further treatment is required as long as the scab remains firmly in position, but if at any time the scab loosens the underlying surface should be treated with the formaldehyde.

Cow Has Leaky Teats.

To the Editor: I have a valuable cow that has leaky teats and I don't want to dispose of her if the trouble can be overcome. What can I do?—C. G. P., Corcoran.

[Answered by Livestock Editor.]

If you mean that when the udder becomes well filled the milk escapes through the natural openings in the ends of the teats, this can be prevented temporarily by putting short, light rubber bands around the teats near the ends. It requires very little pressure—just enough to keep the bands in place until the next milking time. Milking three times a day is a great help in such cases. If your cow has a hole in the side of one of the teats, put a wider rubber band around the teat directly over the hole, and then when the cow is dry have a veterinarian scarify the spot with a hot iron.

Age to Breed Gilts.

To the Editor: How young can a gilt be bred without affecting her development?—G. W. H., Stevinson.

[Answered by Livestock Editor.]

It is customary to breed gilts at eight months so that they will farrow the first time when a year old. However, a gilt should not have her second litter until she is two years old, so when one is bred at eight months she should be carried over for six months after she weans her first litter. Gilts grow a little larger if they are not bred the first time until they are fourteen months of age, and you don't lose any time in the long run by holding them until this age because as soon as they wean their first litters they can be bred again and every six months thereafter. However, a gilt is not really stunted if she is bred at eight months, although to breed one at a younger age than this will stunt her.

Horse Has Eczema.

To the Editor: I have a valuable horse that has a scab on its face. Sometimes it is larger than others and often covers almost his entire face. It is dry and scaly. What can I do for it?—G. H. P., Hollister.

[Answered by Livestock Editor.]

Your horse has eczema of the face. Wash the parts thoroughly with soap and warm water, using a stiff bristle brush to remove the scabs, and then wash daily thereafter with a solution consisting of 1 ounce of carbonate of soda to a quart of water.

DONT'S FOR THE DAIRY SIRE.

Don't underfeed him when young.
Don't overfeed him when mature.
Don't keep him shut up without exercise.
Don't allow him to run with the cows.
Don't lead him with a rope or strap.
Don't trust him at any time.
Don't allow anyone to tease or plague him.
Don't feed him more than 15 pounds of silage daily.
Don't use him too heavily before he is mature.

PACIFIC RURAL PRESS, SAN FRANCISCO.

When to Have Heifers Freshen

[Written for Pacific Rural Press by R. H. Whitten.]

WHAT'S your idea regarding the proper age for heifers of the dairy breeds to freshen? Breeders of experience differ widely. Some claim that late calving is best, believing that it allows heifers to develop greater size and constitution. Others maintain that when heifers are permitted to calve at a younger age dairy type and temperament are promoted, and these breeders consider this more desirable than size. Still others plan to have heifers calve rather young, and then defer breeding for the second calf so as to give them a long lactation period with from birth; have her freshen at about two years; milk her continually through all or nearly all of the first year to establish the habit of holding out; then give her a rest of two or three months with liberal feed before her second freshening period.

"By this means the dairy form and milk organs are developed at a younger age, when the whole system is most susceptible to the conditions of motherhood. The young animal responds more readily to all the influences which have to do with her development, and the coarse, steery, beefy appearance common

Holstein heifer on the McAlister ranch at Chino, weighing 908 pounds at 12 months. Heifers developed like this can be bred at an earlier age than those matured more slowly.

their first calf. They claim that this practice tends to develop the milking habit early in life, and also encourages a long lactation period.

Among those who believe in the latter practice is E. A. Powell, the veteran Holstein breeder of New York. He says: "I have given this subject much thought for over a quarter of a century and have arrived at the conclusion that the best method is to grow the heifer well among heifers that are barren until three years of age is avoided. The latter may develop a little more size, but I do not look upon that as an advantage. A large cow may make a higher record, but it will be done at a much greater expense, and she will not prove as profitable for the ordinary dairyman as the cow of medium size."

Sounds reasonable enough, doesn't it? But the different tests that have been conducted at the various agricultural colleges do not seem to bear out Mr. Powell's contentions. They indicate that it is not necessary to have heifers calve early in order to stamp dairy qualities upon them rather than tendencies for beef production.

PROFIT BY EXPERIMENTS.

On account of the high cost of practically everything connected with the developing of heifers, it is desirable to bring them into production as young as possible, yet we don't want to hasten their breeding to such an extent that in the long run their productive capacity will be so greatly reduced as to more than make up for the few months gained by having them freshen early. So let's study the experiments that have been conducted and profit by them, thus saving ourselves the experience, time and losses of carrying out trials of our own.

At the Connecticut Agricultural College two groups of heifers were studied, the average calving age of the first being 25 months and of the second 37 months. Their production during the first three lactation periods was as follows:

	Milk	Fat
First Period—		
Early calvers	7,691 lbs.	273 lbs.
Late calvers	13,128 lbs.	443 lbs.
Second Period—		
Early calvers	9,684 lbs.	342 lbs.
Late calvers	14,682 lbs.	473 lbs.
Third Period—		
Early calvers	13,552 lbs.	467 lbs.
Late calvers	14,236 lbs.	520 lbs.

In the early group none produced over 18,250 pounds of milk. In the late group three exceeded this—one with her first calf. Two of the late calvers made over 20,000 pounds—one with her second calf.

DON'T HOLD HEIFERS TOO LONG.

At the Maryland Station three groups of heifers were studied, those in the first group calving for the first time at an average age of 27 months, the second at 34½ months,

PUT YOUR HERD ON THE PROFIT SIDE

With high feed prices and high cost of labor prevailing and bound to prevail for some time to come, you must either bring up the production of your herd or go out of business.

Breed up with sires who have back of them big production and who will transmit that production to their offspring. Such sires are to be found in sons of

and the third at 37½ months. The results were as follows:

	Milk.	Fat
First group	3,993 lbs.	155 lbs.
Second group	5,353 lbs.	199 lbs.
Third group	5,295 lbs.	195 lbs.

It is evident that the heifers used in this experiment were not so well bred as those in the first, yet perhaps even more can be learned from the second experiment, as the heifers more nearly represent the class of stock found on the average farm. The difference of 58 pounds of milk between the second and third groups may be considered within the limits of experimental error and of little consequence. But when a comparison is made of the variation between the first and second groups a difference of 1360 pounds is found. In other words, heifers freshening at an average age of 27 months produced less than three-fourths as much as those of an average age of 34½ months. On the other hand, those freshening at an average age of 37½ months did not produce enough more to justify holding them so long before breeding them. It should be borne in mind that the heifers used in this experiment were Ayrshires, which mature at about the same time as Holsteins, and somewhat later than Jerseys and Guernseys.

PRODUCTION LARGELY DETERMINED BY SIZE.

At the Missouri Experiment Station, tests with 95 cows were carried on by Prof. C. H. Eckles. The age at first calving was found to affect the size of the mature animals to quite a marked degree. It was easy to tell the heifers that had been allowed to calve early, as they were much smaller than the others. This was due to the fact that the demand of milk production tended to decrease their size and constitution.

Prof. Eckles' contention is that with two cows of the same inherent stimulation to give milk, but one small and the other large, the small one is limited by her capacity to digest feed and cannot compete with the large one that has the capacity to handle the feed necessary for high production.

The proof of his claim was clearly demonstrated in the experiment, for when the heifers that were bred early calved they were not capable of digesting sufficient feed, and although they were fed abundantly they were unable to produce anywhere near as much as those that were not bred until older.

Early calving puts heifers into the producing class at an early age, and from an economical standpoint this should be considered. But the first consideration is the maximum production over a period of years, and sufficient experiments have been carried on to prove that a heifer well matured at first calving will soon overtake in total production the one whose development was stunted by too early calving.

SHOULD BE WELL MATURED.

"Well matured"—remember that. The way a heifer has been fed should be taken into consideration quite as much as the age, for one that has been liberally fed can be bred several months earlier than one raised on a light ration. Also, the breed must be taken into consideration, for the smaller breeds, such as the Jerseys and Guernseys, mature younger than Holsteins and Ayrshires.

As a rule, when heifers have been fed liberally, Jerseys and Guernseys should be bred to freshen at from 24 to 27 months and Holsteins and Ayrshires at from 30 to 32 months. This practice will give big, strong, well-developed heifers with the capacity to convert a large quantity of feed into a similarly large quantity of milk. They will produce heavily at the start, will keep up their flow better, will have larger and more vigorous calves—will do better all along the line.

LAST CALL FOR MORRIS SALE.

Don't forget the great sale of 90 registered Holstein cows and 15 bulls to be held by A. W. Morris & Sons at their farm at Woodland, Tuesday, November 12. This is the time to change from grade cows to purebreds. Sell your grades in the present good market and stock up with purebreds before the big advance in price comes. You will profit at both ends of the transaction.

The Morris sale represents one of the best opportunities of the season for a sound investment in dairy stock. Be on hand to put in your bids, if you want to start with some of the best bred animals of the breed.

JEREY

How much are a cow's teats worth?

This depends on how much it costs to fill the udder and how rich the yield in butter fat. Jerseys are famous for the richest let-down at the lowest possible up-keep. Jerseys are known as "the profit breed" because they are natural money makers. Beautiful and hardy, their perfection has been standardized for over two hundred years.

Ask breeders for pedigrees and prices. Let us send you some very unusual information about this record-breaking breed.

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

J. M. Campbell, Escalon, has begun official testing and reports that the show cow, Potoki Johanna 2nd, has made a record of 27.89 pounds butter.

A. W. Morris & Sons, Woodland, report that Lady Mead Salambo has recently completed a yearly record of 950 pounds butter from 22,097.8 pounds of milk.

Rudolph Spreckels of San Francisco has purchased from Napa State Hospital the Holstein bull, Huskie Pontiac Gem, for service at his country place in Napa county.

N. B. Balis, who has charge of livestock at the Whittier State School, reports a sale of a yearling Holstein bull to Dante Paggi of San Gabriel and another to Sargent Bros., Whittier.

W. D. Millard of Arcadia is establishing a high-class herd of registered Holsteins and was one of the leading buyers at the Ginn sale. He secured Aralia Pontiac De Kol Salambo for his herd sire.

The Redwoods Ayrshire Farm at La Honda, San Mateo county, have installed a Hinman milker to milk their herd of registered Ayrshires and grade Holsteins. They say there is nothing like a milking machine to save time and money.

Fred Hartsook, Lankershim, has recently purchased a yearling Holstein bull calf from John L. Smith of Spokane, Wash. The bull, Finderne Pietertje Fayne Jr., is backed by a combination of show and heavy producing blood lines and promises to do great work in the excellent herd that Mr. Hartsook is developing.

The Bella Vista Guernsey herd has been sold to J. Wm. Gemmer of Ripon and will continue under the above name. In this herd there are some exceptional individuals with very good A. R. records. Russell S. Cox of Escondido secured four very choice yearlings from the herd and Earl E. Rhoades of Lemoore purchased two very promising bred heifers.

The San Joaquin Valley Milk Producers' Association has just opened its new creamery at Madera. Twenty-one hundred pounds of butter were churned the first day. Preparations are being made to enlarge the plant, which will serve the northwestern part of Fresno county and all of Madera county. A new creamery has also been started at Riverdale.

Thomas Harrison, the well-known Milking Shorthorn breeder of Glen Ellen, has leased the Santa Rosa fair grounds and is converting the property into a stock farm again, to be known as the Santa Rosa Stock Farm. There are over two hundred box stalls and a large pavilion which will prove a great asset for Mr. Harrison's purpose. He intends to erect two silos and make other improvements.

Holstein records have been broken by two half-sisters owned by J. M. Hackney of Arden Farms, St. Paul, Minn. Jewel Pontiac Segis, a senior three-year-old, has made a yearly record of 1171 pounds butter from 27,068.5 pounds milk. Beauty Beets Walker Segis, a senior two-year-old, made 1040.63 pounds butter from 25,343.3 pounds milk. Both cows are sired by King Segis Pontiac Count, who has 30 A. O. R. daughters to his credit. Who says that blood won't tell?

H. L. Redd, herdsman for W. J. Higdon, Tulare, reports that he has just completed a test of two cows eight months after calving. Hertinga Willis, a cow that made 24.35 pounds in seven days when fresh, made 17.78 pounds butter from 380.8 pounds milk 250 days after calving and promises to make 1000 pounds for the year. Coloma Beauty Butter Maid, at three years and eleven days made 24.69 pounds butter when fresh, and eight months after calving made 16 pounds from 350 pounds of milk. She is expected to make 900 pounds butter for the year.

Beef Cattle.

Butte City Ranch has sold a Shorthorn bull by Victor Stamford to Dr. L. E. Tuttle of Willows.

J. D. Grieve of the Davis Horse and Cattle Company has just brought out five carloads of Hereford and Shorthorn bulls from the East.

According to information from the foothill sections, cattle are coming down from the mountains in large numbers and are in rather poor condition. Feed in the mountains is reported scarce, while in the valleys, owing to the early rains, the grass is high.

Swine and Swinemen.

A. Buckland & Son, Fresno, recently sold a herd boar by King's Big Bone Leader to E. E. Lappell, Caruthers.

H. H. Christiansen, Riverside, has sold to H. D. Edwards, San Bernardino, a registered Poland-China boar by Long Smooth Jumbo.

Young & Clark of Lodi have sold to C. R. Wells of Fourth Crossing a fine Poland-China boar pig by Big Bone Bob and out of the famous sow, Miss Bess.

N. B. Balis of Whittier State School reports the sale of a Berkshire gilt by Ames Rival 117th to W. W. Martindale and a boar and gilt to W. J. Gatton, Gardena.

Chas. Gatewood & Son, Fresno, are planning on holding a big public auction of bred sows during the winter, many of them bred to their grand champion, King's Big Bone Leader.

Elmer Lamb, Ceres, has sold his entire herd of Durocs to Miller & Lux for their Santa Rita Ranch at Dos Palos. Mr. Lamb is one of the substantial breeders in the State and we hope that he will soon be back in the game again.

E. M. McFarland, the Ayrshire breeder of San Mateo, has purchased eight Berkshire gilts and a boar from Gossard Breeding Estate, Martinsville, Ind. The boar is by Epochal and the gilts by the English champion, Lord of England.

L. L. McCracken, the live-wire Poland-China breeder of Ripon, has 81 market hogs that are making great growth, having gained 962 pounds in seven days—almost 12 pounds each. They were on good alfalfa pasture and had access to self-feeders, eating 2160 pounds of barley and 85 pounds of tankage. They made a pound of gain for every 2¼ pounds of grain eaten. Who can beat this record?

Sheep.

The Sandercock Land Co., Sacramento, noted for its grand herd of Berkshire hogs, has decided to take up the breeding of sheep and has purchased eight head of registered Shropshires from Butte City Ranch.

C. E. Barnhart, the Solano county stockman, has just purchased from Fred Cokeley 1600 young breeding ewes for an average of $15.50 each, or $24,000 for the flock. They will be pastured on Barnhart's 5000-acre range.

The city of San Francisco has decided to change from scrub sheep to registered Shropshires and has just purchased a fine buck from the Butte City Ranch to head a flock that is being established at the Stadium at Golden Gate Park.

V. C. Richards of Chico has nine acres of Sudan grass upon which 50 sheep have been grazing for the last two and a half months. The field would have carried twice that number from its present appearance. This should make a useful crop for men who are farming for sheep.

PAICINES SHORTHORN OFFERING

Thinking of buying any Shorthorns? The Paicines Ranch of Paicines is offering some top-notch stock of both sexes and all ages—registered and unregistered.

This well-known breeding establishment has one of the best herds of Shorthorns in the State. The animals represent the best blood lines of the breed, and are equally as good in type. They are of the broad, thick, compact, low-down, big-boned sort. They have been bred to make the largest returns on the feed consumed, and if you want to establish a profitable herd, or put money-making qualities into a poorly paying herd you will find the kind of stock you need in this offering. Prices right, too.

Prof. R. F. Miller of the University Farm, Davis, by co-operating with the different farm advisers, has distributed about 1000 ewes to farmers who plan to carry small flocks.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

ADVANTAGES OF PROPER HOUSING.

Unseasonable weather we cannot control; but we can so build, as mentioned last week, that the fowls can be comfortable in all weather. Properly constructed open-front houses will do more towards keeping the fowls healthy and in condition to produce eggs than any other thing we can do. Houses that are built too shallow, or, as some would say, too narrow, allow the wind to whip around the ends, strike in the open front and hit the birds on the roost, even though they are faced in the right direction to avoid direct storms. A house that is built eight feet deep is too narrow to keep out the wind; ten feet deep is better, but twelve feet is about an ideal depth. The back should not be over three feet high nor the front over six or seven. This gives a nice drop, allowing the rain to run off freely and in summer the house is cool. If desired, sliding panels can be made on the ground under the dropping boards for the exit and entrance to and from yards built in any direction you want. Say the house faces north, the yards can be made to the south or to the north, at option of owner. If the house is built to avoid direct storms and the yard is continuous in the same direction, it must be evident that the fowls are doubly protected, and will require very little care in keeping them in when the weather is extra stormy. If, however, the runs face the storms it will be necessary to shut the fowls in during wet, stormy weather to obtain the best results. But as the front is all open there is no lack of fresh air and no such ill effects will be felt as would be the case if the fowls were kept up in closed houses. Closed housing during just a few days soon shows on birds that have been allowed to run in the open, and it takes only a short time to make such fowls so susceptible to climatic changes that they will be a constant source of expense and trouble. Keeping fowls well housed saves feed, saves trouble and loss and is comfortable for those who care for them as well as profitable.

If the poultry house is kept clean and free from foul smells and the birds supplied with plenty of green feed, grit, shell and pure water in clean vessels, the owner will make more profit on less feed than is possible by crowding the fowls with costly feed and neglecting the other essentials. Some people learn these things easy, others learn only when they have paid a good price, and still others never learn at all.

POULTRY AILMENTS DIAGNOSED BY THE SENSE OF SMELL.

A good nose is one of the best assets a poultryman can have, provided he uses it. Roup has a smell so distinctly its own that if a person will take the trouble to learn it he never need make a mistake in diagnosis. I can go in a house where all looks fine to the eye, and if there is just one case of roup, not so advanced as to be seen, I can detect it by the sense of smell and follow it up, too, much as a bloodhound follows the trail; and anyone else can do the same if he will take the trouble.

A sickish sweet odor, that penetrates and seems to stick to everything, made worse by stirring up the fowls until you can smell it on your hands and in the air, can never be mistaken for anything but roup, once you know it. A stale odor, not unlike a case of fetid or sour perspiration, suggests catarrhal colds before they merge into roup. If caught at this stage it is easy to correct the trouble, but once it reaches the roup stage it is harder to handle.

Diphtheria in fowls, as in people, carries an excessively fetid, penetrating odor, even if there is but one case in a whole flock; and if it is not run down and the individual found it spreads alarmingly fast and is almost sure death. This disease is more common among fowls than many suspect. I feel sure that it is carried into flocks of poultry by wild birds, because I have had it in one yard when there was not a trace of it in another only a short distance away.

By killing and burning the carcasses of all that showed symptoms of the disease I quelled it right in the yard where it commenced. The job was one not exempt from danger, for all these things are transmissible to human beings. The hands should be disinfected after handling the fowls. Any simple home disinfectant will do, but it should be strong enough to remove the smell. For disinfecting drinking vessels, feed troughs, or any other articles for the fowl a small mop, a can of lye and a kettle of boiling water are as good as anything. Sal soda is about as effective as lye and cheaper. Keep the hands out of both and use the mop. Rinse out and you can feel sure the article is clean.

TURKEY WEIGHT COMPARISONS.

Now, when we have need for every ounce of food that can be put into form for human consumption, whether ground by mills or gizzards, it is the soundest economy to let the young turkeys live through the fall bug- and seed-hunting season.

A young gobbler that weighs ten pounds in October will weigh twelve or thirteen sixty days later if given a little extra feed along toward the end of that period. A hen in the same time will fill out from seven pounds to nine or ten. Such satisfactory gains can be made at no other time in the bird's life. It is the season when nature is preparing for winter. The turkey hasn't learned to depend on the farmer's grain bins.

The U. S. Food Administration suggests that in order to take advantage of this favorable season for putting on gains that no young turkey hens weighing less than six pounds dressed should be marketed. Young gobblers should be of sufficient size to dress at least eight pounds before being sold. Let the turkeys develop and grow fat.

DON'T MOVE LAYING STOCK.

The moving of hens and pullets that are getting ready to lay should be done early in the season. It is poor policy to move laying stock in the late summer and fall when eggs are scarce and high. A little forethought about these things is worth a lot of after-thought. If you want to prevent pullets and hens from laying, keep them on the move from one house to another. The fancier who is aiming for size and to hold the pullet bloom on his birds is doing this moving stunt on business principles, but the man who is looking for eggs to pay his feed bills does it regardless of anything but just lack of knowledge or common sense.

Poultry Breeders' Directory

BABY CHICKS!—Booking orders for January-February delivery. Reserve yours and be forehanded. Poultry means business to you. Efficiency in labor, housing, feeding and stock means profit. THE HOME CIRCLE

MY SERVICE PIN.

I wear a little service pin
With double stars of blue;
It rests by day, it rests by night
Upon my heart, and holds it tight,
And pins it through and through—
My precious little service pin
With double stars of blue.

I read of battles nobly won,
Of flags unfurled to view;
'Twixt hope and fears, 'twixt pride and tears,
My soul is torn in two.
I clasp my little service pin
With double stars of blue.

And then I read how men have died—
Right valiant men and true—
I bow my head before the dead
Those stars of golden hue.
"Still keep, O God, my service pin
With double stars of blue!"
—Mary-Putnam Hart.

THE STORY OF A PUMPKIN PIE.

Polly and Patty had come from the city to spend a month with grandpa and grandma at Hope Farm. Polly and Patty thought Hope Farm, with its big orchards, the very nicest place in the world. Of one thing in particular they were quite sure—in no other place in the world were there such pumpkin pies made as those grandma made.

She made them every Saturday because the minister came to tea every Sunday after he had driven eight miles to preach his afternoon sermon, and he was very fond of pumpkin pie. Patty and Polly thought it such fun to help grandma make her pies. They were very good little cooks themselves for ten-year-old twins. Mother Rogers had seen to that.

Early one Saturday morning word came that Uncle John Rogers down at Clifton had fallen and broken his leg. Grandpa and grandma got ready in a great flurry and drove straightway to Clifton, leaving Polly and Patty to keep house until they should return at night. Patty and Polly were very sorry about Uncle John, but they were greatly elated over being left to keep house.

"It makes one feel so responsible," said Patty, who liked to drag in a big word now and then when no grown folks were by to laugh at her.

"But," said Polly, soberly, "what about the minister's pumpkin pie?"

What, indeed? But Patty was equal to the problem.

"I shall make the pumpkin pies," she said.

"Oh!" Polly was almost scared. She was never so daring as Patty. "What if you spoil them?"

"I won't spoil them. You must help me. I am sure I can make them all right. I know just how grandma goes about it."

So the two little maids put on very bright, clean, new gingham aprons and ran down to the corn field behind the big fir grove. Polly was always a little frightened to go through that grove, it was so thick and gloomy, but Patty never thought of such a thing. The pumpkins were there, round and yellow as gold, and the twins picked the best and ripest to make their pie.

Patty having rolled her sleeves high above her dimpled elbows, peeled and diced the pumpkin and put it on to stew. She could not find the granite saucepan grandma always used, but Patty was not to be stuck by a trifle like that. She stewed the pumpkin in a round granite milk-pan and it served the purpose very well.

Meanwhile, Polly had hunted the haymow for fresh eggs, had fallen through a hole into the calf pen and nearly frightened the spotted calf to death. But she found the eggs and brought them in triumph to Patty.

Patty made the crust while Polly watched her. Patty clean forgot to put any baking powder in, but Polly remembered it just in the nick of time. Then they strained the pumpkin and beat it up with eggs and sugar and milk and cornstarch, and dusted in the cinnamon and nutmeg and ginger very carefully, for the minister was very particular about the flavoring of his pies. Polly and Patty both tasted the mixture and pronounced it all right and just like grandma's. Then they popped the pies into the oven, and when they came out they were golden brown and looked delicious. So delighted was Patty that she danced around the kitchen three times waving a holder aloft.

Grandma was very much surprised when she came home and saw the pumpkin pies. Secretly she doubted if the pies could be good enough to put before the minister; but she was careful not to hurt the twins' feelings by saying so, and anyway there was nothing else for him this time.

That night Patty had a terrible nightmare and woke up Polly to tell her about it.

"Polly, I dreamed that we put mustard in those pies instead of ginger! Oh, we didn't—did we?"

"No, of course not," answered Polly, reassuringly, and went right to sleep again.

But Patty couldn't sleep. She was afraid she would dream that terrible dream again.

Next afternoon after preaching the minister came. When he had finished his second helping of pie he said politely:

"Your pumpkin pies are always delicious, Mrs. Rogers, but you have surpassed yourself in this one. It is the most delicious I ever ate."

Grandma's eyes twinkled.

"I'm sorry I can't claim the credit for it," she said. "Patty made it."

Patty blushed scarlet beneath the minister's eye.

"Polly helped me," she said honestly.

And the minister—he had driven eight miles, you know, and preached a long sermon, and his wife never made pumpkin pies—took a third helping.—L. M. Montgomery.

DISTRIBUTION OF HOME CARD POSTPONED.

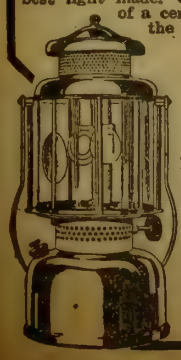
Because of the prevalence of influenza, the Food Administration has postponed the distribution of the new Home Card until the first week in December. In California this work has been placed in the hands of the woman directors and in preparation for the actual distribution an army of nearly 12,000 women has been organized. Under the revised plan Sunday, December 1, will be Conservation Sunday. The distribution of the new Home Card will begin Monday, December 2.

More Light Than 20 Oil Lanterns

AT LAST—the light of lights! A lantern that lights with common matches just like the old style oil lantern, but makes and burns its own gas from common gasoline, giving a brilliant, steady, white light of 300 candle power.

Most Brilliant Light Made

Brighter than the brightest electric bulb. More light than 20 oil lanterns. Cheapest and best light made. Costs less than one-third of a cent per hour. Safer than the safest oil lantern. The



Coleman Quick-Lite

No wicks to trim—No globes to wash. No dirt or grease, no glare or flicker. Absolutely safe. Fuel can't spill—no danger if tipped over. Will last a lifetime.

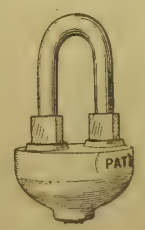
"The Simplest Thing in the World"



LIBERTY FUEL—That Which Produces Most, costs Least and Wastes Nothing.

The world's greatest tragedy has borrowed the hewers of wood and the miners of coal who produced our fuel in abundance. Great necessities have depleted the supply—it is not normal, the price is consequently high. So why continue to struggle against odds that be easily avoided?

In the perfection of combustion as produced by the "PREMIER" Burner, the result is a clean oil-gas greater in heat units than any other fuel and for less money. A good fire at your command—an unlimited fuel supply in the abundance of common Kerosene oil—Liberty Fuel.

Ask for drawing like your stove and circular "B." Be sure and give size and style of stove.

Burner alone is $5.00 — Complete outfit, $9.85

The Burner is Fully Guaranteed and Prepaid Anywhere

Premier Burner Co., Home Office 246 So. Spring St., LOS ANGELES, - CAL.

Agricultural Summary

Sky-High Egg Prices Explained.

The U. S. Food Administration, replying to protests from various individuals and organizations against the recent record-breaking prices of eggs, says the present abnormal price of fresh eggs is due to the fact that the demand far exceeds the production and the only chance for a decrease in price during the influenza epidemic is for well persons to eat either cold storage eggs or none at all, so that sick people may be able to obtain more. Retailers are not permitted to make more than 7½c per dozen on fresh eggs and wholesalers not more than 6 per cent. For instance, fresh eggs were retailing in San Francisco today at 93c per dozen. Eighty-one cents of this went to the producer and the balance is the approved and regulated margins allowed to cover the cost of handling and wholesale and retail distribution. Undoubtedly the normal demand for fresh eggs has been greatly increased by the Spanish influenza epidemic, as sick persons require fresh eggs. There is no scarcity of storage eggs. Cold storage eggs are equal in food value and wholesomeness to the fresh product. Their palatibility is a matter of personal taste. Many regard them to be equally as palatable as fresh eggs in every way. No intelligent comparison of prices of fresh eggs between San Francisco and other cities can be made on the basis of published quotations because conditions are different. Fresh California white eggs are in great demand in New York City, selling at prices above California prices. Published criticisms of the price of California eggs as compared with Eastern prices have been based on a misconception of the Eastern quotations. In summing up, Food Administration officials urged housewives to use the storage eggs as much as possible, particularly in cooking, so that the demand on fresh eggs would be lessened with a probability of a decrease in price.

The Barley Growers' Dilemma.

Barley growers are confronted with an awkward situation—increased production, a falling off in the use of barley as a breadstuff, through the better production of wheat, a disappearance of the demand from brewers, difficulties in transportation and the necessary restrictions of the Food Administration says the Wells Fargo National Bank of San Francisco in a review of the business outlook. These influences have resulted in large quantities of barley still being held in first hands, bringing about a heavy demand in certain districts for funds with which to carry them. This crop from a monetary standpoint is the third most important in the State, being exceeded only by hay and beans in the order mentioned. The total production for 1918 amounts to 34,060,000 bushels, which if it could be marketed at present quotations would put into circulation approximately $30,000,000.

Mixed Varieties Hurt Grapefruit

The reputation of California grapefruit has been injured by the fact that the Marsh variety, the only important variety now grown in the State, is composed of a number of strains, according to a statement of the Department of Agriculture. No recognition previously had been made of these strains, and the marketing of fruits of the various strains some of which are of a decidedly inferior nature, in the same packages, has caused a handicap both to growers and consumers.

Rice Interests Active.

With the exception of some of the new mills, practically all the California mills are now running. The present estimate of the California crop is 3,500,000 sacks of 100 pounds each. Judging from samples received in San Francisco, the quality will be much better than last year.

Army Stocked Up With Cheese

The United States Food Administration states that the needs of the army for cheese are supplied.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, November 6, 1918.

WHEAT.

The Food Administration Grain Corporation announces that it has officially advised all mills, warehouses and grain dealers that, effective November 4, 1918, it is permitted that sales of wheat may be made for feeding use. This ruling, therefore, rescinds the special license regulations of the Food Administration, which prohibited wheat to be used for any other purpose than milling. The removal of this restriction against the feeding of wheat will be of great benefit to the poultry sections particularly, as well as to the other feeding industries generally.

The following are Government prices per bushel for wheat in bulk at San Francisco. The quotation for recleaned is the price per hundred and the charges are strictly regulated by the Government. Per carload the quotation is $4.15. Less than carload lots is $4.25.

Per bushel—	
No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No 2	2.09
Recleaned for seed, per ctl.—	
California Bluestem	$4.15@4.25
Early Baart	4.15@4.25

BARLEY.

The barley market remains unchanged. There is very little demand. As one dealer sizes the situation a bid of $2.05 would probably find no sellers and an offer to sell at $2.12½ would probably find no buyers.

Choice feed, per ctl	$2.05@2.12½

OATS.

While the inquiry for seed oats remains very small, it is believed that the recent rains have put the ground in such condition that a demand for seed is bound to develop in a short time. Feed oats continue quiet.

Red feed, per ctl	$2.20@2.40
Red for seed	2.80@3.00
Black for seed	2.80@3.00
Recleaned Red or Black for seed	3.35@3.50

CORN.

Nothing developed in the corn situation this week. Dealers say there is no new corn in sight for immediate shipment. On Tuesday of this week from $3.65 to $3.75 was asked on the exchange, but no sales are reported at this figure.

HAY.

Receipts of hay for the past week were 644 tons, compared with 852 tons. These are small shipments for the present period. However, they have been sufficient to meet all demands. The Government will doubtless be a heavy buyer throughout the season. Whether the war ends soon or not, it is not believed that it will dispose of its stock for some time to come.

Wheat, No. 1	$26.00@28.00
do, No. 2	20.00@24.00
Choice tame oat	25.00@27.50
Wild oat, new	20.00@22.00
Barley, new	20.00@22.00
Alfalfa	18.00@22.00
Stock	18.00@21.00
Barley straw	.50@ .80

FEEDSTUFFS.

Rolled barley and oats are again weaker, probably owing to the general business conditions. Oilcake is again on the market in sufficient quantity to permit of a quotation and the first sales were made at $77.

New alfalfa meal, per ton	$35.00@36.00
Coconut cake or meal	Nominal
Cracked corn	$86.00@88.00
Oilcake	77.00@78.00
Rolled barley	45.00@47.00
Rolled oats	55.00@57.00
Bran, carload lots in S. F.	None offered
Mixed feed, do, do	None offered
Middlings, do, do	None offered

POTATOES, ONIONS, ETC.

The green vegetable market has been more seriously affected by the influenza epidemic than any other. The Colombo market, where most of the green vegetables are handled, is at present open only three times a week. Beans, summer squash and lettuce show a decided increase in prices. Cucumbers also are higher. Okra is now sold exclusively by the box and ranges in price from $1 to $1.25. Potatoes are quiet. A few Idahos have been received and sold from $2 to $2.10. Some from Marin and Sonoma counties were also on the market, selling from $1.25 to $1.65. The onion market is practically dead.

String beans	7@9c
Wax beans, per lb	7@9c
Pole beans	6@8c
Carrots, per sack	85c@$1.00
Rhubarb, San Jose, per box	$1.00@1.25
Summer squash	1.00@1.50
Pumpkins	75c@$1.00
Cucumbers, Alameda, lugs	$1.00@1.75
Eggplant, per box	75c@$1.00
Livingston	$1.25
Lettuce, Sacramento, doz	25c@40c
Celery, bunch	20@25c
Tomatoes, per crate—	
Bay	$1.00@1.50
Potatoes—	
Garnet Chile, on street	None
Whites	$1.65@1.90
Sweets, per sack	3.25@3.50
Onions—	
River Reds	None
Yellows	75c@$1.00
Australian Browns	75c@$1.00
Garlic, new	15@20c
Green corn, Alameda, per sack	Nominal
Okra, box	$1.00@1.25

BEANS.

The bean market continues weak, with lower quotations on all active descriptions. Cranberry beans appear to be the weakest of the list and are quoted at a decline of 50c.

Bayos, per ctl	$7.25@7.50
Blackeyes, new crop	6.25@6.40
Cranberry beans	8.50@8.75
Limas (south, recleaned), new crop	$10.50
Pinks	$6.80@7.00
Red kidneys	Nominal
Mexican Reds	$7.00@7.25
Tepary beans	6.25@6.50
Garbanzos	8.00@8.75
Large whites, new crop	8.25@8.40
Small whites, new crop	9.40@9.60

POULTRY.

The poultry market is steady, with demand good. The arrival of two carloads of Eastern poultry, mostly hens, tended to bring quotations on this description to a lower figure. It is conceded that last week's quotation was abnormal, but it was maintained by the abnormal demand. Fryers were particularly strong this week, as they were scarce.

Turkeys, live, young spring, lb	32@35c
do, old	32@33c
do, dressed, old	40@42c
Broilers, 1½ to 2 lbs	39@42c
do, 1¼ lbs	45c
do, ¾ to 1¼ lbs	48c
Fryers	38c
Hens, extra, per lb, colored	40c
do, Leghorn	40c
Smooth young roosters, per lb. (3 lbs. and over)	37@38c
Old roosters, colored, per lb	24c
Geese, young, per lb	27@28c
do, old, per lb	25c
Squabs, per lb	55@60c
Ducks	29@30c
do, old	25@27c
Belgian hares	27@28c
Jack rabbits	$2.50@3.00

BUTTER.

The butter quotation on Monday was placed a cent lower than the previous week. Liberal withdrawals from storage have been going on this week and the storage holdings are reported to be at a lower ebb than any other period this season. Consumers have been cutting down purchases and this is having an effect.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	60	60	60	59	..	59
Prime first	59	59	59	Nom.	..	..
Firsts	58	58	58	Nom.	..	..

EGGS.

Eggs have apparently reached about the top of the market for the present. After a steady advance in price for several weeks, extras touched 88c and remained there three days. Then a quotation of 88½c was made and the next day the price fell off 2c. The high price was again reached on Monday of this week, but today the price receded to 88c. Eggs are moving out of storage in larger quantity than for some time past and the consuming public is evidently learning of the great difference in prices. Eggs from Kansas and Iowa are coming freely to this market, nearly half the receipts here coming from those States.

	Thu.	Fri.	Mon.	Tu.	Wed.
Extras	88½	88½	88½	..	88
Extra 1sts			Nominal		
Firsts			Nominal		
Extra pullets	79½	78	79½	..	78½

CHEESE.

Oregon triplets fancy again showed weakness as the trade turned to the California descriptions. California cheddar is again quoted and both fancy and first California flats show advances in prices. The market as a whole is strong.

California Cheddar, flats, fancy	32c
Fancy California flats, per lb	31½c
First California flats, per lb	23½c
California Y. A. fancy	Nominal
Oregon triplets, fancy	36c
Oregon Y. A. fancy	Nominal
Monterey cheese	24@27c

FRESH FRUITS.

Business was very quiet, but receipts were light and prices were maintained. The berry market is about over, and only a few berries have been received since the rains of Sunday. What has come in has not been of prime quality.

Apples	$1.50@2.50
Peaches, 4-box crate	None
Figs, black, per box	None
do, double layer	Nominal
do, Single Row Whites	Nominal
Strawberries, per chest	$10.00@13.00
Blackberries, per chest	None
Raspberries, per chest	$9.00@12.00
Plums	Nominal
Cantaloupes, flats	None
do, ponies	Nominal
do, standard	Nominal
Watermelons, per lb	Nominal
Pears, Bartlett, per box	$1.50@2.00
Grapes, Tokay	2.00@2.50
do, Muscat	2.25@2.50
Persimmons	1.00@1.50
Alligator Pears	3.50@4.00
Cal	1.00@1.25
Pomegranates, per box	$1.50

CITRUS FRUITS.

Grapefruit is now coming in in greater quantity. The quality is reported excellent. Quotations were marked down a dollar, with the assurance that another week or ten days will see them go down another dollar. Lemons are still held at the high prices of last week. The old stock oranges are held at previous high prices and few sales are made. At a wholesale quotation of $12.50, people cannot buy except where oranges are needed by the sick.

Oranges	$12.50
Lemons, fancy	9.00
do, choice	7.50
do, standard	6.50
Grapefruit	Nominal
Grapefruit, new	$3.00@5.00

DRIED FRUITS.

The dried fruit market continues firm with unchanged quotations, except in the case of apples, which are lower. Growers are being offered 13c to 14c and the tendency seems downward, as the stock is difficult to dispose of in the face of lower prices in the East.

RICE.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop, at mill	7.00

HONEY.

Some honey continues to be received from California beemen, and the market continues unchanged.

HIDES.

Wet Salted Hides—Taken off from August 1 to September 1, all weights: No. 1, 19c; No. 2, 17c; No. 3, 15c; bulls and stags, No. 1, 15c; No. 2, 13c; kips, No. 1, 21c; No. 2, 19c; calf, under 15 lbs. No. 1, 33c; No. 2, 31c.

Horse—Dry, per lb.: No. 7, large, $2.25@2.50; medium, $1.75@2.25; small, $1.00@1.50; salted, $3.00@5.00; colts, 25@75c

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, November 5, 1918.

During the past week the quality of the grapes offered for sale in most of the Eastern markets showed considerable weakness as compared to the week previous and this class of stock met with sluggish sale and distribution to the consumer. Good, hard-keeping stock, however, met a sharp demand on an advancing market. In fact, the highest sales of the season ruled in Atlantic seaboard markets during this past week on fancy fruit.

There seems to be hesitancy on the part of the trade to take hold of grapes packed in sawdust, as most of the stock was packed after the rain and the condition on opening has been found to be only fair.

Despite the fact that the bulk of the grape crop has been packed in crates, there seems to be an increasing demand and preference for lugs. What effect this will have upon the general output next season cannot be determined at this time, but this style of package has met with favor among the trade during the past few weeks.

The shipments en route are very light and the season can now be considered as practically closed, with a few straggling cars from districts that have not been affected by the rains.

Averages for the week:

New York: Grapes—Emperor, kegs $4.10, drums $5.14, crates $2.14; Malaga, $1.83; Muscat, $1.48; Tokay, $1.68; Cornichon, $2.25; Alicante Bouchet, $1.81. Pears—B. Clairgeau, $4.16; Winter Nelis, $2.33; E. Buerre, $3.12; Glout Morceau, $3.55.

Chicago: Grapes—Emperor, $1.74; Cornichon, $1.89; Malaga, $1.81; Tokay, $1.70. Pears—Winter Nelis, $2.70.

Boston: Grapes—Tokay, $2.18; Cornichon, $2.49; Malaga, $2.12; Emperors, crates $2.41, drums $5.65; Zinfandels, $1.55. Pears—Glout Morceau, $3.32; Winter Nelis, $2.77; B. Clairgeau, $4.80.

Shipments from October 25 to November 2, inclusive: 57 pears, 1680 grapes. Shipments to date, 1918: 24,600 cars (incomplete). Shipments to date, 1917: 22,242 cars.

Special Citrus Market Report

Los Angeles, November 4, 1918.

November marks the end of the Valencia and the beginning of the navel shipping season. Indeed, it closes the old and opens the new citrus year. The past was a year of low production and high prices. The output of navel oranges in Southern California, the principal source of supply, was 20 per cent, and of Valencias 40 per cent of the previous year's shipments. Had the monetary returns been more evenly distributed, the season would have been very satisfactory to the growers. It is reported that $10 a box became the average price level on Valencias in Eastern markets, and a few fancy lots brought over $19.

Picking and packing of the new season's navels have already started in the protected nooks of Tulare county's foothills—about two weeks earlier than usual. The quality of the new fruit is excellent. Orchard crop sales are reported on a basis of 5c to 5½c a pound spot cash on trees. A good-looking holiday market is in sight, but it will be some weeks before the new price situation is disclosed.

The lemon market continues strong. While the supply is good, the prevalence of the influenza stimulates the demand,

LOS ANGELES

Los Angeles, November 5, 1918.

BUTTER.

Under light receipts prices held steady and demand very good to the extent of the supply. Receipts for the week were 207,600 pounds, against 292,400 pounds the same week last year. To meet this shortage there was withdrawn from cold storage during the week 48,998 pounds, leaving the cold storage holdings now 201,995 pounds, against 186,389 pounds the same week last year. A good rain was had Sunday night throughout the northern half of California and consequently Monday prices were lowered 1c.

We quote—

1917—						
Extra	45	44	44	44	44	44

EGGS.

The snap was out of this market the past week. The extreme high prices causing a falling off in consumption. But under the continued light receipts prices held steady. Receipts of fresh eggs for the week were 2030 cases, against 2170 cases the same week last year. To meet this shortage there was taken from cold storage during the week 9746 cases, against 4123 cases the same week last year. The cold storage holdings are now down to 42,410 cases, against 34,186 cases the same week last year. At the high prices now prevailing the consumption is light and prices are kept up by the scarcity.

VEGETABLES.

Lighter offerings the past week caused a firmer market for many vegetables. Potatoes and onions are both a little higher. Celery coming in slowly and sharply higher. Tomatoes firm and the best in fair demand. Lima beans coming in less freely and higher and demand fair. String beans unchanged, but sales slow. Sweet potatoes continued dull. Cabbage steady. Peppers higher and in fair demand.

We quote from growers:
Bell peppers, per lb..................3@4c
Chile peppers, per lb.................3@4c
String beans, per lb..................5@6c
Lima beans............................4½@5c
Potatoes, northern, per cwt.....$2.00@2.25

Sweet potatoes, per cwt......... 1.25@1.40
Garlic, per lb.........................20c
Onions—
Australian Brown, per cwt....$1.35@1.40
White Globe, per cwt.......... 1.75@2.25
Cabbage, per 100 lbs............ 1.00@1.25
Celery, crate................... 3.50@4.00
Tomatoes, No. 1, lug.................70@80c
do, No. 2, lug.......................25@35c

POULTRY.

Not much coming in and the demand the past week was equal to the supply. Young stuff showed no change, but hens were higher all around under an improved demand. Turkeys in fair demand and steady. But few ducks and geese coming in and but few wanted.

The following prices were agreed upon last Friday, November 1, and hold good until the coming Friday:
Broilers, 1@1¼ lbs......................41c
Broilers, 1½@1¾ lbs.....................41c
Fryers, 2@3 lbs.........................33c
Roasters (soft bone), 3 lbs. and up....30c
Stags and old roosters, per lb..........20c
Hens...............................26@32c
Tom turkeys........................31@34c
Ducks..............................22@28c
Geese...................................15c

MELONS

There were fair offerings of watermelons and casabas, but as the weather was much cooler they were slow sale. The season is fast drawing to a close.

We quote from growers:
Casabas, per lb.....................1@1¼c
Watermelons, per 100 lbs.............50@75c
Honeydew melons, jumbo crate..$2.75@3.00

BEANS.

There were more bean offerings the past week and the market is being hurt by the influenza. Buyers of all kinds hold back and a lower market prevailed for everything. Limas were in most request and they were in moderate demand only.

We quote from growers—
Limas, per cwt.......................$10.00
Large white, per cwt.................. 9.00
Small white, per cwt.................. 8.00
Pink, per cwt......................... 6.50
Tepary, per cwt....................... 4.50
Blackeyes, per cwt.................... 5.00

FRUITS.

The tone of the market the past week was firm. Apples made up most of the offerings and were in very good demand. Pears pretty much out of the market; only cold storage offering. Grapes, too, are getting scarcer and market higher, and demand good for what coming in. Figs, too, are higher under scarcity. Quinces steady but slow sale. Pomegranates steady and in fair demand. Guavas steady but dull. Japanese persimmons coming in more freely and meeting with fair sale.

We quote from growers:
Figs, Black Spanish, per lb...........7@9c
do, White, per lb.....................7@9c
Pears, local, per lb..................4@5c
Pears, Mountain.....................4@6½c
Grapes—
Malagas, per lb.......................5@6c
do, Rose Peru, per lb.................5@6c
Tokay, per lb.........................5@6c
Cornichon...........................4@4½c
Apples—
King Davids, 4-tier..................$2.75
Black Twigs, 4-tier................... 2.75
Baldwins, 4-tier...................... 2.00
Red Pearmains, 4-tier................. 1.75
White Pearmains, 4-tier............... 1.75
Rhode Island Greenings, 4-tier........ 1.50
Yellow Newtown Pippins, 4-tier........ 1.75
Apples, Bellefleur, 4-tier.......$1.65@1.75
do, 3½-tier.................... 1.70@1.80
do, Gravenstein, 4-tier............... 2.25

BERRIES.

Prices remain unchanged from a week ago. Very few coming in. But what arriving found fair sale.

We quote from growers:
Strawberries—
Fancy, per 30-basket crate.....$3.50@4.00
Poor to choice, 30-basket crate. 2.50@3.00
Raspberries, 30-basket crate..... 5.50@6.50

WALNUTS.

There is no change in this market from a week ago. Only a few are to be had from first hands from independent growers. The Association is still working on its contracts and shipped out the past week about thirty cars a day.

We quote f. o. b. California points:

	1918	1917
Fancy budded	34½c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

HAY.

Cooler weather the past week caused an increased consumption and alfalfa met with a good demand at last week's prices. Receipts only fair and they were disposed of without much trouble. Grain hay continues slow sale but steady.

We quote f. o. b. Los Angeles:
Barley hay, per ton..........$23.00@24.00
Oat hay, per ton............. 25.00@27.00
Alfalfa, northern, per ton... 20.00@21.00
Alfalfa, local, per ton...... 21.00@23.00
Straw, per ton................ 9.00@10.00

COTTON.

October settlements out of the way, the market the past week opened lower with Liverpool and the South both selling. Trading, too, was rather of the cautious kind most of the week. The current week opened more active under the prospect of an early peace. Towards the close of the week some of the early advance was lost on profit taking. December finished in New York Tuesday at 28.96c, and January at 28.23c. In New Orleans December closed at 28.14c and January at 27.45c.

Special Livestock Market Report

San Francisco, November 6, 1918.

CATTLE—The cattle supply still comes from California and Nevada mountain points, Oregon having ceased to ship to this market, except occasional odd lots.
Grass Steers—
No. 1, weighing 1000@1200 lbs.12¼@12½c
do, weighing 1200@1400 lbs.....12@12¼c
do, second quality...............10½@11c
do, thin...............................8@9c
Cows and heifers—
No. 1...............................8@8¼c
do, second quality..................7@7½c
do, common to thin....................5@6c
Bulls and stags—
Good..................................6@7c
Fair..................................5@6c
Thin..................................4@5c
Calves—
Lightweight............................11c
Medium.................................10c
Heavy...............................8@8½c

SHEEP—The market is unchanged. The demand is small and sheep raisers are apathetic about selling on account of the high wool market.
Lambs—
Yearlings..........................12@12½c
Milk...............................14@14½c
Sheep—
Wethers............................11½@12c
Ewes................................9@9¼c

HOGS—Hogs continue to come in freely, as more are being taken. Help conditions are improving, so much so that it is thought all arrivals can be handled next week. It is reported that the Moran Packing Co. will open up in South San Francisco next week, which will furnish another outlet for offerings in this line.
Hard, grain-fed, 100@140...............16c
do, do, 140@250......................16½c
do, do, 250@325......................15½c

Los Angeles, November 5, 1918.

CATTLE—Choice fed steers continue scarce and in very good demand and the market for them is firm. A good many poor and medium cattle are still being offered, though they are not being pressed upon the market hardly so strong as a week ago.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers........ 8.00@ 9.00
Good cows and heifers......... 7.00@ 7.50
Canners, per cwt.............. 5.50@ 6.00
Calves, per cwt............... 8.50@10.00

HOGS—The run of hogs to market the past week was only fair. Yet the offerings were ample for the demand. Prices, however, remain steady.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 275@300 lbs..$15.00@16.00
Mixed, 225@275 lbs.......... 15.50@16.50
Light, 175@220 lbs.......... 16.00@17.00
Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—But few offering the past week and under scarcity the tone of the market was firm. Wethers were especially scarce and killers bid them up $1 per cwt. and then they got but few.

Per cwt. f. o. b. Los Angeles—
Prime wethers.................$9.00@10.00
Prime ewes.................... 8.50@ 9.50
Yearlings..................... 9.50@10.50
Lambs........................15.00@16.00

Sure to Hit You Somewhere

A new minister, preaching in a town near where horse races were being held, forcibly denounced the "sport of kings." The principal patron of the church was known to play the ponies, and of this the minister was afterwards informed. Not wishing to offend the wealthy one, he went to him and said: "I am afraid I touched one of your weaknesses, but it was quite unintentional, I assure you." "Oh, don't mention it," cheerfully replied the millionaire, "it's a mighty poor sermon that doesn't hit me somewhere."

And you, Mr. Reader, will find it a pretty poor issue of the Rural Press that doesn't hit you somewhere. Take this one, for example. It is supposed to be devoted to the San Francisco Show, yet see how much else we have crowded into its pages. Mr. Hodges describes successful methods already in operation for the bulk handling of grain. Mr. Fox gives practical suggestions on the pruning of the Sultanina (Thompson), on the use of caustic sprays, and on starting an orchard. The rice situation is ably covered. Mr. Whitten not only tells when to have heifers freshen, but gives the results of various experiments, together with the conclusions drawn.

Read every one of these instructive articles, and the many short ones that are just as helpful. Let them soak in. A man said to his pastor: "I have been through the Bible five times this year." "Good," replied the pastor, "but how often has the Bible been through you?" Only when these articles go through you will you get the benefit intended. Digest them thoroughly.

And prepare for a treat next week. The issue will be crammed full of big features—plans and suggestions that you can put right to work to swell your bank accounts.

Portland, November 5, 1918.

CATTLE—Steady; receipts, 318; steers, prime, $12.00@12.50; good to choice, $11.00@12.00; medium to good, $9.75@11.00; fair to medium, $8.25@9.25; common to fair, $5.75@8.25. Cows and heifers: Choice, $8.00@8.50; medium to good, $5.75@7.25; fair to medium, $4.75@5.75; canners, $3.00@4.00; bulls, $5.00@7.00. Calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—Steady; receipts, 367; prime mixed, $16.70@17.75; medium mixed, $17.00@17.25; rough heavies, $15.50@15.75; pigs, $14.00@15.00; bulk of sales, $17.35@17.40.

SHEEP—Steady; receipts, 14; prime lambs, $11.50@12.50; fair to medium, $8.50@10.50; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@8.50.

Applying Win-the-War Policy to the Automobile

A Letter to Overland Dealers:

Toledo, Ohio, Oct. 1st, 1918

OUR first consideration, as it is yours—and that of every right thinking citizen—is "win-the-war."

Immediately following the American Declaration of War, we offered our production capacity, and the Government is using a very large part of it.

We are ready if need be to devote it entirely to war work.

The Automobile Industry as a whole is on a similar win-the-war basis.

We are building only a limited quantity of automobiles.

How many cars conditions will permit us to build for any future period is problematical—dependent wholly upon the urgency of war needs.

Any existing transportation must be used to its fullest capacity in order to increase the diminishing manpower of our home forces.

The total output of automobiles is fast becoming insufficient to replace cars wearing out in service.

And fewer cars rather than more is the production outlook.

With "win-the-war" our first consideration—and yours—this condition places a responsibility upon us which we are bound to fulfill.

* * * *

Because it has assumed its transportation burdens so gradually few realize the extent to which the automobile is performing essential service.

—so essential that the rest of the system, railroads, trolleys and every other means of transportation that could be pressed into service, would be wholly inadequate quickly to assume the load were automobiles suddenly not available for the performance of their usual service.

In even so essential a matter as our food supply the automobile is a most important factor.

MY war-time conception of the automobile is that it is simply a given number of miles of rapid transportation.

It goes into service as a unit of our national transportation system.

In placing our restricted output of these units of our national transportation system in the hands of individuals, I want our distributors and dealers to discern the uses to which they will be put and to place each unit where it will best serve in the winning of the war.

Willys.
President

Few realize that over half the automobiles now in use are owned by and serve the people of the farms upon whom we and our Allies are dependent for food.

Farm labor is already scarce.

Lack of automobiles to serve our farmers would mean a loss of untold hours of productive farm labor.

Lack of automobiles to serve our loyal industrial workers would seriously hamper our industrial efficiency.

Lack of automobiles for those who direct and serve our essential workers would hamper our national efficiency as a people.

* * * *

It is time for public appreciation of the fact that every mile that an automobile is driven needlessly is a mile of wasted transportation that ultimately may be needed for essential service.

It is time for public understanding that these smaller units of our transportation system should be used and maintained with the same thought for national needs as we demand in the use and maintenance of our larger units of transportation.

Failure on our part to take every means available for us to inform the public concerning the importance of this matter would be neglecting an opportunity to perform a valuable public service and a failure to live up to our win-the-war policy in a vital respect.

Let us, as automobile manufacturers, and you, as automobile dealers, put ourselves on a one-hundred-percent win-the-war basis.

Let us to the full extent of our influence put the war-importance of the automobile fully before the public—you in your contact with the public—we in the public print.

Let us to the fullest extent realize that when we sell an automobile we are in reality selling miles of transportation—placing a unit of our national transportation system in the service of an individual.

Let us intelligently discern the uses to which it will be put and place each unit where it will best serve in the winning of the war.

In this spirit of full co-operation we can bring about a fuller understanding and appreciation of the situation and its trend, and perform a service of value to the whole people.

A Fruit Tree Will Starve Its Fruit to Feed Its Leaves!

Written for Pacific Rural Press by John J. Fox

IN OUR ISSUE of October 12 we published a portion of a letter from Dr. J. C. Whitton outlining the fact that the fruit of a tree was the first to suffer from drouth. Dr. Whitton is now installed as head of the division of pomology in the University and recently recounted to the writer how the foregoing fact first came to his attention and how it was verified by orchard observation and laboratory experiments. It is a matter of fundamental and practical importance to the California fruit grower.

THESE OBSERVATIONS account for much fruit-dropping; also for the fact that inferior fruit may have a great leafy environment; also shows why diligent cultivation may grow leaves at the cost of fruit, and why early wood growth may increase the autumn strain upon the tree.

A Fruit Grower Sends an S. O. S. Call.

A few years ago a peach grower in the Ozark Mountains of Missouri wrote to Dr. Whitton that his peach trees had set a heavy crop of fruit. The soil was not drouth-resistant and the previous winter had been a dry one—could anything be done to help the trees carry the fruit through?

The reply sent was that the only suggestion to be offered was to keep the cultivator going right up to harvest. Later, another letter came from the grower saying that he had followed Dr. Whitton's advice and was cultivating 110 acres of his peaches and had to let the other 50 acres go, as it was more than he could keep going with his teams and tools. Weeds grew up on the 50 acres and were simply mowed down and allowed to lie on the ground as a mulch. The soil was a thin, gravelly, red clay-loam, and not calculated to inspire the owner to great effort.

A Forsaken Portion Rescues Itself.

There was some surprise and dismay when another letter came to say that the 110-acre orchard that had been duly cultivated was drooping its leaves and the fruit was small and poor, though it did mature and was sold; but the 50 acres that had been neglected showed no signs of suffering and was carrying good fruit. There was but one thing for Dr. Whitton to do and that was to promptly go and investigate for himself—which he did. He went into that orchard at all hours of the day — at night going through it with a lantern to note any variation of condition. Then he sent for a trained man from his staff to come and camp in the orchard.

Diligent cultivation and scientific pruning make for symmetry of orchard stand and heavy fruitage.

The first thing to be found out was that the leaves were turgid and strong in the early morning. Then the fruit began to turn dull and shrivelly by 11 in the morning; the leaves losing lustre and drooping in the afternoon. As soon as evaporation ceased, the leaves and fruit would gradually revive during the night.

A good-sized branch was cut off and hung up in the sun with all the fruit and leaves on. The leaves stayed green until the fruit was exhausted of moisture clear to the pit and then they cured green like alfalfa hay. Another branch was hung up with all the fruit picked off. The leaves wilted, shriveled and turned yellow the first day, and at the end of three days they were brittle and brown. The cut branch with the fruit on kept its leaves as fresh as those growing on the tree till the peaches were practically dry. The two branches chosen for this first test each contained a similar number of fruits and leaves.

When the Fruit Draws from the Leaves.

This was the first of a series of experiments carried along the same lines and it was always found that the leaves, when the tree was short of water, began to draw sap from the fruit. But when ripening begins to take place the fruit draws moisture from the leaves—just the opposite way. To account for this Dr. Whitton made sap tests. It was found that the sap of green fruit is less concentrated than the sap of the leaves, while the sap of ripe fruit is more concentrated than that of leaves. According to well-known principles, the movement of water is in the direction of the more concentrated juices. Consequently, as soon as the fruit begins to sugar up, it draws the less concentrated juice from the leaves.

Now comes the explanation of why the 110 acres drooped, though it received such good care, while the neglected 50 acres pulled through. The larger area, by cultivation, had put on a strong growth of young, tender wood. The increased leaf area had itself taken a certain amount of water to produce and had doubled the amount of evaporation through its additional foliage. On the other hand, the 50 acres of neglected orchard had made only normal growth, only strong terminal buds starting, and because wood growth was practically at a standstill the trees managed to pull through without distress.

Californians Had Caught the Wireless.

An interesting incident in connection with this demonstration is that Dr. Whitton found that Professors Coit and Hodgson of the University of California had been working at the same thing and had made an important contribution to our knowledge of the cause and prevention of June-drop of oranges. Their extended investigations, covering years of work under California conditions, indicate that the knowledge obtained may be of especial importance in this State. He cites the fact also that approved California pruning practice proceeds upon a recognition of the fact, though it does not involve the explanation which has now been made. This is shown by the fact that Professor Wickson, in his "California Fruits," emphasizes the desirability of the removal of surplus evaporating surface under certain conditions as a principle in pruning. The knowledge that the leaves can pull the water out of green, growing fruit is, however, only one single reason for observing broader principles and practices which have heretofore been observed in maintaining proper balance of moisture and evaporating surface of the tree.

Suggestions for Rescue Practices.

The above story explains why a cherry tree or any other summer bearing tree always picks up and looks refreshed after the fruit is off. Cherries and apricots both show it very strongly. It is also a very valuable lesson because it demonstrates very clearly one reason why sucker wood and other unnecessary or undesirable growth should be removed and kept out of the trees—particularly of a dry year.

There is no doubt that it would pay well to give the young orchards a little more personal attention during the summer than they have been having. Much time could be saved by preventing sucker growth instead of letting it grow as big around as your thumb and then cutting it off. Fruit wood could be added to in trees just coming into bearing by pinching in the summer shoots that may have to be cut clear off if left. We are thinking of prunes and apricots at this moment, though the above suggestions apply to other fruits, too.

This knowledge would also indicate that after a very dry season our apricots should be cut harder than usual after the crop is off. These things have to be done according to individual judgment, however, because overdoing the thing would induce an excess of wood growth, which we want to avoid. Never make a cut without good reason. The hand of a good pruner instinctively gravitates to the right point.

EDITORIALS

IT IS OVER—OVER THERE!

BY UNANIMOUS vote of a newly-evolved judicial class, the "up-to-date historians," what they describe as the greatest war of all the ages closed "on November 11 at 6 a. m., Paris time" by unconditional surrender of the German Empire—even the last comforting thought of surrendering by Berlin time being denied to the Teutonic nucleus of the most gigantic conspiracy for world dominion which fragments of the human race have ever conceived. We use the term "nucleus" advisedly, for its most outstanding dictionary definition is "the head of a comet"—and the last word advisedly also, for a comet is "an erratic body with a luminous tail," as is justified by the account which says the kaiser "flew across the border into Holland, smoking a cigarette"! Therefore, we exclaim, "Sic transit falsa gloria mundi," which may be liberally translated: the greatest fake of recorded time dissolved in smoke at six on Monday morning, by the transit of the Paris observatory, and was followed by the most glorious sunrise with which sunny France has ever illumined the world! Sic semper tyrannis! Gloria in excelsis Deo!

* * *

WHAT WE MUST REMEMBER.

IN THE relief which comes to the soul through escape from four and a quarter years of the most intense indignation at outrageous wrongs and of suffering and sacrifice for high-born purpose, it is irresistible to mingle thoughts and words pertaining to emotions the lightest and the most profound. That is the natural way with the human soul. The official announcement which awakened the people of the United States when the clock struck ten on the Atlantic Coast and one on the Pacific had a geographical diversity attributable to the slow axial movement of the earth. Happily the lightning flash serves the mind of man better than planetary movement and the American nation awoke simultaneously throughout the whole length and breadth of it to outbursts of laughter and of tears, for both are natural expressions of all the profoundest emotions. Both laughter and tears will continue through the lifetime of this generation as expressive of the human sense of the plight into which the world was hurled in our day and the glory of the escape from it through the sanity and sacrifice of the world's devotion to the highest things! In future generations the laughter will be hushed and the tears will be wiped away and some poet will sing, in profoundest glorification and rejoicing, a new epic—a new victory of Jehovah over Beelzebub in the conflict which began, for mankind at least, at creation's dawn and will endure with constantly increasing triumphs for the Right until "the heavens shall be rolled together as a scroll * * * and sorrow and sighing shall flee away."

But while we of this generation stand in laughter and in tears under the effulgence of our anticipation of this supreme event for mankind and while the exemplars of American liberty in France dip their colors in a tribute to the token of French liberty in America, whose flaming torch in New York harbor gleams now in new enlightenment of the world, there is an elementary thing which we must not forget, and that is that German military autocracy attempted by most heinous crimes and outrages the subjugation of mankind for their own selfish purposes and profanely claimed God Himself a participator in their perfidy and crime. It is not for men to fully rebuke and requite them, but this generation will be accursed by its posterity if it does not hold all who participated in the imperial conspiracy for world robbery and slavery or who drank themselves full of the greed, conceit and stupidity of the very dream of it, to the fullest personal expiation and national reparation—as their several shares may be. For the responsible leaders there should be condign punishment by legal trial and judgment: from all others, who knowingly abetted them in their devilish purposes, there should be taken all ill-gotten possessions for the requital of those whom they impoverished—while from the stupid proletariat who allowed themselves to be used for the abomination which had been set up as a national ideal, there must be exacted national repayment of wrongs and outrages until they realize that the "gott mit uns" of their impious profanation was an insult to all that is god-like in mankind and "bring forth fruits meet for repentance."

* * *

WHAT WE MAY FORGET.

BUT THOUGH it is the duty of every American to "carry on" until the fruits of righteous victory are securely garnered and not to relax a single heart-throb of determination until those who planned to enslave the world are purged of their very last longing for evil, we may forget much of the bitterness and hate of our thought and expression while we cling to the indispensable principle of righteous wrath for the spirit and methods of German aggression. It is god-like to abhor the sin and to love the really repentant sinner, which is a safe proceeding for the omnicient because "God is not mocked." We had better leave it to God then to discern and love the repentant, militant German—if He can. During the armistice and the planning of peace it will be better for us to watch him and all his kind. But we may forget that we ever declared a purpose to destroy. We may even release Satan from the danger of hospitality to the kaiser in view of his protest against our putting one over on him—and yet what shall we do with the outcast abhorred of earth? As we write on Tuesday it is reported that Holland still holds him smoking on its outer wall! Satan himself could not do better.

All this is given as a sample of what we may forget. It is, we hope, our last denunciation of the German, for in spite of his abominations he is still a man and brother and we must live with him and draw him with us into the better world which we have achieved by shooting light into him. We can henceforward refrain from denunciation, perhaps, because we hold no brief for statesmanship and world-polity. Our license is to preach only farming and all that the word implies, and there will be plenty of that in the changed conditions which the world victory over tyranny will induce and enforce. And yet we can go so far in stating a world motive to endorse what President Wilson said on Monday in announcing the end of the war:

My Fellow Countrymen: The armistice was signed this morning. Everything for which America fought has been accomplished. It will now be our fortunate duty to assist by example, by sober friendly counsel and by material aid in the establishment of just democracy throughout the world.—Woodrow Wilson.

We may then forget the asperities of the war which we have won, because it is the fruits of the war that we must ripen and guard with all our might. But we can never forget the evil which the war arraigned and punished. To forget that would be an admission that our heroes had died in vain and that our invaded and devastated European defending peoples had suffered and sacrificed to no purpose. Never that—but still there are things which, in the common interest of humanity and its advancement to a better heritage, we may forget. What they are it is not for us to prescribe: it is rather the duty of every conscience, newly quickened to the true needs of humanity, to dictate such things to its fortunate possessor.

* * *

RECONSTRUCTION.

THE WORLD will now pass from destruction to reconstruction and our part of that is exhortation to effort to more properly place agriculture among the callings of mankind. As we have recently claimed in other connections in these columns, the world mind is awakened to the fundamental relations of an enlightened and self-conscious body of food producers to the prosperity of all peoples. If those who are giving their lives to farming allow this occasion for reforming such relations to pass without impression of just arrangements upon the mellow world mind, one of two things is likely to happen: either the old popular injustice to farming will return in hardened and multiplied discriminations or a new swirl of socialistic vagaries and visions will hurl American farming from its old foundations of personal endeavor and responsibility upon the shifting sands of economic fallacy and social anarchy. But is not the same alternative facing all Americn industries at this time? the reader may ask. Possibly, we answer, but it is not for us to speak for all. We only speak for our part of them and say with conviction that between the far extremes of riveting machines of monopolistic trade, capital mongering and labor exaction on the one hand and of paternalistic and nationalistic confusion on the other, Americn farming is in dire danger of losing its hold upon the principles of independence and self-determination which have achieved its greatness and constituted the American farmers the dependable bulwark of our wonderful industrial development. But again says the reader: is not this also a world problem for all industries? In the present flux of affairs are not all industries liable to fall more deeply than ever into the jaws of monopolistic control or to be spewed out by conquering disorder upon a howling wilderness of Bolshevism? And again we answer: possibly, but we speak only for our own.

* * *

A NEW AUTOCRACY OF DISTRIBUTION.

EUROPEAN reconstruction is imminent and is likely to engross public attention. American reconstruction is a matter which should not be overlooked by American farmers and such reconstruction must either install the American farmers in control of production and sale of their products or it will throw them into the economic jail of distribution by vast incorporated middlemen. A reader of the Rural Press who has seen a glad-hand announcement of a large Eastern packing establishment sends us this note:

To the Editor: I am sending you a booklet and circular of a packing concern which seems to be straight propaganda of a distributing agency somewhat camouflaged as philanthropic extension work, and proposing to issue in the public interest "unbiased reports." When I consider the fact that the distributing agencies of these great monster corporations are rapidly gaining control of evaporated milk, cheese, butter, poultry, eggs, rice, rolled oats, sauerkraut, grape juice, vegetables, and to a large extent canned fruits, I am wondering whether it is good for the people's food supply to be subject to control by such large private corporations. If this thing continues, we will soon of necessity have to buy everything we eat, except fresh milk and a few things, through the packing corporations.—Constant Reader, San Francisco.

Our reader approaches the problem from the consumer's side, but his insight illumines also the aspect which the food producer must contemplate. If a vast corporation, or several of them, gain control of the consuming side as our correspondent fears, it must also close to producers all avenues to selling except that which it offers, and that means slavery to the producer. Evidently our great corporations have learned much by the war and are marching out briskly toward reconstruction on their own lines!

* * *

BETWEEN DEVIL AND DEEP SEA.

ALTHOUGH the "old boy," according to current reports, will brook no partnership with the kaiser for fear of a freeze-out, he seems to have no reluctance in taking the farmer into his hot-box for better or for worse. There is just one way the farmer can get the better of it and that is by co-operation. This is the only way the

food producer can protect himself against oppression by great distributing corporations—such as the one to whose propaganda our reader calls our attention. Food producers must organize not only to produce but ultimately to pack and distribute the product, as the current experience of our citrus, raisin, walnut, prune and other associations amply demonstrates. But before this is attained they must organize even to regulate the movement of their raw products to packing corporations, or they will be ground down to living expenses—with all profits taken away from them. On another page of this issue there is a most important statement by Frank T. Swett, president of the Pear Growers' Association, which gives accurate demonstration of what has been gained by the associated growers of that fruit through presenting a firm front to those who needed pears in their business. No matter how much public good packing and distributing corporations may do, and we are not denying their claims to public service nor disputing their right to do a profitable business, the original producers of the materials they need must qualify themselves to trade with them on a fair basis of profit to him to whom profit is due and on no other basis. If they do not it will be the deep blue sea for all their producing enterprises.

WHO CAN RECONSTRUCT FARMING?

WE HAVE cited a suggestion that farming can be so reconstructed that it will find itself in a reinforced concrete jail instead of the old stockade in which country storekeepers and bankers used to imprison it—and of course the new corporate construction affords less chance of breaking out. The opposite danger in reconstruction which we have hinted at is that which will surely result to American agriculture if blown about by too much paternalism and communism—of which we have no space for discussion at this time. If such policies will destroy the distinctive character of American farming, who can reconstruct it in such a way that earlier achievement shall be developed into the greater accomplishment which the present and the future demand? Obviously it must be advanced by internal forces—farming must be carried forward by joint effort of farmers.

We have harped on this string for some time. We have exhorted the different groups of co-operators to co-operate to secure the general things which agricultural reconstruction under new conditions requires. We do not seem to be accomplishing much: each group seems to prefer to get in a corner and co-operate by itself! This being the case, we are disposed to exalt and impress an opportunity for delegated representation and some joint action for agricultural solidarity which was mentioned on page 505 of our issue of November 9. The California Farmers' Union will issue a call to all other farming organizations to send delegates to a joint meeting which will be held in Modesto on December 3 to 5 next. There are a good many things about this invitation which commend it to our judgment as entitled to wide consideration. California farmers must co-operate to reconstruct: why not start in at Modesto?

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

More About Rye Grasses.

To the Editor: In your answer to "rye and rye grass," in your issue of November 2, I notice you say that English and Italian rye grasses "live from year to year." In England, English rye grass only is used on permanent pastures and there it extends in forming a sod. Italian rye grass is considered a biennial and is only used as a rotation crop sown with crimson clover (Trifolium camatum). A clover ley is rarely left after two years, as it "runs out" after that and wireworm is generally very bad after a three-year ley. The reason for sowing Italian is that it gives an enormous crop the first year, while in England it takes two years to mow anything appreciable from English rye grass. This clover and rye grass is harrowed in amongst the young wheat or oats in March or April in some parts of England and the herbage produced by harvest time increases the feeding value of the straw. I do not know whether the Italian rye grass is a perennial in California, but it may be.—Britisher, San Francisco.

What you say about the rye grasses in England is interesting, but you will have to forget in California much that you learned in England, just as we have to forget much that we learned in New York State. English rye grass is only a short-lived perennial in those countries—even if the terms are mutually contradictory. Italian rye grass, to continue the term, is a shorter-lived perennial: that is, it is not a "biennial," which is a plant that seeds in the second year and then surely dies. That is the way the two plants stack up in foreign behavior. In California both plants live longer if they have summer moisture enough and both die sooner if they do not. On low lands in California both rye grasses are longer lived than they are in cold, humid climates, and show a disposition to become more properly perennial. Many other plants act that way in California—some plants rated as "annuals" even assuming a perennial habit, in a way. As Italian rye grass does this, it serves us as a perennial (limited) and as it comes more quickly and is more leafy, or less stemy than English rye grass, it is given preference, especially as it seems to them sufficiently "perennial." What you say of raking in rye grass and clover with grain in the spring is a humid climate practice. In most parts of California if you tried that you would not get much grass and might lose the grain from the heads not filling through lack of soil moisture.

Grafting Over Wine Grapes.

To the Editor: I have acquired a property near St. Helena which contains 25 acres of wine grapes. The soil is a deep, rich, heavy loam, but is not bottom land. I would like your opinion as to the feasibility, both horticulturally and from the business standpoint, of grafting these grapes to a raisin or table grape variety. If neither of these are practicable, what would you advise that would require the shortest period to come into profitable bearing?—J. M. B., Willits.

Thrifty wine grape vines can be easily grafted over to raisin and table varieties by anyone who understands the job, and there are such men to be found in all grape districts. It is therefore feasible horticulturally. As for the profitability of enterprises we offer no advice: that is for a man to fight out with his own financial soul. St. Helena is not a raisin district nor is it likely to be commercially, though raisins can be made successfully in most years from the proper grapes. What the chance is of selling table grapes profitably, in view of the amount of grafting over which is likely to be done in well-developed interior table grape districts, is a matter to be carefully looked into. As for other fruit crops than grapes, bush fruits (berries) will come in soonest, but they have problems of their own. All the tree fruits commercially grown in the district will require about five years or more to get around. Of course, we cannot tell you what fruit will pay best. If we could, everybody would plant it and then it wouldn't. You are up against the whole practice and economics of agricultural production; God help you!

Is His Land Too Rich for Limas?

To the Editor: I am desirous of knowing if land that will raise 18,000 pounds of headed and cured milo to the acre will be too rich for Henderson lima beans. I have asked a great number of people the question, but no one has such rich land, perhaps, and I am still at sea. You will say it can't be done (the milo yield), but that is the actual weight over the scales, though, for 3.4 acres, and the balance of five acres was better. Last year five acres went better than 40 sacks per acre and there were lots of poor spots. My motto has been for four years: "Haul something home."—C. E. C., Van Nuys.

It seems to us that we would keep on hauling milo if we could get it at that rate. As you are in the lima belt, you might try Henderson on some of your "poor spots" because they may need the soil improvement which bean roots furnish. We are in the same class as your neighbors—disqualified to answer your question. You will have to try it out for yourself on a small piece and see how the results stack up with the milo—the most of which we would hang on to. A winter hay crop will help you hold the land down for the milo.

Black Scale on Lemon.

To the Editor: I am mailing a sample of scale from our lemon trees. We have three trees in our garden which are yielding a good supply of lemons, but we fear the scale will kill them. At first this black scale was just on the leaves, but it is now growing on the branches, too, and even the fruit. The tree is almost black with it.—R. K. D., Watsonville.

The scale of which a few specimens are on the leaves is the common black scale, but what is much more conspicuous and perhaps is what you mean by "black scale" is the black smut, which is a by-product of the scale insect. Prune out all dead and weak growth so as to open the tree so you can get at all parts of the interior and spray and scrub thoroughly with distillate emulsion. Fumigation is the best treatment, but perhaps hardly practicable for a few garden trees in a place where outfits are not handy.

Patriotism and Profit

You can combine them by joining us in our campaign to help farmers raise more and better crops. We need more men to attend to our renewals and present the paper to those who are not already subscribers. If you have an automobile, can give us your whole time, and think you can present the merits of the paper in a convincing way, let us hear from you. We have an attractive proposition. Pleasant work; straight salary; permanent, with advancement.

Don't let this opportunity pass by.

To Knock Out Fleas.

To the Editor: Please prescribe a good cheap yet effective spray that will clean the barns, pens and yards of fleas. Please answer as soon as you can, as our lives as well as the lives of our animals depend on immediate help.—C. F. W., Paicines.

Tie a sheet of sticky fly paper around each of your legs and then rake up and sweep up all loose litter possible and burn it. Then scatter "flake napthalene," which you can get at the drug stores. It can be used as a liquid by dissolving the flakes in cheap kerosene (as much as the oil will dissolve) and sprinkling the mixture generously around the places overrun with fleas, or throw handfuls of the flakes, just as they come, here and there about the infested places. This has been approved by many as an effective flea killer.

Irrigation for Pear Thrips.

To the Editor: I have been told that if I irrigate my Bartlett pears during this month that it will practically eliminate the pear thrips. Do you know if there is any foundation in fact for this statement? I should be glad of any information you can give. I am familiar with the formula for spraying for the pest, but if flooding the ground in November will do the trick it will beat spraying which is unsatisfactory at the best.—W. E. A., Suisun.

You surely have one on us, but we seriously doubt if you have anything on the thrips. We should say that an insect which can seal itself so snug and warm in its little earthen casket that it can go through ground freezing at the East and ground soaking in California might find a November irrigation not unpleasant. However, who knows anything about it from actual experience?

Cabbage Pests on Kale.

To the Editor: I have a patch of kale that I am using as green food for poultry. It has become infested with highly colored bugs similar in shape to a lady bug; also a long green worm. What can I use to get rid of them that will not be injurious to the chickens?—Subscriber, Cupertino.

You probably have the "harlequin cabbage bug" and the caterpillar of the cabbage butterfly. Kerosene emulsion spray ought to get both of them. You can defoliate the worst infested plants and give the hens both kale and the pests of it. Later growth from the old stem will be too late for these bugs and be ready for lice. The way to get most from kale is to keep on pushing the leaves into the hens.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., November 12, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.60	5.73	6.53	64	40
Red Bluff	...	10.13	3.39	68	38
Sacramento	...	4.44	1.95	68	40
San Francisco	...	4.59	2.18	68	48
San Jose	...	7.12	1.65	68	34
Fresno	...	1.00	1.21	68	40
San Luis Obispo	...	1.75	2.19	80	40

San Diego	.40	1.23	.78	74	46

Pear Growers Gain $228,619 Thru Co-operation

Written for Pacific Rural Press by Frank T. Swett, Manager California Pear Growers' Association

CALIFORNIA'S PEARS are famous over the civilized world wherever a superbly luscious fruit is appreciated. So rapidly is her reputation extending in this line of horticultural preeminence that many new plantings have recently been undertaken and others are in contemplation. At this writing it is estimated that there are about 17,000 acres of bearing pear trees in California. In addition to this there are about 30,000 acres planted but not yet in bearing. In 1917 the crop was about 90,000 tons. In 1927 it is possible that the tonnage may amount to 250,000 tons. Without organization disaster would undoubtedly overtake those engaged in the industry.

In June, 1918, thanks to the volunteer work of many prominent pear growers, assisted and advised by the State Market Commissioner, the California Pear Growers' Association began its work of stabilizing present markets and planning for the future. In 1917, when there was no organization, growers who sold to cannery received from $25 to $40 a ton, a price which in many cases meant a loss instead of a profit.

PRICE SET INSURED FAIR PROFIT TO GROWERS.

In June, 1918, with the requisite acreage signed up, our first work was to ascertain the average cost of production, something that had never been done. Groups of growers from different districts met, and after days of investigation the directors decided to set a price of $70 a ton on No. 1 pears and $35 a ton on No. 2 pears. These figures insured a profit on well-managed orchards. In many sections the pear grower must plow, prune, cultivate, spray from four to seven times, to control the eighteen different insect and fungous pests which afflict pears, in addition to the costs of picking, sorting and hauling. He has to fight pear blight at a cost in some orchards of not less than $30 an acre annually. At the present time he is paying more than twice as much for labor and material as before the war. All these costs have been advancing by leaps and bounds. At the old schedule of prices growers would face bankruptcy.

CANNERS VOLUNTARILY ADVANCE 1918 PRICE $10.00 A TON.

We found that there were about 6000 tons of pears under long-term contracts, made before the war. To relieve these growers a conference was held with a committee of canners, under the auspices of the Food Administration, represented by H. Clay Miller, who acted as a mediator for both parties. The Food Administration has no direct authority over the price of pears. Upon our detailed showing of the advance in costs, the canners generously and voluntarily advanced the 1918 price $10 a ton, making a difference to the growers concerned of $60,000. This enabled them to properly handle their crops and care for their orchards during the year to come. This action of the canners was greatly appreciated by the growers affected.

GOVERNMENT APPROVES PRICE BASIS.

Besides the pears affected by these contracts, over which, of course, the association had no direct control, the association had for sale to canneries about 6000 tons. At first canners hesitated to purchase at the association price, fearing that possibly the Government, which had announced its intention of commandeering 60 per cent of the canned output of pears, might not approve this price and might commandeer at a lower basis. But when we submitted our figures of costs of production to the Government representative on this Coast, he wired Washington that the growers' price was entirely justified both on the basis of cost of production and upon the prospective demand for fresh pears in Eastern markets.

HAD TO DECLINE ORDERS AND PRORATE AMONG CUSTOMERS.

By the end of July we had booked orders for every ton at our disposal, and could have sold a considerably larger tonnage had it been available. Much to our regret, we had to pro rate among canners, and to decline orders from several canners who notified us of their requirements after we were sold out. We hope to supply every cannery in California during the 1919 season. The last two weeks of July and all of August were spent in attending to details of delivery, in inspecting shipments to see if they were up to standard and in expediting the delivery of empty picking boxes to growers.

At the close of the season we had marketed every ton of pears at the full price for the respective grades. In a half dozen cases growers failed to deliver up to specifications. This was due to the carelessness of tenants in shipping wormy or scabby pears. But with these exceptions deliveries were acceptable. This is a good record, for we have 323 members and the results are shown in the panel printed above.

WHAT DID IT COST TO SECURE THESE RESULTS?

1. The unpaid, volunteer work of leading growers who unselfishly gave their time and study to wisely planning an effective organization. They took no pay for their work, which could not have been duplicated for thousands of dollars, for it took days and months of attention and endeavor to convince some of their doubting and ultra timid neighbors.

2. For paid organizers the sum of $2,545 was paid. In June we opened offices in the Consular Building, 510 Battery street, very modest quarters, at the trifling expense of $25 a month. The expenses for the assistant secretary and one stenographer have been less than a total of $300 a month.

The writer deserted his own pear orchard during the season and served from July 1 to September 15. For the whole marketing season, including the work of securing the raise on contract pears and the placing of the 6000 tons of association pears, the manager's salary, if pro rated, would amount to less than 10 cents a ton. So we have been economical.

We have closed the season without the loss of a single cent in bad debts. Nearly all the canners were prompt in payment, in spite of the difficult position of all canneries, owing to the Government directing them to hold half the pack for future delivery, with payments in the dim future. Only one cannery failed in reasonable promptness and this was partly due to the difficulty of their securing accountants to handle their work. This cannery has now settled its accounts with us. Our relations with canners have been friendly. They have been fair with us and we have tried to be equally fair with them.

MAY HANDLE DRIED PEARS IN 1919.

During 1918 it was thought best to confine our work simply to the cannery pears. We did not want to attempt too much the first season. While under our crop contracts we could have handled all the dried pears of all our members, it was thought best by the members this season to market as individuals.

However, the manager made a study of the changing prices on dried pears and answered all inquiries that came in from members. One member informs us that one letter was the means of his getting the full market value for 20 tons of dried pears. At the prices his neighbors sold for the same week, his gain was $600, or 1½c a pound. In 1919 if the members desire we can make adequate preparations for getting full value for every ton of dried pears.

JOINS FEDERATION OF CO-OPERATIVE MARKETING ORGANIZATIONS.

The association has joined the Federation of Co-operative Marketing Associations, which is at work planning for shipping connections, shipping space in steamers equipped with refrigerating rooms, and export connections for a variety of California products.

It is within the bounds of probability that after the war is over there may be found in South America markets for a considerable tonnage of late varieties of pears, and even of Bartlett pears, under refrigeration. The foreign markets for dried pears will not be overlooked.

Many owners of young orchards who have as yet no pears to market are joining the association in order to build up a strong organization for the extension of markets to keep pace with the prospective enormous increase in annual production.

Unorganized and Organized Selling Contrasted

An analysis of the difference between the 1917 (unorganized) and the 1918 (organized) marketing operations discloses the following:

1. The raise on contracts amounted to	$60.000
2. The 1918 sales ($378,619) if sold on the 1917 basis would have brought only $210,000, making a difference to growers of	168,619
Total gain over 1917	$228,619

These gains were, in a very large degree, due to the work of the association.

Sulphur Saves Wet Raisins

[Written for Pacific Rural Press by John J. Fox.]

This year of showery weather has been the means of developing a definite plan for saving raisins in showery weather. The viticultural division of the University of California has for several years carried out experiments in sulphuring wet raisins in the field and under field conditions such as those prevailing this year. Many hundreds of tons of raisins could have been saved this year had preparations been made for the use of sulphuring hoods which could be used in the field. If grapes get wet, especially before they have been turned on the tray, they will mould whether in the stack or exposed, moist, warm weather especially aggravating such condition.

But if these fresh or partly cured raisins had been stacked—even after the rain started and they became wetted—they could be sulphured in this wet condition and remain safely in the stack until ready to set in the sun again. Of course, those using paper trays were out of luck anyway, but another year it is probable that many growers will be supplied with portable hoods for this purpose. They may not be wanted, but they would be insurance against too heavy a loss. Where hoods and sulphur are provided beforehand, it is not necessary to be in such haste to stack when rain threatens, as the raisins can be saved even after a thorough wetting. After stacking and sulphuring, they should remain in the stack until the weather appears settled.

COMMISSIONER HECKE'S CONCLUSIONS.

We noticed some results of sulphuring on Geo. H. Hecke's grounds at Woodland. He says: "The results from the re-sulphuring of seedless (Thompson) and Sultanas after the September rains was satisfactory. The re-sulphuring was done immediately after the cessation of the rain. It stopped mold and gave a uniform color to the product. This does not mean, however, that I have not suffered from the rain, because the loss

The War Is Won

But the consumer of Food
Must Still Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.
While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.
Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR

FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

in weight was quite material and there was a large amount of half-dried raisins in which the mold had made such progress that further attempts to save the fruit were considered inadvisable.

If the weather conditions immediately following the rainstorm had been normal, it would not have been necessary to re-sulphur, but the nights and mornings continued to be foggy—weather the most unfavorable we have ever had for drying. On the whole, I am well satisfied with the salvage, considering my loss at approximately 35 to 40 per cent, including additional cost of re-hauling and loss in weight."

Loss of weight is occasioned partly by sugar being washed out of the fruit in solution and partly by its loss through process of fermentation so far as it goes.

SPREADERS AND STICKERS FOR SPRAYS.

[Written for Pacific Rural Press by Prof. G. P. Gray, University of California.]

It is a common practice in California to use soap as a spreader in tobacco preparations. Soap is added at the rate of about five pounds to each 200 gallons of spray, the amount used depending upon the character of the water. The use of flour paste as a spreader for lime-sulphur solution is commonly recommended but is not generally practised. W. B. Parker, formerly of the U. S. Department of Agriculture, recommends the use of four gallons of flour paste to each 100 gallons of diluted lime-sulphur spray. Parker's directions for mixing the flour paste are as follows: "Mix a cheap grade of wheat flour with cold water, making a thin dough, without lumps, or wash the flour through a wire screen with a stream of cold water. Dilute until there is one pound of flour in each gallon of mixture. Cook until a paste is formed, stirring constantly to prevent caking or burning. Add sufficient water to make up for the evaporation."

Soap is used to some extent as a spreader for lead arsenate sprays, but is not recommended by this station on account of occasional foliage injury. Glue is used to a slight extent in place of soap as above. The proper amount has not been definitely determined. A few growers are using glue in the preparation of home-made wettable sulphur. This, however, is not a general practice, as most growers prefer to buy ready-made sulphur pastes, such as "Atomic" sulphur or "Milled" sulphur. The spreading agent in atomic sulphur is glue and in milled sulphur is dexterine.

Miscible oils are used to some extent and so far as I know have given excellent results. These are usually quite expensive, so that growers generally use the common emulsions. As far as I know, casein has not been used to any extent as a spreader in California.

IMPROVED APPLE PICKING BOX.

Apples are not improved by bruises in picking; and finances of growers are not improved by paying $5 per day for slow methods of picking. More rapid picking and less bruising of apples are claimed by N. Nielsen of Santa Cruz county as a result of the picking box devised by Pink Dickerson, who works in the same orchard. A Northwestern apple box or a common apple box cut down so it will go inside a 50-pound lug box is fitted with a wire handle and hook to hang it from limbs. Its bottom is hinged by leather straps on both sides and free to open lengthwise along the center line. It is held shut by a piece of half-inch rope from the center edge of each half to a hole through the opposite side of the box near its top. The rope is knotted and the hole notched to catch the knot until the box has been filled. To empty into boxes in which the apples will be hauled to the packing house, the picking box is set inside the lug box and the ropes loosened. When the picking box is lifted, its bottom opens and the apples are thus dumped without bruising.

The Fruit Growers' Convention that was to have been held at Riverside this week has been called off by State Horticultural Commissioner George H. Hecke owing to the influenza epidemic.

"They're *All* First Grade"

"And from new-bearing trees, too!—I can hardly believe that this lot has not been sorted. *That's* what comes of using my *head* as well as my muscles in planting and taking care of this new orchard."

"I thought when I sent to the Hercules Powder Co. for their book, 'Progressive Cultivation,' that all I could use dynamite for was to blast out the old, dead trees before I planted again, but I found out that *that* was only a starter.—

HERCULES DYNAMITE

can be used for all sorts of other things. Why—I blasted the holes for this whole orchard in a third of the time that the old, 'spade dug' method would have taken; and with only one helper instead of five. The young trees grew faster and looked better than any I've seen in this locality and are in bearing a full year ahead of their time."

"Then I used Hercules Dynamite to dig a mile of new ditches; that work took only about half the time I had reckoned on—and a lot less than half the back-ache. Now I'm using it to keep the earth loosened around the roots of my bearing trees and I figure that it'll make a difference of 20 per cent. in the yield this year."

"I'm advising all the men in this locality to send to the Hercules Powder Co. for their free book, 'Progressive Cultivation'—They're sending, too—for they can *see* how I am '*cashing in*' on the information that I got out of that book."

[Written for Pacific Rural Press.]

Status of the Grape Crop.

According to the latest report of the United States Bureau of Estimates, the total production of wine grapes in California in 1918 is estimated to be 92 per cent of a full crop. The rain of September spoiled the promise of a full crop or better, and the quality suffered fully as much or more than quantity. November 1 showed a still further decline in the condition of table grapes as picking progressed following the rainy and unsettled weather conditions of the first week in October. Raisin grapes on September 1 promised almost a full crop, but some damage followed the rain of September 12 and 13. At the time of making the October report the heavy raisin-producing counties of Fresno, Kings and Tulare were experiencing rainy, cloudy weather, with a resultant increase of damage daily which it was utterly impossible to estimate. Reports as of November 1 indicate an average yield of 1800 pounds per acre and a total production of 135,000 tons. Practically all of the raisins outside of the sweat-box on October 1 were damaged more or less in quality.

Rodent Control.

Most of the Western States are conducting rodent control work in co-operation with the Biological Survey, U. S. Department of Agriculture. Washington, Montana, Colorado, Arizona and New Mexico are very active in this line. North Dakota in 1917 cleaned up 17,000,000 acres and in 1918 13,000,000 acres. In California it is hoped that in another year co-operative agreements will be in operation covering work by the Biological Survey on State lands and by the Rodent Control Division on Government land, under State Commissioner of Horticulture G. H. Hecke. Horticultural Commissioner Rutherford plans a squirrel poisoning campaign for November 1 and 2 in co-operation with the State Council of Defense and the County Division. Every constable in the county will be squirrel inspector, to report on November 3 to the chairman of the Council of Defense.

Blackleaf 40 for Pear Root Louse.

H. A. Bolster of Grass Valley has been using a douch of blackleaf 40 to destroy pear root louse on his young trees, where any of this pest manifests itself. He makes a basin around the tree and pours in about 15 gallons of mixture of one gallon of blackleaf 40 to 600 gallons of water and claims good results. He has 30 acres of pears four years old, consisting of Bartletts, Comice and Beurre d'Anjou, planted in alternate double rows, also a few acres of bearing trees. He averaged a net of $3 a box for his pears this year.

A Soldier's Ranch and Management.

Right across the road from the above we went to see the ranch of a young friend who has been called to the colors and who had bought this ranch on time, bravely shouldering a considerable weight in the purchase. His father, A. Sorrensen of Fresno, is running the place for him in his absence and the 15 acres of peaches have turned off 15 tons of dried fruit and a small acreage of Thompson Seedless grapes producing four tons of raisins. At this rate the boy's ranch will soon be paid for. Good luck to Leland Sorrensen.

A Good Average in Peaches.

The average production of dried peaches per acre in Merced county is said to be three-quarters of a ton to the acre. Landram & Clough, near Livingston, have 80 acres of peaches, half drying and half cling. The freestones (Albertas and Muirs) averaged one ton to the acre of dried fruit this year and the clings (Tuscans, Phillips and Orange) averaged over six tons.

Dr. Mead in the South.

On November 11 Dr. Mead will speak at a conference of men from the Southern States on "Land Settlement." California has set an example that other States desire to follow and carry out successfully, and Dr. Mead's services are now much in request. Canada has also applied for his help for the purpose of placing the returned soldiers on the land.

Smyrna Figs Unirrigated.

There is a very handsome young Calimyrna fig orchard of 22 acres in the Wolters district, near Fresno, that is never irrigated. It is ten years old, makes good growth, is said to bear regularly and it is kept like a garden. It belongs to C. T. Forbes, who also has a peach orchard and five-acre orange grove on the same tract.

Grape Leaf Roller.

Fred K. Howard, Horticultural Commissioner of Kings county, reports some damage to grapes in his section by the action of the grape leaf roller in curling up the leaves and vines, so that many grapes were injured by exposure to the rain and sun.

Young Growth on Apricots.

Apricot trees are still putting forth new growth (November 4). From Haywards south it looks like early spring in these young orchards. Fortunately the older trees have better judgment and are only developing their buds. Pruning has commenced in prune orchards and a lot of the dead wood has already been cut out and piled up.

Mallow in Orchards.

We have noticed more mallow growing as a cover-crop in orchards this year than for many years. This and mustard crops will need to be turned under pretty early if the best results are expected. With such an early start they will be woody by the middle of March and will also be taking too much out of the ground in the shape of moisture.

Precocious Young Orchard.

Richards & Denel of Chico have a 30-acre almond orchard five years old that produced over 13 tons of nuts this year. The varieties are Nonpareil, Drake's Seedling and I X L and a new huller was bought and installed to deal with the crop, which was all saved in good condition.

"THE BEAN IS THE BEST"

Get Ready For Winter Spraying

Give your trees a thorough clean-up this winter and watch the results at harvest-time next fall!

Winter spraying cleans the trees of scale and moss—keeps the bark soft and healthy—and results in a bigger crop of better fruit. Every dollar you put into the work comes back and brings several dollars with it!

You Need a First-Class Sprayer

—A sprayer that will drive the material onto the trees at sufficient force to be effective.

—A sprayer that will stand up to hard grinding service day in and day out.

—A sprayer that is reliable—dependable—efficient—free from trouble.
That's the kind of a sprayer you get when you get a Bean.

Why "Bushels" Instead of "Sacks"

The field agent is often asked, "Why does the Bureau of Crop Estimates persist in estimating crop production in bushels instead of sacks or hundred weight?"

The bushel is the standard unit of measure throughout the United States. Ninety million people in forty States of the Union think and talk bushels. The bushel measure is definite, and Congress and the various States have stabilized it, enacting laws specifying the number of pounds of the different commodities legally constituting a bushel. The census figures of crop production have all been reduced to bushels for all commodities for which legal weights have been established, and doubtless will be until a different unit of measure has been adopted.

A sack is not definite and cannot be made so, except by legal enactment standardizing the volume and then in turn standardizing the weight per volume of the different commodities.

The cental or hundred weight is now in general use in buying and selling grain and vegetables and seems quite likely to come into general use in estimating crop production throughout the State.

Oranges and apples are thought about and talked about in boxes, dried fruits in pounds or tons, and it is doubtful if custom will permit of a material change. A big box may hold 30, 40, 50 or even 60 pounds, yet market quotations are often made in lugs, without specifying the size. If the bulk handling of grain ever becomes prevalent; as now seems likely, the sack will largely disappear, particularly as a unit of measure, and the cental or bushel take its place.

Estimates of average yield per acre and total production will undoubtedly continue to be made in bushels for all grains and some fruits, as long as the bushel continues to be the standard unit of measure throughout the United States.

The following weights per bushel are used by the Bureau of Crop Estimates in all estimates of crop production:

WEIGHTS PER BUSHEL.

Apples	48	Barley	48
Beans (dry)	60	Buckwheat	48
Clover seed	60	Corn (shelled)	56
Corn on cob	70	Flaxseed	56
Oats	32	Onions	57
Peaches	48	Peanuts	22
Pears	48	Potatoes	60
Rough rice	45	Sweet potatoes	56
Rye	56	Timothy seed	45
Tomatoes	56	Wheat	60

THE FARM LABOR CONFERENCE.

Under the joint auspices of the State Council of Defense and the U. S. Department of Agriculture a conference was called in this city, November 8, to consider California's complex labor problems, and especially the shortage of workmen in rural communities. Farmers, fruit growers, labor union men and others joined in the discussion of the problems presented.

A resolution calling for the importation of 25,000 Chinese into California for a period of four years to relieve the labor shortage on the farms was rejected. Its rejection followed a day of argument and debate in which Colonel John P. Irish maintained that the scarcity of labor and the demand for increased production made the importation of Chinese a necessity. John A. O'Connell, secretary of the San Francisco Labor Council; John P. McLaughlin, State Labor Commissioner, and others allied with the State and Federal employment service opposed the resolution and voted against its adoption.

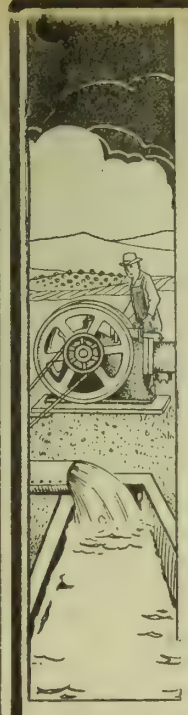
The conference went on record in favor of a more drastic law against vagrants and urged it as a means to compel men who are offered employment in orchards and on farms to accept such work under penalty of prosecution. A closer co-operation of farmers in organizations to solve the labor problem and standardize wages was also endorsed.

Resolutions urging a law to make it a misdemeanor to accept transportation to work and then refuse the work; a resolution scoring the "poaching" of one farmer on the workmen of another and one commending the work of the Woman's Land Army were approved by the conference.

The resolution committee was composed of John P. Irish, Stockton; W. F. Setchel, representing the Valley Fruit Growers' Association of Fresno; J. P. Dargitz of the Farm Labor Bureau of the State Council of Defense; H. J. Fleming of Ripon, and Frank T. Swett of Contra Costa county.

Professor R. L. Adams of the State Council of Defense and the University of California presided at the conference, which adjourned to meet at the call of a committee of three named by Chairman Adams.

"Were you ever rewarded for bravery?" "Oh, yaas." "Did you get the Iron Cross?" "Nope." "The Victoria Cross?" "Naw; I got the Maltese cross." "How did you get the Maltese cross?" "I stepped on her tail."—Exchange.



Dependable Pumping Plants

When you install a pumping plant you want water—plenty of water—full rated production and more if possible. And that's what you get when you install

American Centrifugal Pumps

These pumps produce the full guaranteed amount of water and they keep power bills down to a minimum! That's more than a claim—it's a guaranteed fact.

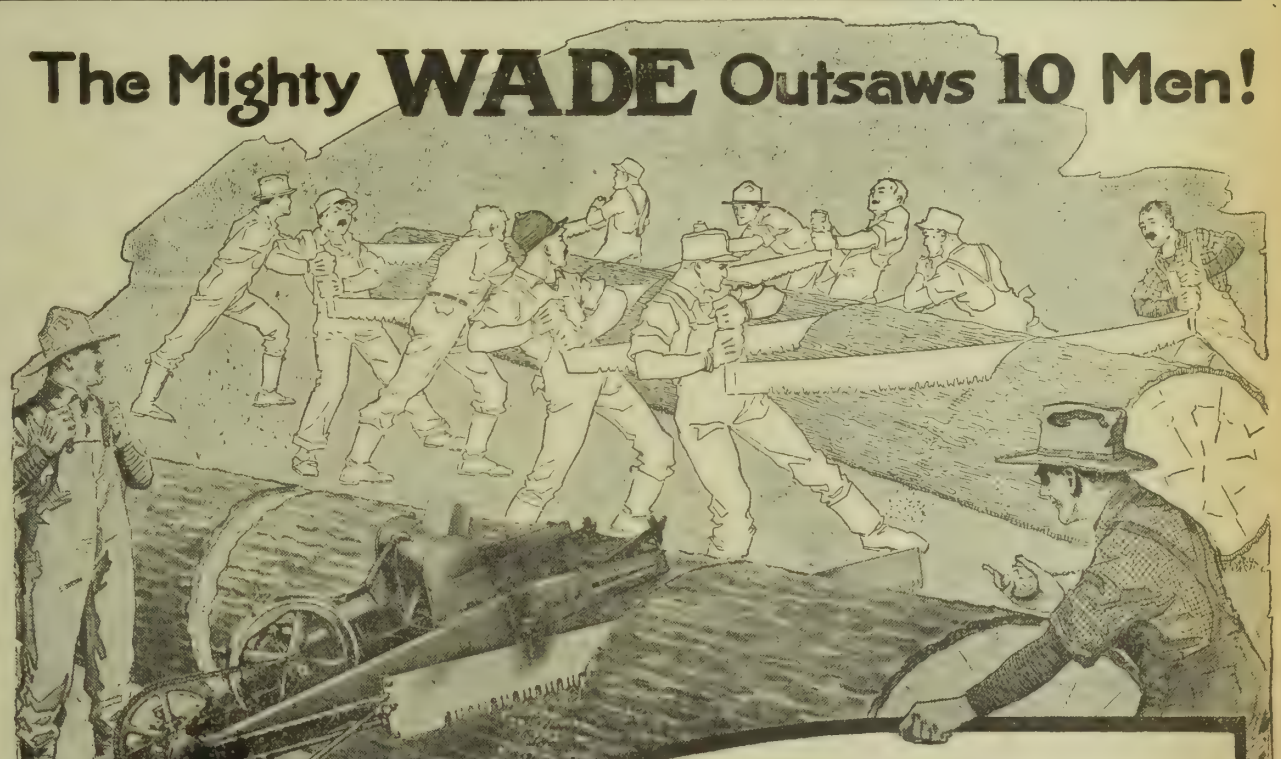
The Mighty WADE Outsaws 10 Men!



A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the United States—in the woods of the Pacific Northwest, California, Minnesota, Arkansas, New York. When not in use for wood cutting the 4-H.-P. motor will run feed mills, feed cutters, pumps, etc.

Read What These Owners of WADE DRAG SAWS Say:

"One afternoon my brother-in-law and I took my WADE into the woods and sawed three hard maple trees into 16-inch blocks, the trees averaging about two and one-half feet at the stump. He expected it would take me from eight to ten hours to do the job, but it was all done in three hours.—F. W. Hiller, Vernon, N. Y.

I cut thirteen and one-half ricks of cottonwood in six hours.—J. W. Stratton, Atkins, Ark.

One gallon of gasoline will cut six to ten cords of wood; it depends on the kind of timber you cut.—W. D. Thomas, Bull Run, Or.

My WADE saw paid for itself six times over.—F. W. Taylor, Swisshome, Or.

I am making $250 a month with my WADE.—F. A. Storts, Orville, Cal.

Thirty-six inches in diameter, yellow birch, is the largest I have cut and I cut down to six inches.—P. L. Cole, West Duluth, Minn.

I cut down to eight inches in diameter.—F. T. Swank, Park Falls, Wis.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free book, "How Dan Ross Cuts 40 Cords a Day." Full details and special price.

A 53 YEAR REPUTATION BACKS THE WADE

Farm-Demand for Returning Soldiers

To the Editor: Labor unions are not and do not claim to be altruistic institutions. Perhaps it is because they have so formed the habit of always speaking for themselves first that they framed the resolution on demobolization at San Diego in the form which you interpret as opposed to the welfare of the future soldiers and in favor of labor profiteering. Read it over again fairly and you will surely see that they had more in view than the continued exile of four million Americans in order to bolster up wages, or they would have richly deserved your editorial castigation. Namely, what can these boys do, when they return, to make a living?

The labor unionist sells the pure commodity of labor on the labor market while the farmer sells his labor in the form of wheat, cotton, milk, etc., the value combined with other charges incidental to production. We all know the effect of dumping commodities on the market and the consequent glut, from sad personal experience. The effect of glutting the labor market is similar.

Now to the point. Ninety-nine per cent of the soldiers are workers without capital or business and have to find work at a living wage to make an existence when they return. If they had farms, they have sold them and only a small per cent will find their old jobs open. It will have taken two years to mobilize the army and the incidental hardships to industry and agriculture have been many and real. The turning loose in say two weeks of four million ex-soldiers together, with other millions of war workers to seek work would be aptly paralleled if the Government should buy and store vast quantities of farm products for the army and on the day peace was declared dump them on the market. Would we farmers think that was a square deal and worthy appreciation of our efforts to produce foodstuffs during the war? And will the released soldier thank us for throwing him adrift upon the labor market in competition with other millions of war workers? In that case your desideratum of lower wages will be speedily reached. And a few large employers might profit, temporarily.

The man over there deserves a better deal than this. He deserves the best we can do for him. There should be provision made now for increased production and more jobs when these millions are taken from the debit side and placed on the credit side of production. He should have better prospects than a bitter struggle for jobs with long hours and low wages.

Secretary Lane's honest but inadequate scheme for placing soldiers on farms only scratches the surface of the problem, for the farms can only absorb a small per cent of new producers.

The answer to the question is increased production, a better standard of living and decreased hours of labor. Yes, even for the farmer. We will always lag along behind the city producers in the fight for better conditions, but when they get their six-hour day we may at least expect an eight- or nine-hour day. In the meantime let us not get jealous of their success and start a row with organized labor, for our interests, while not identical, are similar to theirs and can best be achieved by co-operating with them.

Finally, don't say these "radical" ideals of better living standards can't be realized because this is a poverty-stricken old world, for the war has scrapped the word "can't" from the vocabulary.—K. S. Harlow, Imperial.

[We have received a number of communications approving our protest against the labor federation's plan to hold our soldiers abroad and "feed them into industry" in their own homes so as not to upset wages and the claim of a six-hour day. We cannot give indefinite space to the subject, so we take an opposing communication so that readers can have another point of view. Mr. Harlow does not convince us of the patriotism or humanity of the San Diego proposition. We are willing to agree with him that the holding-back scheme has more bearing upon urban conditions than rural, for we believe that rural interests, which underlie all others, require that these boys be brought back just as soon as autocrats are securely tied down. If this country is to proceed with production, which all interests require, it is indispensable that all these war schemes of farm production by boys and girls and city idlers be forgotten and the countryside recover just as soon as possible all it can of the spirit and muscle which it has sent abroad to win the war. Anyone who tries to interfere with this is neither American nor patriot.—Editor.]

SQUASH VARIETIES TO PLANT.

Hubbard is the standard by which all other varieties may be measured. Mrs. A. M. McCall of Santa Cruz county says it is the best all around, but Mr. McCall says the Sweet Potato squash is just as good in every way. He has several varieties now mature. Among them is the Banana, so named from its flavor. Its shape is a bit like its namesake, but its color is reddish orange. It keeps and bakes as well as Hubbard and its flesh is thicker. Mr. McCall last year grew a wagonload of them in a short corn row, planting a couple of seeds in alternate hills of corn in April or May. A peculiar squash is the one called Century for lack of a better name because it is of ancient California history. It is shaped somewhat like a pear and the small end is solid meat five or more inches in diameter. Ordinary specimens are about two feet long. It may be peeled as easily as a potato, yet a specimen has been kept by Miss Arano of Santa Cruz county in perfect condition at the end of a year. This squash bakes up watery; but is fine for cooking, having an old-time pumpkin pie flavor like the writer's grandma used to make, and it is extra sweet, requiring very little sugar.

SWEET CORN STALKS SYRUP.

Samuel Haigh of San Jose writes us that he took the butt ends of 20 or 30 stalks, cut in quarter-inch lengths in a feed cutter, steeped it in water and evaporated the water until a nice light-brown syrup was made. The first joint only is sweet enough to use if the corn is ripe.

WITTE IRRIGATING ENGINES

Kerosene-Distillate 2 to 30 H.P.

Pump your water with a WITTE. All you need is a centrifugal and my Special Model Kerosene-Distillate Engine. I can lay your engine down at least cost. Save the middleman's profit—Get your engine NOW, while prices are favorable. Have reliable power for all your work. Made in standard sizes—2, 3, 4, 6, 8, 12, 16, 22, and 30 H. P. Battery or magneto equipment. I am in a position to offer you the best prices and make Quick Shipment. 90-Day Trial — 5-Year Signed Guarantee. Field and Garden Notes

Inoculating Alfalfa Increased Crop.

"I'm satisfied that I got as much prune alfalfa hay in one cutting from five acres as my neighbor did in two cuttings from 12 acres and we both planted last spring," says S. W. Turner of San Joaquin county. Mr. Turner inoculated the seed and he thinks that was largely responsible for the great growth. He had cut it twice when the writer saw his field last September, and it was again nearly knee high with no blossoms showing. It had stooled wonderfully and was as pretty a stand as could be wished. The soil is a sandy loam with some hardpan. It had grown beans in 1917 and gyp corn in 1916. It was checked last spring and planted with a drill in March. Some of the seed went too deep into the loose soil; but what came up soon filled the vacant spaces. Both Mr. Turner and his neighbor clipped the weeds once in the spring. When the alfalfa was ten or twelve inches tall, it showed need of water and was irrigated. Water came again in about two weeks and was applied. No more irrigation was given until after the second cutting. No manure or fertilizer had been applied.

Squirrels in Peat Levees.

To the Editor: How can we kill ground squirrels in our peat-soil levees? We can't explode gasoline or carbon-bisulphide in them for fear of setting them on fire. We can't flood them; and the critters won't eat poisoned barley, or at least it doesn't get rid of them.—J. P., Holt.

[The only way that appears feasible is to use a "gun" such as the one designed a few years ago by the U. S. Health Service and force carbon-bisulphide or Kilmol into the holes when the ground is moist. It is not necessary to explode the gas.]

Cost of Bulk Grain Handling.

In a test, the Sperry Flour Co. transferred 2500 tons of grain in bulk at a cost of 3 cents per ton and lost practically none by spilling. In the same year they transferred the same amount in sacks at a cost of 35 cents per ton and lost several tons by spilling. The cost of taking bulk grain from barges, cleaning it, and loading it on barges or cars is about 8 cents per ton, according to George H. McLeod.

Irrigated Wheat.

In planting irrigated wheat in Kern county G. H. Peters irrigates and plows thoroughly eight inches deep, planting not later than December, and leaving the land level because no more irrigation will be needed. He drilled 20 pounds of Chul wheat per acre in the fall of 1917 and harvested 200 sacks from 18 acres. This winter Mr. Peters plans to greatly increase his wheat acreage.

Irrigate Farthest Furrow First.

In irrigating by furrows from a lateral ditch, some folks run water into the nearest furrows first. Another way is to run into the farthest furrows and simply shut off water in the lateral as each set of furrows gets filled. Thus no gates or work are needed at the inlets to the furrows, and if another irrigation is to come before cultivation the furrows are all ready for it.

Lime Shows Increased Vegetation.

Hydrated lime applied last December on several ranches in Santa Cruz county had small chance to show results on account of lack of moisture, but it is showing a considerable difference since the 1918 fall rains, on whatever vegetation is growing where it was applied, according to Farm Adviser H. L. Washburn.

Plant Peas Now.

Peas are a good winter growing crop for the farm garden, as well as for a cover-crop. If they are not already planted, the sooner the better, and you will appreciate peas from the garden when town people are eating them from cans at extravagant prices. They stand quite a bit of frost.

The Germain Seed and Plant Company first introduced the genuine proven strain in Hairy Peruvian Alfalfa to the farmers of California.
Our seed has produced wonderful results—in most instances 2½ more tons per acre per season. Don't be fooled—buy the genuine—Germain's—the proven strain.

General Agricultural Review

Field Crops.

A $60,000 crop of hay is reported in Alaska.

Approximately 8,580,318 bushels of corn are being produced in the State of Washington this year.

A large acreage of kafir corn is being harvested in the Delano section. The weather has been ideal for the maturing of the grain.

The bean harvest of Ventura is about cleaned up. The yield was very heavy, many fields going as high as 40 to 45 sacks per acre.

The United States Department of Agriculture's November bean crop report has placed the preliminary estimate of production at 2,749,000 bushels.

Corn production this year will be 2,749,198,000 bushels, the Department of Agriculture announced in its November crop report giving the preliminary estimate of the crop.

Women's organizations are sending women and girls to the fields throughout Georgia to save the crop of cotton staple. Farmers are paying from $1 to $1.50 per hundred pounds for the picking.

The new sugar beet contracts offered to growers in all sections of Southern California are very favorable, and will enable the beet farmer to net as much from his crop as the bean planter.

Regulations limiting the importation of wheat and wheat flour to shipments from Canada and Mexico in wagonload lots by producers and customary border traffic, consignments to the Food Administration Grain Corporation, and shipments in bond in transit to allied countries were issued by the War Trade Board November 1.

Mr. Churchill, its president, states that the California Bean Growers' Association is not quoting lima beans at any other price than the set price, which is 12c, less the customary discount. Selling is not active, but some orders are coming in. Dealers are trying to break down the association's price.

Picking is under way on the first commercial tract of long-staple cotton to be grown in the Porterville district. Arizona cotton men who have seen the product say it is high grade and declare it indicates much of this district can be used to advantage in cotton culture. A resurvey of the section for cotton-growing possibilities will be made by United States experts early in December.

According to a food survey of the Department of Agriculture, dated October 1, 1918, the commercial stocks of wheat reported for that date amounted to 195,997,839 bushels, as against 114,331,842 bushels reported on hand in a similar survey for September 1. These figures refer to stocks actually reported and do not represent the total commercial stocks of the country, nor do they include stocks on farms.

According to the Scientific American of October 19, a machine is now operating successfully in the Imperial Valley which promises to revolutionize the cotton industry. The persons running the machine claim that five men with the machine can pick 1000 pounds per man per day of ten hours, or 5000 pounds per day, and it does a clean job instead of a wasteful one. Hand pickers gather from 100 to 200 pounds of seed cotton in eight hours.

Cotton ginned prior to November 1, the U. S. Census Bureau has announced, amounted to 7,793,615 bales, including 120,343 round bales and 15,780 bales of Sea Island. Ginnings by States were: Alabama, 55,061; Arizona, 9565; Arkansas, 537,605; California, 18,404; Florida, 16,111; Georgia, 1,475,090; Louisiana, 359,644; Mississippi, 688,471; Missouri, 25,094; North Carolina, 414,478; Oklahoma, 398,901; South Carolina, 966,040; Tennessee, 152,144; Texas, 2,168,495; Virginia, 6307. All other States, 1835.

The Food Administration at Washington has appointed L. D. Sweet to take charge of dehydration for the Department of Agriculture, which announces a campaign to increase the use of dried fruits and vegetables. The War Department says the value of dried produce compares favorably for table use with the fresh article. Last spring the army ordered and used 14,000,000 pounds of dried foodstuffs, costing $3,000,000. Potatoes, carrots, onions and soup mixtures are in greatest request.

Deciduous Fruits and Nuts.

One hundred and twenty-six fruit specials, with 4758 cars, operated from California to the Missouri river and to Chicago last month.

The almond crop is expected to reach nearly 5000 tons for the State. Definite figures cannot be obtained until deliveries have been completed. The loss on almonds was small.

The Golden State Canning Company at Ontario and its branch cannery at Cucamonga have become links in a chain of deciduous fruit canneries under the control of the California Packing Corporation.

In New Mexico this fall much of the apple crop was saved by women's labor in picking and packing the fruit. When a shortage of box-makers occurred the women undertook the job and turned out an average of 200 boxes a day.

The Winters Fruit Packing Company is making large shipments of dried fruits, mostly consignments to the Government. It is anticipated that during the season over 600 tons of dried peaches and 200 tons of dried prunes will be shipped.

About 900 sacks of black walnuts, nut shells and fruit pits is the contribution of the San Joaquin Junior Red Cross to the Government for making carbon for gas masks. It takes seven pounds to make enough carbon to last twenty-four hours in one mask.

The embargo on Oregon prunes has been lifted. Arrangements have been made by Willamette Valley prune men for shipment of 18,000,000 pounds of dried prunes for the British Government, and they have received an order for 10,000,000 pounds for the United States Government.

Prof. T. Francis Hunt has arranged for this week a two-day series of orchard meetings in Fresno county for study and observation of common diseases of orchard trees, with methods of control. The purpose of these open-air meetings is to bring together statement of orchard conditions last year and success attained through the use of various control measures. Different orchards were to be visited to determine whether peach blight is again making its appearance. Other diseases to receive attention are leaf curl, little leaf, crown gall or any other disease conditions about which questions may be raised.

Citrus and Semi-Tropical.

Some navel oranges from orchards at Narango, Tulare county, have tested as high as 15.2 to 1.

While the retail value of the 1917 crop of citrus fruits was $58,277,000, even better returns are expected for that of 1918.

The California Associated Olive Growers recently obtained a court decision compelling growers to deliver crops under existing contract.

San Bernardino is making elaborate preparations for its annual exposition, the ninth National Orange Show, to be held February 14 to 23, 1919.

About 100 Los Angeles women are at work picking olives in the orchards of the Los Angeles Olive Growers' Association near San Fer-

LOOK for the K-W Trade Mark on the MAGNETO

Before Buying Your Tractor Make Sure Of Its Ignition System

Every K-W Magneto carries the K-W trade mark. It is put there for your protection. It is a symbol of quality. It assures you of continuous, reliable, no-trouble ignition regardless of working conditions.

K-W High Tension MAGNETOS

give immediate and easy starting regardless of the weather, how large the motor or how slowly the engine is cranked. K-W Magnetos fire any kind of fuel and increase the power derived from the same amount of fuel over that of any other ignition system. They enable you to plow additional acreage *without additional fuel cost*. They are protected against powder-fine dust, oil and water.

The Time To Avoid Ignition Trouble Is When You Buy Your Tractor

Forty tractor manufacturers pay more for K-W Magnetos but it is their assurance that you—the tractor buyer—are being provided with the most reliable ignition system, guaranteeing to you a "no-trouble" service day in and day out.

If you are *not* using a K-W now write us. Let us show you how a K-W Magneto will give quick and easy starting, and get full power out of the cheaper grades of fuel. There is a type for *your* tractor that will do this.

Before You Buy A Tractor

look up one neighbor or a dozen using K-W Ignition and talk it over with them. Then we know you will *insist* upon a K-W Magneto on *any* tractor you may decide to purchase.

Write for list of K-W equipped tractors and full information.

"A dip in time saved mine"

Harness rots because the natural oils of the leather fiber dry out, and dust, sweat and moisture get in and cause rot. Eureka Harness Oil takes the place of the natural oils and keeps rot out—keeps harness strong, flexible and jet black. No animal oils in "Eureka"; rats, mice and other rodents dislike it and won't gnaw harness dressed with

EUREKA HARNESS OIL

MADE BY STANDARD OIL COMPANY (CALIFORNIA)

nando and have proven so adept at it that the growers want more.

The first olives of the season have reached the local wholesale market. They are said to be selling at 8c and 10c a pound. The yield is expected to be heavy, according to reports from the olive-growing belts of the State.

Estimates compiled by the railroads indicate the total output for the Porterville district this season will be 2000 cars of Washington navels. Price conditions are good. Consignments are being made at about $5 a box f. o. b., it is reported.

A $5,330.90 check was received early this month by the Hillside Orange Association of Lindsay for a car of Valencia oranges containing 462 boxes. It is said to be the highest price on record for San Joaquin Valley oranges.

A new species of codlin moth has made its appearance in the walnut groves of Southern California, according to statements made by a committee of the Walnut Growers' Association, who ask that some official action be taken to check the pest.

The 8-to-1 test for oranges may have to undergo revision. This year fruit has been brought in which tests as high as 18 to 1. Nevertheless, because the acid content is much below the normal this fruit is insipid in flavor and deficient in color. Federal chemists are collecting data on the 8-to-1 standard, and they are of the opinion that some change will be needed which will take into account the citric acid content of the early fruit to safeguard its quality.

Grapes.

The big raisin plants at Fresno have been badly crippled for want of help, due to the absence of employes retired by the influenza. Urgent orders have been seriously delayed.

The Lodi wineries ceased grape crushing this week. Nearly half the grapes were Tokays. The sum of $5,481 was received recently for a carload of Emperor grapes shipped from Fresno to Boston.

As a result of the German devastation of hundreds of thousands of acres of French vineyards and orchards, Europe may have to depend upon American vineyards for the greater portion of its wine for many years to come.

THE 1918 CROP OF CALIFORNIA CITRUS FRUIT.

Following is an abstract of the crop report of the U. S. Bureau of Crop Estimates, San Francisco, as of November 1, 1918:

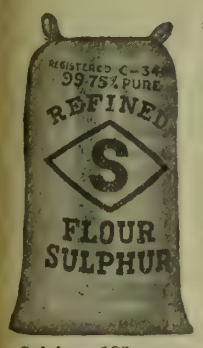
ORANGES.

The 1918 crop of California oranges is beginning to ripen and an estimate of the number of boxes now indicated as likely to be marketed between November 1, 1918, and October 31, 1919, eagerly awaited by both producer and consumer. Reports of correspondents as of November 1, supplemented by personal investigations of the field agent, warrant a production forecast of 14,322,000 boxes. Of this total, Northern California will produce approximately 138,600 boxes; Central California 1,339,800 boxes, and Southern California 12,843,600 boxes. Conditions are more or less spotted, although in some sections the crop is uniformly good. The fruit generally runs to large sizes, which has materially helped to increase the total number of boxes. For the shipping year just closed approximately 7,893,270 boxes were moved. About 800,000 boxes were carried over from the 1916 crop, leaving a total of 7,093,270 boxes to represent the production in 1917. California's big orange crop was grown in 1916. Shipments for that crop amounted to 19,374,873 boxes, plus about 800,000 carried over for shipment in the succeeding year, making a total for 1916 of 20,174,873 boxes actually marketed.

LEMONS.

The condition of the lemon crop is 88 this month, compared to 86 October 1 and a ten-year average of 86. Following the heat wave of June, 1917, lemons recovered very quickly and according to shipping records the crop of 1917 was under-estimated by practically everyone. The 1918 crop is very promising and the big crop of two years ago may be exceeded.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur.

It has been proven that sulphur has increased various crops up to 350 per cent.

How Special TrackPULL Tractor Works Orchards, Vineyards

The Bean TrackPULL Book tells plainly why you need a Bean Tractor if you want orchard and vineyard work. Worth its weight in gold because it posts you on vital qualities in such a tractor. You know what your tractor must do. Send for catalogs of all tractor makers and compare with Bean TrackPULL Book. Then decide on your tractor.

The Bean TrackPULL operates through single track which does all pulling and steering. Full power on turns same as on straightaway. Makes no difference how far off center you hitch—pulls just the same. Works close to trees and vines. Pulls, "gees," "haws" and backs just like team. 12-year-old boys can handle.

Made by manufacturers of orchard machinery for 34 years. All their specialized experience built into it. Advanced improvements in Motor, Track Rollers, Drive Sprocket, Bearings and Rear Wheels make the Bean the most efficient orchard and vineyard machine ever manufactured.

Get invaluable Bean TrackPULL Book Now—send the coupon before you forget it. Save money. Learn name of nearest agent who can show machine.

BEAN TrackPULL Tractor

Choose the Tractor with a Satisfactory 4 Year Working Record

WATERLOO BOY
Original Kerosene Tractor

Pin your faith to the tractor whose record you know. Four years of consistent success in the hands of thousands of American farmers have established Waterloo Boy supremacy.

Waterloo Boy users have demonstrated its ability for ample power in all work, under various soil conditions; its average consumption of less than 2 gallons kerosene to the acre of plowing; its threshing cost of 15c per hour. Waterloo Boy users plow from 8 to 12 acres per day and get special acreage advantages in other farming operations.

They have found this reliable Three-Plow Tractor easy to operate, strong and durable in construction, and fully up to their expectations in performance. Dust-proof gear construction, complete accessibility, automatic lubrication and reliable ignition insure easy and continuous operation. Every part of the Waterloo Boy performs its service.

Its Record Is Your Guarantee

Get these facts from our users themselves. They spell Waterloo Boy success for you. Many bona fide voluntary expressions of our users' complete satisfaction are contained in our catalog. Consult this book before going further into the tractor question. It will save you time, labor and money to buy a Waterloo Boy. Write for our literature today.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

LOS ANGELES TRACTOR DEMONSTRATION NOTES.

Torbensen Gear on Tractor.

The R. & P. tractor, first shown in public at the Los Angeles Tractor Demonstration last fall, has an enclosed Torbensen internal gear drive like Republic trucks. Its drive wheels were fitted with shoes pivoted on rollers and rockers. It develops 20 horsepower and is rated at 12 horsepower on the drawbar. It pulled two 10-inch moldboards 6 to 8 inches deep and did a good job.

Small Track Type Tractor.

A small track type tractor, built for California vineyards and orchards and demonstrated at Los Angeles last fall, is the Monarch Lightfoot of 6-10 horsepower. It has one clutch and is turned by braking one track. It has a great opportunity on small farms where wet or sandy spots occur, but the writer got rather uncomfortable while driving it on account of the solid wooden seat. This feature was to be fixed for greater comfort. A shield was provided on the demonstration machine to brush aside the limbs of citrus trees.

Needs Disk in Orchard.

A 6-foot double disk set at the full angle and loaded with 200 pounds of concrete pipe is pulled easily in A. G. Beaulieu's Santa Clara county orchard soil by a Bean tractor. It pulverizes the dirt beautifully and Mr. Beaulieu says he would not farm without a disk.

What One Tractor Had Done.

"This Best tractor is three years and four months old. It has subsoiled 2100 acres, plowed 300 acres, and cultivated 7400 acres. The expense for repair parts has been $63.38.—J. E. Dullam, Rancho La Brea." This was the sign on a 75-horsepower tractor, pulling five 14-inch Oliver moldboards in the hard adobe at the Los Angeles Demonstration. Mr. Dullam has two other tractors of the same make.

Single Track Tractor.

The Belt Rail tractor, first shown last fall at the Los Angeles Tractor Demonstration, has a single track behind two wheels, one of which runs in the furrow. Its three-point suspension two ways automatically keeps the frame and motor level when one wheel goes into the furrow. It is a 12-20 tractor and it pulled two 10-inch P. & O. moldboards 8 inches deep in the hard soil fast and easy.

Pumping for Field Crops.

Last summer and fall, when Weed Patch farmers in Kern county were suing the ditch water company for ruining their crops by diverting water which they claimed by contract rights, G. H. Peters was irrigating all he wanted, when he wanted to, and with water which did not carry weed seed onto his land. He had paid $6,000 to put a well 320 feet deep through a gravel stratum of 140 feet, and was lifting 125 miner's inches or about 1100 gallons per minute 100 feet by a 50-horsepower electric motor which cost some more. The water was used for irrigation of potatoes, corn, and small grain, besides a family orchard and garden. Mr. Peters has farmed many years in this district and he knows that his expensive pumping plant will pay even when using the water on common field crops.

CHAIN-DRIVEN PUMP.

To the Editor: I have a small centrifugal pump driven by belt from an electric motor. I want to change the drive and put the motor in the pit with the pump. I had thought of direct connection, but the motor runs 1800 r. p. m. and the pump should run about 1200 r. p. m. Would a chain drive two or three feet between centers be practical?—A. M. H., Florin.

[You could have a direct connection geared down properly, but such installations are not common. Chain drives are more common and quite feasible. We can refer you to parties who can equip your outfit this way.]

THE TRACTOR OPERATOR.

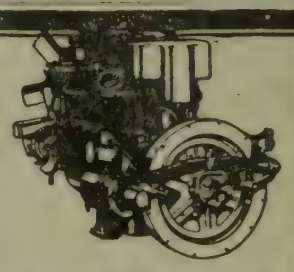
Difficulty in operation is mentioned by tractor owners as the principal disadvantage of the tractor, says A. P. Yerkes, United States Agriculturist. Though any man of ordinary ability can operate and care for a gas tractor very satisfactorily after a little study and experience, it is decidedly unwise for him to undertake to gain the necessary experience by experimenting with his own machine. Experience in running stationary engines or automobiles, while of some value, is not enough. The important thing is the ability to detect trouble the minute it begins to develop and to be able to remedy it promptly instead of allowing it to run along until an expensive delay results.

Many owners report that it is extremely difficult to get hired help capable of operating a tractor satisfactorily. Where a tractor is to be so operated it is very important for the owner to understand the proper care of the outfit in order to see that it is not abused.

Usually the necessary training can be obtained rather easily without great expense. It pays to spend a few days in gaining experience under a competent instructor, and it is unwise to attempt to run a tractor without such preparation. Very often the time and expense involved in obtaining such training will be offset during the first year's operation.

House moving by automobile is not common. The writer recently saw a large chicken house being carried rapidly down the road on an automobile trailer.

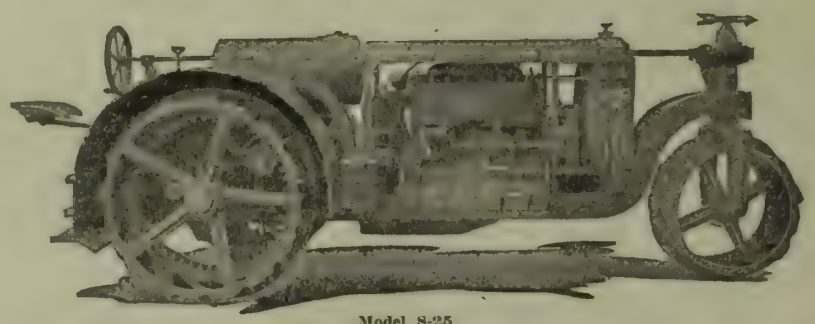
Experts Say
"ZEROLENE IS BETTER"
—because it holds better compression, gives better protection to the moving parts and deposits less carbon.
Zerolene is the correct oil for *all types* of automobile engines—the correct oil for your automobile.
Get our Lubrication Chart showing the correct consistency for your car.
STANDARD OIL COMPANY
(California)



The "T"-Head type engine, illustrated here, like all *internal combustion engines*, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the cylinders and goes out with exhaust. Zerolene fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude.*

ZEROLENE
The Standard Oil for Motor Cars

Samson
GMC TRACTORS SIEVE-GRIP GMC TRACTORS
Tractor



Model 8-25

Simplicity, dominant feature of the GMC SAMSON SIEVE-GRIP TRACTOR, goes hand in hand with efficiency. Correct design and few and accessible working parts assure low up-keep cost and long life to the GMC SAMSON SIEVE-GRIP TRACTOR.

Thousands of owners testify that where the GMC SAMSON SIEVE-GRIP TRACTOR goes the farmer's trouble ceases. This is its record for nearly two decades of trying service here and in far corners of the earth.

Mere youths are successful operators of the GMC SAMSON SIEVE-GRIP TRACTOR, and in the emergency, even women have proved equal to the task.

The GMC SAMSON SIEVE-GRIP TRACTOR performs tasks requiring the power of ten horses and does the work better, faster and cheaper than any other power. It is also adapted for many farm labors for which horses are unsuited.

The GMC SAMSON SIEVE-GRIP TRACTOR is simplicity itself.

Further information is furnished by our illustrated booklet, Better Farming.

Samson Sieve-Grip Tractor Company
DIVISION OF
GENERAL MOTORS CORPORATION
STOCKTON, CAL.

GROWING EFFICIENCY OF MOTOR TRUCKS.

Motor truck hauls in 1918 from farm to shipping point averaged 11.3 miles, while wagon hauls averaged 9 miles; and a motor truck made 3.4 round trips per day over its longer route of 11.3 miles, while wagons made 1.2 round trips per day over the 9-mile distance.

The estimated cost for hauling in wagons from farm to shipping point averaged in 1918 about 30c a ton a mile for wheat, 33c for corn, and 48c for cotton; for hauling in motor trucks or by tractors the averages are 15c for wheat or corn and 18c a ton-mile for cotton. These figures are based on reports made by correspondents of the Bureau of Crop Estimates of the United States Department of Agriculture.

A similar inquiry in 1906 showed an average for wagons of 19c per ton-mile for hauling corn or wheat, and 27c for cotton. In 1918 wagon costs were naturally higher, since prices and wages have increased, but motor truck costs were much lower in 1918 than even the wagon costs of 1906, due to greater efficiency of the motor truck.

The cost of wagon hauling a ton-mile for wheat among the geographic divisions in 1918 was lowest in the Pacific States, 22c. Above this, in order, are the North Central States east of the Mississippi river, with 26c; the West North Central States, 29c; the West South Central, 32c; the East South Central, 36c; New England and the Middle Atlantic States, 38c; the South Atlantic States, 39c; and, highest of all, the Rocky Mountain States, with 42c a ton-mile.

In motor truck hauling the order of the different divisions of the country begins with 9c a ton-mile for wheat in 1918 in the East North Central, 10c in the East South Central, 14c in New England, the Middle Atlantic, and the West North Central, 15c in the West South Central, 17c in the Pacific, 18c in the South Atlantic, and 29c in the Rocky Mountain States.

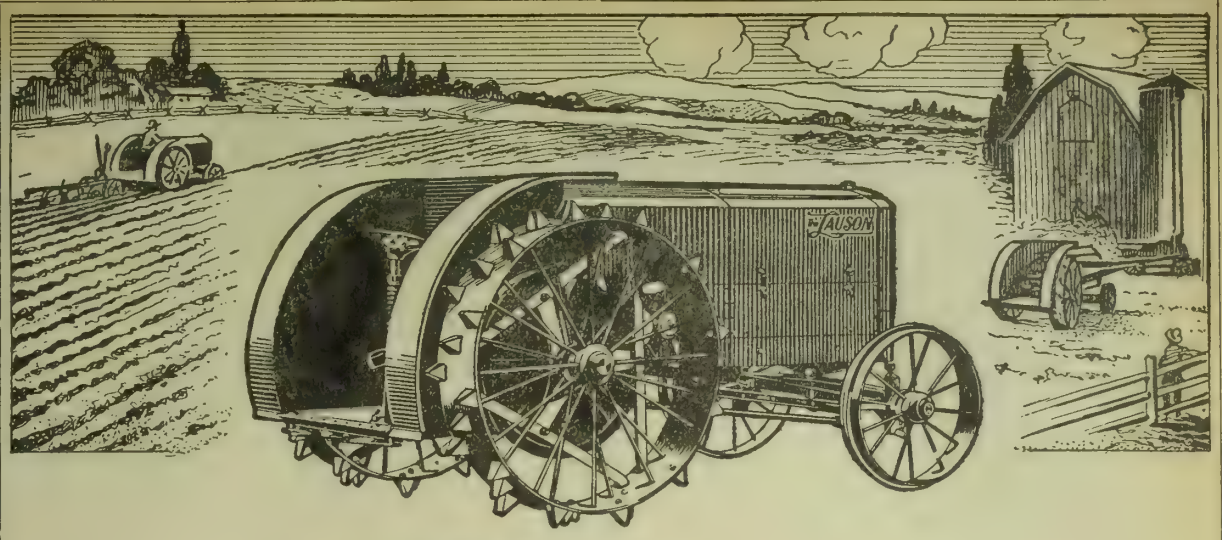
The motor trucks generally in use by farmers are not large trucks, but small ones whose nominal capacity is usually 1 to 2 tons. In quite a number of counties throughout the country the trucks used for hauling are made-over passenger cars. In some cases light wagons are attached as trailers to ordinary passenger cars and produce is taken to market in that way. In North Dakota and California, as well as other States, tractors, each drawing several wagons, are used for hauling grain. Trailers are also used, especially in the West, with horse-drawn wagons.

For the United States as a whole the average wagon load of wheat was 55 bushels in 1906 and 56 bushels in 1918, and the motor truck load in the latter year was 84 bushels. For corn, the wagon loads of 1906 and 1918 were 39 bushels, and the motor truck load of 1918 was 58 bushels. The cotton load for 1906 and 1918 for wagons was 3.4 and 3.6 bales, respectively, and for motor trucks 6.6 bales in 1918.

TELEPHONES A NECESSITY.

The telephone is not strictly a convenience, but a necessity. The cost is small and every farmer should join with his neighbors in installing a system on a co-operative basis. The chief financial value of the telephone (apart from its social benefits and prompt help it insures the family in case of fire, accident or sickness) lies in the fact that it enables the farmer to keep in closer touch with his local markets. When you have a telephone, you can call up several merchants and get their prices on the things you have to sell even before you start to town.

The "Little Husky" Laughlin 8-16 track type tractor, demonstrated in public for the first time at the Los Angeles Demonstration last fall, is to be handled by the J. W. Leavitt Co. of San Francisco, who recently contracted with the Homer Laughlin Engineers Corporation of Los Angeles to take 500 of the Huskies per year for five years.



The LAUSON 15-25
DUST PROOF-ALL GEARS ENCLOSED

FULL JEWELED TRACTOR

24 HYATT AND TIMKEN ROLLER BEARINGS
REDUCE FRICTION TO THE MINIMUM

The Maximum One Man Machine. Power, Stamina, Utility, Coupled with Low Up-Keep Cost High Efficiency and Moderate Price

FOR five years we watched the Lauson before taking it into the De Laval Line. We visited the factory, studied the Lauson factory methods and policy, and compared it with other tractors; we tried it out ourselves and saw the Lauson Tractor prove itself 100 per cent right.

The Tractor Thoroughbred

Before making your selection compare some of the mechanical refinements of this tractor thoroughbred with the cheaply built "get the money" tractors:

In the first place, don't make the mistake of buying a tractor too small to be practicable or one too large for efficient general utility.

Why choose a tractor with a cheaply built, unreliable fuel-wasting motor instead of a Lauson with its efficient, accurately machined, perfectly balanced Lauson-Beaver motor?

Why select a tractor with driving gears or other heavy wearing parts exposed to dirt and grit instead of a Lauson in which every vital part, including the machine cut steel drive gears, is enclosed and constantly bathed in oil?

Do you prefer rough, exposed cast iron driving gears which absorb power and soon wear out to the machine cut steel driving gears of the Lauson?

Why purchase a cheaply constructed tractor with a necessarily inferior transmission rather than a high-class Lauson with its hardened chrome nickel steel transmission gears built 100 per cent over strength?

Select the Lauson, which has ample strength in every piece of its high quality materials to withstand the grinding demands of tractor service year after year.

De Laval Service

The De Laval Dairy Supply Company stands squarely behind every Lauson Tractor delivered to a purchaser. The same prompt attention and service given to the thousands of De Laval Separator owners on the Pacific Coast may be expected and will be received by all purchasers of Lauson Tractors

Livestock Industry Outlook Prosperous

[Written for Pacific Rural Press by R. H. Whitten.]

Are you prepared for peace? It was all right to talk about how we lacked preparedness to go into the war. You know what that cost us. It is past history. But why not take a lesson from it and prepare for the next chapter that is about to be written? England has been preparing for peace for some time; so has France, and even Germany. America has been preparing along industrial lines, but how much thought has the farmer given the matter?

To the average farmer the war has been a far-off event. He has been too busy to clearly realize its tremendous bearing upon American agriculture. Thus far he has thought of the war mainly as it has affected the labor necessary to handle his crops, and as to their market value. But with the end of the war at hand the far-seeing, thinking farmer begins to consider the future, and as he investigates he wakes up to the tremendous possibilities which will follow the close of the war. He sees that the preservation of breeding stock on our farms is one of the most vital factors to all nations in order that the world's rapidly disappearing supply of meats, dairy products, wool and leather may be replenished, and he sees that livestock raising is going to be the most profitable branch of farming for years to come.

One of Uncle Sam's officials at Washington was showing a visitor about and pointed out the new "temporary" structures that have been hastily put up to accommodate the new war-making organizations. "Temporary," said the visitor. "Why, they look as though they were good for twenty years of service." "Don't worry," replied the official, "they may have to be in use longer than that."

Undoubtedly the official had in mind the time that the Government would have to lend a hand in reconstruction work both at home and abroad. Too many persons have felt that as soon as peace was declared all of the commissions and bureaus doing war work would immediately be disbanded, but we find that there will be equally as important work to do from now on.

It was understood that the Food Administration was organized for the period of the war only, but along comes an announcement that President Wilson has instructed Food Administrator Hoover to make immediate arrangements for supplying the food and livestock necessary for the rehabilitation of northern France and Belgium and the demoralized civilian populations in southern Europe.

As long as our boys are in France we must send to the armies and the allies three times the normal amount of our exports, and in addition to this we must feed for a long time 180,000,000 people who are actually facing starvation at present. Apparently the demand for grain and other crops should keep up for a reasonable time, yet if ships are available other nations may step into the market with their grain.

TREMENDOUS LIVESTOCK SHORTAGE.

With livestock, however, it is different. In the first place there is an enormous shortage in all classes of meat, milk and wool producing animals. The most recent survey of the livestock situation of the world showed a net decrease during the first three years of the war of 28,080,000 cattle, 64,500,000 sheep and 32,425,000 hogs—a total of 125,000,000. The total number of these animals in the United States is only 187,000,000, so Europe has already lost over two-thirds as many animals as there are in this country today.

In the second place, the United States is the only nation that is in a position to even help replenish the depleted herds. Of the producing countries, Mexico has been rapidly exhausting her supply of meat-producing animals, pending restoration of stable government. Canada, suffering from an acute shortage of labor, has been reducing her livestock and will not have much for export, except perhaps a few hogs. Australia and New Zealand are recovering from the effects of several seasons of drought, which greatly depleted flocks and herds. In South America livestock conditions are far from normal. Money has been scarce in Brazil and Argentine and breeding operations have been checked for two years.

MUST COME TO UNITED STATES.

Consequently, our herds will constitute the main source from which Europe will draw for both her present and future needs—for both meats and breeding stock. "Restoration of normal conditions," says Thos. E. Wilson, who was made chairman of one of the important livestock committees, "will open the flood-gates to an unprecedented demand for meat from foreign countries which will sweep into the United States as the only available source of supply. Even the Scandinavian countries, which in pre-war years were able to export meat products, have been stripped of their livestock resources and must turn to this country for replenishment. Add the demand for breeding stock to that for meat, and I look for a long period of uninterrupted prosperity for livestock men under after-war conditions."

SHORTAGE AT HOME.

Yes, the demand is coming all right, but how about our ability to supply it? Let's see. During the first nine months of this year 17,531,560 cattle, 31,278,887 hogs and 14,348,578 sheep were received at stock yards, as against 15,490,931 cattle, 27,690,247 hogs and 13,204,678 sheep for the corresponding period in 1917. An increase in all classes, but this does not mean an increased production. For instance, since the first of the year shipments of hogs have increased 27 per cent, while production has increased only 8 per cent. Because of frequent peace rumors and the weakness of corn and other feeds, the markets have been flooded with stock, and this means a tremendous future shortage, for, according to statistics, the rate of livestock production in normal times did not keep pace with the increase in our population. Consequently, even before the war, we were approaching a serious problem, and now, with Europe crying for meat and breeding stock, the problem is all the more complex.

It's the same with dairy products. In October, 1917, 390 storages reported 104,926,813 pounds of butter and in October, 1918, only 86,253,033 pounds, a decrease of 17.8 per cent. On the same dates 470 storages reported 89,082,290 pounds and 38,249,780 pounds of cheese, a decrease of 57.1 per cent. Consequently, holdings are below normal and no vast quantities of dairy products will be dumped on the market.

Furthermore, on account of the high price of feed, the shortage of labor and the good price received for beef, many dairy herds have been sold off since the war began and have found their way to the block. It is estimated that in this State 25 per cent of the dairy cows have been slaughtered in the last year and a half. This statement is borne out by the receipts of butter and cheese. For instance, in October, 1917, 1,952,400 pounds of butter were received at San Francisco and in October, 1918, only 1,374,400 pounds. Of cheese, 1,035,300 pounds in October, 1917, and only 776,500 pounds in October, 1918.

GOOD DEMAND FOR YEARS.

There is a real shortage, all right, and it is certain that the demand will continue good for a long time. Recently butterfat has gone up to nearly 70c here in this State; hogs have brought as high as $18.75, and steers as high as $13.10. Prices may be lowered, but the margin between farm costs and market prices should even then guarantee the farmer a substantial profit.

The price of farming machinery will go down soon. Labor will not be so scarce or so high priced, as the demobilization of the army will turn hundreds of thousands of men back to the farm. Barley will remain low, and the prospects are good for a wet winter, with plenty of good feed.

Certainly the future looks bright for the livestock industry, and the only danger is that our herds will be depleted in an effort to supply Europe with meat and breeding stock, unless special effort is made to increase breeding operations in this country.

EXPAND CAUTIOUSLY.

But this does not mean that it is a good time to plunge into livestock breeding recklessly. "De befo-dewah days hain't never comin' back," and there never again will be a time when scrub stock can be made to pay. In the ten years between 1900 and 1910, according to U. S. census figures, American farm lands doubled in value—an increase greater than during the entire fifty years preceding. With land growing costlier every year it must bring a greater return per acre if it is to yield the farmer the right kind of profits on its higher valuation and the increased operating costs.

This is a time for conservative expansion only, and just as much attention should be paid to breeding up herds and culling out the boarders as to increasing the numbers. "More and better livestock"

THE GREATEST AUCTION SALE
Ever Held West of Chicago
Tagus Ranch, Tulare, Cal.
December 10, 11, 12, 13, 1918

90 REGISTERED HOLSTEIN COWS, HEIFERS, AND BULLS

P. O. Box D, Tulare, Cal.

The tremendous amount of high-class equipment on the ranch is also rich in opportunity for buyers. Only the most modern, highest quality implements and tools have ever been considered at Tagus Ranch, and all of the hundreds of articles to be sold are of comparatively recent purchase, in first-class condition, and in many instances still in the original cases and crates in which they were received from the manufacturer or dealer. Not a few of the items to be sold are entirely out of stock with jobbers and dealers at present and cannot be bought new at any price.

Watch later issues of this paper for more detailed announcements of this mammoth event—and prepare to profit by it.

should be the slogan, with the emphasis on the "better." Meat is badly needed, and market prices never before were so near the prices for purebred stock, so we can well afford to sell all unprofitable animals and reduce our herd to a paying basis.

Then we should begin the program of rebuilding our herds upon the foundation of profitable animal husbandry. We should have better breeds to make bigger profits. For instance, a well-bred beef animal attains larger size on less feed, and puts on more quality meat in a shorter period than a low-grade steer. In other words, it costs no more to raise a 1200-pound well-bred steer than a 500-pound scrub, and the profits are vastly larger.

The same applies to hogs and sheep. When there is too much daylight under a hog it costs you extra money to feed him and you get nothing for it. High-grade sheep produce finer cuts than can be secured from scrubs; they are worth more and bring more. With dairy cattle, two animals may consume exactly the same amount of feed, yet one may produce twice as much as the other. It's all a matter of breeding.

So sell off the stock that doesn't pay, keep the rest, and add to your herd if you have the feed and means. The biggest profit-making proposition that looms up on the agricultural horizon at present is the raising of high-class stock. Go into it as heavily as your means will permit, with full confidence as to the future.

ARE YOU FINDING CHURNING DIFFICULT?

"Oh, dear, oh, dear! What is the matter with my cow?" writes a discouraged subscriber. "For months I have been making the finest butter you ever ate, but now I can hardly make any at all from her cream, and when I do succeed the butter gets strong in a day."

This poor woman is not alone in her dilemma. A dozen of subscribers are writing us similar letters, perhaps not all in such endearing terms but all having the same trouble with churning. Cheer up! There is nothing wrong with dear bossy. As soon as cold weather arrives and a change is made from green pastures to dry feed these troubles occur. They are usually experienced when only one or two cows are used, and these are quite far along in their lactation periods.

The slowness of churning results from a combination of the hard fat and the large amount of curd found in the milk of stripper cows. The trouble has no connection, contrary to what is often thought, with failure to supply salt, nor is it the result of using any particular feed or combination of feeds. Sometimes the trouble comes from too thin cream or attempting to churn at a too low temperature.

The first thing is to make sure the temperature is right and the only safe way is to use a thermometer. During the winter season 65 to 70 degrees is generally about right for churning such cream and no advantage results from having it warmer. However, having the temperature and thickness of the cream right will not always remedy the trouble. In some bad cases there is no practical remedy, especially when the milk comes from one cow. A cow producing milk giving this trouble had best be dried up as soon as she has been in milk ten months or more. Adding cream from a fresh cow will generally cause the cream from both to churn if the temperature is right and the cream not too thin.

TULARE SALE PROMISES BIG.

The first sale of registered Holsteins to be held at Tulare, Wednesday and Thursday, November 20 and 21, will be remarkable in more respects than one. The new sales pavilion will be dedicated, and there will be an offering of 125 Holsteins representing more high record reference sires than have ever before appeared in a sale in the West. The females will represent some of the very best blood lines of the breed, and they are bred to bulls with records of from 30 pounds to 40 pounds back of them. Thus purchasers will be afforded an unusual opportunity to buy well-bred cows, safe in calf to the greatest bulls ever represented in a sale on the Coast.

Every animal will be guaranteed to be a breeder, and all over six months of age will be tuberculin tested and sold subject to re-testing by the buyer. Assignments have been made by many of the leading breeders of the State. Plan to be on hand. You will find what you want.

TREATMENT FOR RINGBONE.

To the Editor: I have a mare that has developed lameness in one front foot just above the hoof. It seems puffed and spongy, and is sore to the touch. Can anything be done to relieve it?—S. T., Puyallup.

[Answered by Dr. E. J. Creely, San Francisco.]

It is quite difficult to effect an entire cure, and blisters alone are not generally sufficient. The best treatment consists in the application of cold water packs for one week. Then clip the hair and burn with a hot pointed iron. Immediately afterwards apply a Spanish fly blister made of 2 drams cantarides (Russian), 1 dram euphorbia, 1½ ounces benzonated lard. One month later apply a Mercury blister made of 2 drams bin iodide of mercury, 1½ ounces simple cerate. Remove all shoes during treatment and keep the animal at complete rest. It may be advisable for you to have a veterinarian do the firing and perhaps the blistering also.

NOT THE WAY WE ANSWER.

Recently one of our subscribers kindly requested us to cover ailments of animals at greater length in these columns. We shall be glad to comply with this request, but we hope that our answers will never be as complicated as the following, which is the reply that a subscriber to another magazine received:

"We are at a loss to account for this peculiar complexus of symptoms, a condition evidently chronic as revealed by the history of the last three years, with yaws and suppurating otitis as predecessors, yet with acute exacerbations, a condition not clearly explained on the basis of an organic lesion of any one organ, yet showing cardiac enlargement, albuminuria and cylindruria, general adenopathy, icterus, with a secondary anemia not remarkable for the great reduction in red corpuscles or hemoglobin, but strikingly atypical in the large number of nucleated red corpuscles of the normoblastic type and in the tendency of the erythrocytes to assume a slender, sickle-like shape."

QUIT
Wasting Cream Profits

NINE out of ten dairy farmers are **actually throwing away $20.00 per cow per year!** They are doing it by using wasteful, inferior cream separators—or, even worse, by clinging to the old-fashioned gravity, shallow-pan method of separation. Stop this cream waste at once on your farm.

Get ALL the Cream—Use a

VIKING CREAM SEPARATOR

Over One Million In Use! Each Viking Guaranteed For a Lifetime! Greater in capacity than any other separator of equal rating. Easiest operated and easiest cleansed separator on earth. Be At TULARE
November 20-21, 1918

And be there early the morning of the 20th, for it is a two-day sale and the good ones start under the hammer right from the jump.

125 Registered Holstein Cows, Heifers and Bulls

will go to the highest bidders in this sale, absolutely without reserve or limit, and there has never been a better balanced offering of high-class registered Holsteins made in the State.

10 Consignors Contribute to This Sale

and there are first-class attractions in every consignment, practically all choice young cattle, bred in the greatest producing lines of the Holstein breed and sold under conditions most favorable to the buyer.

The Highest Record Group of Reference Sires

ever listed in a western sale are represented in this sale, among them some of the most famous California herd sires, two 40-pound bulls, one 36-pound bull, three 35-pound bulls, one 32-pound bull, two 30-pound bulls, and many of them out of dams with records from 1000 to over 1300 pounds butter in one year.

Outstanding Females Both as to Breeding and Records

are in the sale, bred to the great reference sires just mentioned, including the highest record junior two-year-old ever sold in the west, daughters of cows with records up to over 31 pounds butter in seven days, young cows with records up to over 26 pounds butter in seven days, and a wealth of good breeding.

Bulls to Suit Any Breeding or Dairy Requirement

are in this sale, out of dams with records up to over 30 pounds butter in seven days, dams with over 29,000 pounds of milk and over 1000 pounds butter in one year, and representing the best producing families of today.

Sold Under the Most Stringent Regulations

which positively guarantee every animal to be a breeder, either sex or any age; every animal over six months of age tuberculin tested and sold subject to retest by the buyer.

Feeding Second Growth Sorghums Risky

[Written for Pacific Rural Press.]

Are you having any trouble from feeding sorghums? At this season of the year numerous cases of poisoning of livestock from Johnson grass, and some cases from various members of the sorghum family, are reported — generally among cattle and sheep.

An investigation of these cases shows that there are no losses from feeding grain heads, or sorghums fed as silage, dry fodder or stover. The trouble occurs when the sorghums are eaten green, when stunted, or in the stage known as "second growth." The plants are often stunted by frost or drouth, and afterwards begin to grow again.

In such cases a glucoside is formed in the new shoots, which sets free prussic acid through the action of a ferment. This prussic acid, also known as hydrocyanic acid, is a deadly poison and usually kills very quickly. The worst feature is that there is no method aside from a chemical analysis by which the presence of the poison may be detected. Furthermore, a chemical analysis would not be sufficient, for different plants do not always contain the same proportion of prussic acid. One plant might show a negative test and the very next one, looking almost exactly like it, might contain a large amount of the acid.

SYMPTOMS OF POISONING.

The acid is so strong and its action so rapid that a small quantity will cause severe symptoms in a few seconds. The animal generally staggers or falls, the eyes are motionless, the heart action is slowed and the breathing is slow and convulsive. It is recorded that a cow has died in ten minutes after taking a few mouthfuls of poisoned sorghum. If the animal lives a half hour, no more serious consequences are apt to follow and recovery is probable.

In non-fatal cases the symptoms vary from slight staggering and stopping of chewing the cud to severe convulsions. In cattle or sheep bloating sometimes occurs as a secondary effect. Recovery is generally rapid, and most animals that get well appear normal the following day, but in some cases cattle show weaknesses and a staggering gait for several days.

TREATMENT FOR POISONING.

It is claimed that large doses of ordinary molasses diluted with water will prevent the formation of prussic acid in the animal's stomach if given in the early stages of poisoning, before the animal goes down.

Cattle or sheep which are down in the hot sun should be protected by an improvised shade. If the ground is sloping, the head should be turned up hill, care being taken not to interfere in any way with respiration. When bloating occurs, it should be relieved by puncturing the paunch with a trocar and canula, or a sharp knife, thrust through the left side at a point a hand's breadth in front of the hip bone.

Dr. C. M. Having of the University of California recommends an ever-ready antidote to be prepared as follows:

Bottle No. 1—Select a strong bottle of at least a quart capacity, having a long neck suitable for use in drenching cattle. Place in this bottle one pint of water and one ounce of sodium carbonate (ordinary washing soda will do). Keep tightly corked.

Bottle No. 2—This should contain one-half ounce of iron sulphate (copperas) dissolved in a pint of water. Keep tightly corked.

When needed, pour the contents of Bottle No. 2 into Bottle No. 1, shake and administer immediately. A cow should receive the entire quart of mixture. For a sheep one-half pint of the mixture would be sufficient. Several bottles of the antidote may well be kept on hand in case there are a number of animals liable to poisoning.

Attempts to administer the drenches should be cautious to avoid choking, as the animal may be unable to swallow. The antidote may be given to cattle and sheep through a canula inserted into the paunch through the left side in the manner used for relieving bloat.

PRECAUTIONS.

Don't turn a valuable herd in to feed on sorghums of any sort. Try one or two less valuable animals, and note the effect. If they are not poisoned, it is then safe to turn in the balance of the herd.

When a crop is suspected of being in a dangerous stage, all risk can be eliminated by cutting and air-drying it before feeding it to the stock, or by making it into silage. Even if you know that it contains poison, do not destroy it, for it can always be rendered harmless by being made into hay or silage, and may then be fed with perfect safety.

ALL SHOWS POSTPONED.

As we announced in a footnote in last weeks' issue, the California International Livestock Show has again been postponed—this time until February 9 to 16. The change was made at the request of the Board of Health, and it was decided to put the new dates far enough ahead so that all chance of further interference by the epidemic would be avoided.

This will make the San Francisco show follow the International at Chicago and the Royal at Kansas City. Manager Jos. E. Painter will visit these shows and expects to induce many of the exhibitors to bring their herds out here.

The Shorthorn and Hereford sales will be postponed to correspond, and will be held during the show week.

No definite information has been received from Los Angeles except that the Liberty Fair will surely be held as soon as conditions permit. A large number of beef cattle breeders are still holding their herds there, expecting an early opening. We hope to be able to make a definite announcement next week.

The Pacific International Livestock Show at Portland will be held December 9 to 14. The Shorthorn sale will occur December 12; that of Holsteins December 13, and that of Herefords December 14.

TOMORROW.

"Tomorrow I will go into purebreds."
And he gazed with dreamy eyes
Toward the misty clouds that were
tinged with pink
From the glow of western skies.
"And I'll show the big, indifferent
world
How a good herd wins its way!"
But the prize he sought was won by
the man
Who started his herd today.

DUROC-JERSEY SALE

The Uneeda Duroc-Jerseys. The greatest herd on the Pacific Coast must be sold at once

I have been placed in Class A1 in the draft and my father, on account of ill health and old age, is unable to look after the herd.

This year we produced more champions and prize winners bred by exhibitor than any other breeder on the Coast showing at California and Oregon State Fairs.

UNEEDA QUEEN MODEL,
Grand Champion, State Fair, 1918.

Won at Sacramento

Grand Champion Sow
Senior Champion Sow
Junior Champion Boar
Seven Firsts, Including
First young herd and first produce of dam
23 other Prizes

Every animal must be sold. The herd includes:
A great bunch of sows, many with litters by their side.

Young gilts and boars by the greatest sires of the breed, living or dead.

Three great herd boars that you could not duplicate in the East at the present time at less than $1,500 to $3,000 each.

The **greatest opportunity** breeders on the Coast **have ever had** to secure the best Duroc-Jersey blood at a great sacrifice in price.

Livestock Queries

Close Breeding of Hogs.

To the Editor: Is it a good idea to breed a boar to sows out of the same litter? Also, will it be all right to breed him to his own mother? I have been told that it is well to do this if the stock is good. —F. H., Kenwood.

[Answered by Livestock Editor.]

To breed a boar to his full sisters is inbreeding and is not considered advisable. To breed him to his own mother is commonly called line-breeding, and is a practice that has produced some of the greatest hogs in the world. Greater progress can be made by this method of line-breeding than in any other way, but it must be practiced with great caution. You must be sure that the male and female do not have the same undesirable points, for if so they will be intensified in the offspring and you will be breeding backwards. Of course, every animal has certain weaknesses, but if they are not found in both sire and dam they are liable to be eliminated in the offspring. If a boar has been used on his mother the offspring should be bred to a boar representing an out-cross, as close line-breeding should not be carried on for more than one generation.

Difficult to Cure Heaves.

To the Editor: Can I cure a horse that has the heaves?—J. M. L., Red Bluff.

[Answered by Livestock Editor.]

When heaves are of long standing the disease is difficult to cure. Feeding small amounts of hay and larger amounts of concentrates will give relief. It is very important to see that the hay is free from dust. The horse should be kept in a stall where it cannot eat the bedding, and should be fed at least two hours before working. It should not be allowed to drink very much water before exercising. A bran mash two or three times a week containing one teaspoonful each of salt and baking soda will prove beneficial. Fowler's solution of arsenic may be given in tablespoonful doses twice daily in feed or water.

Pigs Have Stiff and Swollen Joints.

To the Editor: I have several pigs that get stiff in their legs and have swollen, tender joints. The lameness appears in one leg, then in another. What can I do?—R. W., Reedley.

[Answered by Livestock Editor.]

This is a form of rheumatism and the best treatment is to give salicylate of soda and baking soda mixed in equal parts. For pigs three or four months old, give each a half teaspoonful in the slop once a day for a week or two.

Don't Let Pigs Lose Tails.

Grease those pigs' tails if they become cracked, for even a farmer doesn't like to have a bob-tailed hog. He is always the hardest one to sell.

There is nothing that causes the loss more frequently than damp bedding or muddy quarters. Keep things dry and clean, and the minute you notice a tail crack and get sore, grease it with plain lard. This is an old one, but there seem to be lots of breeders who don't know it.

ANGUS CATTLE HEALTHY AND PROLIFIC AT TAGUS.

When Tagus Ranch, Tulare, Cal., brought out two trainloads of grade Angus cows and registered Aberdeen-Angus bulls some years ago, they made a noteworthy addition to California's beef cattle resources, and these cattle are proving most useful and satisfactory. During the past year the entire range herd of Angus had a calving record of 85 per cent and not a single one of them died from any disease. The breeding herd has been carefully culled, and now that all of the livestock and equipment on the big 6000-acre ranch is to be sold at auction on December 10-11-12-13, the pick of the Angus herd, 200 cows and 15 bulls, will be one of the many star features.

CALCO HOG TROUGHS

Your profit in hogs comes out of what you save in hog raising. Disease, filth, and dirt eat up profit—wasted feed is lost profit.

Calco Hog Troughs, with smooth metal sides and round bottoms, are made from rust-resisting Armco iron and cast iron. They are absolutely sanitary and cost less than wood or concrete troughs.

Serviceable sizes in Calco Troughs include:—

SIZE	DEPTH	LENGTH	PRICE
$10\frac{1}{4}$ inch	$5\frac{5}{16}$ inch	40 inch	$3.70
$10\frac{1}{4}$ inch	$5\frac{5}{16}$ inch	60 inch	4.50
14 inch	$7\frac{3}{16}$ inch	24 inch	4.55
14 inch	$7\frac{3}{16}$ inch	60 inch	6.55

Order by mail—with check or money order. Other sizes from 24 to 120 inches in length, from $2.95 up,

California Corrugated Culvert Company

417 Leroy street, Los Angeles. 406 Parker street, Berkeley.

Record Holstein

This four-year-old is first of all HEALTHY. Her record shows it. Her yearly production record is 30,230.2 lbs. milk and 1,111.56 lbs. butterfat. Surprising results are possible if a dairy cow's condition is kept perfect.

Go After Records YOURSELF

Production records of dairy cows are not just to read about—they are distinctly worth trying for, this year more than ever.

The fact is, the health condition of most dairy cows is decidedly lowered, especially during the winter and spring months. They need some medicinal aid to keep their digestive and genital organs in proper working condition, and to enable them to throw off disease.

KOW-KURE, besides being invaluable in the treatment of Abortion, Retained Afterbirth, Scours, Barrenness, Bunches, etc., is also a great PREVENTIVE of disease—a conditioner that works on scientific principles. It strikes at the seat of ailments peculiar to cows. By raising the health standard, it directly aids nature in increasing the milk flow.

Use KOW-KURE this winter to keep your cows healthy and then compare your milk records with other seasons. KOW-KURE can be bought of feed dealers and druggists; 60c. and $1.20 packages.

Send for our Free Book "The Home Cow Doctor" —very useful to dairymen

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

J. E. Wherrell, Fuimus Farm, Riverside, reports that Beauty of Walnut Park, a six-year-old Jersey, recently made a yearly record of 756.63 pounds of butter from 12,966.5 pounds milk.

F. A. Heroux of Oakland has sold to C. L. Morse of Modesto the bull, Dutchland Aaggie's Lucky Guess. This bull was shown at several fairs last year and won three blues, including first, at the State Fair.

The Kerman Creamery, Fresno county, recently sent out notices to its patrons that it would suspend operations on the 1st of November because of the small supply of cream that it has been able to obtain lately.

Lint Sanders, a dairyman of Imperial, has four Jerseys that within the past year have presented him with nine calves. One had triplets and the other three twins. Sanders claims the most patriotic herd in the State.

Five women cow testers have recently been appointed. One is in Iowa and the other four are in Wisconsin, where the first cow tester in the United States is now starting her second year of work. The women seem to be giving excellent satisfaction.

Apple Blossom of Indian Creek, an eight-year-old Guernsey owned by H. P. Hamilton, Two Rivers, Wis., recently completed a record of 702.57 pounds of butterfat from 14,107.8 pounds of milk in 275 days. This makes her champion cow in class AA.

W. J. Higdon of Tulare has a two-year-old Holstein, Madigal Mooike, that is coming along well under official test and in spite of the fact that she had a setback at the Fresno Fair she is expected to make 700 pounds of butter, 20,000 pounds of milk during her year.

Thomas Harrison of Glen Ellen purchased the Milking Shorthorn cow, Yellow Star, at the sale recently held by Otis Farms, Willoughby, Ohio, paying $500 for her. At this sale 31 head sold for an average of $978, the top animals bringing $5,000, which is the record price for Milking Shorthorn cows.

Milking Shorthorns are making good records back East. A report on the work of 28 cows shows that one averaged over 60 pounds per day; three 50 pounds or more; eleven 40 pounds or more; and twenty-three 30 pounds or more. Five averaged under 30 pounds, but only one of the five fell below 4 per cent in butterfat, and one reached 5.05 per cent. The highest butterfat percentage in the list was 6.72. It appears that all the Shorthorn cows needed was a little individual attention to the milking qualities, and we expect to hear much more in the future about Shorthorn milk records.

Beef Cattle.

In a series of auction sales held in the Middle West 1282 Shorthorns sold for $1,000 or more each, the average for all being a trifle over $1,500.

Recently a carload of Hereford steers sold at Chicago for $19.70, the highest price ever paid for a load of beef cattle at any market. The steers averaged 1442 pounds.

W. D. Duke, owner of the Alamo herd of registered Herefords at Likely, reports that the demand for registered Hereford bulls of breeding age has been very heavy and that he is entirely sold out.

E. E. Jones of the United States Forest Service warns cattlemen of the danger of breeding for color in Shorthorn stock cattle herds. He says that this is most injurious to the breeding game and that market qualities should be given chief consideration.

J. A. Bunting of Mission Hereford Farm, Mission San Jose, has just completed a 16x140 shelter for his cattle. At one end he has two bull pens, so that the animals can go in and out of the shed to suit themselves. Mr. Bunting plans on building a new silo next summer.

Cattlemen in Tulare county are reporting the feed situation serious on the ranges, with a prospect that herds may later be moved to portions of the State where grass is plentiful and ranges available. The rainfall of last week was very light in this part of the State and close feeding will be necessary even if more rain comes within a week or two.

Swine and Swinemen.

At a sale of Poland-Chinas recently held by A. D. Severe, Dows, Ia., the yearling boar, Chancellor, sold for $5,500. He was sired by Severe's Big Timm.

Chas. Gatewood & Son of Fresno report they have purchased a son of Caldwell's Big Bob to assist King's Big Bone Leader at the head of their herd of Poland-Chinas.

Falfadale Farm, Perris, has at the head of its Duroc herd the boar, Alexandro, son of Orion Cherry King. He weighs 980 pounds and is one of the smoothest, best bodied boars in the State.

At the recent Topeka State Fair E. J. Erhart & Sons of Ness City, Kan., showed the Poland-China boar, Big Sensation, weighing 1204 pounds at three years. If he had been developed in California probably he would have weighed 1500 pounds.

P. E. Mitchell, the Poland-China breeder of Atwater, is selling hogs like hot cakes, recent sales including three gilts to Martin Veraguth, Atwater; a young boar to Theo. Wackerman, San Luis Rey; a young boar to Mr. Schwin, Le Grand; a service boar to J. S. Rogers, Chow-

Grand Champion BERKSHIRES

AMES RIVAL 70TH

We have in our herd the Grand Champion Boar, Grand Champion Sow and First Prize Senior Herd at State Fair.

Forty-three litters this year averaged ten to the litter. Let us supply you with foundation sows and boars to head your herd.

JAMES MILLS CO.

Gives Greatest VALUE for LEAST MONEY. **IT MAKES THEM FAT.**

HAUSER PACKING CO. LOS ANGELES

chilla; a service boar to John Yager, Merced; and a weaned boar pig to Mrs. A. M. Flint, Hermitos.

One of the leading Duroc breeders in the State, who has been touring the East in search of good stock, recently visited Donald Graham at Lancaster and said that with but one exception Mr. Graham's Orion's King Gano was the best fall boar he had seen. The boar was farrowed October 5, 1917, and on October 30 of this year weighed 500 pounds in breeding condition. Mr. Graham will breed the best of his sows to this boar and says that next year he will bring him out as the best hog of the year.

Sheep.

Over two hundred members of the Sheep Shearers' Union are "over there." We hope that they were among those who sheared the kaiser's goat.

E. C. Spear, the Rambouillet breeder of St. Helena, sheared three yearling rams last month. The first one sheared 18 pounds, the second one sheared 18 pounds, the third one sheared 20 pounds, and afterwards weighed 143 pounds. She is out of an ewe that sheared 24 pounds and raised a pair of twin lambs the same year. These are not record breakers, but, considering that the ewes ran with the band until three weeks before they were sheared and received no grain, it proves that well-bred stock is the most profitable in the end, even if it does cost more at the start.

MORRIS & SON HOLD SUCCESSFUL SALE.

The auction sale of registered Holsteins held by A. W. Morris & Sons Corporation at their farm near Woodland on Tuesday of this week was well attended. The popularity of the Morris breeding is shown by the averages received. Eighty-six head of females, many of which were aged cows, some with missing quarters and none tuberculin tested, brought an average of $286.50 each. Twelve bulls brought an average of $219. Most of the females were bred to the great Morris herd sires, King Morco Alcartra, Sir Aaggie De Kol Acme, King Mead of Riverside, Prince Gelsche Walker and Segis Pontiac De Kol Burke. The bulls sold were by the same sires. Bidding was brisk and there was manifested a good demand for both bulls and females.

W. L. Hodges of El Centro was the largest buyer, securing 18 head; Leeman & Kilger of Sacramento bought 15 head; J. S. Dato of Petaluma bought 12 head. Other large buyers were Dr. E. J. Weldon of Sacramento, J. McKinley of Acampo and Harvey De Wolf of Ripon.

The sale was held under the auspices of the California Breeders Sales and Pedigree Company. Col. Ben Rhoades of Los Angeles and Col. Cy Clark of Modesto were the auctioneers.

LIBERTY FAIR WILL OPEN NOVEMBER 21.

The announcement is made that the Los Angeles Liberty Fair and Stock Show will open November 21 and continue to December 1 by permission of the health office. As a good part of the show and stock exhibits have been on the grounds for some time, there should be little difficulty in getting the rest of the stock from over the State in place by the opening time next Thursday. Now that the war is over and the influenza rapidly becoming only a memory, it is time to celebrate. Take a week off and visit the Los Angeles Liberty Fair, also the various beautiful sections in the "sunny southland." You will be well repaid.

FOR SALE—A few Hampshire rams, 1 registered Duroc boar, 1 6-year-old jack—large breeder. H. M. Barngrover, Santa Clara, Cal

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

FEEDING THE THANKSGIVING TURKEY.

The wise turkey raiser has selected all the birds he intends to put on the market for Thanksgiving, and is already feeding to give that finish to both quality and quantity that is desirable for both producer and consumer. The consumer gets little satisfaction from an underfed turk, no matter what it weighs; in other words, the quantity is not desirable unless quality goes with it.

FEEDING.

Corn cooked and allowed to get cold before serving is one of the best all-around finishing feeds for turks; next comes a mash of boiled potatoes mashed up and mixed with ground oats and cornmeal. This, too, should be left to cool. No hot feed of any kind should be served to poultry of any kind. If a handful of salt is added to the water before cooking, it makes for palatable food. Whole corn takes a long time to digest, and if it is to be served it should be given at night, when there is time for the turk to get the good out of it. By feeding cooked corn or mashes in the early hours of the day it is possible to get them to eat much more—consequently make more good meat, in a given time, than can be done by feeding all raw food, no matter what it is.

NEW LAW GOVERNING TURKEY SALES.

The new law is that all poultry must be sold with empty craws, and the Los Angeles buyers are sending out statements that turkey hens under six pounds are not wanted and young gobblers under thirteen pounds are better kept for a later market. It has taken the buyer a long time to realize that these changes were necessary, but now that they are laying down rules it will pay the turkey raiser to not only take notice but to conform to them as near as possible. They are good rules, not only to protect themselves, but they are a sort of guarantee to the purchaser that he is getting a square deal; and they are good for the producer because they will encourage the feeding and proper care that should be given turkeys intended for market. Too many think that, provided they can grow a lot of bone and muscle, it can be unloaded on the market and bring top price. In New York chickens have been killed with more than half a pound of clear gravel in the intestines, crammed into them to make them weigh. No such rascality as that can be good for any business and sooner or later the whole business has to be reorganized in order that such crude methods of robbery can be eliminated.

Turkey crops are worth money these days and it really pays to take the very best care of them. Naturally,

MITES LOWER THE CONSTITUTIONAL VIGOR

and every breeder should have poles put up in the lee of some windbreak for his turkey perches. These should be sprayed and kept free from mites and vermin. The worst case of mites I ever saw was in a pear tree where chickens roosted. The tree was literally alive and had to be sprayed several times to clear it of the pests; yet most people think that birds sleeping in the open are bound to be free from mites, but they are not. Now, as

TURKS PREFER TO SLEEP OUTDOORS

of the birds, they are to a great extent the cause of roup and other troubles in turkeys, so that the sleeping-place should be often inspected and at the least sign of trouble the cure should commence with cleansing the perches and arranging so that the birds are protected from a direct draft on their heads. A sick turkey is so unnatural a thing that the cause should be run down and stopped at once. Medicine may relieve, but nature is the direct cure for turks. Clean, wholesome range, clean perches, good, clean feed—this is the trio of things that makes for both quantity and quality.

HENS SUDDENLY STOP LAYING.

I have 180 White Leghorn hens. From March 1st to September 1st they averaged 90 eggs per day. They then began to moult heavily, and the eggs dropped to about six per day. I have continued their regular feed. The hens have an unlimited range to forage on alfalfa and various other greens. Their quarters are light, clean and airy, with no sign of vermin.—V. M. E., Hollister.

[Your hens need a little tonic to start them off. You should have a copy of "California Poultry Practice," which contains several good flock tonics. However, here is one to start them off. One pound sulphate of iron; one pound red oxide of iron; quarter pound of cayenne pepper, and four ounces of powdered nux vomica. Mix thoroughly and give one tablespoonful in mash, either moist or dry, for one dozen hens, more in proportion to number. Serve every day for one week, then drop to twice a week, and when you think the hens are all going good, drop to once a week, then altogether. This is not a food, just a tonic.]

DOES DO NOT BREED.

To the Editor: I have been trying to breed eight doe rabbits. So far only three have had young, and the rest have had repeated service with no results. The rabbits are fed alfalfa hay, with occasional green stuff. Rock salt and fresh water are kept in their pens and the pens are clean. They are all fat and healthy. What is wrong?—Subscriber, Sutter.

[A little rolled barley or oats would be advisable, cutting out a portion of the hay. The does may not have heat enough to make them breed to best advantage. Grain in some form is necessary for best results. It gives heat, strength and more vitality than an all-around vegetable diet.]

Poultry Breeders' Directory

Rate in this directory 3c. per word each issue.

EGGS, MEAT, GOING HIGHER!—Great shortage. Big profit for years sure on really heavy laying strains. Our 200-290 egg Leghorns, Anconas, Reds, Rocks, Minorcas, Wyandottes, Orpingtons, ducks, turkeys, are more profitable now than ever, clearing $5 yearly. Some best Government trap-nested hens, 280-283-eggs. Hundreds breeders; laying, younger pullets; thousands chicks weekly; reasonable. **Chicks scarce.** Few open dates winter, spring delivery, last year's prices. J. Beeson, Pasadena, Cal.

BARRED PLYMOUTH ROCKS—Winners at leading shows and wonderful layers. Choice stock for sale. "Nothing better in poultry." Catalog free. Chas. R. Vodden, Box 396, Los Gatos, Cal.

BRONZE TURKEYS—Young toms and hens for sale; also yearling hens. Order breeding toms now and have them shipped when wanted. Eggs in season. Albert M. Hart, Clements, Cal.

EASTMAN'S BRED-TO-LAY, Hoganized and trapnested Barred Plymouth Rocks, Cockerels; Eggs. Fairmead Poultry Farm, Fairmead, Cal.

WHITE LEGHORN BABY CHIX from heavy laying (Hoganized) stock, $15 per 100. We guarantee safe arrival. The Pioneer Hatchery, 408 Sixth street, Petaluma, Cal.

LAST FALL CHICKS IN OCTOBER—Booking orders for spring deliveries. Several varieties. Stubbe Poultry Ranch and Hatchery, Palo Alto, Cal.

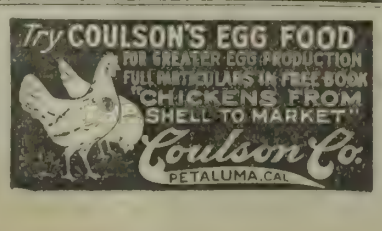
MAMMOTH BRONZE TURKEY TOMS and hens for sale. Order now before prices advance. Also Collie dogs for herding. John G. Mee, St. Helena, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal. Stamps.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch, R. 2, B. 144D, Pomona, Cal.

BOURBON RED TURKEYS—Order now and we'll reserve them until January 1st. Mrs. Geo. F. Smith, Hardwick, Cal.

FOR SALE—MAMMOTH BRONZE TURKEYS—The best in the West. Geo. A. Smith & Son, Corcoran, Cal.



PRUSSIAN HILL POULTRY RANCH—Blue Andalusians, pens, trios, pairs, cockerels. Black Minorcas, trios, pairs, cockerels. Barred Rock cockerels. Prices low. Geo. I. Wright, Prop., R. F. D., Mokelumne Hill, Cal.

Chickens Sick?—Use Germozone
Roup, colds, bowel troubles, sore head limber neck, etc. At dealers or postpaid 75 cts. with 5 book Poultry Library. GEO. H. LEE CO., Dept. 428 OMAHA, NEB.

THE HOME CIRCLE

HOLY WILLIE'S PRAYER.

O Mars, now hear thy servant's prayer—
I've always done my best to square
Mysel' wi' those who've gow'd to spare
A' for thy glory;
For my ain guid I dinna care
I bow before ye.

I praise thee, Mars, by day and night
An' treat thy chosen junkers right,
Those that be smirched I render white
Wi' words o' grace.
As thy high priest I am a light
To a' the race.

Then bless thy junkers in this land;
Tho' they be but a little band,
Thine enemies are like the sand
In numbers;
Let not their threatening, selfish stand
Disturb my slumbers.

Lord Mars, hae I not sarved thee well?
Still in thy service, fain I'd dwell,
To minister, anither spell
To thine elect;
Then let my foes in flames o' hell
Their fau'ts correct.

Tho' millions die o' common swine
Beyond the sacred river Rhine,
Be kind, O Mars, to me and mine
And let me reign.
For I am King by right divine,
Excelled by nane.
—Wi' Ian's apologies to Robert.

THE BOY WHO DIDNT WANT TO.

"Don't want my hands and face washed," whimpered the Boy Who Did Not Want To, holding his hands before his face, spreading his fingers fan-like.

Mother came closer. "Why, that looks just like a little picket fence!" she exclaimed.

"What does?" asked the Little Boy, curiously.

Mother touched the grimy little fingers. "One little, two little, three little, four little, five little, six little, seven little, eight little, nine little, ten little, pickets," she counted. "Why, that's quite a nice little fence. But I think it needs a new coat of paint."

Little Boy held the little fence farther from his face and regarded it thoughtfully. "Maybe it does," he said.

"But first," said mother, "we shall have to clean off the dust.

Little Boy giggled. Mother filled a bowl with splashy water and put in a cake of pinky white soap.

"I'll clean this side first," mother said, holding up the fuzzy washcloth and drawing it between each stiff little picket.

"Why, I don't believe the fence needs to be painted, after all," she said. "I'll just fix up these shiny ornaments at the top a little." So she cleaned his nails.

Little Boy giggled. "Play that again."

Mother studied his face thoughtfully.

"Such a nice clean fence," she said. "I declare it makes the little house look kind of shabby. Don't you suppose we could just clean up the front door a little?"

"What door?" he asked.

Mother tapped his mouth. "I'll have to use a brush like the man had who came to clean our porch," she said, picking up toothbrush and paste. "There! Our front door is clean, at any rate, but it makes the walls and the windows look positively ashamed."

Little Boy laughed. "You may clean the walls and the windows if you like," he cried. So mother washed his rosy cheeks and blue eyes. Still she seemed downcast.

"Those dreadful side porches!" she said.

Little Boy clapped his hands to his ears.

"What will the little words think," continued mother, "when they have to go through such dirty porches?" Down came the hands and in a moment the "porches" shone like pink seashells.

Her eyes traveled to his neck next. "That awful basement!" she cried.

Little Boy wriggled delightedly. "Take a brush to it," he suggested.

She shook her head. "I'll take this cloth."

"Is the dirt coming off?" he asked.

"Indeed it is! Now the house is all right but the slates on the roof. Do you think we could straighten them a little?" Little Boy nodded, and mother combed his curly hair.

"Now!" she exclaimed, "the house is all bright as new, and here comes a snowstorm." With talcum powder she dusted his hands and face, then she and Little Boy went to tea.—London Christian Life.

TAMALE LOAF.

One can corn, 1 can tomatoes, 2 tablespoons shortening (melted), 1 large onion (chopped), 1 tablespoon pepper, 2 eggs (well beaten), 1 cup cornmeal, 1 dozen ripe olives, 1 cup chopped nuts or meat. Season with salt and cayenne to taste. Melt shortening, add onion and cook until tender. Add corn, tomatoes, salt, pepper. Bring to boiling point. Add cornmeal gradually, stirring constantly. Cook about twenty minutes, then add eggs, olives, nuts or meat. Pour into baking dish and bake forty-five minutes. Serve with or without tomato sauce.

SAUCE FOR TAMALE LOAF.

Two tablespoons salad oil. Cook in it 1 onion and 1 clove of garlic chopped fine. Add 1 cup of tomatoes, season generously with all kinds of seasoning — sage, thyme, bay leaves, tabasco sauce, Worcestershire sauce and salt. Simmer slowly one hour. Strain before serving.

WHERE OUR STRENGTH LIES.

In the homes of America is the strength of the people. By household habits national vigor is greater or less. The new conservation program is an appeal to all households to save food.

It would be easier, perhaps, to follow specific directions—the wheatless days and meatless meals. The new program calls for individual initiative and resourcefulness, which is the spirit of democracy. The new program is in terms which only an intelligent people could execute—a people actuated by a war conscience.

Intelligence and thoughtful conscience are required. Nourishment must be watched intelligently, cost must be counted intelligently, values must be regarded intelligently, waste must be avoided intelligently, saving must be made intelligently. The consumption of food must be reduced intelligently.

The sugar allowance, the rule of universal Victory bread—these are but incidents in the program. It is the original program of the Food Administration in a new setting.

FIG PICKLES.

Irresistible fig pickles enjoyed by the writer at the homes of Mrs. H. A. Clark and Mrs. Leroy Anderson are made by the following recipe, as told by Mrs. Anderson: Fill a two-gallon crock with clean, ripe figs of any common variety and cover them with water to which ½ cup salt is added. Let soak over night and in the morning soak them an hour in fresh water. Make a syrup of one quart vinegar, four pounds brown sugar, and spices to taste. Bring it to a boil, put the figs in and cook ten minutes. Let them stand until next morning, when they are to be cooked ten minutes more, after bringing them to a boil. On the following day cook at least an hour. Mrs. Anderson has generally used stick cinnamon and whole cloves for the spices, keeping them in a bag, but her last ones were made with powdered cloves and cinnamon.

Convert
your old-fashioned
bathrooms

into modern bathrooms to which you can conduct your guests with a feeling of pride.

The combination of beauty and simplicity contained in Pacific Plumbing Fixtures make them the vogue. Their added convenience, and the amount of unnecessary work they save, will more than compensate for their moderate cost.

Agricultural Summary

Next Season's Orange Outlook.

Oranges brought record prices this year, but few profited thereby, as high prices are little satisfaction to the grower who has little or nothing to sell. According to the latest figures, this State shipped this year to date about 23,000 carloads of citrus fruit of all varieties. Shipments last year reached a total of over 53,000 cars, and it is predicted, from estimates based on a painstaking survey of California's citrus districts, that next year our shipments will probably reach 43,000 cars. It is almost futile at this time to make a forecast of prices, as great uncertainty hangs over the political and economic future of our foreign competitors in citrus production, and natural conditions can never be foreknown — except to the almanac makers and sunspot gazers. Nevertheless, it seems fairly safe to hazard a guess that prices next year, though somewhat below this season's high level, will be satisfactory to California growers.

California's Bean Production.

The preliminary estimate is for an average yield of 14 bushels per acre, making a total production of 6,258,000 bushels. The preliminary estimate of limas last month was 2,610,000 bushels, making the total production of "all beans" 8,868,000 bushels, compared to 8,091,000 bushels in 1917. The bean market continues to show evidences of weakness throughout the list. There is an unconfirmed rumor that the Government is making heavy purchases of Asiatic beans, despite the seductive encouragement held out to American bean growers at the beginning of last season. The enormous bean crop in Michigan this season seems also to have had a depressing effect on the local market.

California Crop Conditions, 1918.

E. E. Kaufman, field agent, local office U. S. Bureau of Crop Estimates, issues the following estimate of the total production of important crops compared with last year:

Corn	110.8 per cent
Potatoes	82.5 per cent
Sweet potatoes	101.8 per cent
Apples	97.3 per cent
Raisins	82.8 per cent
Almonds	130.7 per cent
Walnuts	112.0 per cent
Beans	109.6 per cent
Oranges	201.0 per cent

Egg Shipments; New Regulations.

The U. S. Food Administration has just issued specific instructions to govern henceforth the distribution of fresh eggs. Special regulations covering the kinds of cases and fillers to be used are set forth in "Special License Regulations, No. XIX," copies of which may be obtained from your dealers. Permits to dealers to use up supplies now on hand should be secured from the local Federal Food Administrator.

California Eggs in Eastern Markets.

Last week's market report from New York quotes the highest grade of eggs at $1 per dozen. The arrival of several carloads of fresh California stock is also reported. One car sold at 95c even before the Eastern market reached the dollar mark. The high quality of California eggs is accepted without question in the Eastern markets.

California Barley, $2.38 Per Cwt.

Local grain traders recently stated that the Government is buying all California barley offered at $2.38 per cental for export to England, but that many farmers are holding for higher prices. Brokers are not permitted to hold their stocks more than thirty days, but farmers are not restricted in this respect.

The National Wool Harvest

The wool clip of the United States for 1918 totals 290,000,000 pounds, S. W. McClure, secretary of the National Wool Growers' Association, announced. The clip has a value of $170,000,000, according to the same authority.

Two Rice Grades.

There are two Government grades of rice as it comes from the mill—Fancy No. 1 Cal. Jap, 7½c; choice Cal. Jap., 7⅜c.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, November 13, 1918.

WHEAT.

The following are Government prices per bushel for wheat in bulk at San Francisco. The quotation for recleaned is the price per hundred and the charges are strictly regulated by the Government. Per carload the quotation is $4.15. Less than carload lots is $4.25.

Per bushel—

No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 2	2.09

Recleaned for seed, per ctl.—

California Bluestem	$4.15@4.25
Early Baart	4.15@4.25

BARLEY.

The barley market was a little stiffer, probably on account of the prospect of freer shipments to Europe, which are expected to follow the cessation of hostilities.

Choice feed, per ctl	$2.10@2.20

OATS.

Oats are dead, although choice red feed is quoted at a slight advance over last week's prices.

Red feed, per ctl	$2.30@2.50
Red for seed	2.80@3.00
Black for seed	2.80@3.00
Recleaned Red or Black for seed	3.35@3.50

CORN.

Some good Eastern corn has been offered on the exchange at $3.75, but found no buyer. An inferior lot was offered at $2.75 without sale. Milo maize and Egyptian are offered at $3 to $3.10, but there seems to be no demand at these figures.

HAY.

Receipts of hay for the past week were 815 tons, compared with 644 tons the previous week. Most of this hay arrived by water and was more or less damaged by the September rains. Very little arrived by rail, and this was from warehouses. Trade has been dull and it is difficult to sell these arrivals ex-warehouse to advantage. The Government is again in the market for a large amount of hay, but outside of this feature the market is almost at a standstill.

Wheat No. 1	$25.00@27.00
do, No. 2	20.00@24.00
Choice tame oat	25.00@27.50
Wild oat	20.00@22.00
Barley	20.00@22.00
Alfalfa	18.00@22.00
Stock	18.00@21.00
Barley straw	.50@ .80

FEEDSTUFFS.

The market for feedstuffs is dull and unchanged. It is anticipated that the stoppage of fighting in Europe will have a considerable effect on this market, but as yet the influence has not made itself felt.

New alfalfa meal, per ton	$35.00@36.00
Coconut cake or meal	Nominal
Cracked corn	$86.00@88.00
Oilcake	77.00@78.00
Rolled barley	45.00@47.00
Rolled oats	55.00@57.00

POTATOES, ONIONS, ETC.

A good local demand increased the price of potatoes somewhat this week. This advance, however, is not expected to stand for any length of time, as the local market is said to be higher than nearly all other markets. The onion market is weaker. Fancy stock of both descriptions is selling higher than the ordinary run. There were few changes of importance in other vegetables.

String beans	5@7c
Wax beans, per lb	5@7c
Pole beans	5@7c
Carrots, per sack	50c@$1.00
Rhubarb, San Jose, per box	$1.00@1.25
Pumpkins	75@90c
Cucumbers, Alameda, lugs	$1.00@1.50
Eggplant, per box	75c@$1.00
Livingston	$1.25
Lettuce, Sacramento, doz	25@40c
Celery, bunch	20@25c
Tomatoes, per crate—	
Bay	75c@$1.50
Potatoes—	
Garnet, Chile, on street	None
Fancy	2.10@2.20
Whites	$1.65@2.00
Sweets, per sack	3.00@3.25
Onions—	
River Reds	None
Yellows	65@90c
Australian Browns	65@90c
Fancy	$1.00@1.15
Garlic, new	15@20c
Green corn, Alameda, per sack	Nominal
Okra, box	$1.00@1.25

BEANS.

Beans showed a further inclination to slump this week and lower prices are quoted on the leaders. So far it is said the armistice has had no effect on the local market, and no prediction is made regarding the future.

BEANS—	
Bayos, per ctl	$7.25@7.50
Blackeyes, new crop	5.00@6.00
Cranberry beans	8.50@8.75
Limas (south, recleaned), new crop	$10.25
Pinks	$6.60@6.80
Mexican Reds	$6.75@7.00
Tepary beans	6.25@6.50
Garbanzos	8.00@8.75
Large whites, new crop	8.25@8.40
Small whites, new crop	9.40@9.60

POULTRY.

Five carloads of poultry from the East on Monday of this week depressed the price of small to medium sized hens. However, the demand was good and the price recession not great. Dressed turkeys are strong and are now quoted at 10c a pound higher than the live bird. The entire poultry market is steady, with no other changes. Prices of jack rabbits fluctuate daily.

Turkeys, live, young spring, lb	32@35c
do, old	32@33c
do, dressed, old	42@45c
Broilers, 1½ to 2 lbs	39@42c
do, 1¼ lbs	45c
do, ¾ to 1¼ lbs	48c
Fryers	38c
Hens, extra, per lb., colored	40c
do, Leghorn	38c
Smooth young roosters, per lb. (3 lbs. and over)	37@38c
Old roosters, colored, per lb	24c
Geese, young, per lb	27@28c
do, old, per lb	25c
Squabs, per lb	55@60c
Ducks	29@30c
do, old	25@27c
Belgian hares	21@22c
Jack rabbits	$3.00@3.50

BUTTER.

Butter was marked up 2c on Monday of this week. It was found that at 59c the price was low enough for shipments to be made to other markets. A considerable quantity was sent to the north and some went south. This had the effect of lowering the local supply and a higher price was made to keep a normal supply in this market. Some butter also went into storage at 59c, while other butter that had been placed in storage at a lower price was brought out and sold. The stock in storage shows a constant diminution. Street stocks of butter are also reported lighter than a week ago.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	59	59	59	61	61	61
Prime firsts	59	59	59	Nom.	..	..
Firsts	58	58	58	Nom.	..	..

EGGS.

While extra eggs touched 89c during the week, the price quickly receded to 86½c. On Wednesday the first sale was made at 84½c and each subsequent sale showed a lower price until the close at 80c. No opinion was forthcoming from members of the exchange for the sudden drop. The Eastern markets were strong and Chicago showed an advance. On the street it is said that eggs have been too high and that they have "been due for a drop" for some time. The movement into storage has been nominal for some time past, while the movement out has shown a steady increase. This fact, together with the refusal of the average user of eggs to pay the high price demanded, probably accounts for the drop.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	85½	89	89½	89½	85½	80
Extra 1sts			Nominal			
Firsts			Nominal			
Extra pullets	79	74½	75	73	71	64½

CHEESE.

There was not much interest in cheese this week. All prices were lowered with exception of California Cheddar.

California Cheddar, flats, fancy	32c
Fancy California flats, per lb	32½c
First California flats, per lb	Nominal
California Y. A. fancy	Nominal
Oregon triplets, fancy	35½c
Oregon Y. A. fancy	Nominal
Monterey cheese	22@25c

FRESH FRUITS.

There is very little doing in the fresh fruit market except in the case of apples, which are on the market in good variety and condition. The demand is excellent. Following are the principal varieties with the prices at which they sell at wholesale:

Apples—	3½-tier	4-tier	4½-tier
Jonathan	$1.75@2.00	$1.50@1.75	
Newtown Pippin	1.50@1.65	1.35@1.50	1.25@1.35
Bellflleur	1.50	1.50@1.65	1.35@1.40
Baldwin		1.25@1.50	1.00@1.25
R. I. Greenings		1.25@1.50	1.00@1.25
Wagner		1.50@1.75	1.25@1.50
Lauver		1.50	1.25

	Extra Fancy	Fancy
Spitzenberg (N. W.)	$2.75@3.00	$2.50@2.75
Jonathan (N. W.)	2.50@2.75	2.25@2.50
Baldwin (N. W.)	2.25@2.50	2.00@2.25
Winesap (N. W.)	2.50@2.75	

Other Fruit.

Peaches, 4-box crate	None
Figs, black, per box	None
do, double layer	None
do, Single Row Whites	None
Strawberries, per chest	$10.00@13.00
Blackberries, per chest	None
Raspberries, per chest	$9.00@12.00
Plums	None
Cantaloupes, flats	None
do, ponies	None
do, standard	None
Watermelons, per lb	None
Pears, Bartlett, per box	None
Winter pears	$2.00@3.00
Grapes, Tokay	2.00@2.50
do, Muscat	2.25@2.50
Persimmons	1.25@1.50
Alligator Pears	$4.00
Cal.	$1.00@2.00
Pomegranates, small box	1.25@1.50
do, large box	1.50@2.00

CITRUS FRUIT.

Navels are now coming on the market, but the price is high and most of the fruit is moving slowly. Grapefruit of the new crop is quite plentiful. It is somewhat green. The price was materially lowered and the fruit is moving at $3 for the best. Lemons are selling for less, and it is expected that the passing of the influenza epidemic will cause a further drop.

CITRUS FRUITS.

Oranges	$12.50
do, Navels	$9.00@10.00
Lemons, fancy	$8.50
do, choice	7.00
do, standard	6.00
Grapefruit	Nominal
Grapefruit, new	$3.00@3.00

DRIED FRUIT.

There was no change this week in the dried fruit market. The market is quiet but firm and last week's quotations are maintained.

RICE.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop, at mill	7.00

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, November 12, 1918.

Practically all auction markets held up remarkably well during the past week, taking into consideration the indiscriminate offerings that prevailed. Sound, good-keeping stock averaged with the highest prices of the year, and over ripe and weather damaged grapes were picked up for wine making. An unusual fall has made it possible for the fruit stands to remain open and, consequently, has resulted favorably for the California shippers. This, together with the light offerings, has resulted in a strong market.

Averages for the week:

New York—Grapes: Malaga, $2.13; Emperors (crates), $2.00; Emperors (drums), $5.75; Emperors (kegs), $5.07; Cornichon, $2.11; Tokays, $1.74. Pears: B. Clairgeau, $3.68; Winter Seckle, $3.40; Winter Nellis, $2.79; Easter Buerre, $2.64; Glout Morceau, $4.18.

Boston—Grapes: Emperor (kegs), $5.20; Emperor (drums), $5.65; Emperor (crates), $2.23; Malagas, $1.92; Tokays, $1.66; Cornichon, $2.30. Pears: Winter Nellis, $2.25; Glout Morceau, $4.22; B. Clairgeau, $4.82.

Chicago—Grapes: Malaga, $1.61; Emperor, $1.82; Tokay, $1.54; Cornichon, $2.11.

Shipments from November 1st to 8th, inclusive (incomplete), 29 pears, 432 grapes.

Special Citrus Market Report

Los Angeles, November 11, 1918.

The new crop of navels is not moving to market as expeditiously as was expected a few weeks back. While the fruit seems sufficiently matured and meets the 8-to-1 test readily, it is not coloring up as well as desired, and growers have been advised to hold back a little while. Prices on the new crop have not yet settled down. F. o. b. quotations on last week's shipments ranged between $3 and $9 a box. On fruit shipped up to November 15 several cars have been sold on a $5.50 cash basis. For shipments November 20 to 25, $4.50 f. o. b. is offered for top grades.

The movement of Florida fruit has set in strong, the Florida shippers being anxious to forestall the arrival of California navels and to take full advantage of our between-season period. Valencias are about cleared up.

California lemons are moving freely to market. The crop is large, and although there is no competition from foreign sources, the tendency of prices is strongly downward. Between 25 and 30 carloads are leaving daily.

Deciduous Fruit Shipments 2,358 Cars Over Last Year

This week will undoubtedly terminate the deciduous season for California, one that will go down in history as probably the most profitable for nearly all of the districts, despite a few shortages that developed on account of early rains in some sections. It must be borne in mind that the figures are not quite complete, as some minor additions are still to be made, but they serve to show in a striking way California's capabilities as a fruit growing State, even in an "off" year.

Shipments to date, Nov. 5, 1918	24,600 cars
Shipments to date, Nov. 5, 1917	22,242 cars
Excess of shipments this year over last	2,358 cars

LOS ANGELES

Los Angeles, November 12, 1918.

BUTTER.

A steady market and very good demand was had the past week for what little came in. The receipts were light, only 249,500 pounds against 320,000 pounds the same week last year. To make up this shortage there was withdrawn from cold storage during the week 30,616 pounds, leaving the cold storage holdings now only 171,379 pounds against 163,697 pounds the same week last year. Eastern advances had no influence upon the markets here on the coast.

We quote—

California fresh, extra....................57c
California fresh, prime first..............55c
California fresh, first.....................54c

1917—						
Extra	43	43	42	42	42	42

EGGS.

There was a little done on 'change in eggs the past week. The receipts were light, only 394 cases against 510 cases the same week last year. Under scarcity the market for fresh ranch eggs was steady and firm, but dull. The trade turning to cold storage eggs for relief, they finding more ready sale at the difference in prices. There was taken from cold storage during the week 3112 cases against 3863 cases the same time last year, leaving the holdings now 39,998 cases against 30,323 cases the same week last year. San Francisco declined 2½c on fresh extras up to Monday, but this failed to influence the market here. Chicago is 1c higher than a week ago on first, and New York is 5c higher, which more than offset the weakness in the San Francisco market.

Case count	56	56	56	56	54	54
Pullets	51	52	52	53	53	53

VEGETABLES.

There was quite a falling off in the receipts of potatoes the past week and market higher and demand very good at the advance. Sweet potatoes continue dull and weak under free offerings. Onions influenced by a falling off in the receipts and cooler weather met with a better demand than for some time. Peppers steady. String beans slow of sale. Cabbage dull, but steady. Not many tomatoes now coming in; the best in very good demand.

We quote from growers:

Bell peppers, per lb....................3@4c
Chile peppers, per lb...................3@4c
String beans, per lb....................5@6c
Lima beans..............................4@4½c
Potatoes, northern, per cwt........$2.25@2.50
do, Idaho Russets, per cwt..........2.25@2.40
Sweet potatoes, per cwt.............1.25@1.40
Garlic, per lb............................20c
Onions—
Australian Brown, per cwt.........$1.40@1.50
White Globe, per cwt................2.50@2.75
Cabbage, per 100 lbs................1.00@1.25
Celery, crate.......................3.50@4.00
Tomatoes, No. 1, lug....................70@80c
do, No. 2, lug..........................25@35c

POULTRY.

Receipts continue light and the market the past week was steady for everything. The heavier broilers, fryers and hens were all in good demand. Turkeys, too, were in better request, dealers stocking up for the Thanksgiving trade. Ducks in fair demand and geese also.

The following prices were agreed upon last Friday, November 1, and hold good until the coming Friday:

Broilers, 1@1¼ lbs.........................37c
Broilers, 1½@1¾ lbs........................41c
Fryers, 2@3 lbs............................33c
Roasters (soft bone), 3 lbs. and up........30c
Stags and old roosters, per lb.............20c
Hens....................................26@32c
Tom turkeys.............................31@34c
Ducks...................................22@28c
Geese......................................20c

MELONS.

The melon season is now over.

BEANS.

It is still dull in this market. The trade only buying what is needed from day to day, and there is no disposition to anticipate future wants. Limas are meeting with more ready sale than anything else.

We quote from growers—

Limas, per cwt.........................$10.00
Large white, per cwt.....................9.00
Small white, per cwt.....................8.00
Pink, per cwt............................6.50
Tepary, per cwt..........................4.50
Blackeyes, per cwt.......................5.00

FRUITS.

Not much now in, aside from apples, save cold storage stock. Pears have stopped coming in. Grapes are getting scarcer and higher. Demand is good. Apples continue steady. Few figs now arriving and are in good demand. Japanese persimmons are meeting with a good demand.

We quote from growers:

Figs, Black Spanish, per lb.............10@12c
do, White, per lb.......................10@12c
Grapes—
Malagas, per lb..........................6@7½c
do, Rose Peru, per lb......................6@7c
Tokay, per lb..............................6@7c
Cornichon...................................6c
Apples—
King Davids, 4-tier......................$2.75
Black Twigs, 4-tier.......................2.75
Baldwins, 4-tier..........................2.00
Red Pearmains, 4-tier.....................1.75
White Pearmains, 4-tier...................1.75
Rhode Island Greenings, 4-tier............1.50
Yellow Newtown Pippins, 4-tier............1.75
Apples, Bellefleur, 4-tier..........$1.75@2.00
do, 3½-tier..........................1.70@1.80
do, Gravenstein, 4-tier...................2.25
Japanese persimmons, lb....................6@8c

BERRIES.

Few now coming in, but meet with fair sale and bring steady prices. Not enough arriving to justify a continuation of the market after this week.

We quote from growers:

Strawberries—
Fancy, per 30-basket crate..........$3.50@4.00
Poor to choice, 30-basket crate......2.50@3.00
Raspberries, 30-basket crate.........5.50@6.50

WALNUTS.

Few are to be had even from independent growers, and the market remains steady and firm. The Association is still working on its contracts and shipped out about 25 cars a day the past week.

We quote f. o. b. California points:

	1918	1917
Fancy budded	34½c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

HAY.

The market turned quiet again. Receipts were not heavy, neither was the demand. Many buyers anticipated their future wants last week and were therefore out of the market. Prices held steady all round.

We quote f. o. b. Los Angeles:

Barley hay, per ton...............$23.00@24.00
Oat hay, per ton...................25.00@27.00
Alfalfa, northern, per ton.........20.00@21.00
Alfalfa, local, per ton............21.00@23.00
Straw, per ton......................9.00@10.00

COTTON.

There is not much change to note in the cotton market since our last review. The market in New York opened our review week a little stronger under fair buying by shorts. But later it lost tone, though prices held up under the prospect of peace. In New York December closed last Friday at 29.35c and January at 28.75c. In New Orleans the same day December closed at 28.70c and January at 28.76c. Since then there has been little doing owing to the excitement over the signing of the Peace Armistice.

Special Livestock Market Report

San Francisco, November 13, 1918.

CATTLE—Cattle have been somewhat scarce during the past week, especially steers of good quality and good weight. Prime, well finished stock, when obtainable, commands a premium. Prices are firm, with a tendency to advance in the near future.

Grass Steers—
No. 1, weighing 1000@1200 lbs.......12¼@12½c
do, weighing 1200@1400 lbs..........12@12¼c
do, second quality..................10½@11c
do, thin...................................8@9c
Cows and heifers—
No. 1....................................8@8¼c
do, second quality.......................7@7½c
do, common to thin.........................5@6c
Bulls and stags—
Good.......................................6@7c
Fair.......................................5@6c
Thin.......................................4@5c
Calves—
Lightweight................................11c
Medium.....................................10c
Heavy....................................8@8½c

SHEEP—Mutton sheep are not plentiful, and the bulk of the stuff coming in is from the feeding stations.

Lambs—
Yearlings...............................12@12½c
Milk....................................14@14½c
Sheep—
Wethers................................11½@12c
Ewes.....................................9@9¼c

HOGS—Hogs are offered very freely, and packers are accepting all coming their way, notwithstanding there is continued difficulty in securing adequate help for killing and cutting. Stuff of good quality and good weight bring the market price.

Hard, grain-fed, 100@140...................16c
do, do, 140@250..........................16½c
do, do, 250@325..........................15½c

Los Angeles, November 12, 1918.

CATTLE—There was a little more life to the market, incident to cooler weather, but no changes in prices. Choice fed steers continue scarce.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs.....$9.00@12.00
Prime cows and heifers..............8.00@ 9.00
Good cows and heifers...............7.00@ 7.50
Canners, per cwt....................5.50@ 6.00
Calves, per cwt.....................8.50@10.00

HOGS—There were more in the past week than for some time. Under the influence of the increased supply and lower markets east of us, the market broke sharply and sales were slow. While the demand for fresh pork was somewhat better under the influence of the cooler weather, it was not sufficient to keep the market up at old prices.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs..$14.00@15.00
Mixed, 225@275 lbs.................15.00@15.56
Light, 175@220 lbs.................15.00@16.00

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—Few are offering, and the market was steady and rather firm for all choice offerings.

Per cwt. f. o. b. Los Angeles—

Prime wethers.......................$9.00@10.00
Prime ewes...........................8.50@ 9.50
Yearlings............................9.50@10.50
Lambs...............................15.00@16.00

Portland, Oregon, November 12, 1918.

CATTLE—Steady; receipts, 2015. Steers, prime, $12.25@12.75; good to choice, $11.00 @$12.00; medium to good, $10.00@11.00; fair to medium, $8.50@9.50; common to fair, $6.00@8.00; cows and heifers, choice, $8.25@ $8.75; medium to good, $6.50@7.50; fair to medium, $5.50@6.50; canners, $3.00@4.00; bulls, $5.00@7.50; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—Steady; receipts, 2152. Prime mixed, $17.25@17.35; medium mixed, $17.00 @17.25; rough heavies, $15.25@15.35; pigs, $14.00@15.00; bulk of sales, $17.25.

SHEEP—Slow; receipts, 4127. Prime lambs, $11.50@12.50; fair to medium, $8.50 @10.50; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@8.50.

"Best by Test"—The Verdict

Two men were hotly discussing a book. Finally one of them, himself an author, said to the other: "No, John, you can't appreciate it. You never wrote a book yourself." "No," retorted John, "and I never laid an egg, but I'm a better judge of an omelet than any hen."

So we believe that our subscribers are better judges of magazines than we are, and it is gratifying to receive this renewal letter from Sam Devine of Sattley: "You bet I don't want to miss a single issue. I take eight different farm papers and the Rural Press is the best of the lot." And in writing about a sick cow, D. M. Searby of Sebastopol adds: "I could not get along without your 'bully' paper. I read it from 'kiver to kiver' every week, and only wish it came bi-weekly.. I haven't missed a copy for thirty-nine years."

Why has the Rural Press become the one indispensable paper in its field? Because for forty-two years we have been doing something for California farmers which they needed to have done for them, and in the way they preferred to have it done. We have championed their interests, fought their battles, solved their problems. We have spared neither effort nor expense in our endeavor to put before them everything that they needed to know to make farming highly profitable.

Notice how much we give in this issue. Read Mr. Swett's great article on the results of co-operation; the one by Mr. Whitten on the effects of peace upon the livestock industry; the one by Mr. Fox on the artificial stimulation that fruit trees require; the suggestions by Mrs. Swaysgood on feeding the Thanksgiving turkey; the notes by Mr. Hodges on the recent tractor demonstration; and the valuable short articles that you will find on every page. Some issue, isn't it?

But "Every week better than the last," is our slogan, and as good as this issue is, the next will be better. It will contain some mighty interesting articles—timely, too. They will be full of valuable tips. You will like them.

MISCELLANEOUS.

SHIP YOUR LIVE AND DRESSED POULTRY to Campodonico, Lemos & Hanscom, 155 Washington St., San Francisco. We are the leading poultry firm of the city. Reference, Bank of Italy, S. F. The two old reliable commission firms of Chambers, Lemos & Hanscom and Chas. Campodonico united under the above name the first of this year.

FOR SALE—Holt 30 Caterpillar, ready for work, with engine completely overhauled and track in good shape, with Deere power lift plow, at a bargain; might consider roadster or light car as part payment. Box 116, Paso Robles.

CROLEY'S BALANCED DAIRY FEED—The cheap milk producer; and Croley's Calf Meal, the best California calf raiser. Geo. H. Croley Co., Inc., Eighth and Townsend streets, San Francisco, Cal.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. Weissbaum Pipe Works, 160 Eleventh street, San Francisco.

A 15-13 RUMELY OIL PULL TRACTOR—This engine is in good running order and has been running every day. I am through with it now and will sell at very reasonable price for quick sale. Geo. W. Simpson, Dixon, Cal.

TRACTOR FOR SALE—Bean TrackPULL tractor. Nearly all improvements attached. Perfect order. Very little used. Price one thousand dollars. A. Ryder, Loomis, Cal.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

WANTED—From one to two hundred second-hand smudge pots. State price and condition of pots you have. John A. Then, Mgr., Festiva Ranch, Red Bluff, Cal.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

NORWICH CANARIES FOR SALE.—Mrs. Geo. Thayer, Route 2, Healdsburg, Cal.

FOR SALE—One light tractor Sanders four-disc plow. Price $200. Address, P. O. Box 111, Minden, Nevada.

COUNTRY LANDS.

TO LET, RENT FREE—160-acre hill ranch, 10 miles from Santa Margarita, on good road, two miles to small town. Rabbit-tight fence all around; small, 3-room house; plenty oak wood. Eighty acres cleared and in beans this year will pay for clearing balance. Fine springs; school across the road. Fine sandy loam soil, family orchard. Best climate in California. One to four years to first-class tenant. Plenty work in adjoining orchards. Address, J. G. McClurg, 431 Laine Ave. Monterey, Cal.

FOR LEASE—SUMMER SHEEP RANGE—Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the Diamond Match Company, Grazing Dept., Chico, California.

FOR SALE—24¾ acres young orchard, apples and walnuts, coming into bearing. Very desirable home site, 4½ miles from town. Price $8000. Address Ogden Bolton, Route 4, Box 447, Santa Rosa, Cal.

SEEDS AND PLANTS.

BUDDED AVOCADOS — Fuerte, Sharpless, Lyon, Dickinson, Blakeman, Spinks, Taft, Linda, Rey, Queen, Knight, and many others. A fine stock of field-grown trees. $2.50 for one. $2.00 each by the 100. Better order now. Newbery-Sherlock, R. D. No. 2, Pasadena. Nursery, Rose, and Palm, Altadena, Cal.

SUDAN GRASS SEED WANTED—We are in the market for Sudan Grass seed that is free of Johnson Grass, Morning Glory, and other noxious weeds. Send samples and state quantities of seed you have to sell. Bomberger Seed Co., Desk B, Modesto, Cal.

TO THE TRADE—Buy almond trees from an almond specialist. 100,000 almond trees on bitter almond roots, standard varieties. Car load lots solicited. Write for prices. W. T. Hohenshell, Le Grand Nurseries, Le Grand, Cal.

FOR SALE—Black oats for seed, direct from grower. Prices on application. Werner Bros., Watsonville.

WANTED.

WANTED — Position as ranch manager. Married; 32 years old. Exempt. Capable of taking entire charge. Born and raised on ranch. Address: G. A. B., Box 386, Santa Cruz, Cal.

Dressed Turkeys Will Probably Range From 42c to 45c THANKSGIVING WEEK

—here's something that will wake 'em up!

It is easy enough to produce eggs in the spring; but in the fall and winter, when prices are highest—ah! that's a different story.

And yet—hens are pretty much like the rest of us: they have to be fed into action. They won't stir until you stir them up; and the biggest single help you have is Surelay.

No matter what results you may have secured heretofore—no matter how disappointed in the egg foods you may have tried—you owe it to yourself, your flock, and your profits, to use Surelay.

Surelay is a perfect balanced ration—nothing less! Its function is to give your hens the exact ingredients they need to bring about the greatest egg-production in the most natural way. Now then—

The elements of an egg are derived from so many sources that no single food will answer the purpose. This is why Surelay contains sixteen separate ingredients, blended and mixed more skillfully than can possibly be done by hand. Another thing—Surelay is always the same. Each sack must measure up to a definite standard of uniformity—or else it cannot be Surelay.

The formula that has made Surelay a prime favorite among successful poultrymen is no secret. You have a right to know what you are feeding your flock; and the manufacturers of Surelay recognize this by printing, on the back of each sack, its exact analysis.

Remember this: when it comes to a uniform, high-grade feed that will rouse your flock into a sense of duty—that will prod your hens into profit-producing—Surelay rings the bell and taps the gong every time. That's why poultrymen who know are quite frank to acknowledge that "Surelay is sure some stem-winder!"

[Be sure to look in your Surelay sack for the Certificate that entitles you to our 1919 Surelay Egg Record and Calendar]

The Dead Bean Market Will Come to Life

Written for Pacific Rural Press by R. E. Hodges

BEAN GROWERS want to know whether they will get prices that will pay their costs of production and living expenses. They also want to know when those prices will be available. Careful investigation from many angles leads us to believe the following statements of fact. There is an increased world production of beans and a greatly increased world hunger to absorb them. The Asiatic crop is more than double that of last year, but H. Clay Miller, California purchasing agent for the Government and Allies; President George A. Turner of the California Bean Growers' Association; Manager J. S. Courreges of the Hale Co., who do a million dollars worth of bean importation annually, and others unite in saying that Oriental beans are not likely to depress American markets materially. While large quantities of the 1917 Oriental crop are being imported at prices lower than our own growers feel able to sell in competition, these beans have not generally during the past month been stopping in America, nor have any of them been bought for use of American armies. They are mostly being trans-shipped to Europe. Those nations are all hungry. They are also poor; and will buy wherever lowest prices are to be found. They are likely to buy more beans than they would normally demand, because they will be studying how to get the most food value for their money. Much of their demand will be supplied by Oriental beans shipped through the Suez Canal, a far shorter route than the present one across two oceans and one continent. Many may perhaps be sent via the Siberian railway, which reaches almost to Japan, the principal producer of Oriental beans. Still, if exportation from the United States were free-for-all, it is predicted that the price of American beans would soar. All exportations until peace is actually declared are and will be under direct control of the Food Administration, to prevent waste and to prevent their going where they might aid our enemies. It is easily possible, however, that the Food Administration should put forth rules to encourage exportation.

Threshing beans in California. Our investigations seem to indicate that while much of the crop has been damaged, there is hope for an early opening of the market at prices that will mean no loss. (Photo by courtesy Stockton Chamber of Commerce.)

Meanwhile, America will have her own populations to supply. No great Government orders can be expected, for there is a considerable carryover from the supplies of pinks and whites commandeered for the army last February. The navy uses relatively few beans. Mexico uses quantities of reds when transportation is available. Blackeyes are largely shipped to the Southern States and there seems no indication of a lessened demand. Teparies were sold heavily last year, due to their resemblance to small whites and to the scarcity of other varieties. They are not selling this year, however, and there will be a heavy carryover. People who buy teparies once usually specify some other variety next time. Nevertheless, teparies can be cooked into a tempting food by using right methods; and while it may take a few years to teach housewives generally how it is done, we will not be surprised to see factories scientifically cooking and canning this variety for an increasing trade. Until that time comes, however, we can neither hold forth hope for a market nor can we encourage further planting of teparies. We have always aimed to lead our readers to go slow on this variety.

California Canned Beans.

The canned dry beans whose brilliant labels decorate California grocery shelves were grown in Michigan mostly. Some were grown in California and shipped East to be canned and shipped back again. They are practically all large or small whites. A very few California beans have been canned in California in previous years. These include some pinks and a few reds. Last season a small but definite beginning of what promises to become an important factor in the marketing of the bean crop in this State was made by California packers canning about 2000 tons. Their product, as the writer can testify personally, is far superior to many of the Eastern brands we have been buying to help Eastern farmers market their crops and to help railroads pay dividends. When Californians eat California canned beans exclusively there will be profit in growing a few more acres. Only a small amount of canning was permitted the past season by the Food Administration in order to save canning facilities, labor, and tinplate for more perishable foodstuffs than dry beans; but permits have been more freely granted of late, and soon there will be no artificial limitations on this industry.

This Year's Crops.

California in 1917 produced over half of the beans grown in the United States — 8,091,000 bushels. She has this year, according to latest Government estimates, produced 8,868,000 bushels of 60 pounds each. The fall rains caused total loss of hundreds of tons north of Santa Barbara and Merced counties and damaged the quality of those remaining. Many fields in widely scattered sections were left uncut. In many harvested fields so many beans shattered out that the plants grown from them have made the fields green. In the sacks of harvested beans are so many spoiled and discolored ones that whole districts are hand-picking the bad ones from moving belts on which the beans are spread. The present rains, coming since the above estimates were made but while threshing was still in progress, have reduced the tonnage considerably below those estimates. Southern California had but little rain damage. Monterey and San Luis Obispo counties suffered severely, the former losing about 50 per cent besides the labor of turning piles of vines many times and hand-picking the bad ones out of the threshed crops. The pinks, Lady Washingtons, red kidneys, and Mexican reds of the North San Joaquin and the Sacramento valleys were less damaged, but of the 30,000 acres crop in Sutter Basin 40 per cent had to be thrown away and the remainder must all be hand-picked, according to Manager George F. Maddock of the Sutter Basin Co. The vines, which had not set a heavy first crop, took new growth after the September rain and set a big crop, which was destroyed by frost in November. Michigan, New York, and Colorado are the only rivals of California in bean production. All of them together had less acreage than California and only Michigan produced a notably large crop. Japan alone produced a closely estimated yield of more than 7,500,000 bushels in 1917, and the 1918 crop is increased to an amount not accurately known. Reliable estimates place the Kotenashi (small white) crop of

WHAT SHALL WE DO ABOUT IT?

THE WAR has stayed "over" for a week. The Huns are raising the devil with each other—to "taper off" their murderous impulses. The allies are moving nearer to the Rhine to establish themselves as peace-makers. Hoover has gone abroad to establish multitudinous free-lunch joints in devastated districts and to dispense American good cheer to the miserable millions who can best understand the blessings of freedom in terms of doughnuts and flapjacks. It is announced quite confidently, as we write on Tuesday, that President Wilson will himself soon go abroad and slap the kaiser's face for what he so insolently said about "settling up with America after the war." At home the draft has been called off and draft boards are instructed to get busy finding jobs for soldiers released from training camps and war industries in this country and to keep right at it after that to find jobs for those who will soon be coming home over seas at the rate of a quarter of a million a month possibly. Fortunately those who have this homeward movement in charge do not seem to be deeply impressed with the "infiltration" process of re-Americanizing Americans with which the politicians are flirting with the labor unions. They have probably learned that schemes to indefinitely exile the nation's heroes after the glorious work they have done and the sacrifices they have made are abhorrent to the American people. They are perhaps beginning to understand that we propose to have all those boys back in the arms of their mothers and their sweethearts just as soon and just as fast as possible—or there will be more dish-rags flying around the heads of our rulers than ever there flopped down sea-gulls upon a floating biscuit! "Yo dun har muh. Ananias?"

WHERE ARE THE BOYS NEEDED?

IN THEIR old homes first of all, of course. They must tell their stories to those whose old eyes will glisten and whose young eyes will sparkle as they realize how nobly they have played men's parts in the world: how they have yelled their triumph in the ears of the fleeing enemy: how they have suffered and endured in silence: how their great joy is in the success of their cause and in their return to those who love them and who bravely bade them go forth and do their duty in the world. They must go first to their old homes, of course. They must bring the last tender consolation to the darkened homes of their fallen comrades: they must deliver their last messages to those who loved them: they must pour the balm of personal knowledge of their brave deeds and noble deaths upon the hearts of those who have loved and lost. The words may be few and hesitating: they will be understood and remembered and God will make them messengers of "that peace which passeth understanding." The boys must go first to their old homes, of course—to hallow joy, to hallow sorrow: it is their god-like duty.

CITY OR COUNTRY?

WHAT THEN? Those who are strong of heart and sound of limb and have no city task which beckons them to return to activity which they understand and enjoy should seriously consider beginning life anew in the country. Everyone says these boys are a changed lot: they appreciate freedom and breadth of action and are keener to seize opportunity than they were before their eyes were opened and their spirits awakened. It is very doubtful if they can see as much in city jobs as they might if their skies had not been lifted and their horizons extended. It is also doubtful if the usual recreation joints of the city will content them now. If not, it will be well for them and for the city also—for the city does not want them and those who have most to say about city occupations declare that they should be "infiltrated"—not welcomed. If some reader should think that this unusual word signifies a surgical operation, it does not matter: it is at its best the cruel surgery of economics.

On the other hand, the country needs these returning soldiers and will do its best to welcome them to man-like industry and wholesome homes. The same qualities and attitudes to which they have been recently trained and which now nerve them and guide their actions are exactly what they need for success in rural pursuits—whether they work for others or have others working for them. A country job well performed requires knowledge, initiative and loyalty to the execution of it. It makes requirements which must be met: energy in attack; patient pursuance; no finish without success. Time-serving, slacking, striking are abhorrent from a rural point of view, whether one works for himself or for another. Demand what is right in pay, subsistence and environment and insist upon it before you begin, but, having accepted service, go through with it. This is just what our boys have done in Europe: it is what they are now better qualified to do in America than ever before. It is what their grandfathers and their fathers have done on American farms and it is the secret of their success and their dependable citizenship. To such success and to such citizenship the rural industries welcome the returning soldiers and sailors. There is room for every man and jack of them—for the prosperity of the whole country and their own. Upon them largely depends the future of American agriculture.

WHAT ABOUT CROPS?

WHILE the boys are returning, our political labor-dominators say they will let us have a few more Mexicans—if they too can be "infiltrated" so as to keep the wage-rate going up. The farmer then has to reckon on wages artificially going up and prices naturally going down. Evidently crops must be studied with increasing attention to their requirements of hand labor and with the expectation that tractors and other labor-saving machinery will at once become more available, for two reasons. One of these is that the War Industries Board has already knocked the limitation from steel for farming uses and factories released from an output for war will swing immediately to increased manufacture for peace. Another encouragement to build upon the availability of machinery lies in the fact that the farm labor supply likely to increase first is of the highest class—that is, men competent to run and keep in order tractors and power-tillage machinery of all kinds. Uncle Sam has been running gas engine and tractor schools and the like in France all the way from the wharves to the trenches and he has secured a great output of skilled graduates. Tens of thousands of practical machinery operators will be distributed over this country before next harvest. The use of power and the appliances for power must stand between the farmer's pay rolls and his sales returns.

What crops and other investments in production will pay best? We do not know. We never expect to know. As we have frequently intimated, it seems to be a scheme of economic salvation that no one can know "what will pay best" because such knowledge would immediately destroy its own truth through over-production of that thing. This is not particularly the case in farming: it is a universal truth in production. If manufacturing tailors could demonstrate that pants would pay better than coats, the human race would soon be marching around in its shirt sleeves—and vice versa! Therefore, neither we nor anyone else can say what crop should be preferred. That is up to individuals to choose, and the hope always is that the diverse tastes and judgments of men will hit off diverse human needs about right. But there is one thing which can be done and the Pacific Rural Press is trying to do it systematically, and that is to give the most up-to-date facts, and expert judgments about facts, concerning every important feature of food production, so that every reader can use his own noddle to fit these facts and judgments to his own conditions and abilities. Last week we expounded the matter of beef: this week we tackle beans—and so on. If the subscriber will faithfully use each issue to warm up his own brain-box before kindling the stove with it, he will not have to go around asking people, who know no more than he, to give him a fool tip about what crop to put in this year!

WHAT CALIFORNIA SHOULD DO.

BUT though it is and always will be a tough problem about what an individual should do, it is clear enough what California should do. California should keep right along in her scheme of diversified productions—with particular emphasis on things of world-want which most other countries cannot produce at all or not so well as we. But this does not mean that we need avoid world-competition even in great staples: they should be the background of our picture of production: or perhaps it would be better to call them the foundation upon which are built the pointed arches and clustered columns of our cathedral of special products. For instance, we have particular advantages in growing rice, long-staple cotton, beet sugar, beans, a group of truck crops for fresh sale out of the season of other parts of the country and for dehydration. We have capacity for all profitable animals and their products and we have immense opportunity for forage for local feeding and for export. We have a great chance for wheat and when we get a surplus again our millers will see to it that we export only flour—keeping the fraction of the total weight which is best for higher-value animal products and finally for the soil itself. Perhaps we should count less on barley in the immediate future, for tractors cannot eat it and Americans may not drink it, but other uses may call for it to an extent which cannot now be foreseen. All thees products, and others like them in the staple class, are firm in the foundation of our agricultural wealth and it is a great item in our natural endowment that we are equipped to hold them up in world competition and to turn them out with a short haul to the ships of the world. As compared with other States which must flip-flap between two or three staples and use them not merely as a foundation but for superstructure as well, California is grandly all right in the basis of her prosperity and development. As now the world has been thrown open as never before and as an American merchant marine has been realized in speed and capacity such as no one could have dreamed, California should push her production of staple products to the limits of her idle land.

OUR CATHEDRAL OF SPECIAL PRODUCTS.

AND if so much can be said of the foundation which surpasses that of other States in extent and variety of cornerstones and connecting walls, what can be said of the lofty structure of special products which rests upon it? The State Development Board estimated the selling value of our fruit products for 1917 at upwards of two hundred million dollars. War prices are involved, of course, but it is a question whether such inflation has not been balanced by the contribution of enduring publicity and popularity which it made to the future of these products. In a way it may be said that we have really advertised our brands at the consumers' expense—which every enterprising producer tries to do. Therefore we now have in the added pulling power of the brands assurance that we have established increased credit with the future and not incurred a debt of exaction to repay to it. In our mind the value of our war shipments to the allied armies and to the civil populations of European countries lies

more in the recognition of their desirability than in the money they returned. It has put California on the map for commercial fruits and fruit products of style, quality and nutritive importance beyond anything ever conceded to such foods before. To meet what seems to be a reasonable anticipation of increased demand there should be reasonable extension of fruit planting. If there has been a fortunate plunge in "crops to win the war," the one who made it should think seriously whether it is not now wiser to invest the money in permanent improvement than in making another plunge. In this line trees for orchard planting, pure stock for better breeding, more alfalfa for better feeding, better implements and machinery to better serve them all—might put more value on the farm inventory a year from now than another plunge in quick-selling produce would put in the bank balance. It may be a good year for quick-sellers, and the way the rains are coming makes it look as though there would be good yields of them, and yet it may be a bad year for over-reaching. If we had good land and money in hand, we would use some of the latter to fit the land for future production in California's most distinctive line, good fruits, or in the line which promises another great distinction—the larger production of good animals.

MAKE IT GOOD AT MODESTO!

WE HAVE just heard from Secretary Fred Millard of the Farmers' Union more about the coming delegated assembly of representatives of California bona fide farmers' organizations at Modesto, which we commended last week. Up to November 16 invitations had been sent to sixty organizations and only one had sent regrets. Mr. Millard wishes us to give notice that accredited representatives of all farming organizations will be welcome. It will be impossible to get formal invitations to all the organizations with which it is desired to co-operate. The Farmers' Union will hold its own closed meetings on December 3 and 5. On Wednesday, December 4, there will be nothing but this pan-conference. The questions proposed for the conference are these:

1—Are the farmers getting a fair share of the wealth they produce? If not, why?

2—Is the influence of the farmers in national, state and local affairs in reasonable proportion to their numbers and power and the value of the services they render to all people? If not, why?

3—What changes are necessary to bring about permanent agriculture—an agriculture yielding returns financially and socially as satisfying as those of other industries and modes of life?

These are the real things in the agricultural situation. They underlie and surround the farming industry as though with reinforced concrete. The only way out of them is upward. If California organizations will send their best men and women to Modesto on December 4 there may be a high jump! We are waiting for it.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Keeping Sweet Potatoes.

To the Editor: I do not have much success in keeping sweet potatoes. How can I keep them for general purposes, also to grow plants for next season?—E. E. W., Yuba City.

It is simpler to keep sweet potatoes in California than in regions of heavy freezing because "sweet potato houses" are not required and yet due care and proper arrangements are necessary. Many pack the potatoes in dry sand and keep them in the house. This is expensive and is not a sure way. Many will rot and sometimes only one-third of them will keep till spring. Storage in the open air with due protection against too great temperature changes and moisture is better. This method has been approved in Fresno county, as given in our book on "California Vegetables":

Take stout stakes, say five to six feet long, and drive them into the ground in a row and five feet apart, in some dry place that is not sheltered by trees. Dig the potatoes and throw them up around the stakes to the height of four feet. For a large field a great many such rows may be necessary; for a small patch perhaps one single stake will suffice. When all dug, put four inches of straw as covering. After a week or ten days, according to the weather, the potatoes will have undergone a sweating process. They first cover themselves with moisture, as if they had been dipped in water. This moisture gradually begins to disappear, and as soon as it does so it is time to throw off the straw. This should be done when the wind is blowing; the potato hills should be left open for three or four hours, or until the potatoes appear entirely dry. If the straw covering is taken off in the morning, the potatoes will be dry at noon. Then cover them again with three or four inches of fresh, dry straw, and on top of the straw put three or four inches of soil to keep out the cold. On the top of this must be placed a roof, which is easily made of shakes, nailed to strips of two by three and made in the shape of panels, to allow of easy handling and of repeated use year after year. Potatoes kept in this way will preserve perfectly until next spring. Very few, if any, will be found decayed.

This is the best way we now know and the potatoes are of course suitable to go into the sprouting bed in February or March, according as the locality is safe for an early start. If any reader knows a better or an easier way to keep the saccharine spuds, please tell us about it quickly!

Prefers One Nut in a Place.

To the Editor: In your issue of November 9, page 499, you give a reader advice for planting walnuts. I planted ten acres of walnuts just as you advised, but I will never do it again. It is very much better to have the land ready and the places for the trees marked out, and then watch the sand boxes and as soon as the nuts begin to sprout go over the boxes carefully every three days, pick the sprouted ones out when the sprouts are about one inch long and plant these nuts in their permanent place and only one nut—putting three stakes around each nut to protect it. I am sure the man will then have splendid trees, ready to be grafted over when they are three years old. It is essential to plant the remaining nuts in nursery rows in case he will have to replace some of the trees.—H. H. H., Oakland.

Yours is a good way if you wish to grow seedlings for grafting in the orchard. The only difference between your way and ours is that you put one sprouted walnut and three stakes in a place and we put three walnuts in a place. Black walnuts are cheaper than stakes and we would rather grow stakes than buy them. But we like also to choose the best of the three for the permanent tree. All walnuts that sprout alike do not grow alike. If your one happens to be a bum grower, you have to stay with it or pull it out and plant in another. We pull it out and keep the better one already growing alongside. You say you will never plant another orchard our way. We would never do it our way nor yours either. We would grow the seedlings in nursery row and plant out the best of them—keeping the land clear for crops a year or two. The inquirer did not ask us that. He asked how to plant the nuts in place and we told him. He may like your way better and we are glad to have it.

Pruning Trailing Berries.

To the Editor: Please inform me how to prune Himalaya, Logan and dewberry vines.—W. H., El Cerrito.

Briefly stated, the Logan hybrid and the dewberries should be pruned in house garden practice in this way: All the wood which fruited last summer should be removed—cutting away at the starting point or at the ground surface. The wood which grew last summer should be trained upon the fence or trellis and tied or nailed securely in place, to bear fruit next summer. If the canes have run out too long for your convenience in training up, cut them back wherever you wish to end them, but give all convenient length, because side shoots from them will bring the fruit. The Himalayas are different in this way: the fruit may come from canes which have fruited before—therefore train up all the wood which you have space for and run it as far outward as you like.

Make the Germans Eat Barley.

To the Editor: If the United States is to help feed Germany and other people, why not take it up with the right people and see that they use a lot of our California barley?—A. T. G., Chico.

Surely enough: why not? The Food Administration proposes to get good, patriotic Americans back onto pure wheat bread and it will only be fair to have our reformed enemies eat up the substitutes—which they will probably be glad enough to do, because they are accustomed to these substitutes and will consider them much better than the substitutes they have been making for the last four years. It may be urged that they are more likely to drink our plump California barley than to eat it, but need we take any responsibility for that? We have been fighting for the right of self-determination among small nations and Germany has got into that class both geographically and morally. Give them barley in the neck!

Field Men Wanted

Are you free to travel? Have you an automobile? Are you convinced that the Rural Press is the best paper of its kind on the Coast and that it should be in every farm home? If so, we need you to take the place of field men who have been drafted. Pleasant work, attending to our renewals and presenting the paper to those not already subscribers.

Straight salary; permanent work, with advancement. Lack of experience no barrier. If you are a live wire, are willing to learn and want to make more money, let us tell you how to do it. Our offer is a liberal one.

Lime on "White Ash" Soils.

To the Editor: Is it necessary to put on slaked lime in "white ash" soil for better production of olives?—C. W. P., Kingsburg.

As the "white ash" soils of your region are distinctively calcareous or rich in lime they, theoretically, do not need it for plant food: as they are readily permeable or well-drained and aerated, they presumably do not need it to correct acidity: as they are light and easily cultivable, they do not need mellowing. If you have in some way changed these natural traits of the soil you designate, they may be helped by lime. That you have to determine by a limited area of application and comparative observation of the behavior of the plants as compared with plants on the non-limed area. Presumably your soil needs no lime: it is up to you to prove the contrary.

Tender Garden "Sass" Out Late!

To the Editor: I have had poor luck with my garden this year; have never farmed in California before. My cucumber vines are covered with a green louse. Beans are turning white, as though they had been whitewashed, and are dying in spite of all care, watering and cultivating. Can you tell where I can get a book or information on this subject?—M. K., Stockton.

In your kind of a thermal belt it is now too late to care much what happens to your cucumbers and beans, for the frost will get them anyway very soon if it has not hit them already. Both for the cucumber aphis and for the red spider or thrips which turned your beans white it is necessary to spray much earlier in the season, at the first sight of the trouble, with a soap and tobacco insecticide. Our book on "California Vegetables" was written to cover just the elementary information you need about gardening.

Pumpkins for Fowls.

To the Editor: Are pumpkins good for chickens?—Subscriber, Escalon.

They surely are. If you want to see some fun, set out a pumpkin pie for them. Raw pumpkins are wholesome for them so far as they will eat them when otherwise properly fed. They are not good as a sole feed for starving fowls because they do not contain all that a fowl needs to be thrifty. Split open a pumpkin and let them take what they like. Do not be scared about the seeds, but do not try to make a sole feed of them. Pumpkins and milk are a good ration in connection with dry feeds.

Who Can Poison Rye?

To the Editor: I want to plant some rye and I do not want the blackbirds to pull it up. Can I poison the seed by soaking it in something or must I use my shotgun?—J. F., Fresno.

We know no practical way to do it. We should use a little heavier seeding and get the gun.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., November 19, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.83	6.56	6.89	64	42
Red Bluff	.70	10.83	4.12	66	38
Sacramento	.48	4.92	2.57	66	42
San Francisco	2.49	7.08	2.86	64	50
San Jose	.48	9.00	2.19	64	36
Fresno	.77	1.77	1.59	66	40
San Luis Obispo	2.44	4.19	2.67	72	44
Los Angeles	1.32	2.03	1.60	72	52
San Diego	1.08	2.31	.99	74	54

A Fruit Evaporator Embodying the Best in Its Line

Written for Pacific Rural Press by L. W. Parsons. Reprinted by request.

ALTHOUGH California summer conditions of adequate heat and dry air favor open-air evaporation to such an extent that nearly all our product of cured fruit is secured in that way, there are some parts of the State where artificial heat would be a safer recourse and there are late fruits which sometimes collide with early rains in a way to cause losses even in our best sun-curing regions. The present is one of the exceptional years where unseasonably early rains have caused heavy losses to our fruit growers, more especially the growers of prunes and grapes. These losses might have been in a measure avoided had the requisite drying facilities been on hand.

It is interesting, therefore, to describe a machine evaporator constructed upon true principles and having capacity sufficiently large to encourage its use. L. W. Parsons of Campbell, Santa Clara county, has given most of his life to the design and construction of fruit evaporators, and secured patents thereupon which have expired and are now public property. In the Pacific Rural Press of June 19 and 26, 1909, he gave his conclusions on the desirability of machine evaporation and a design for the construction of an evaporator which embodied all his best work in this line. The accompanying drawings and description are from Mr. Parson's writings]:

A fruit drying chamber capable of holding about two tons is about as large as one heater can well handle. Wire trays two feet wide by five feet long are as large as one strong man can conveniently handle; he might prefer them shorter; in fact, if the smaller tray would give a drier of sufficient capacity to meet the demands of the owner, he could make the trays two by four feet, with a narrower furnace, to correspond. Where two men are always available, trays three by six feet have been found to work well.

A drier five feet wide and twenty-four feet long, having ten trays in its length and twelve trays high, holds 120 trays 2 by 5 feet, or a total drying surface of 1200 square feet, which at the rate of 3 pounds per foot give a total of 3600 pounds at one time: that is, it would take that much gross weight of fruit before cutting to fill the trays. Large fruit would amount to more, and small fruit or culls might not go above two pounds to the foot.

By making the drier one or two trays longer and higher, and a foot or so wider, the capacity may be materially increased. But if much more capacity is desired, it would be better to build another drier, or several of them, alongside of it, which would work satisfactorily.

The fruit drying chamber rests on top of the hot air chamber, which is surrounded by brick or cement walls about 8 inches thick, and is as long and wide as the fruit chamber above. The height of these walls depends on the size and shape of the heater enclosed by them. The furnace is a very important factor; it must be strong, not easily burned out, smoke-tight in all its joints and flues, with caps or covers so placed to facilitate cleaning out soot and ashes. There must be room between the sides of the furnace and the side walls to allow for circulation of the air to be heated.

Fresh air enters this hot air chamber through openings about a foot square at the bottom in front between the furnace and the side walls; passes along on the sides and top of furnace and flues until it reaches the back end of the hot air chamber, where it passes up through an opening into the fruit chamber above.

The next, and perhaps the most critical, part in the construction, is the sheet iron floor which covers the furnace and flues and separates them from the fruit chamber above. This iron floor is made of either black or galvanized iron, not thinner than No. 24; thicker would be better. It rests on rods or bars of angle or T iron stretched from wall to wall, with ends built into the walls. These rods are spaced about two feet apart. The sheets of iron should be riveted or bolted together. The edges of this iron floor should project into and be imbedded in the brick walls in front and along the two side walls as far back as the floor goes to the other end of the drier. Cover this floor with an inch or so of sand or fine earth, so as to stop up all cracks. At the back end of drier this iron floor is cut short one foot, allowing an opening of one by about five feet to allow the hot air from the heater below the iron floor to pass up into the fruit chamber above. This floor must be made tight everywhere, so no hot air can possibly leak upward and scorch the fruit or the woodwork above.

The brick walls should be built about 18 inches above the iron floor, so that the wooden frame which rests on top will be safe from burning.

The furnace may be about 4 feet high by 3 feet wide, with an ash pit in the bottom part, and 6 or 8 or more feet long. This will handle 4-foot cordwood conveniently and make a liberal combustion chamber for the flames. It may be a cylinder or shaped like a boiler, or have brick walls, with a cast iron arch on top. Or it may be a big wrought iron box made of quarter-inch boiler iron, braced with angle iron to prevent warping.

A smoke pipe one foot in diameter connects with the back end of the furnace, passes horizontally to near the back end of the drier, then by a short elbow doubles back, coming to the front over the top of the furnace, and then, by an elbow, to right or left through the side brick wall to connect with the pipe inside of the ventilator shaft or flue.

If the furnace is 4 feet high and the pipe above it 1 foot thick, allow 6 inches space between the top of the furnace and the pipe and between the pipe and sheet-iron floor above it: then add the 18 inches of brick wall above the iron floor; we get a total height of 7½ feet from the ground to the top of wall.

But only the furnace needs to be as deep as this, and it can be placed in a pit at one end of the drier. The brick walls back of the furnace do not need to go so far down by perhaps two feet. The smoke pipe leaving the furnace close to its top can rest on a brick lying on top of the ground, so the part of the heating chamber holding the long flues may be shallower, thus saving some expense in masonry. The top of the brick wall should be level all the way around and even with the floor of the house, so the operator can easily handle the trays on the upper track. Do not insert woodwork of any kind into the brickwork.

Lay 2x4-inch sills on top of the brick walls all around the four sides. Cut your upright studding of 2x4 joists 6½ feet high, spaced 2 feet apart, and nail a 2x4 plate on top. This is for the two long sides. The ends of the drying chamber are to be supplied with close-fitting doors. Nail surfaced matched lumber on the inner face of the studding. These boards had better be of redwood, so as not to gum up the trays with pitch.

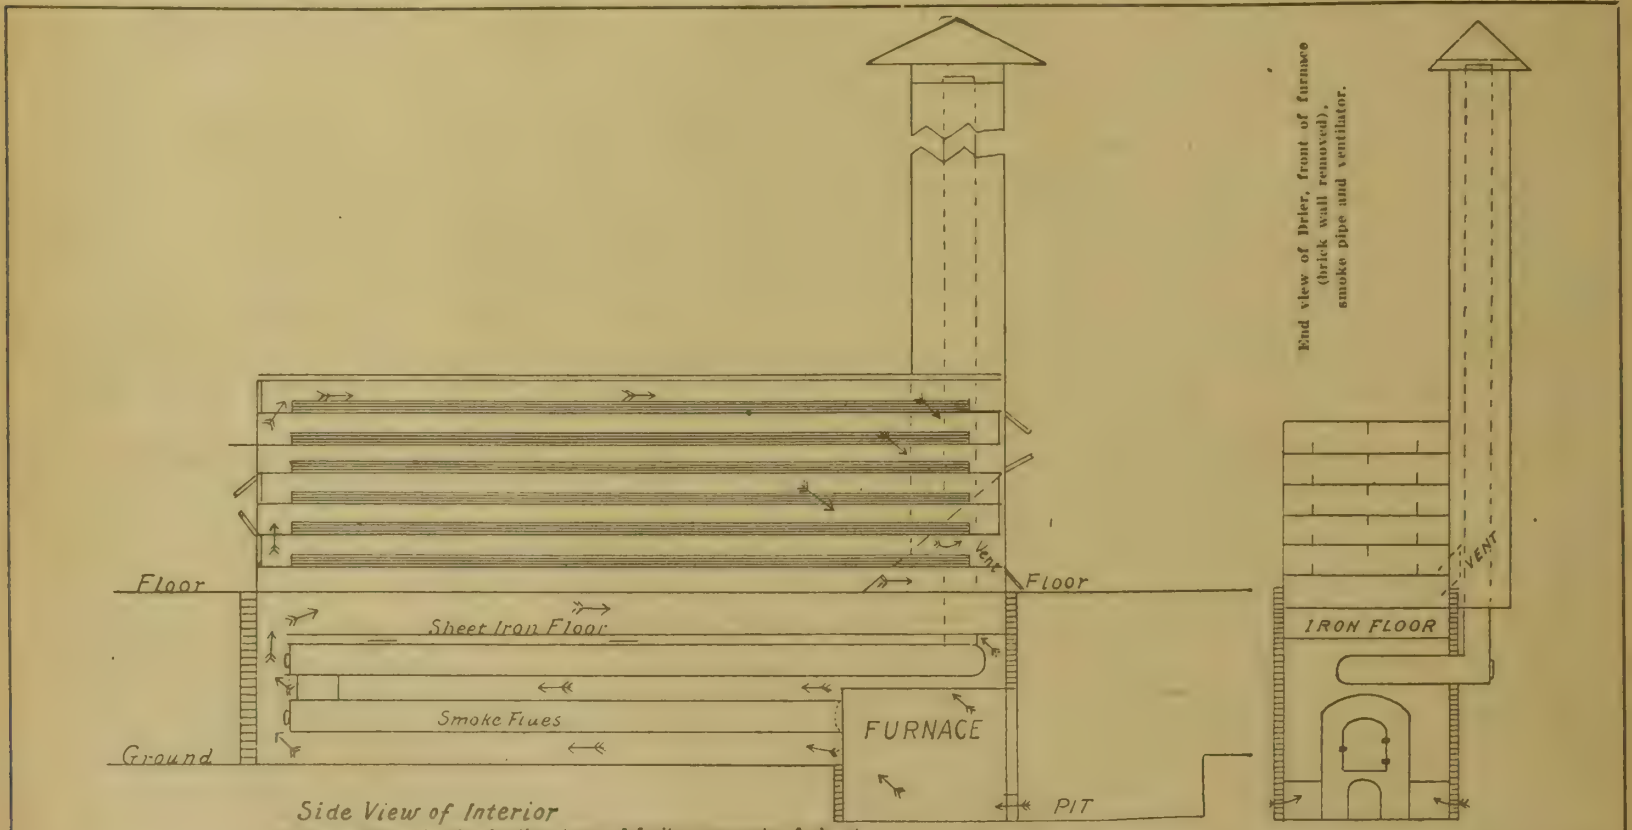
These two side walls should be perfectly straight, plumb and level and at equal distance apart at all points, so the trays will work true and not bind or slip off the tracks. Nail to these walls tracks or slides made of strips 1½ inches square. Fasten to these tracks wheels, known to the hardware men as "sash rollers," 1 inch in diameter and spaced 10 inches apart along the track. Cut a little notch in the edge of the track, so the wheel can turn freely, with the big side of the wheel upward. Put 12 of these tracks on each wall, spaced 6 inches apart, beginning 6 inches from the ceiling to the top of the first track, then 6 inches to the top of the next track, etc. One strong 16-penny wire nail driven into each stud will hold these tracks securely. Fasten the wheels with screws to the track on a work bench before nailing them to the walls.

Nail matched lumber on top of the plates from side to side for a ceiling. This wooden shell will have to be braced from the outside so it can stand up firmly with its load of fruit.

The ventilator or exhaust flue should be about 2 by 3 feet inside and extend about 20 feet above the top of the drier. Build it against the side of the drier, resting on top of the brick wall, close to the front end of the drier.

The smoke pipe must be carried by a suitable elbow from its position above the furnace through the side brick wall to a point under the center of the ventilator, thence up through it to the top. A sheet-iron weather cap on top should protect the ventilator and smoke pipe. Make the bottom of the ventilator where smoke pipe enters, air tight to insure good draft. Provide caps or covers at the elbows to facilitate cleaning out the soot.

On the side of the drying chamber, at the bottom, cut a hole into the ventilator for the passage of the damp air from the fruit into the ventilator. This opening should be



Section of Drier showing heating, trays of fruit, movements of air, etc.

the shape of a right angled triangle, in such position as though the bottom cover of the side wall were being cut off. The bottom and perpendicular side of opening are to be 3 feet long. The lower tracks go past this opening to carry trays to the door. Some kind of a small guide rail should be placed to prevent the corners of the trays from striking against the edge of opening. The trays are to be ½ inch shorter than the drier is wide inside, so as to move freely without danger of being bound. Two or three rods of ½-inch iron provided with screws and nuts should pass through from side to side of the drying chamber about half way from top to bottom, to prevent the walls of the drier from warping or bulging, or else the trays will drop off the tracks.

Make four sides of the trays of stuff 1½ inches square, notched at the corners of trays. Tack on No. 3 mesh galvanized wire cloth. Over this nail strips 1 inch thick by 1½ inches wide for runners to roll over the wheels. Nail a similar strip across the middle of the tray to prevent the wire cloth from sagging. From 25 to 50 extra trays will be found convenient in operating the drier. The wire cloth is 2 feet wide. Make the tray frames 2 feet 1 inch wide. With average prices for labor and material this drier can be built in a substantial manner for about $500.

To Operate the Drier.—Get started right by taking all day in gradually filling the drier, so that by night time the first trays will be within a few hours of being finished. Start a good fire before putting in the fruit, so as to burn out the oily smells of the new ironwork. Use the eight lower tracks for the fresh fruit. Put eight trays in at a time, one tray on each of the eight lower tracks about every 45 minutes, starting them at the front end over the furnace and pushing along. After ten lots have been so placed, the eight lower tracks will be full. Then take out one tray from each track at the back end, and put them in on the upper four tracks, two trays on a track, to be gradually pushed along from time to time, as often as fresh trays are put in at the front, until the machine is full and the driest trays will be at the front end of the upper four tracks. The fresh, wet fruit will in this way have its vapor drawn out through the ventilator close by, without wetting the fruit which is partly dry.

As the fruit gets drier it is moved into drier and warmer air at the back end. But this fresh air right from the heater below is 180 degrees hot and unsafe for fruit to finish in, so it is started back on the upper tracks to finish in a milder temperature, with enough vapor in the air to allow the fruit to finish gradually without danger of scorching, turning out the fruit in a soft and flexible condition, evenly cured and right in color. This process is peculiar to this evaporator and yields the best results in quality of work done.

If fruit is rushed too fast through the drier, it will get back to the front and top too soon and will be too wet to dry readily in the lower temperature.

If the beginner gets caught this way, it will be better, after waiting a little, to take it out, and, if still too wet, carry it back to the other end and put in on the upper four tracks again to gradually go forward again. After a little experience he will learn how and when to move the fruit.

As to variations of heat in different parts of the drier and the effects thereof, it may be added that the thermometer hanging in the current of air just as it strikes the fruit may register 190 degrees and do no harm, for the fruit at that end of the drier has enough moisture to save it. The air cools rapidly, and when it reaches the other end of the drier where the fruit on the top tracks is nearly dry, the temperature will be about 40 degrees cooler. This is one of the most valuable points in this evaporator, finishing the fruit in a lower temperature and yet with but little moisture in the air.

Wood or coal fires will fluctuate in heat, and a careless operator might allow the temperature to get to 200 or 210 degrees, but if it does not last more than a few minutes, and as the fruit is not too near being finished at the exposed end, no harm is done. A thermometer resting on the tray at the back end lying between the fruit will show about 10 degrees lower temperature than when hanging clear in the draft at that point.

While drying the trays should not touch the ends of the drier, but be pushed back about a foot and a half from the doors to allow room for free circulation of air at the back end of drier and down at the front end. It takes 16 to 24 hours to dry the fruit, according to kind and size. Apples are dried in six to eight hours.

The furnace may be made to use any fuel. An oil burner is the best, because the heat can be kept steadily at the maximum.

F. D. Fowler of Palermo, who has 40 acres of olives, said that his Manzanillos yielded a better crop than the Missions this year. He has also 50 acres of oranges and has 100 acres that will be planted to figs this year—a large undertaking.

Pointers on Pruning of the Cherry

Written for Pacific Rural Press by John J. Fox

THE TWO primary reasons for heading a cherry tree low are: (1) That it may protect itself from sunburn from its youth up, and (2) that it may be more easily and cheaply harvested—a matter of very great importance. The low-head performs another service which is not calculated on. It prevents plowing too close up to the tree trunk as the tree gets older, and this is a distinct advantage. For it saves the large roots or the bark from injury from the plow or cultivator, wherein the spores of a fungus or the germs of bacteria may enter, or suckering from an injured small root.

The tree may be headed then at 15 inches from the ground and three or more leaders selected for the head. Any other little shoots should be pinched back while they are young and tender to form fruit wood and especially to protect the young tender bark.

No definite rule can be applied as to cutting the second year, but about two-thirds of the growth may be cut off. During the next growing period any small laterals that appear should be pinched back while they are tender to keep the little tree filled up with fruit spores. The second year's growth can be taken back one-half or more, according to growth, always cutting to an outside bud, thinning out any crossing or undesirable branches in the summer time after pinching back the laterals for fruiting.

The above illustration shows a well-cared-for cherry orchard.

A DANGER PERIOD.

It has been the writer's experience that from the third to the sixth year is a danger period for the cherry on account of sap circulation going wrong. Sometimes it is profuse gumming. Sometimes a limb will go, or half the tree, by the trouble spreading and shutting off the flow of sap. These remarks do not apply to soursapping at the base (which may come from defective soil conditions). It has appeared to be worse where trees have been heavily cut and thinned at the fourth year and may have to do with an over-vigorous sap condition and insufficient wood to deal with it. It is for this reason, since no better is forthcoming, that we advocate going over the young orchard during the summer of the fourth year and pinching or cutting back leaders then, pinching back laterals for fruit wood as usual. After the fourth year no more winter pruning should be necessary. Any thinning out of limbs or crossing branches can be cut out after the crop is off.

ADVANTAGES OF SUMMER PRUNING.

The advantages of cutting the cherry at this time are (as in the apricot): The area of evaporation of moisture through foliage is reduced, by which means the tree is benefited and refreshed; secondly, the wound heals more rapidly, because of the ready flow of sap to the injury; and lastly, there is less danger of infection from fungus spores entering than during the moist weather.

From the fifth year, when a sprinkling of fruit may be expected, the efforts of the orchardist will be applied to getting all the fine wood he can and of keeping the tree as low and spreading as possible—no easy matter with upright growers like the Black Republican and Tartarian. When taking back a good-sized limb it should always be cut back to a leader anyway, and cut closely enough so that it will heal over.

An important reason for not having too many leaders at the point of heading is because by constriction at points of contact a ready flow of sap is checked. It is here that pockets of gum are often found in the fall of the year right in the crotch. Where the limbs are jammed up together they never unite, but are always divided by the layers of bark, as anyone knows who has ever chopped up an old cherry tree.

REPAIRING INJURY.

When pruning is being done, all gummed areas should be opened up to sound bark, scraped and painted. This applies to sunburned areas as well as those produced by gummosis or dried up for any other reason. Dried areas of bark are always found above a very large cut extending from the width of the cut at the base up to a point. These dried-up areas are also often found from the center of the crotch upwards. It is here that the infection of wood rot undoubtedly often enters and is a difficult matter to deal with. The bark may look sound but will be found lifeless by cutting into it. It would pay to plaster these over with a good coat of asphaltum after clearing off the bark, filling the pocket with a wad of it.

Old trees that have a lot of dead branches can be renovated by cutting back to sound wood if possible. Sometimes they can even be dehorned, a piece at a time, and be serviceable producers for some years, but they are never satisfactory. Besides occupying good ground and giving inadequate returns, a really decrepit old cherry tree is an eyesore and makes no demand for effort on the part of the owner. Under such circumstances it may become simply a breeding place for red spider and scale insects—a nest of iniquity. Let us burn it up and turn our attention to good, vigorous trees that are worth while.

California's Fruits "Over The Top" Despite Dry Year

The prophets who early in the season predicted a short fruit crop in California on account of the dry year must go in hiding. Out of a soil alleged to be desiccated by two successive years of short rainfall there bloomed this spring a fairyland of variegated blossoms which a few months of California sunshine transformed into a harvest of delicious fruits for the world's regalement valued at forty million dollars and over. There are still a few scattering shipments throughout the State to be finished up, but there are hardly fifty cars of grapes left to move, and probably five or ten cars of pears. The season can be considered as practically closed. We present below an itemized statement of shipments for 1918 (to date) compared with shipments for the years 1916 and 1917 (final).

These figures are furnished by the California Fruit Distributors, Sacramento:

	1916	1917	1918
Cherries	164	295	351
Apricots	289½	403	440¾
Peaches	1,909½	2,430¾	3,137
Plums	1,998½	2,650¾	2,483¼
Pears	3,701	4,789½	4,545½
Grapes	9,721	13,111½	16,238¼
Miscellaneous	106½	63½	70
	17,891	23,744	27,265¾

It is worthy of note that our grape shipments surpass in volume all others combined, and a few late varieties are still going forward.

MILDEW ON APPLES.

[Written for Pacific Rural Press.]

The best method of controlling mildew on apple trees, according to H. B. Hopkins, Horticultural Inspector in Santa Cruz county, is by winter clipping and the burning of all infected wood, followed by a dormant spray of crude oil emulsion and lime-sulphur alternate years, afterwards using 10 pounds of milled sulphur to the tank in April, with the arsenate of lead spray. A rather unaccountable feature presented itself this year in the apple orchards where mildew is rife: that rather less mildew was apparent where crude oil emulsion was used last winter than where lime-sulphur had been applied. Now is a good time to start in on those infected twigs—a lot of it can be done with the pole clipper, while the regular pruning can be done any time between now and spring.

Restriction on canning of beans is removed for November, December and January.

The War Is Won

But the consumer of Food Must Still Economize

and the producer of Food Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.

While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.

Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

OIL EMULSIONS FOR DORMANT SPRAY.

[Written for Pacific Rural Press.]

The time has come when we have to haul out the spray pump or engine and see that it is in good working order. For the dormant spray season is approaching when everybody will be at it—from the large 200-gallon tank and power machine down to the hand (force) pump and barrel on a sled. The man with only five acres of fruit must keep his trees as clean as the man with 500 acres, if he wants to be in the running with his trees and fruit.

Excepting for peach blight and shothole fungus, the various oil emulsions and miscible oils are perhaps the best early winter sprays, judging from their increasing use. They are second only in importance to lime-sulphur, which is also a fungicide. They are very valuable in the control of black scale, San Jose scale, Italian pear scale, greedy scale and leaf rotter, making a good killing of the armored scales so often hidden under the edges of cracks in the outer bark, where the oil sprays creep. The above scales can be found on prunes, pears, peaches, plums, apricots and cherries and a thorough spraying in early winter of crude oil emulsion, distillate emulsion or any of the miscible oils will be productive of good results. These oils and emulsions also seem to leave the bark in good condition. The system followed by some orchardists of using oil emulsions and lime-sulphur alternate years where annual spraying is necessary seems to be a sound one. Using a contact dormant spray every other year seems to be also a good practice, doing only half the orchard one year and the other half the next, as it does not then clear out the beneficial insects that serve to hold the red spider and aphis in check.

WET WINTER PROPHESIED.

As all signs, portents and prophecies (whatever they are worth) point to a wet winter, the clean-up spray should be carried out as early as possible. If we wait till all the pruning is done, first spraying is put off till pretty late and occasionally a wet spring puts it off altogether—especially on clay and adobe soils.

Labor being rather scarce and dear these war times, it is probable that the majority of growers will take a hand at the spray nozzles themselves and thus insure a thoroughly good job being done. For it cannot too often be repeated that the results of spraying depend not alone on the quality of the material used but quite as much on the thoroughness of its application.

Where contract spraying is done, unless by people you know are to be trusted, there is always the danger of skimping on material and time. Also it is not uncommon for a rancher to try to make his spray reach so many trees to the tank, no matter how unequal they may be in size. This leads to slovenly work. Many large trees get one or two gallons that ought to get five or six or more.

No portion of the tree should be missed—every twig must be wetted and the trunks and limbs drenched on all sides, as insects breed and fungous diseases develop so rapidly from any infested or infected portion left untreated. It is often very disagreeable to get around all sides of a tree if there is a light wind blowing, but it is something that has to be met. A good equipment is particularly necessary with oil emulsions to apply the mixture right—150 pounds pressure is desirable. Then if men are employed who are more concerned about the efficiency of their work than of their personal comfort good results are bound to follow.

Peat fires are mighty hard to control, yet on the peat soil of the delta islands it is the practice to break down the Indian corn stalks and burn them, according to J. D. Happy of the Brack tract in San Joaquin county. They are not burned until the soil is well wetted by rain, but even then, if piled up too much, they may set the peat on fire.

TREES

—with roots such as these

are grown only on our foothill soil and location. Hardy-of selected parentage-well-grown-absolutely reliable-and free from root-knot and diseases common to other localities.

We know we can meet your requirements. Our stock of trees is complete. Submit today a list of your wants for special quotations. Remember, behind each tree is our guarantee.

Those who wait will be disappointed. Write now—right now!

Fresno, California

The Famous Hardie Junior Sprayer

We believe this is the greatest small power sprayer ever manufactured. And placed on the market with phenomenal success in every fruit section in the United States, and vouched for by thousands who own the FAMOUS HARDIE JUNIOR. Equipped with 1½ h.p. engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of 4 gallons per minute with a steady working pressure of 200 pounds, and two 25-ft. of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR $300. DELIVERED ANYWHERE IN THIS STATE.

If truck is not needed, deduct $55.00.

These prices are subject to change without notice. The wise buyer will place his order now for future delivery.

This low price is made possible by big production.

If you are interested in other types and sizes of the HARDIE POWER SPRAYER, write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufacturer. The HARDIE ORCHARD GUN is now $12.00; none better.

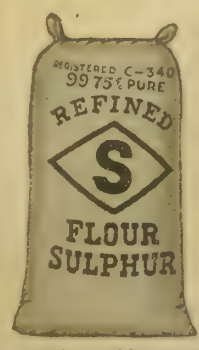
HARDIE SPRAY HOSE IS THE SAFEST HOSE TO BUY.

THE HARDIE MANUFACTURING CO.
200 North Los Angeles Street - Los Angeles, Cal.

All city and county food administrators, women directors and food conservation speakers of California and Nevada will gather in conference in San Francisco next Friday at 10 o'clock at the Palace Hotel to plan in detail the part the two States will play in a nation-wide intensive food saving campaign to be launched the week of December 1-7.

The Beekeepers' Short Course at University Farm at Davis is to be conducted December 2 to 7. Any Californians interested may attend at a nominal cost.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur.

It has been proven that sulphur has increased various crops up to 350 per cent.

SAN FRANCISCO SULPHUR CO.
624 California St., San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples and please state for what purpose you use the sulphur, quantity needed and date of shipment preferred. Tel. Kearny 871.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Fruits Grow Up Salinas Valley.

One does not expect to find fruit in the upper Salinas Valley, yet the Moon Bros. of Monterey county have a considerable orchard, including Tartarian, Royal Ann, sour, and other varieties of cherries; Skinner Seedling, Bellflower, and other kinds of apples, J. H. Hale peaches, a bearing orange tree, and some other fruits. The Hale peaches were set out a year ago and this season had magnificent peaches up to 12 inches in circumference. So many peaches set that they had to be thinned out. The ranch is high on the hillside overlooking the valley. Its air drainage keeps it warmer than the flat lands below. S. O. Pugh, with a similar location, has a considerable number of bearing oranges and other fruits.

Almonds in the South.

Tom Henry, ex-Horticultural Inspector at Paso Robles, is now superintendent of the White Sox Ranch, owned by Chas. A. Comiskey et al. He has set out 224 acres to almonds in a "safe" region, six miles east of San Miguel, and in spite of the dry season of last year (when they were planted) the young trees have come through with very little loss and they have made a good first year's growth. The soil is a good quality of adobe mixed with chalk rock, and Mr. Henry says that the peach root does not stand the chalky soil so well as the almond root, which thrives well on it. The varieties he planted are one-half Nonpareils and the other half Ne Plus Ultras and Drake's Seedlings.

A Fine Walnut.

Martin Slaughter of Carpinteria, in Santa Barbara county, has a walnut seedling 15 years old that has one of the best nuts we have seen. It is large and well filled. The shell is thin, smooth, well sealed and a light tan color. The tree has a dense foliage of very wide, large leaves and this year the tree bore over 100 pounds of nuts. E. S. Kellogg, Horticultural Commissioner of Santa Barbara county, considers it about the best seedling in his district. Mr. Kellogg is carrying out experiments with hybrids both in stocks and fruit nuts that will be watched with much interest by his growers.

Influenza and the Fruit Business.

A meeting of packers and canners was held in the office of A. W. Tate, Jr., at Watsonville to consider ways and means to combat influenza in their warehouses. To have closed down entirely would have occasioned serious losses to farmers and packers, but it was decided that employees should all be compelled to wear masks during working hours.

High Prices for Drying Apples.

Dried apple men are paying as high as $32 a ton for apples for the evaporator. The Newtown Pippin is the best apple to can, according to Horace R. Beesley, vice-president of the Geo. H. Hook Co. of Watsonville. Bellflowers cut away to waste too much, swell in the cooking and then shink away after cooling.

Pears for Pajaro Valley.

Watsonville section expects to plant more pears on her rich bottoms where the later varieties seem to do well. We recently saw a winter Bartlett that weighed 36 ounces, grown by Frank Crossetti near here.

Santa Cruz County Apple Shipments.

Last year 2,700,000 boxes of apples were shipped from Watsonville packing houses. This year there will be about 75 per cent of last year's crop and the fruit is of excellent quality.

Dead Bean Market Will Come to Life

(Continued from first page.)

the Orient at approximately 2,500,000 bushels. Kotenashis are only one of 21 distinct varieties imported to the United States from the Orient. The present price on the 1918 crop of Kotenashis for January or later delivery is 8½c to 9c f. o. b. San Francisco.

WHAT SHOULD THE PRICES BE?

The 1917 crop of small whites was commandeered by the Government and prices conceded to be fair both by the growers and by the Food Administration were paid. They were higher than any offered now, though the cost of production was less than in 1918 and the losses were negligible. In stating a fair price, consideration of previous years' losses should be given, as well as the present year's costs of production and losses. Otherwise, bean production will do what butter and egg production have already done for lack of profitable prices awhile back. Already the Sutter Basin Co. has decided to reduce its bean planting next year 10,000 acres below that of 1918. A fair living price as arrived at by the Government last winter, if it was fair with relation to costs of production, would indicate that the price of beans this year should be 10 to 20 per cent higher than last. Most growers would be glad to sell at last year's prices, because the market has been dead and the growers need money to pay their bills.

Looking at it from another angle, if the prices of 1915 were fair, this season's crop ought to bring at least as much as last season's crop, not allowing much for the losses and extra labor in 1918. H. L. Pabst of Rindge & Pabst, San Joaquin county, gives the following estimated increased costs since 1915: Labor, 75 to 100 per cent increase; board for men, about 50 per cent increase; hay for work stock, about 85 per cent increase; grain for stock, average about 50 per cent increase; threshing, 40 per cent increase; sacks, 300 per cent increase; twine, 100 per cent higher; transportation from the islands to Stockton, 50 per cent increase. Ed Powers of Southern San Joaquin county puts the cost of production this year at 40 per cent more than in 1917. Ranch laborers this year cost $3 or more and board; teamsters $3.50 to $4, sack sewers $6, separator men $8, tractor engine man $6. Threshing alone cost $1 per sack where the machine owner furnished all labor, wagons, and horses.

Whether growers should sell at lower prices than last year is a question for each to decide. The Bean Growers' Association maintains that a profitable demand will develop. Meanwhile, as President Geo. A. Turner says, most of the growers are able to borrow money on their warehouse receipts. Dealers are hardly yet in position to make offers, for they are not supposed to be allowed to hold stocks over sixty days, though this ruling is winked at on account of the present deadness of the market. The California Bean Dealers' Association, which sets the various bean grades each year and furnishes samples for comparison, has not yet set its grades. When it does, as soon as threshing is generally over, when the Government prices on what it is going to buy are known, and when exportation is opened unhampered to the world markets, we may expect beans to move and prices to be profitable.

The State Horticultural Commission has had its attention called to the introduction and establishment in California of an European snail, Helix pisana. This snail in southern Europe occasions much damage to both field and orchard crops, even attacking citrus trees.

"What Can I Reasonably Expect of a Tractor?"

SO MANY farmers ask us this question that it deserves a public answer. When you buy an International kerosene tractor you can expect —

Plowing, as deep as you need, as fast as good plowing can be done, at low cost because your tractor operates on kerosene.

Good work on plowed ground. This is important. You can use your tractor for all the seed bed work, giving your crops a better start and a better chance.

All kinds of belt work. Individual threshers, ensilage cutters, feed grinders, hay presses, and many other useful, labor-saving belt machines soon follow an International tractor because it does good belt work at low cost.

An International will haul your crops to market, clear your land, grade and level roads. In any size or style it is a true "general purpose" tractor, useful for all kinds of farm power work, built by a Company that has built farm machines and tractors in large numbers for many years.

That is what you may reasonably expect from an International kerosene tractor. The local dealer can give you any further information you want. See him or write direct to us.

Dead Spots on Lawn

To the Editor: What ails the lawns? Most all the bluegrass lawns in my neighborhood are affected with ring worms. There first appears a round spot having the appearance of being dry; in a few days the grass has a distinct dead appearance and in a short time the place is bare, when other spots will appear until the lawn is completely ruined. What is the cause and what is the remedy?—Mrs. C. M. M., Chico.

[Answer by Prof. P. B. Kennedy, University of California.]

Your correspondent's description of her lawn trouble coincides so closely with my own experience that I am inclined to believe the same enemies are at work.

PERHAPS IT WAS CUTWORMS.

I discovered two insects playing havoc with a lawn that I thought ought to be well nigh perfect, from the early and late hours attention that it received in the way of watering, cultivating or fertilizing. Yet these brown spots would appear and for some time I was surely puzzled.

But one day, digging out dandelion roots, I unearthed an ugly worm in one of the spots. The dandelion was healthy and the grass was dead. Further probing proved to me that wherever there was a ring of dead grass there was one or more worms. The culprit proved to be the larva of the cutworm, well known to all who have to tend gardens. The mature insects, which are moths, lay their eggs preferably on grass blades. Hence the reason for the lawn injury. The larvae attack the grass and eat it so close to the ground that death results. Myriads of these larvae may be in the grass without one's being aware of their presence.

The worms become very juicy and fat and correspondingly ugly, dirty and greenish-black in color, and about an inch and a half long. Then each one transforms itself into a pupa—one of those things one frequently digs up in the soil that look something like a date seed but is capable of wiggling at one end only. After awhile a gray night-flying moth appears and the process of egg laying begins again.

While these interesting phenomena are taking place, your lawn just naturally goes from bad to worse and you finally dig it up and discover that most of the wretches have gone in search of "pastures new."

But you say, "Why didn't you spray the lawn with one pound of arsenate of lead to fifty gallons of water or feed them a genuine meal of bran and paris green and molasses?"

Well, just because there was always a fine lot of children around, both ours and the neighbors', and I thought more of them than the lawn. Then there was a pet riding horse, and a dog, and a cat, and a bevy of fowls, so why take any chances? So I just spaded up the lawn and picked out all the pupae I could find while they wiggled their tail and fed them to the chickens. The lawn was then dried out thoroughly and disturbed as much as possible to expose the insect life to all kinds of weather, which treatment they thoroughly disliked.

Finally it was spaded again, accompanied by a liberal dressing of barnyard manure and re-sown. A fine lawn was again secured and I forgot all my grass trouble until something else happened.

PERHAPS IT WAS WHITE GRUBS.

This time it was the back lawn. The same general conditions prevailed, except that much less water was applied. Depriving the lawn of water seemed to favor this particular trouble, as the injury was very rapid. Observing the brown condition of the lawn, I at first thought it was due to lack of water, so I gave it a good soaking. Although this checked the trouble, it was far from a cure. An insect was again to blame, the "white grub," one of the most uncanny looking creatures that it is the lot of the gardener to encounter. It lowers its large brown head and pushes forward much as we imagine a "tank" does on the battlefield, looking equally ferocious. Ordinarily I can handle worms and caterpillars and such like without batting an eye, but I draw the line at these fellows. They have the nerve to remain in this ugly condition, feeding and waxing fat, for three years before emerging as beetles, which during the months of May or June make life miserable for all who have their windows open and the lights on. It is the grubs that eat off the roots of the grass just below the surface of the ground, causing the brown areas. When the lawn is raked the entire grass is removed from the patches, leaving the ground bare.

What can be done in such a case? If the area is small and the damage slight, remove the sod and soil to the depth of a foot and replace with fresh soil. When the entire lawn is affected, dig it up and expose and worry the pupae which live in earth cases, which are destroyed by the process. Turn the chickens loose and the fun they have scrapping for the bugs is akin to a circus. Hogs and birds will also destroy them. Then keep the ground stirred and plant something else for a season, and when you re-sow trouble number two will be over and you will be ready to tackle the next one which is sure to come.

SEND FOR A DOCTOR.

Now, perhaps you may be able to discover which of these time-killers is playing havoc with your lawn, but then again you may not and we may be entirely wrong. If you still have trouble or cannot find any bugs, call in my friend Roland McKee of your own home town and if he cannot fathom the difficulty directly on the ground then you surely have just cause for an extended investigation.

Berkeley.

SEEDBED MADE OAT CROP.

A pretty good crop of black oats for last season, the dry one, was the 620 sacks raised by A. McCall in Santa Cruz county on 22 acres of rolling hill land. Some of the oats were so tall that a man could not reach their tops with his hand. It may be remembered that in many sections of the State many fields of grain were not harvested for lack of heads. Mr. McCall credits his success to thorough preparation of the seedbed before planting. When he plowed six inches deep before the rain, the bottom of the furrows was dry. A three-horse spike harrow was fitted with a seat on a heavy plank. The teeth were driven through to project about six inches. Five horses pulled this over the whole field twice with the teeth going full depth and Mr. McCall riding. This was followed by a "bulldozer" made by spacing three old railroad ties parallel and about three inches apart and driving drag teeth through two of them so they projected slantingly about three inches. Two weeks later there was moisture near the surface and the oats were drilled in as deep as possible with a disk drill. They received full benefit of all the rains.

BI-SULPHIDE FOR CORN-EAR WORMS.

Samuel Haigh of San Jose writes us that he failed to prevent corn-ear worms from entering the cob, although he dusted every ear twice (with lead arsenate powder?) about 10 days apart. A few were killed, but others managed to escape. He, therefore, resolved to try bi-sulphide of carbon. This effectually settled them and does no injury to the grain. He used a spring bottom oil can and squirted a few drops into each ear. This saved the corn.

A. H. Anderson of Winters has 20 acres of Royal apricots that look well for next year's crop. Mr. Anderson said that the early rains were a blessing to his district. Shothole fungus was very light this year.

Losse Blenheim
Apricots

One of the finest 'cots in existence.
The fruit grows to a uniformly large size—is of finest flavor and quality—and brings a big price in the market.
We offer the Genuine Losse Strain—budded from the original Losse orchard.

Cost of Handling Grain Reduced

[Written for Pacific Rural Press.]

Reducing the cost of handling grain from thresher to mill to less than 25 per cent of the charges involved in shipping it in the old-fashioned sacks is the record made by a number of California wheat and barley growers this year who have installed metal grain-storage bins on their ranches and are handling their grain in bulk.

COSTS OF THE SACK METHOD.

In the five operations of handling the grain from the thresher to the mill the costs by the sack method of handling grain as outlined by George R. McLeod, manager of the grain department, Sperry Flour Company at Stockton, run about as follows: Sacking at the thresher, sewing, and picking up sacks in field and hauling to pile with a team costs about 50c per ton. Each of the remaining four operations of hauling the sacks from the pile to the warehouse, storage and handling in the warehouse and to the freight car, transferring from freight car or river barge to mill warehouse and from warehouse to binds of the flour mill average about 35c per ton per handling, making a total cost for the five handlings of between $1.90 and $2 per ton.

COSTS OF THE BULK METHOD.

In the bulk method of handling grain on the average wheat or barley ranch, the first operation from the thresher to the tank wagon and storage in a metal grain bin on the farmer's own place will cost about 20c per ton and each of the remaining four operations, namely, transferring from bin to wagon or truck and elevating into a grain car at the railroad siding; unloading car at tide water to barge or elevator; and transferring grain from warehouse or barge to mills will average not more than 6c per ton per handling, a total not exceeding 45c per ton for the entire handling at the highest cost.

In handling grain in bulk in a large way, as is done by the Moreing Brothers of Sacramento county on their 20,000-acre wheat ranch, the cost per ton by the bulk method has been lowered to approximately 35c. This is an indication of the results achieved by carefully planned organization and facilities to handle grain in bulk.

The contrast between the cost of $2 per ton in sacks and 45c per ton by the bulk method is an indication of the tremendous overhead cost added to every pound of wheat raised in California which is traceable to the antiquated methods of handling it, which dates back to the days of '49. These tremendous costs, aside from the 26c sack charge, are for labor, which, under the present conditions, is the farmers' greatest source of trouble. It could be used in more constructive work than "bucking" grain sacks on threshers, storage piles, freight cars, barges, and warehouses.

OTHER LOSSES INCIDENTAL TO SACKING GRAIN.

The above mentioned costs do not pretend to consider another phase of loss entailed through handling grain in sacks. The loss due to leaking sacks, weather exposure (and consequent deterioration of the quality of the grain), consumption and spoilage by rats, mice and other vermin, fire losses and theft are responsible for damage approximating 25 per cent of the grain raised in California.

Under the present conditions, where every grain of wheat is required to feed this country's military forces and allies, this is positively criminal. It is a condition that is almost totally eliminated through the storage of grain in metal grain bins and the bulk handling of grain in shipping it from farm to mill.

This loss of wheat by handling in sacks is illustrated in a shipment of 2500 tons from steamer to barge consigned to the Sperry flour mills at Stockton. There was an actual deficiency of 16 tons in this one transfer, which is a loss of .00625 or more than six-tenths of 1 per cent. Expressed in another way, this loss amounts to 12½ pounds per ton. Multiply this by five handlings and it becomes a matter of real concern to the grain raiser, shipper, and buyer; and this handling loss does not include inroads by rats, mice, and other vermin, weather damage, fire loss and theft.

On a shipment of 2500 tons of wheat in bulk made coincidently with 2500-ton lot in sacks to the Sperry Flour Company at Stockton, there was loss of only 1000 pounds, or less than ½ pound per ton; expressed in percentages by the decimal, .00025 per cent; or by the fraction, 25/1000 of 1 per cent.

METAL GRAIN BINS SUCCESSFUL.

Storage of grain in metal grain bins on the farmer's ranch is the beginning of the chain in the bulk handling system. These metal grain bins have been used successfully by wheat raisers throughout the Central and Eastern States, in the Pacific Northwest, and are beginning to come into their own on California ranches.

Metal grain bins are made in varying capacities from 600 to 5500 bushels and come in galvanized iron sheets, shaped and punched to fit. They are put together with stove bolts and two or three workmen can erect one in half a day. In case of need, they can easily be taken down and set up again in some other location.

How the Farmers Were Outvoted

To the Editor: Something seems to be necessary to complete your report of the recent conference on farm labor, called by the State Council of Defense.

The committee on resolutions reported in favor of introducing 25,000 Chinese farm laborers, for a term of four years, to be used in farm labor only, and to be repatriated at the end of the term. This resolution was beaten by a vote of 10 noes to 9 ayes. Seven of the ten noes were cast by salaried officials of the Federal and State Governments, employed in the labor bureaus, one no was cast by the Secretary of the State Labor Council. None were farmers or connected in any way with farming. The ayes were cast by actual farmers.

Just why a farmers' conference should admit these non-farming elements is not explained by the State Council of Defense. Farmers do not intrude upon meetings of union labor. If they did and outvoted organized labor in matters of policy, labor leaders would resent it.

It may be that farmers will get tired of being outvoted in their own conferences by labor intruders and their paid servants whom they support by taxation.—John P. Irish.

[Of course. Why farmers do not boycott these meetings and arrange their own assemblies, which will adequately represent the facts as they see them and declare the principles as they have to live and work with them, we cannot understand.—Editor.]

P. R. P. ITEM SAVED $20.

One item in the Pacific Rural Press made A. Anderson of Campbell $20 richer recently. Mr. Anderson has nine seedling English walnut trees along the roadside. A walnut buyer offered him 23c and actually bought his neighbor's nuts at that price. The neighbor does not read the Pacific Rural Press, but Mr. Anderson saw in its market report that the nuts were worth 25c. He shipped them and received a check for $231.25, which is $20 more than he would have received at the local buyer's price.

The Engine Selected by over 150,000 Farmers

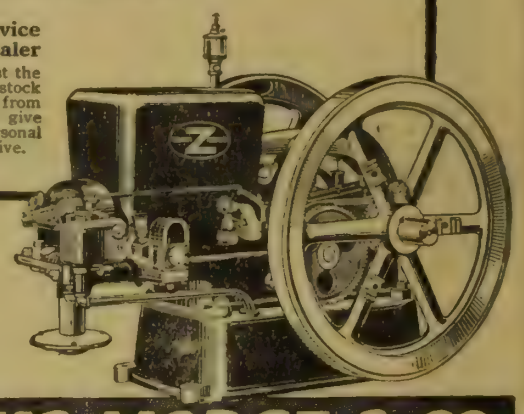
RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.



The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

THE WAR IS OVER

BUT THE FOOD SCARCITY IS GREATER THAN EVER

What will You Plant Next Year?

You must soon decide upon your next garden and field crops, and the best guide at this time is the latest edition of

California Vegetables, in Garden and Field

BY E. J. WICKSON

The long winter evenings are with us—why not take the opportunity to study up the best way to grow and make the most out of your soil? Whether you wish to produce beans, beets, potatoes, celery, cucumbers, corn, melons, onions, tomatoes, rhubarb, squashes, turnips—or any garden or field crop—you need this book. It is a handsome volume of over 300 pages, well illustrated, bound in cloth, and will be sent to your address for $2 per copy postpaid.

Make yourself a Christmas present—you will get an enjoyable, an interesting and a practical book.

PACIFIC RURAL PRESS
525 Market Street, San Francisco

Will You Plant Barley or Wheat?

[Written for Pacific Rural Press.]

Stocks of barley reported on hand by 6352 firms in the United States aggregated 27,560,565 bushels. The Pacific Coast reported 14,389,282 bushels, of which 13,618,619 are in California. This is almost exactly half of that in the entire United States. Reports from 5360 firms October 1, 1917 and 1918, show that their stocks include nearly two and three-quarters million bushels more than a year ago, and the increased holdings on the Pacific Coast are nearly seven hundred thousand bushels. E. J. Luke, manager of the Sperry Flour Co. at Stockton, gives a summary of the barley situation about as follows: There is no demand for barley except what the Government takes occasionally. About the first of November, 1918, barley at Port Costa wouldn't bring two cents. In the middle of November the heavy 48-pound barley had raised to $2.35 due to Government buying, partly to ship to Scandinavia for human food. This buying has again ceased. With removal of the wheat-flour substitutes ruling, the barley-flour market is absolutely dead, with considerable stocks on hand. No more will be made for an indefinite time. Due to the motorization of farming and city transportation, the demand for rolled barley for feed is not over half what it was a year ago. (See Power Department of Pacific Rural Press.) The Stockton mills' sales of rolled barley in August, 1917, were over three million pounds. Their sales in August, 1918, were about one million pounds. Light feed barley, which comprises most of the California crop, can scarcely get any price. Dealers do not want it on account of the uncertainty of Food Administration regulations. The brewery demand is sleeping and may never wake up. The only hope for use of the crop seems to be in feeding it, chiefly to hogs. Here again barley has been losing out because "mill-run" feeds were cheaper per ton, if not per feed value. "If the Government continues buying, barley may stay about $2 to $2.25," says Mr. Luke. "If not, I can't see any future for it over $1.50."

What about wheat? A profitable price is fixed for all that will be sown this fall. The Government wants us to raise a big crop. This is especially true of California, which has always of recent years transported great quantities of wheat and wheat products hither from the East. The United States Department of Agriculture figures for stocks on hand October 1, as reported by 12,979 firms, total 195,997,839 bushels, of which, according to Norman F. D'Evelyn of the Sperry agricultural department, California has only 3,408,745 bushels, or about 1.7 per cent of the total.

Normal consumption of wheat in California is figured at 5.6 bushels per capita, 0.3 bushels above the average for the United States as a whole. On a population estimate of 3,119,412, and after deducting 10 per cent for the voluntary reduction from normal requirements, California consumption will this year be about 15,722,000 bushels plus about 780,000 bushels for seed. This year's production in California is figured at 6,240,000 bushels. About 10,262,000 bushels must be brought in from outside for our own consumption. Patriotism would demand that we should at least grow what we eat, and our pocketbooks surely demand the same thing for the year 1918-1919.

SUTTER BASIN BEANS.

Of the 30,000 acres of beans planted in 1918 on reclaimed land in Sutter Basin, 2000 acres were farmed by the Sutter Basin Co. and the rest by about 150 tenants, the company doing most of its plowing by tractors. The yield turned out only 60 per cent of what was expected, and that 60 per cent must be hand-picked. Ten thousand acres were on land that had never been farmed before, and this will be planted to grain or other crops than beans next year. The small growers are rather discouraged, especially on the higher lands, which do not produce so well as the lower areas. It was a dry year at the start; vines made pretty fair growth but set only a few beans. Then the September rain started them growing and they set a heavy crop, which was destroyed by four successive nights of frost in early November. The whole area has been singularly free from insect pests. A few thrips and red spiders appeared, but they were not serious on account of the lack of roadside weeds, where they ordinarily multiply. No weevils were found, probably due to the lateness of planting here.

RICE HARVEST WAGES.

Wages for the Princeton Ranch rice harvest are given us by J. H. Ryan, who was recently working there. Unskilled laborers received $3.50 to $4, teamsters $3.50 to $4, drivers for the rice binders $4.50 to $5, "trouble shooters" to take care of seven or eight auxiliary engines each on the rice binders $7 to $9, bundle pitchers $4, sack sewers $5 to $6, sack buckers $6, separator man $8. Board and lodging are furnished in addition. At that, one of the four threshers was laid up for lack of a crew.

The sweet potato business is on a thriving basis around Turlock.

It contains the signed statements of many ranchers who tell how they are becoming wealthy in the famous Santa Cruz Valley near Tucson, Arizona. About 80% of all products consumed in the valley are shipped in from California. The rich mining camps and the city of Tucson (25,000 population) pay fancy prices for all farm products Local farmers are getting rich. A very limited amount of land with water (suburban to Tucson) may be had at $150 an acre on long time terms. Best farming opportunity in America. Land selling fast.

Water

Water is the one thing essential to the home—water when and where you want it—day or night—all the year 'round.

A Pacific Redwood Tank and Pipe Line is the essential thing to bring the water to the home. The cost for installation is less than you think, and the cost of upkeep is almost nothing.

Your home on the farm is not complete without water, convenient, for use as needed.

Tell us about your water supply, distances, heights, etc., and we'll give you an estimate for a tank and pipe line.

Our engineers are at your service.

Write us as soon as you read this.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

FIGURING TRACTOR DEPRECIATION.

In the Middle West the life of a tractor averages around eight years In California five years is more nearly the average on account of our longer seasons, harder soils, more severe use, according to Prof. J. B. Davidson of the University Farm at Davis.

Supposing a man has $4,000 invested in a tractor, the interest might be figured at $280 and the annual depreciation at $800, making a total of $1,080 per year. Now if he works the machine 200 days in the year and keeps it in repair, depreciation may be charged at the rate of $5.40 per day. If he runs it only 70 days in the year, depreciation will have to be charged at the rate of $15.43 per day. The difference in favor of longer use of the machine is $10.03 per day of income-producing operation.

The daily running expenses of such a tractor would be about as follows:

Distillate, 30 gallons at 11c	$3.30
Lubricating oil	1.50
Repairs (estimated)	1.00
Engine driver (average for season)	5.00
Daily expense total	$10.80

The total daily cost of a 70-day run would be $26.23, including the depreciation. The total daily cost of a 200-day run would be $16.20, including depreciation. The 200-day run is actually $10.03 per day cheaper, all costs considered, than the 70-day run.

STEEL OR CHILLED IRON PLOWS.

A steel plow share costs four or five times as much as a chilled iron share, according to a representative of the Oliver Plow Co., which makes both. The steel share is best where a keen edge is required as in cutting alfalfa roots, etc. A chilled share is best where the soil is gritty or gravelly and the most wear occurs. It is made by pouring iron onto a cold surface, thus "chilling" it. This makes it so hard that it is almost brittle, but if excessive sudden shocks are avoided it does not break and it wears longer than a steel share. "Temper checks" on the surface show that it has been tempered as highly as possible. A chilled iron moldboard will scour after standing a winter in the ground, while a steel share would be pitted with rust on account of its carbon content. A "soft center" moldboard is made of three layers welded together, the wearing surface being tempered to the limit, the middle layer being soft to cushion the shocks which might otherwise break the hard surface. The under layer is harder than the center. A "crucible moldboard" is of a single layer. It may be identified by tapping with the point of a knife. The point will frequently stick on the surface of the crucible moldboard but will slip off from the others.

RENEWING AUTOMOBILE LICENSE.

To renew your automobile license, detach the upper half of the "Certificate of Registration" you have been carrying in a metal container in the driver's compartment of your car, sign it on the face only, and send it to the State Motor Vehicle Department at Sacramento only, with the same annual fee you paid last year. Detach the upper half along the line of perforations between it and the lower half (which is a "Notice of Transfer"). Do not cut it in two. Keep the lower half in the metal container. Do not ask the Department for a Certificate of Registration, as no such certificates are being mailed out for renewal of licenses.

TRUCKLOAD OF HOGS IN MOUNTAINS.

Sixty-eight hogs were better off riding in a motor truck 125 miles, including the San Benito Pass, than they would have been in the corrals near Coalinga in Kern county recently. N. P. Mascovich was moving his ranch equipment and stock to a ranch near Gilroy, using a five-ton truck. Eighty pigs and hogs were left in the corral on one trip recently, but coyote trapping has languished on account of the war and on the return of Mr. Mascovich he found coyotes had gotten twelve of the hogs, including a big boar. He loaded the sixty-eight onto his truck in the evening and got them across without loss during the night. A dozen of them weighed over 200 pounds each. The rest were small shoats. A double deck was built on the truck, both decks having solid beds and solidly enclosed sides 12 inches high. An open space of 4 inches was left above the sideboards of the lower deck. The shoats were stacked in outrageously, but owing to the coolness of the night none was lost. Mr. Mascovich recalls times when twenty hogs would be too much of a load on account of heat. He also notes that if you are hauling hogs in the summer and have engine trouble in one of the sunlit canyons, the hogs had better be turned loose at once than after an hour or two, because in the former case they will unload themselves while otherwise they would have to be unloaded by the truck driver. There is not much danger with reasonable loads so long as the truck keeps moving and creating a breeze over the hogs.

CORN HARVESTING MACHINERY.

One firm in Stockton sold 45 corn binders and nine corn shredders for the 1917 crop. They sold about eight binders and no shredders this year, though they have a considerable number in stock. This slump is due, according to the manager of this concern, partly to the attempt of users to make the machines do too much, and partly to the reluctance of workers to use machines at all. Asiatic laborers generally prefer hand methods of doing their work rather than machinery.

NO TRACTOR CORRESPONDENCE COURSE.

The item in our issue of November 2, "Gas Engine Machines Are Abused," has given the impression to many people that the University of California offers a correspondence course in tractors. The course mentioned is for automobiles; a charge of $7 is to be paid by each student. This covers the cost of text books.

Tractor Production Has Jumped Tremendously

A report as of June 30, 1918, from every tractor manufacturer in the United States was made in August to the office of Farm Equipment Control of the United States Department of Agriculture, pursuant to the Presidential proclamation of May 14, 1918. It shows that 29,670 tractors were manufactured in 1916; 62,742 in 1917; and 58,543 in the first half of 1918. The total tractors manufactured in the two and a half years was 150,955. Of these, 30,464 were sold to exporters in the past year and a half, more than half of that number having been sold in the six months ending June 30, 1918. More than half of the total two and a half years' production was sold to American users in 1916 and 1917.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Schmeiser Manufacturing Co.

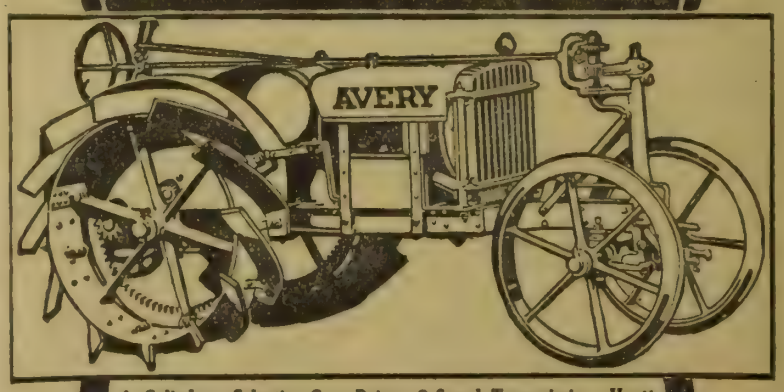
12 Mechanic Street DAVIS, CAL.

Manufacturers of

Sure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

THE SMALL FARM TRACTOR AT A SMALL PRICE

$650. HERE



4-Cylinders, Selective Gear Drive, 3-Speed Transmission. Hyatt Roller Bearings. Adjustable driver's seat and controls on the rear. Double exhaust piped to the Bull Gears, keeping them always clean. Built by the oldest and largest manufacturers of tractors in the United States.

Will do the work of four good horses and costs but 15c an hour to operate. No special implements to buy—uses your horse-drawn tools and works right up to the trees.

The Avery by reason of its patented California Lugs is guaranteed to work in Sand or Mud. It is the simplest tractor built—all parts in plain sight and get-at-able. Don't keep farming in the old way—save yourself and family a lot of hard work.

Get a 5-10 Avery—Now Only $650 Here.

Terms if desired—we can make immediate delivery if you order at once. Write and let us tell you how an Avery will enable you to get a bigger and better yield with less work at a smaller cost—

Address Department (P)

Avery Company of California

Fred Poss, President

67-69 Beale Street, San Francisco

There is a Size Avery Tractor to Fit Every Size Farm

TRACTOR RUNS THRESHER.

A Yuba 12-20 tractor keeps sixteen men and four wagons busy on A. L. Roddick's Ventura bean thresher in Monterey county with ordinary beans. The thresher has a capacity of about a sack per minute of any variety of beans when they are in good threshing condition. The tractor was belted to it at a distance of about 45 feet when observed recently threshing rather moist Kentucky Wonder beans. The thresher truck wheels were set in holes in the ground, but no stakes or braces seemed necessary on it or the tractor to keep them from pulling toward each other.

ENGINES ON RICE BINDERS.

Auxiliary engines are being used on all rice binders on the Princeton Ranch in Colusa county to relieve the draft stock from the labor of operating the machines. Three or four horses keep a binder going all day even on soft ground, whereas more would be required without the engine, more slippage of the bull wheel would occur, more rice would be lost during such slippage; and on the first round in each check more rice would be knocked down by the additional horses or mules. Two men at a cost of $7 to $9 per day keep the sixteen binder engines in repair and busy.

CHARGE FOR TRACTOR PLOWING.

To the Editor: What does it cost to hire tractor plowing done?—Subscriber.

[It varies with size of field, size of job, kind of soil, condition of soil, time of year, and depth of plowing. With loamy soil in San Joaquin county, Ed Powers says $2 per acre for six inches deep to $2.50 for eight or nine inches deep is a common charge now.]

TRUCKS DELIVER PROMPTLY.

Owing to the present uncertain freight deliveries, the Daniel Hayes Company, H. J. Small, manager, of Chowchilla, has just ordered from the Killefer Manufacturing Company a shipment of heavy tractor chisels and cultivators weighing some six tons, to be delivered by auto truck from Los Angeles to Chowchilla at a charge of $220, as against a freight charge of $91.

ENGINE TROUBLES LOCATED.

The most concise and pointed statement of gas engine troubles and their causes that we have seen is a folded sheet issued by the Avery Co. of Peoria, Ill., entitled "One Hundred Questions and Answers to Tractor Troubles." Apparently it is printed to be distributed free to all applicants.

POWER NOTES.

A record has recently been kept by dealers in Haynes automobiles on the occupations of their customers. Of 1643 such customers, 331 were farmers—over 20 per cent. Every mile of improved highway such as California has in abundance adds to the market for high-class automobiles among farmers.

Have your spark plug porcelains been breaking unduly? It is probably because you screw their lock nuts down so tightly that when expanded by engine heat there is nothing for them to do but break.

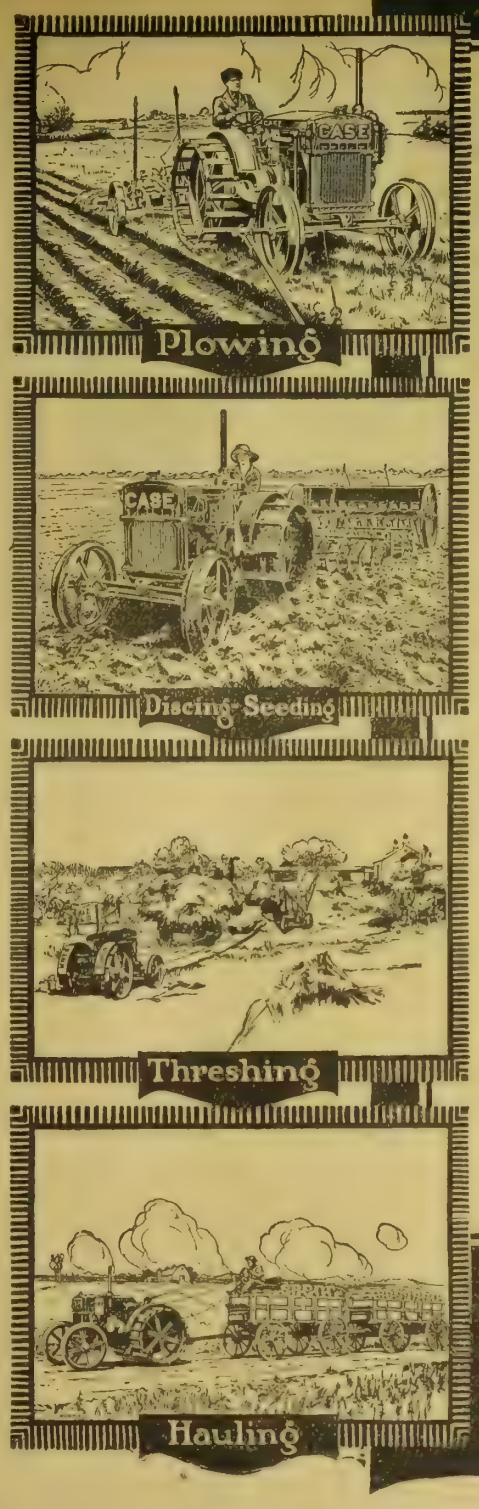
A Ford car recently observed was going very steadily by jerks. All monkeying with the spark plugs and coil boxes seemed of no avail. Kerosene dripped into the commutator lubricating cup cleared the dirt from contact surfaces and cut out the jerks.

About two things are responsible for all tractor grief — carelessness and dirt.

If the tractor costs anything, it costs too much to overload. Get a size that won't need to be overloaded.

Fifty per cent of disappointed tractor customers are disappointed because they did not know what they wanted and did not know what they were getting.

As a gas engine does not have the great reserve power that horses can occasionally exert, it is very desirable to have a low gear in the tractor by which we can pull slowly out of extra hard or extra soft places.



Why a Case Tractor Is More Profitable

THE number of working days for an advanced tractor like the Case 10-18 is rapidly increasing. Men thought of tractors principally for plowing twenty-six years ago, when we first began to build motor tractors.

In later years, with the introduction of our smaller sizes, men were satisfied with a maximum of 30 days' use per year.

But war-time conditions have brought about changes not only in the mechanical development of tractors, but in their adaptation for multiplied uses.

More Ways to Use Your Tractor

Our latest and best small tractor, the 10-18, is purposely designed for maximum use. It is adaptable for all kinds of work. It represents years of study in the field, dozens of extensive investigations.

The Case 10-18 is small and compact. It weighs little more than a team of horses. Its length is 102 inches, width 56 inches and height 54½ inches. It turns in a 22-foot circle, and can get around easily. It goes through a small gate or door and easily shares the road with other vehicles.

While rated at 10 horsepower on the drawbar, it develops nearly 14. While rated at 18 on the belt, it develops up to 24. This reserve power makes it ever ready for an emergency.

There are dozens of improvements in this Case 10-18. For instance, it has a one-piece main frame, with a four-cylinder engine mounted crosswise. This frame construction affords a dust-proof housing for the rear axle, bull pinion shaft, transmission and the bearings for these parts. It also provides a base for the motor.

This type of construction brings rigidity. It minimizes vibration and prevents disalignment of gears, which are all cut steel and fully enclosed. Thus we multiply strength, reduce weight and conserve power.

Another feature is its economical consumption of kerosene. It has a Case Sylphon Thermostat which controls the cooling system and insures complete combustion of kerosene. And it prevents raw fuel from passing by the pistons and diluting oil in the crank case.

An improved air-washer delivers clean air to the carburetor. No grit nor dust gets into the cylinders to minimize their efficiency and shorten their life.

Our illustrated booklet describes all the advanced ideas in the new Case 10-18.

We will gladly send a copy free. Or it may be obtained of a Case Dealer.

General Agricultural Review

Field Crops.

Rice growers have been prohibited by the State Highway Commission from piling bags of rice along the highway.

The celery area in California for the season of 1918-19 is reported at 300 acres, as compared with 5500 acres for the season of 1917-18.

It is thought that it will not be possible for the threshing outfits in the vicinity of Manteca to handle the large tonnage of beans produced there this year.

The Sutter Basin in Sutter county is now entirely surrounded by adequate levees and will not be overflowed this year, according to Manager George F. Maddock.

Among people who are taking a most rational method of selling their barley are A. C. and S. Franscioni of Monterey county, who have bought a number of hogs to feed.

A number of sales of the 1918 crop of barley was recently made in Merced, it is reported, at $2 per cwt. net to the growers. The grain was shipped to Port Costa.

The cotton boll weevil is said to thrive best in countries where the cotton is watered by rain, as in the South. It is claimed that irrigated districts are comparatively immune.

The Manteca Canning Co. expected to finish its season's run this week, having packed 100,000 cases of tomatoes as the wind up of the season. The prices have been high.

An experiment has been successfully conducted on heavy adobe rice land near Winters which seems to demonstrate that broom corn can be utilized as a crop for rotation with rice.

Approximately 75,000 acres of wheat, said to be the largest single area of grain in California, is to be planted in the northern part of Tulare Lake Basin on the south side of King's River.

Word from Salt Lake says that the beet growers of the intermountain region received this year $7,000,000 for their output. It is estimated that 3,000,000 sacks of sugar were produced.

The acreage of cauliflower and broccoli in San Mateo and Los Angeles counties is estimated to be 4600 acres for the season 1918-19, as compared with 6400 acres for the season 1917-18.

The Spreckels Sugar Company advises growers of beets in the territory of the Manteca factory to begin preparing their land at once. Planting, it says, should be done in December and January.

Although the Gridley rice mill was greatly increased in capacity this year, it is unable to handle all the rice offered. No drop in the price of rice is expected because of the signing of the peace armistice.

A record for rice production was made by the Dodge Rice Company at Chico when 27,000 sacks were threshed and placed in the warehouse within 48 hours. The crop will amount to about 150,000 sacks.

The acreage of peas in the Imperial Valley will be nearly 600, the cantaloupe acreage about 10,000, and the lettuce acreage about 2500, according to the estimate made by Secretary Ozawa of the Japanese Farmers' Association of Brawley.

The first carload of this season's celery to leave Antioch went East this week via the Santa Fe. The season is later than last year. Prices are better at the beginning of the season; the price hitherto has been about 25c a dozen, reaching 40c by Christmas.

Beet growers are having difficulty in obtaining seed for next year's planting. It is announced that the plant of the Sacramento Valley Sugar Co., located at Hamilton City, cannot operate next year because of inability to get seed for planting and because of labor shortage.

There are lots of beans in the warehouses of southern San Joaquin county, according to Ed Powers of Manteca, and they are in good shape. They are about 40 per cent teparies, 30 per cent red Mexicans, 10 per cent Lady Washingtons, 10 per cent blackeyes, and the rest of other varieties.

The Government is taking all solid-packed canned tomatoes and a large quantity of extra standards and those packed in puree from whole tomatoes, according to H. Clay Miller, purchasing agent for the Food Administration. All canned tomatoes packed with puree from tomato trimmings have been released for civilian use.

Fifty per cent of the potato acreage of the State is found in the delta regions, where the yield has this year been good. Nevertheless, the yield per acre shows a falling off of 10 bushels from that of 1917. The percentage "grown for the market" is 80 per cent—a new determination by the U. S. Bureau of Crop Estimates.

It is worthy of note that the percentage of the corn crop of California cut for ensilage is now 53 per cent, as compared with 48 per cent last year. The yield per acre for grain shows an increase over last year of three bushels. The total production in the United States is 2,754,807,000 bushels, as against 3,159,494,000 in 1917.

For the wheat crop of 1917 the farmers of this country received an average price of $2.05 per bushel; for 1916, $1.44; for 1915, 98c; 1914, 99c; 1913, 79c, as estimated by the Bureau of Crop Estimates. In the past year State averages (excluding States producing less than 1,000,000 bushels) ranged from $1.83 per bushel in Utah to $2.66 in South Carolina.

Santa Maria has a five million dollar bean crop and Lompoc a three million one. The Pacific Rural Press correspondent noticed the threshers at work on Sunday as he passed through, as not a day could be spared in these times of harvest. In the bottoms lima beans did not set well this year for some reason, though they gave normal returns on the hills. One man in the Carpinteria district threshed 400 sacks of limas from 33 acres last year. This year he only harvested 58 sacks from the same acreage.

The prices paid for picking cotton this year average $1.18 in North Carolina, $0.99 in South Carolina, $1.05 in Georgia, $1.34 in Florida, $0.92 in Alabama, $0.96 in Mississippi, $1.04 in Louisiana, $1.25 in Texas, $1.28 in Arkansas, $1.31 in Tennessee, $1.57 in Oklahoma, and $2 in California. These prices are per 100 pounds of seed cotton, including short and long lint and sea island, and have been ascertained by the cotton crop specialist of the Bureau of Crop Estimates. In 1896 the United States average price for picking upland cotton was 44c.

Deciduous Fruits and Nuts.

A critical inspection of the orchards of Sutter county, recently made, shows the trees to be in excellent condition.

California's commercial crop of apples is estimated to be 3,337,000

EMBARGO ON RAISINS IS LIFTED

The embargo on raisins has been lifted by agreement between the War Trade Board and the United States Food Administration, it was announced here today. This action will release thousands of tons of California raisins for exportation to Canada and abroad.

Your Wife Should Be Considered

Mr. Farm Owner:

You may have fitted up your farms and out-buildings with electric, labor-saving devices, but have you considered the *lady of the house?*

An electrically driven washer, mangle, vacuum cleaner and other household devices will greatly lessen her work and add to her comfort.

A few words to your lighting company suggesting as a preference G-E MOTORS will repay you for the trouble.

Agents wanted to represent us in each locality. Address

OREGON NURSERY COMPANY, Orenco, Oregon.

boxes, as against a production in 1917 of 3,530,000 boxes.

Great Britain's Food Controller has just announced that he is arranging for an early importation of apples from the United States and Canada.

Henry Markarian, president of the California Fig Growers' Association, a recognized expert on the fig industry, died at Fresno last week of influenza-pneumonia.

California's production of pears in 1918 is 84 per cent of normal, indicating a crop of about 3,600,000 bushels. The quality was not up to the average, being only 87; a high medium grade representing 100.

A Government inspector has condemned 50 per cent of the Anderson (Shasta county) prune crop on account of so much being damaged by the early fall rains that the Government would not receive them.

Through the efforts of the Chamber of Commerce, a fruit frost station will be established in Chico during the coming spring. The purpose of the service will be to warn orchardists of threatening frosts.

The nurseries of Nevada county are preparing for the 1919 season by announcing large stocks of young trees. Several nurseries are competing for the local business, and expect to make shipments to other points.

Government requirements in prunes have been practically taken care of, according to H. Clay Miller, purchasing agent of the Food Administration. It is expected soon that all prunes not actually taken by the Government will be released.

A considerable amount of pruning of prunes and apricots has been accomplished in the Santa Clara Valley, and fall irrigation started. The ground needs filling up and this operation will not be neglected because of the rain. Recent frosts have made it safe to go right ahead with the work.

The State Commissioner of Horticulture issued a warning to the prune and apricot growers of the State to prepare for a heavy infestation of pear thrips during the year 1919. During the past season the thrips have been more abundant than for many seasons past, and the early fall rains are favorable to its hibernation.

Citrus and Semi-Tropical.

Six to eight cents per box is being paid for orange picking in Tulare county.

Fig men will meet in Visalia for a three-day conference with Prof. I. J. Condit of the University of California, beginning December 12.

Help in the citrus belt of the Porterville district is very scarce. The fruit is ripening rapidly because of the cool nights, and the output is limited only by the amount of help available.

Navel orange sales on the Eastern market this season are much below the prices received for Valencias, and while indications are for much better returns than in former years, much depends on quality.

The citrus season on Tulare county's 55,000 acres is almost a continuous one. The gathering of the grapefruit followed the late Valencia crop, and now the navel harvest is under headway, this crop ripening from two to three weeks earlier than usual owing to the warm rains and bright sunshine of early October.

It is reported that some olive growers in the Porterville district who some time ago joined the California Olive Growers' Association have announced their intention of refusing to deliver their fruit to association plants, affirming that under the form of contract signed by them they are no longer members of the association. Local orchardists also say the injunction recently granted to the association was only temporary and that the validity of the contract is to be attacked in the courts.

Grapes.

The shipment of table grapes has practically ceased, the late rains and frost destroying what few remained.

The first car of Emperor grapes to leave Exeter brought $1,500 net in New York after express charges of $960 were paid on the shipment.

Miscellaneous.

The erection of a cottonseed oil mill at Bakersfield is being talked up.

The Kirkman Nurseries of Fresno are preparing another tract of land in Madera county for planting to nursery stock this winter.

Grain shippers must secure inspection of shelled corn and wheat sold, by Federal grades, for each interstate shipment from or to an inspection point.

The annual meeting of the Imperial Valley Beekeepers' Association was held at El Centro, November 12. The attendance was large and the organization bids fair to be most successful.

The campaign for rodent control is being vogorously prosecuted in the Santa Clara Valley. Ranchers and stockmen are co-operating with County Horticultural Commissioner George L. Wright.

The bill stopping liquor sales until the army demobilizes has gone to the President for signature. The bill would stop sales of distilled, malt, or vinous beverages June 30, 1919, and thereafter during the war and demobilization.

DECEMBER

750 High Class Breeding Animals
AT YOUR OWN PRICE

Including all the famous producers and prize winners in the herds. Animals that money could not buy from us in anything but a dispersal sale.

TUESDAY, DECEMBER 10th
WE WILL SELL
90 REGISTERED HOLSTEINS

For several years we have subjected our Holstein herd to the most severe culling, throwing out every single animal that did not measure up to our standard. As a result the herd that will greet you on sale day is one of which we may feel justly proud. The milking cows will show for themselves, through their many splendid official records, and the splendid families represented in their breeding.

Of our heifer herd, from calves up to bred heifers, we can conscientiously say that we believe no breeding farm with a herd of equal size can show better. Buyers wanting heifers from two-year-olds down should, in justice to themselves, make it a point to be at this sale.

Among the many splendid individuals to be sold are:

TWO 26-LB. THREE-YEAR-OLDS and five of their offspring.

34 COWS AND HEIFERS bred to King Sadie Vale Rose, son of King Korndyke Sadie Vale.

FOUR DAUGHTERS of King Segis Pontiac Jannek, two of them out of a 27.96-lb. senior three-year-old.

12 DAUGHTERS of King Sadie Vale Rose.

12 GRANDDAUGHTERS of Korndyke Queen De Kol's Prince, 91 A. R. O. daughters with records up to over 35 lbs. butter in 7 days and over 1000 lbs. in one year.

8 DAUGHTERS of Sir Holland Gamp, sire of the 25-lb. two-year-old, El Dorado Winifred.

2 DAUGHTERS of King Segis Pontiac Zella.

FIFTEEN OTHER COWS AND HEIFERS with records up to over 25 lbs. butter in 7 days.

KING SADIE VALE ROSE

will himself be sold, and his breeding and individuality entitle him to a place at the head of a high-class breeding herd. He is by King Korndyke Sadie Vale and out of a 27.98-lb. daughter of a 32.41-lb. cow, and has an average of 33.82 lbs. butter in 7 days for his three nearest dams.

A SPLENDID SELECTION OF YOUNG BULLS will include sons of "King" out of dams up to over 26 lbs.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER.

NO ANIMAL TUBERCULIN TESTED

We Will Lease

in tracts of 20 acres and up, on liberal and attractive terms, to

SUCCESSFUL AND RESPONSIBLE PARTIES

the entire

TAGUS RANCH

The richest, most productive, best watered and equipped

6000-ACRE RANCH

in California. Located in Tulare county, five miles north of the city of Tulare, on the main cement State highway. Apply to

Pacific States Corporation

(Owners)

At office on ranch, or write P. O. Box D, Tulare, Cal.

WEDNESDAY, DEC. 11th

WE WILL SELL

200 REGISTERED DUROC JERSEY HOGS
200 HIGH GRADE POLLED ANGUS COWS
100 HIGH GRADE SHORTHORN COWS
15 REGISTERED ABERDEEN ANGUS BULLS
3 SHORTHORN BULLS

THE DUROCS offer a splendid selection of breeding and show animals of most highly approved blood lines, noteworthy for the great uniformity of breeding throughout the herd.

Twenty proven brood sows will be sold, every one of which we can recommend as the sort of sow that regularly farrows large litters of strong, uniform pigs, and every one of them will be a big money maker in the hands of the man fortunate enough to buy.

CALIFORNIA'S DEFENDER, the senior herd sire, is in the sale. As all Duroc breeders know, this famous boar was Junior Champion at Panama-Pacific International Exposition, and his worth as a breeding boar is fully up to his show ring performance. He is vigorous, a sure breeder, and a boar that any man might own with pride and profit.

More than 150 daughters and sons of California's Defender will be in this sale, making a wonderful opportunity for the securing of liberal drafts of this great blood. Those wishing to establish high-class breeding herds will find here the animals fit for the purpose.

THE POLLED ANGUS

The 200 cows in this sale represent the tops from several hundred head of our range breeding cows, those that we thought below the standard for this great sale now being on their way to the block. We feel safe in asserting that California stockmen have never before had such a grand opportunity to found range herds of these hardy and profitable cattle. The entire Angus breeding herd had an 85 per cent calving record last year, with not a single death from disease.

The 15 registered bulls are from the best Aberdeen Angus tribes, rugged, typey individuals, young but have already seen range service, and they are the pick of a larger number until recently in service.

THE SHORTHORN COWS

The 100 head of grade Shorthorns are mostly reds and roans, all young cows, and the pick from a very large number, the balance going to the fattening yards.

FOR THE BUYER OF A FEW HEAD

While most of these cows will be sold in car lots, we have made especial provision for the buyer who wants only a few head and will sell a substantial number of the cows individually.

OPPORTUNITY
YOURS!
FARM AUCTION SALE

CH TULARE, CALIFORNIA
11-12-13, 1918

$50,000 worth of the highest class farm equipment and implements for every kind of crop

In first-class condition, some of them not now obtainable new at any price.

THURSDAY, DEC. 12th
We Will Sell

17 REGISTERED PERCHERON AND BELGIAN MARES.
16 REGISTERED PERCHERON AND BELGIAN STALLIONS.
100 HIGH GRADE BROOD MARES, WORK HORSES, AND MULES.

We shall part with nothing more reluctantly than with our good horses, for they have been an especial pride with us. Our registered stallions and mares have been frequent and consistent winners on the show circuit wherever shown, and their breeding is of the highest excellence.

We confidently believe that we have both stallions and mares that are not excelled anywhere on the Pacific Coast, for our foundation stud was chosen only after thousands of miles of travel and inspection of a very large number of animals.

Our grade brood mares and work stock are high class, practical farmer's animals, that have proven their worth right on this ranch in our every-day operations.

We feel sure that this sale comes at a time when it will be particularly appreciated by those who wish to buy horses. Beyond the possibility of a doubt the draft horse business in the United States has now entered upon one of its most prosperous eras, but it is up to every raiser of horses to breed the sort that will meet the most desirable market demands. Buyers will find the right sort in this sale in wide selection.

ANNOUNCEMENT

For ten years the 6000-acre Tagus Ranch has been devoted to intensive agriculture and breeding of purebred livestock, producing only the best.

To the accomplishment of that end no expense or endeavor has been spared, and as a result the **TAGUS RANCH** occupies a position of undisputed primacy with respect to its **PUREBRED DAIRY CATTLE, BEEF BULLS, SWINE, STALLIONS** and **BROOD MARES,** and **MODERN FARM MACHINERY** and **EQUIPMENT.**

This development has reached its culmination under the direction of Mr. Hulett C. Merritt's son, Hulett C. Merritt, Jr., who, at the moment when the fulfillment of their ideals was being realized, answered the call of our country and is now en route overseas.

No one could be found to take his place, and Mr. Merritt was therefore confronted with two alternatives, and only two. He could try to keep matters in their present style until his son should return to take up his work again, or he could dispose of the stock and equipment which they had accumulated through their careful development.

Many reasons made it impossible for Mr. Merritt to give to the Ranch the careful and constant attention which its high standards required. To this problem Mr. Merritt could make but one answer.

At this time, when waste in any form increases the difficulties of accomplishing the common task, Mr. Merritt could not permit so much essential material to lie idle. Therefore he authorized me to conduct a complete dispersion sale.

In all my extended experience I have never known a sale which presented so many opportunities, which livestock breeders and farmers may turn to their own advantage, and made possible by careful, intelligent breeding and by unstinted expenditure.

C. L. HUGHES,
Sales Manager.

FRIDAY, DECEMBER 13th
WE WILL SELL

$50,000 WORTH OF HIGH CLASS FARM EQUIPMENT AND FARM IMPLEMENTS FOR EVERY KIND OF CROP.

Only the most modern equipment and implements of the best manufacture have ever found a place on Tagus Ranch, and our extensive and intensive farming operations have called for a very broad variety of implements.

All of the equipment and implements in this sale are of comparatively recent purchase, and they are in first-class condition. Many of the most useful items are still in the original crates and cases in which they came from the jobbers and manufacturers, so suddenly did we halt our farming operations when the decision was made to hold this sale.

The space of this announcement is entirely inadequate to give a complete list of the equipment and implements to be sold, but a few of the items are as follows:

30 Bain and Studebaker Wagons, most of them absolutely as good as new, and many of them, particularly the heavier Bains, not to be had new except from the very largest jobbing centers.
24 Plows, 3, 4, and 5-gang Plows, Disk Plows, Engine Plows, Road Plows, Special Purpose Plows, all of the very best makes.
Beet Implements, including **Drills and Beet Pullers.**
Hay Mowers, Bunch and Buck Rakes, Tedders, Loaders, Stackers.
Potato Cultivators, Diggers, and other special machinery.
A long list of cultivators, seed drills, gasoline engines, and other items.
5 15-35 h.p. Sandusky Tractors, in first-class condition, and ready to go right ahead the day you get them home. Also 2 Bull Tractors.

TAGUS RANCH is five miles north of the city of Tulare, Tulare County, California, on main cement State Highway. Tagus Switch, a shipping point, on the main line of the Southern Pacific, is right on the Ranch.

HOTEL ACCOMMODATIONS may be had at Hotel St. Maxon, Tulare; Hotel Johnson, Visalia; Hotel Kings, Hanford, all of which are within convenient distance by auto. Motor busses will leave Hotel St. Maxon and Hotel Johnson on days of sale.

The Future of the Dairy Industry

[By R. N. Davis, Associate County Farm Adviser, Fresno.]

The dairyman has never been considered a diplomat, but he and his products will play an important part in the settlement of the war. The questions of food and foundation stock are going to be as important as territorial or indemnity problems. Dairy products will stand at the top of the list of foods needed from this country, and breeding stock will be required in large numbers to build up the depleted herds. The period of greatest prosperity for the dairyman is ahead of him.

The world war is working great changes which will materially affect American dairymen. The Department of Agriculture says: "The continental dairy countries imported much of their feed before the war. The war brought about a reduction of such shipments. There was not enough ocean tonnage to be spared for hay and concentrates because guns, powder and human food were the urgent military needs. At the same time armies and civilian population had to have more meat, so dairy cattle were killed to supply this demand because there was not feed enough to keep them alive.

"Because of this slaughter of dairy animals abroad and because of the decrease in European milk production per cow, the demand on this country for butter, cheese and condensed milk has grown by leaps and bounds and continues to grow. Our exports are limited apparently only by the available space in ships. Since the beginning of the war our dairy imports have decreased while our exports of butter have jumped 700 per cent, cheese 2600 per cent and condensed milk 1600 per cent."

PEACE WILL NOT CAUSE DEMAND TO CEASE.

As soon as the first crop is harvested after the war, foreign nations will be able to care for themselves as regards grain. "Not so with dairying," says the Department of Agriculture. "It takes a long time to develop dairy herds and a still longer time to increase the number of dairy herds so as to supply the world's needs."

There is not a country in Europe where the people have enough dairy products. In round numbers, the cattle of France had decreased from 14,800,000 on December 31, 1918, to 12,200,000 on December 31, 1917—a decrease of 2,600,000 head. With the possible exception of Great Britain, there is not the faintest doubt but that the decrease in cattle in the European countries that have been at war represents as big or a bigger percentage than that of France. To quote Carl Vrooman, Assistant Secretary of Agriculture, we have the following, written before peace was declared:

"The dairy herds of the old world are depleted to an appalling degree, and we shall find the world with a demand for dairy products two-fold, four-fold, ten-fold greater than the supply. Europe will come to us with outstretched hands and say,' We must have milk; give us canned milk; give us dry milk; give us butter; give us cheese; give us dairy cattle; give us animals to build up our dairy herds again.' And unless we have stimulated the production of dairy products and have increased our supply of dairy animals far beyond anything in the past, we will be utterly unable to supply this demand."

HOME CONSUMPTION WILL INCREASE.

It has been estimated that by the end of the present century there will be a density of population in the United States of about 200 people per square mile. At the present time it is about 16 people, and that of Europe is about 120 people. And it has been prophesied that by the middle of the present century there will be a wheat shortage of 400,000,000 bushels. One only has to think how the population of the United States has increased during the last decade and of the present wheat shortage to realize the possible accuracy of these estimates.

What has this to do with the dairy industry? Livestock consume feeds which are not fit for human consumption and convert them into indispensable human food. Although these inedible products may be converted into human food by other kinds of livestock, the dairy cow is the most efficient of them all and will produce larger amounts of human food in a given time. It is generally admitted that the beef cow cannot be profitably grown except where range or other cheap forage may be had, and therefore the cattle industry on the small farm must be confined to the dairy or dual purpose cow.

Owing to the by-products of the dairy being so very profitable when fed to hogs and the value of alfalfa as feed in the dairy and pig industry, the dairy cow, hog and alfalfa combination seems both feasible and profitable on the average California farm. By feeding the skim milk to the pigs and growing sorghums for silage, alfalfa being available, one can compound an excellent ration for the pig and dairy cow with only a limited amount of grain. The required grain can easily be produced along with the alfalfa and silage.

RETAINING THE SOIL FERTILITY.

The growing of grain or any other product of the soil suitable for human food rapidly decreases the fertility of the soil. The dairy cow and pig will return this fertility to the soil.

The grain, vineyard and orchard men cannot go on indefinitely growing crops which remove the fertility of the soil without replacing the fertility. It is true that expensive commercial fertilizers can be applied to the depleted soil, but this will not replenish the organic matter and humus which is so very essential for its physical condition. This can only be replaced by applying vegetable matter or manure. When farm products are fed to livestock, a large percentage of the fertility is returned to the soil. The person who advocates the shipping of California feeds to be fed to livestock in other States is not advocating good agricultural principles, to say the least.

OBSTACLES TO THE DAIRY INDUSTRY.

Forty-four per cent of the milk produced in the United States goes into the making of butter and 41 per cent is used on the farms for drink or sold as market milk. Thus 85 per cent of the entire milk production is marketed either in the form of butter or as milk for household use. In the market we find consumers warring with milk producers, some of our city newspapers and city chemists condemning the dairymen and exploiting the value of butter substitutes, while consumers curtail purchase of milk and butter with every small advance in price, though other food products may advance by leaps and bounds, without protest and without proportionate decrease in purchase.

Why this warring against dairy products? There are several reasons which may be assigned, viz.: the desire to economize, the methods used by oleo interests in advertising, and last but not least, the ignorance of the average consumer of the food value of dairy products.

During the present period of high cost of living there is a general tendency to economize where possible. The dairy industry has been pleading its case in the halls of Congress while the oleo industry has been shrewdly pleading its case before the court of public opinion.

PUBLIC MUST BE EDUCATED.

Oleomargarine is advertised as a good, wholesome product. The dairy industry has not publicly denied this. Therefore, the average consumer considers the food value of a pound of oleo equal to the food value of a pound of butter. This mistaken idea is doomed. As the consumption of oleo becomes more general in its use, its food value as compared to that of butter will be brought to the attention of the public. The doctors will soon be advising their patients to spend money for dairy products instead of medicine and doctor's fees. Dairy products contain an unknown substance called vitamines which have the ability to produce growth in young ani-

LALLEY LIGHT & POWER

Doing Necessary Work Every Day in the Year

Lalley-Light power performs essential farm work every day, and saves approximately 250 man-hours during the active farming season alone.

Eight years of practical farm use have shown Lalley-Light to be an economy and a necessity for the average farm.

The nearest Lalley-Light dealer can give you figures to convince you that it *is* a necessity on your own farm and will be an economy. Call on him and see the plant in operation.

Help for After-the-War Problems

"Let me kiss those tears away," he begged tenderly. She fell into his arms and he was busy for the next few minutes. And yet the tears flowed on. "Goodness, can nothing stop them?" he asked breathlessly. "No," she murmured, "it's hay fever, you know. But go on with the treatment."

While Billy-be-damned was trying to conquer the world, the farmer was confronted by many unusual problems, and we helped him solve every one. Now that Peace has shown her wings above the battle smoke he will have other problems to solve, and we are going to stay right with him and keep on with the treatment.

First of all, he wanted to know the effect of peace on ranching. So the minute the first peace rumor came in we sent up airships, chartered steamships, started submarines one way and automobiles another, kept cables at white heat, and as early as last week were able to answer the question in a general way.

In this issue Mr. Davis shows that there is a bright future for the dairy industry, and Mr. Whitten assures beef cattle, hog and sheep men that there are good times ahead for them. Be sure to read these articles; also the one by Mr. Hodges on the waking up of the bean market, the pointers on pruning the cherry by Mr. Fox, the article on the fruit evaporator, and the one on the reduced cost of handling grain.

With the coming of peace you are going to need the Rural Press more than ever before. Every day you will run up against some new problem that is a stunner, but you will find that we have published articles telling you just how to grapple with it. For, now that we have given you an idea of what the future has in store for you, we are going to help you get your share of the profits that will be made from ranching.

The paper will be chock full of practical articles. The greatest discoveries for growing record crops, the most approved methods of fertilizing the soil, the soundest principles for improving herds, the most profitable marketing plans—these and dozens of other subjects will be treated and you will be shown how to double and treble your profits. Don't miss a single issue.

mals. Animal and vegetable fats which are used in butter substitutes do not contain vitamines.

How many people know that a quart of milk is equal in energy producing value to 8 eggs, 2 pounds of chicken, .79 pound of sirloin steak, 7 oranges, or that one pound of butter, on energy basis, equals 11.6 pounds of potatoes, 40 pounds of lettuce, 3½ dozen eggs or 4 pounds of sirloin steak? The true food value of butter, besides its digestibility, lies in its palatability, its keeping qualities, and the vitamines which it contains. Oleomargarine may be used to a certain extent in the ration of the adult, but for growing children butterfat is essential. Experiments which have been carried out prove this, and it is safe to say there is no substitute for butterfat.

THE DAIRYMEN'S PART.

The dairymen must test their cows, because the Babcock tester and the scales are the only means of determining the merits of the dairy cow. The star boarders must be weeded out. Owing to the high cost of feed and labor, now as never before the dairymen can ill afford to keep inferior cows. The average dairyman of California should not keep a cow that will not produce at least 250 pounds of butterfat per year.

Recently a dairyman made the statement that there is no money in dairying. On being asked how much butterfat his cows produced, he replied: "They will average about 175 pounds per cow." He belongs to the Cow Testing Department of the Fresno County Farm Bureau and knew what each cow produced. Most assuredly there is no money in milking 175-pound cows.

The dairymen must educate the consumer as to the real food value of dairy products as compared to other foods, especially as to butter substitutes. They must inform the people that the 10c tax on butter substitutes which we hear so much about applies to that which is colored only. Until recently there was only one-quarter of a cent per pound tax on that which was not colored. The attention of the consumer must be called to the fact that it is cheaper to buy dairy products than it is to buy substitutes and pay doctor's fees, without considering the health of the children.

The dairymen must plead their case before the court of public opinion, from which there is no appeal.

To those who are thinking of building on their farms, whether dwelling, barn, stables, concrete work, etc., the new book, "The Farmer His Own Builder," by H. Armstrong Roberts, will be of interest. This book contains 300 pages, is well illustrated, is cloth bound and sells for $1.25 per copy by its publisher, David McKay, 608 South Washington Square, Philadelphia.

Keep the Beef Herds Growing

[Written for Pacific Rural Press by E. H. Whitten.]

Peace will mean no setback to the American farmer, and particularly to the livestock raiser. It was clearly shown in last week's issue that for several years yet he will have the allies, the belligerents and many neutral countries to feed, and his resources will be taxed to the limit.

That's all right for livestock raising in general, but let's see how it affects beef cattle raising in particular, for the latter industry has problems of its own which must be taken into consideration in making an analysis of the situation.

First of all, considering the country at large, we find that not to exceed 60 per cent of last year's crop of cattle will be put in feed lots during the present winter season. High-priced feedstuffs and the extra hazard incident to war conditions kept many men out of the business—temporarily at least. Also the Government demands and requirements have been such that the packers have taken practically all of the weighty feeder cattle for slaughter at a price that virtually has prohibited the conservative feeder from getting into the game.

On the side of production we find that a widespread drought has seriously depleted the breeding herds of the West, and authorities estimate that the calf crop this year is one million short, and that because of unusual liquidation now the crop next year will be two million less than normal.

From the standpoint of consumption we have shown in a previous article that the foreign demand for beef will be heavy for years to come. And here at home it is bound to continue good because even before the war began the production of beef cattle was not keeping pace with the increase in population. We must increase our herds to meet the home demand alone, and if we are to keep the people of the foreign nations from starving we must produce to the utmost.

WHAT DETERMINES THE PROFITS?

But will the prices continue high enough to justify raising beef cattle to the limit? I asked one man this question and his answer was that it depended more upon the weather than upon any other factor. He said that the beef cattle industry here in California differs from dairying or hog raising in that nearly all steers are grass fed, and very little grain or even alfalfa is used. Consequently, his opinion was that while the profits from dairying or hog raising are determined largely by the price of grain, those from beef cattle raising are regulated by the rainfall. If we have a wet winter and there is abundant pasturage profits are good; if we have a dry year profits are poor.

I was not satisfied with this answer, for it did not seem to me that the progressive, resourceful beef cattlemen of California would allow themselves to be kept at the mercy of the Fates, so I put the matter up to Prof. Gordon H. True of the University Farm. Because of his connection with the Livestock Commission of the Food Administration, I believe that he is in closer touch with real conditions than any other man in the State. And I know that his judgment is sound, for many times I have asked his opinion about livestock matters and always things have turned out just about as he said they would.

DROUGHT HAS TAUGHT LESSONS.

"Don't you believe that statement for a minute," he said when I related what had been told me. "As hard as the drought has been on our beef cattlemen, it has proved a blessing in disguise, for it has taught them to prepare for the dry years. They have learned many valuable lessons that prosperity never would have taught them, and the result of one alone is that over 800 silos are to be built in this State for feeding beef cattle."

As I listened to Prof. True I thought of a story I once heard. In Pennsylvania dwelt the descendants of an ancient German settler. The farm had gone for generations from father to son, and the original customs had been faithfuly adhered to. But a youth was born into the family who was inclined toward more modern ideas.

One day this boy, Johannes, was told to take some grist to the mill. It had always been the custom to place the grist in one end of a bag and a large stone in the other end to balance it, and then throw it across the horse's back. But Johannes managed to get the grist divided between the two ends of the bag so that there was no need of the stone and he called to his father, "Oh, daddy, come and see. There ain't no use for the stone."

The old gentleman calmly surveyed the device and, with a severely reproachful attitude, said to his exulting son: "Johannes, your fader, your grandfader und your great-grandfader all went to der mill mid der stone in one end of der bag, und you, a mere boy, sets yourself up to know more as dey do. Yust put dat stone in der bag und never lets me hear no more of such foolishness as dat."

There are beef cattlemen of this type in this State today. They and their ancestors have been operating along primitive lines for years. They have taken no steps to improve upon nature's ways, and their profits have been regulated entirely by conditions over which they have assumed no control. Unless they change their ways they will always live from hand to mouth. They will never know where they are at; will never be able to get their business on a stable basis; will never be assured of a steady year-to-year income.

For profit's sake keep good stock like this. Swat the scrub!

PROGRESSIVE METHODS INSURE PROFITS

But there is another class who won't have to worry about dry years or unfavorable conditions, for they will establish their operations upon such a sound basis that they will not be at the mercy of the Fates.

First, they will protect themselves against shortage of feed in dry years by building silos, raising silage crops, developing water wherever possible and raising other forage crops.

Second, they will breed up, realizing that from a marketing standpoint alone more profit can be made from a few high-class animals that have been bred for fast-growing, easy-fleshing qualities than from twice as many of the ordinary sort.

Third, they will combine into selling organizations so as to market their stock collectively and in large quantities direct to the packers, and thus save for themselves the commission which now goes to the itinerant buyer.

Necessity is indeed the mother of invention. She has given the beef cattlemen of California an opportunity to learn some valuable lessons. And the only ones who will not succeed are those who will not profit by her teachings.

The future never was brighter. Play the game along sound lines and you can bank upon a sure profit.

Feeding and Watering Stock at Terminals

[Written for Pacific Rural Press.]

Herbert Hoover, U. S. Food Administrator, recently expressed himself as dissatisfied with what he calls wastefulness in the present method of feeding livestock before going over the scales to slaughter. The Bureau of Markets of the Department of Agriculture is working on this matter and before long farmers may expect to hear of a modification of the rules which now permit livestock to be fed and watered before being weighed in at terminals.

Come to think of it, doesn't it seem ridiculous to stuff an animal full and be paid meat prices for grain? To eliminate this method does not mean that the farmer will receive less for his livestock. Under the present method the packer has to dock a certain amount to cover the feed and water consumed by the animal before being weighed in. He strikes an average which works out unfairly. One breeder gets his animals to consume a great deal at the last moment and is paid more than some other fellow who is not wise to these methods or is not skillful in getting his stock to consume a large amount of feed and water.

If the method is eliminated and animals are weighed without being filled, packers can afford to pay a higher price per pound. Each man will receive exactly what he should for his stock and the plan will work out more satisfactorily to all concerned. At least this is our idea. What do you think about it? The whole question is fraught with interesting possibilities and should receive the careful attention of livestock raisers. We shall be glad to know what our readers think about the plan.

Livestock Queries

Cow Has Digestive Troubles.

To the Editor: My cow suddenly went off her feed and would eat nothing offered her. Since then she has been eating a little but not very much, and she is giving very little milk.—A. G. M., Armona.

[Answered by Livestock Editor.]

The symptoms point to some digestive disorder. There may be inflammation of some portion of the animal's stomach. This is often caused by some irregularity in the diet, change of feed, indigestible feed, etc., and is especially noticeable at this time of the year when so many cows in California are changed from green to dry feed. However, in such a case there is always danger that the animal may have swallowed some foreign body, such as a nail or piece of wire. Such objects stick into the wall of the stomach and even pass through into some adjacent part of the body, causing more or less inflammation, often resulting in death. For treatment, the animal should be given green feed, if possible, or, if this cannot be done, the bowels should be kept relaxed with Epsom salts or linseed oil. A dose of the former is a pound dissolved in a quart or two of water and given as a drench. A dose of the latter is one quart. They may be repeated if necessary. If the diet is carefully looked after and the bowels kept active, improvement should take place unless there is something incurable. A tonic might prove beneficial and for this a teaspoonful of fluid extract of nux vomica diluted in a pint of water and given twice daily as a drench is recommended.

Feed in Proportion to Weight.

To the Editor: How much feed per day will growing pigs eat?—L. H. W., Orland.

[Answered by Livestock Editor.]

The proportion of feed to the weight of a pig will depend upon both size and condition. A very young pig will eat as much as 6 per cent, or 6 pounds of feed for every 100 pounds of his live weight, whereas an old, mature sow that is in good condition will not eat over 1½ per cent. A real lean hog weighing 200 pounds will eat as much as 12 pounds per day, which would mean 6 per cent of his weight, but he can keep it up only a short time. When he weighs 300 pounds he will not eat more than 8 pounds per day, which would mean only a little more than 2½ per cent. Generally speaking, pigs from weaning time to 250 pounds eat about 4 per cent when on full feed, 3 per cent when on three-quarters feed, and 2 per cent when on half feed, which would be a mere maintenance ration.

Growing Hair on a Cut.

To the Editor: What can I do to bring the hair back on a cut on the front leg of my horse which was caused by barbed wire? If possible, I want the hair to come back in its natural color.—M. B., Loomis.

[Answered by Livestock Editor.]

If your horse recently received this injury, you can restore the hair over the cut in its natural color by simply using pure lard. If the cut is of long standing and a hairless scar has been formed, it will be necessary for you to blister this with a Spanish fly blister, which should be prepared as follows: 2 drams cantharides (Russian), 1 dram euphorbia, 1½ ounces benzonated lard. Clip the hair near the spot and rub this blister in thoroughly for ten or fifteen minutes. Wait until after it has exhausted itself, then wash the spot with hot water and soap and apply lard daily to bring the hair back.

Gathering in Ear.

To the Editor: What treatment can I use for a dog that has a gathering in his ear? It has been troubling him for a month, although at times for a year he has evidently had pain, causing him to shake his head violently. His ear runs and the discharge has a bad odor.—C. C. C., Soulsbyville.

[Answered by Dr. E. J. Creely, San Francisco.]

Your dog has canker of the ear caused by a barley beard or wild oats. Medicine is useless unless the foreign body is removed, which probably will have to be done by a veterinarian. The following wash should be used before and after removal, when it will readily heal: 8 ounces saturated solution boric acid, 2 drams pulo alum, 1 dram zinc sulphate. Mix and inject once daily after washing.

Age for Vealing Calves.

To the Editor: At what age should calves be vealed?—M. G. C., Merced.

[Answered by Livestock Editor.]

Reports from the Chicago stock market show that in 1917 the average live weight of veal calves received was 137 pounds. However, we judge that you have dairy cows and veal the bull calves, and it should be added that the range in weights of veals from dairy districts was from 90 to 130 pounds. This may be taken as an indication of the weights at which dairy farmers consider it the most profitable to market their veals.

We Will Exhibit at the LIBERTY FAIR-Los Angeles

THE HEREFORD CORPORATION

OF WYOMING

Ranch six miles east of Cheyenne, Wyoming. Twenty-five thousand acres devoted exclusively to the production of Registered Herefords. Sixteen hundred head on ranch at present time.

MISS RIALTO 2ND,
Never Defeated Grand Champion Wherever Shown.

We won Grand Champion on carload of females at Denver the last two years. We have stock for sale at all times. Glad to answer questions and explain anything. Look us up at the fairs—we are here on the Coast for that purpose. We have calves from these herd headers with us in our show herd:

HERD SIRES

Wyoming Fairfax, Grand Champion at Denver in 1918.
New Era, Senior Champion at P.-P. I. E.
Gold Dust, first in two-year-old class at Denver, 1917.

We have 3 yearling bulls in our show herd for sale—Ready for service.

Draft Horses Still Necessary

[Written for Pacific Rural Press.]

The day of the small horse has gone, but the draft animal will always be in demand. In 1914, at the outbreak of the war, the United States had a vast surplus of horses, ranging from 1000 to 1500 pounds, but that surplus is now exhausted. Farmers sold themselves short of horses and are now searching for teams to do their work. As a result, prices are going up again and a steady increase may be expected for several years.

Another reason for this, besides the heavy demand for horses, is the fact that comparatively few mares have been bred recently. Failure to breed mares makes a short horse crop, but the effects are not noticeable within a few months, as is the case with ordinary farm crops. The shortage in horses does not become manifest until four or five years later.

In 1916 and 1917 less than 40 per cent of the mares of breeding age, excluding registered draft mares, were bred. And it is estimated that yearling colts have decreased from 1,732,000 in 1910 to approximately 1,000,000 for the spring of 1918, and this decrease will be felt most acutely in 1920 and 1921.

The greatest obstacle to improvement is the small horse. Such animals are not marketable; neither are they profitable to farmers. The man who owns and works horses under 1100 pounds is standing in the way of his own financial betterment. If he cannot dispose of them and buy mares that are in excess of 1200, his only chance is to breed better stock.

Doing this from a foundation of small mares is a rather slow process, but it may be hastened by breeding to a very prepotent, heavy-boned stallion that is 16½ to 17 hands high and weighs over 1900 pounds in breeding condition. The half-bloods from such a stallion will, if properly developed, mature at 1400 pounds or better. The small mares carrying some draft blood have produced progeny from such crosses that closely approximated real draft size and character.

More rapid progress will be made by selling very small mares at whatever they will bring and buying good grade or purebred draft mares. If mares weighing from 1200 to 1500 pounds are bred to selected draft stallions, their offspring will mature at 1600 pounds or over, and the man who breeds along this line will reap a good harvest, for, aside from our own farm and city needs, foreign countries will be heavy buyers of draft horses in American markets for several years. The governments are already seeking to obtain horses over 1500 pounds, and are especially desirous of getting all the heavy mares they can secure.

But we cannot spare them. We need them here at home. The man who sells mares of this kind will pay good prices for work animals in the future and will regret that he failed to grasp the opportunity now before him.

WHAT FARM HOMES OF COMFORTABLE MEANS SHOULD HAVE.

1. A keen interest in making brains and machinery perform the physical labor of the household.
2. A good water system that works when needed.
3. A good lighting system that works when needed.
4. A good heating system that works when needed.
5. Cold storage.
6. Sewing machine.
7. Modern laundry conveniences.
8. Fireless cooker.
9. Good range.
10. Oil stove.
11. Plenty of fuel.
12. Warm, comfortable floors.
13. Convenient kitchen.
14. Plenty of good cooking utensils.
15. Plenty of shelf and closet room.
16. Canning outfit.
17. Windows that raise and lower easily.
21. A good garden.
22. Flowers and flower garden.
23. A cow.
24. Modern dairy utensils.
18. Screens.
19. Comfortable beds.
20. Pretty but simple furniture and furnishings.
25. Plenty of reading material.
26. Musical instruments. —Ex.

The Farm Bureau of Armour & Company has issued a 60-page booklet entitled "Progressive Sheep Raising," the keynote of which is "back to the farm with sheep raising." It contains many helpful articles on the breeding, feeding and care of sheep, and is well illustrated. Free copies may be obtained by addressing the Armour Farm Bureau, Chicago.

The headquarters of the California International Livestock Show have been moved from the Exchange Building to the show grounds at Twelfth and Market streets, San Francisco.

CLEAN YOUR BARN

The Louden Way

One man with a **Louden Litter Carrier** on Louden overhead steel track system can clean the barns in half the time that two men would take without it. **That's** Louden economy. On **every** up-to-date farm—**your** farm—the **Louden Litter Carrier** and steel track system will earn its cost many times a year.

Track can be bracketed to barn wall—out one door—in at other, and in this way no switch is needed. Manure loaded direct on wagon or spreader—its full fertilizing value thus saved.

Louden Litter Carriers

are made of heavy galvanized steel—wear for years; have improved worm gear—**1 pound on chain lifts 40 pounds in box**; box stands at any elevation—raised or lowered any distance up to 25 feet; have many **special** advantages not found in other makes. Send today for valuable **free** book on manure uses, and catalog of hay and litter carriers, sanitary steel stalls, cow stanchions, etc., for modern barns.

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

The plan of holding a Guaranty Holstein sale at Sacramento, December 5, has been abandoned owing to the difficulty of obtaining sufficient animals of high enough quality.

Twelve grade Holstein cows were recently sold in San Luis Obispo county at $150 each by Clark & Marzorini. These prices show the results of years of breeding to registered bulls.

A. W. Morris & Sons of Woodland have sold to the Durham Land Settlement Colony Livestock Association the young bull, King Morco Alcartra 13th. He is a grandson of Tilly Alcartra and is an unusually well-bred animal.

The Holstein-Friesian Association reports 161 public sales for the first six months of the year, covering the entire United States. In all, 8635 animals were sold for an average of $296.92. No getting around it—purebred stock does pay.

Spring Farm Pontiac Maid 2nd, senior four-year-old Holstein owned by the Bridgford Company, Knightsen, is on official test and is expected to make a record of 37 pounds in seven days. She already has made one seven-day record of 34.4 pounds.

Miss M. Holdridge, owner of the Creamcup herd of Holsteins, San Jose, reports the demand for high-class stock very good and says that the Rural Press has sent many buyers. Perhaps so, but then Miss Holdridge has excellent stock, and that counts too.

Two 30-pound butter records have recently been made at the James J. Jeffries Holstein ranch at Burbank. Novelty Pauline 2nd made 30.94 pounds of butter in seven days, Phebe Canary De Kol, a senior three-year-old, made 30.61 pounds. Four other cows made records above 20 pounds.

Gerben Abbekerk Maid, owned by Stalder Bros., Rosamaines Rancho, Riverside, has crossed the 30-pound mark three times. As a four-year-old she made 30.1 pounds butter, as a five-year-old 34.21 pounds, and 34.36 pounds as a seven-year-old. One of her daughters has a record of 25.77 pounds as a senior three-year-old.

Beef Cattle.

L. B. Crabb of Colusa has just brought in 450 head of beef cattle from Arizona to fatten in the Colusa county foothills.

T. T. Miller, the Shorthorn breeder of Los Angeles, plans to move his noted herd to a new ranch that he has acquired near Hollister.

Thirty thousand head of steers for feeding soldiers have been purchased by the Government during the past few weeks in the vicinity of Sacramento. The price paid was 22c per pound for partly dressed steers.

Miller & Lux have purchased from Robert H. Hazlett of El Dorado, Kan., for their Los Banos ranch, the two-year-old Hereford bull, Rialto 2nd, one of the winners of the Pereda trophy when shown as senior calf.

Harris & Son, owners of the Model Farm, Harris, Mo., one of the largest Hereford breeding establishments in the United States, are establishing a herd of 100 head of Repeater stock at Hayward for distribution over the Coast and Hawaii.

W. M. Carruthers of Live Oak has received a flattering offer for his grand champion Shorthorn bull, Count Glory, from Carpenter & Ross, Mansfield, Ohio. These breeders recently lost their show bull, Maxwelton's Revolution, and wanted Count Glory to head their show herd at Chicago. But Mr. Carruthers knows the value of his bull and says that he will not sell.

Swine and Swinemen.

E. R. Eichner, Selma, has recently sold to A. Buckland & Son, Fresno, three young Poland-China boars sired by King's Big Bone Leader and Young Jumbo, out of the sows Pride of King's and Han's Rosebud 2nd.

As the Western Berkshire Congress has abandoned its plan to hold a sale and meeting at the Liberty Fair, it is now proposed to have a sale and the annual meeting in connection with the San Francisco show opening February 9.

H. E. Boudier of Napa reports that the Rural Press continues to bring good results and that he has recently made sales of Durocs as follows: One boar to Cordel Bros.; one sow to P. Adams; two sows and one boar to A. Pacchelli; one sow to J. H. Bowman.

A. B. Humphrey of Grapewild Farm, Escalon, has purchased from Butte City Ranch the Berkshire boar, Onward Prince, a grandson of the Gossard boar, Epochal. He is out of Escalon Fashion Princess, a $500 sow which topped the Berkshire Congress Sale at the University Farm two years ago.

E. H. Whiting, proprietor of River Garden Farm, Ukiah, has sold since the first of November two bred Berkshire sows to Hunter & Brown, Ukiah; one bred gilt to D. M. Beldon, Calpella; one weanling boar pig to Clifford Bishop, Ft. Bragg; one weanling sow to Everett Warren, Coulterville.

Bert Potter of Edelstein, Ill., recently sold at public auction a litter of seven Poland-China pigs for $5,910—the highest price ever paid for a litter of this breed. He bought the sow last March for $1,550, the highest price ever paid for an untried sow, but the first pig sold practically replaced the original investment.

Joseph E. Steely of Clements reports the sales of registered Poland-China pigs for Corp. Clarence A. Reasoner, with the A. E. F. in France, out of his fine sow, Wonder's Miss Bess, sired by Big Bone Bob, as follows: C. R. Wells, Fourth Crossing, one boar pig; Chas. Smith, Bellota, one boar pig; L. F. Schmitt, Clements, one boar pig; Young & Clark, Lodi, four fine gilts.

Sheep.

Sheep are arriving in the Imperial Valley by the thousands for winter feeding.

Four thousand sheep have been placed on California farms in the campaign recently conducted by the farm bureaus.

Scab is reported among the sheep of Tehama county for the first time in six years. Several flocks are already affected, but precautionary methods are being taken so that the disease will not spread.

E. C. Spear of St. Helena writes that he has received splendid results from his ads in the Rural Press. He says that the numerous inquiries he has received show that many California farmers are becoming interested in sheep.

Livestock Miscellaneous.

Last year members of the boys and girls' club raised 10,583 pigs, 415 beef calves, 599 dairy calves, 178 sheep and 106,358 chickens.

Jos. E. Painter, manager of the California International Livestock Show, left last week for the East to attend the Royal and International Stock Shows. While East he will secure more entries of stock for the San Francisco show next February.

Peace Demands Greater than War Demands

Exports of pork products during July, August and September of this year were almost three times as great as during the same months of 1917, and those of beef and dairy products were nearly double. Here are the figures in pounds:

	1917	1918
Beef	93,962,477	171,986,147
Pork	196,256,750	538,602,400
Dairy	130,071,165	161,245,029

As staggering as these figures are, Food Administrator Hoover states that we must ship 20,000,000 tons of food overseas by July 1, 1919, which is 75 per cent more than we shipped last year. "It should be the aim of every farmer," says he, "to see that our herds are maintained and improved, for now our burden will be greater than ever if the world is to recover from the enormous destruction of animals without even greater hardship than that endured during the war."

It's a whale of a job to meet this foreign demand for meat, fats and dairy products, but we can and must put it over. California farmers will certainly do their part.

Warranted to Give Satisfaction.

Gombault's

Caustic Balsam

Has Imitators But No Competitors.

A Safe, Speedy and Positive Cure for Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs, and all lameness from Spavin, Ringbone and other bony tumors. Cures all skin diseases or Parasites, Thrush, Diphtheria. Removes all Bunches from Horses or Cattle.

As a Human Remedy for Rheumatism, Sprains, Sore Throat, etc., it is invaluable. Every bottle of Caustic Balsam sold is Warranted to give satisfaction. Price $1.75 per bottle. Sold by druggists, or sent by express, charges paid, with full directions for its use. Send for descriptive circulars, testimonials, etc. Address

Sanitary-Strong-Light Troughs for Healthy Hogs

California Hog Book

By W. S. Guilford

Book Worthy of a Large Sale

"I wish to congratulate you on the manner in which you have handled the subject. You have given our California farmers a comprehensive, practical discussion of the subject of hog raising, and I hope that your labors will be rewarded by a very large sale."—F. W. Woll, Prof. of Animal Nutrition, Davis.

Appeals to All Breeders

"I wish to congratulate you on the great hog book you have turned out. It is very interesting and instructive from cover to cover and has the dope that appeals in the proper way to the advanced breeder and beginner alike."—Frank B. Stetson.

Raise More Swine in California

This book will help you. It contains over 250 pages of practical information. Is well illustrated and sells for $2 per copy postpaid.

PACIFIC RURAL PRESS, 525 Market St., San Francisco

Hogs Convert Barley into Bank Accounts

Ha, ha! I got the laff on you fellers who're worrin' about the poor market for barley. Last season, when the price was high you figgered you could make more sellin' grain than feedin' it, so you got rid of lots of your hogs. But now, gosh-ding it, when there ain't nobody wants your barley you ain't got enuf hogs to feed it to.

Mebbe you made more money out of your barley last year than I did out of my hogs, but I'm havin' my innin' this year, and I'll bet dollars to donuts my profit over several years by stickin' to livestock is a heap bigger'n yours by sellin' grain.

Ain't no use cryin' over spilt milk, but don't keep on spillin' it. Don't sell off any more stock. Don't even be satisfied with what you got. Buy more! Take it from me, if you want to make money off'n your barley after this you got to market it thru stock. They tell me shipments across the pond are light and the market back East is low. Breweries ain't buyin' none no more, and autos and tractors have cut the demand for feed barley, never again to return.

Discouragin'? Not a bit. Why, folks, if we had a few million more head of stock in this state it would make the best kind of a market for our barley crop and—listen—it would make barley one of the big payin' crops of the state.

Just think! Before the war speculators bought our barley, shipped it way over to Denmark and sold it to the farmers. They fed it to their hogs, made the best pork in all the world, and sold it in England for more than our fancy, corn-fed pork from the Corn Belt brought. Enough to make us ashamed of ourselves, don't you think?. And I can't see why in Sam Hill more of our California barley growers don't raise hogs when 5 pounds of barley will bring them 18 cents when properly fed, and besides the fertilizer is left on the farm. Figger it out yourselves. That's at the rate of $72 a ton, by heck!

Scared by peace comin' on? Shucks, that's all flapdoodle. Why, Mr. Food Administrator himself says now that the Huns have caught the Haig-fever and we have brought the kaiser to his sneeze, we have a bigger feedin' job on our hands than ever. Look at Bulgary. She don't bulge no more. She's got 4,000,000 people hollerin' to us for grub, and besides them there's 180,000,000 people in Poland, the Balkans, and other parts of Europe darn near starvin'. We haven't been able to send 'em a pig's foot to save our blamed necks, but now that the scrap is over it's up to us to feed 'em. Then there's the Allies—300,000,000 people in all to look after—not to say nuthin' about our friends the enemies who love fat so much, and whose supply is plum gone.

Doggone it, the change from war to peace don't add no pork to our supply. There will be an awfuller demand for it than ever, and it will keep up for an awful long time, too. There ain't hardly enny foundation stock left over in them countries, and it's going to take years for 'em to raise enuf to fill their own tummies.

Mebbe I can't write a skolarly article like some of them editers up in the Rooral Press do, but I know how to give you the korrect dope. You see the smile on my face, don't you? Well, that's the smile of prosperity. And you see my bank book? That means a whale of a big deposit—all money made by marketin' barley thru hogs.

Take the tip from me. Feed your hogs a full ration of barley and you won't have to dine on half rations yourself. You'll have a big fat bank account like I got.

I. B. WISE.

Liberty Fair Now Victory Fair

[Written for Pacific Rural Press]

Our compliments to the fellow who conceived the idea of changing the name of the great show at Los Angeles from Liberty Fair to Victory Fair. He has proved himself a worthy member of the Brotherhood of Brains.

And just as the new name is infinitely better than the old, so the fair itself, after being postponed several times, will be much better than if it had been held on the original dates.

Unless another postponement is made necessary at the last minute, the fair will be "on" when this paper is received, as the opening was announced for Friday, November 21. It will continue for ten days, and there will be something doing every minute—military spectacles, harness races, horse show, pageants, fireworks, and special Thanksgiving features. And these in addition to the wonderful educational exhibits of agricultural and horticultural products, fine arts, farm machinery and livestock.

Livestock will be weighed in Friday morning, November 22, and Saturday at 1:30 p. m. there will be a livestock parade. Judging will begin Monday morning and will continue until completed.

Of course you are going. Everybody is. The fair will be a humdinger. It will make your blood tingle. Take the folks along. They'll all enjoy it.

INSPECTION OF DAIRY COWS.

To the Editor: I have a family cow and want to sell milk to my neighbors. Must I have the cow tuberculin tested, and if so what steps should I take?—C. E. M., Walnut.

[Answered by Livestock Editor.]

According to the State law, milk cannot be sold from cows that have not been tuberculin tested unless it is pasteurized. You would not want to put in a pasturizing plant for just one cow, so it will be necessary for you to have her tested. Simply notify the State Veterinarian at Sacramento, and from that time until he sends a deputy to test your cow you can go ahead and sell the milk. There is so much of this testing to be done that often it is months before the officials get around, but if there is a delay you need not worry, as you will have done your part.

The University of California will make a good showing at the International Livestock Exposition at Chicago, November 30 to December 7. They will take along fat steers, wethers and barrows and hope to even excel their former excellent winnings.

Sheep Raising Still Profitable

[Written for Pacific Rural Press by R. H. Whitten.]

"The United States does not produce enough wool to make a bathing suit for each inhabitant." This was the amusing and impressive statement on a sign which Prof. Miller had on the wall of his little "office" in the sheep barn at the State Fair this year.

It was impressive at that time, when the war was on, but it is almost as impressive now, for even after demobilization has been completed and wool is no longer necessary for uniforms, the need for more sheep will be imperative.

The United States consumes under normal conditions 900,000,000 pounds of wool, yet we are only producing 270,000,000 pounds. Think of it—consumption more than three times the total of our production! Sheep in this country decreased from 51,000,000 in 1913 to 46,000,000 in 1917 in the face of an increased population and an increased demand.

The principal sheep countries of the world were not increasing their production before the war, and seemed to have reached their limit. In our own country the big ranges are being cut up and the supplies of wool must come chiefly from farm flocks hereafter. Also there is a constantly increasing demand for lamb, and the farmer is always sure of having a good market for his fat lambs, as the quality of the frozen lamb from the Antipodes or the Argentines practically prevents it from competing with fresh American meat.

CONVERT WASTE INTO PROFIT.

Sheep, in proportion to the value of their products, are produced more economically than any other livestock. They get much of their subsistence from rough forage, weeds and grass that would not support other stock. Only about 50 per cent of the plants called weeds are eaten by horses and cattle, while 90 per cent are eaten by sheep. They can utilize materials that otherwise would be wasted; they can be maintained on lost grain in stubble fields and on voluntary growth too scanty for other stock. They can be kept on the average farm without entailing a reduction of other livestock, without interfering with any other agricultural plans, and without making it necessary to hire more help.

Sheep add materially to the farm revenue but add almost nothing to the expense. The lambs are marketed when about five months old, and this year the prevailing price has been from $9 to $10.50 per head. Twins are common among sheep, and under farm conditions the increase should always be over 100 per cent.

Average farm sheep shear about eight pounds of wool annually, which at present is worth about 50c per pound, making a total of $4 for the wool. Adding the price of a lamb, the gross returns per ewe are from $13 to $14.50. Ewes can be purchased within these figures, so it may be said that an ewe will return her purchase price the first year. This is gross, but the feed bill will be light, for her lamb will be finished on its mother's milk and grass, while the ewe will be run on pasture or stubble most of the year, with not more than three pounds of alfalfa a day in the winter.

BUY BRED EWES NOW.

As early lambs are desired in California, ewes are bred the latter part of July or early in August. The period of gestation is 145 days—not quite five months—so the ewes lamb late in December and during January.

Consequently, you can make a quick start at this time of the year, for when you buy an ewe you really buy two or three animals, counting the lambs that she will deliver very soon.

The inexperienced farmer should begin with good grade ewes and a registered ram. Merino ewes mated to a mutton type of ram, such as the Shropshire or Hampshire, will give good results. Have all of the ewes of one breed, for not only will they look better but their fleeces will be more alike and their lambs will be more uniform than from a mixed bunch.

Discard ewes with small bodies, narrow chests and small heart girths, also those with crooked or club feet that will catch and hold filth between the toes. Sheep that have long, thin, "goose" necks usually have weak constitutions and are poor feeders. Select upheaded, vigorous ewes with straight, broad backs, roomy bodies and plump hind quarters.

The price of young ewes is so high at present as to be almost prohibitive. Often you can do well by buying broken-mouthed ewes if you have good feed. These are ewes that have lost some of their teeth as a result of age and cannot pick up a living on the range, yet would be good for two or three more lambs on the farm, after which they could be fattened on alfalfa pasture and sold to the butcher.

These older ewes produce more twins and triplets than those that have never lambed, but in buying them be sure to examine the udders to see that they are free from lumps that would prevent them from being good milkers. Also be sure that the ends of the teats have not been clipped off in shearing.

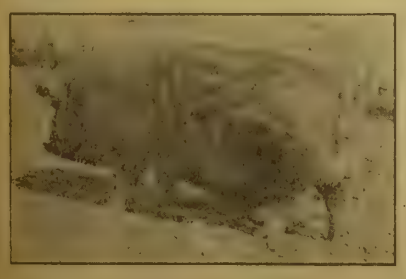
DON'T RUSH INTO IT.

If you are inexperienced with sheep, start with just a few. You can acquire experience rapidly with ten or a dozen, and by keeping all of the ewe lambs you will soon have a good sized flock. However, as a rule it is not advisable to start at all with sheep unless you can eventually keep at least thirty ewes, and if possible fifty or sixty, as the larger flock can be cared for with very little extra labor or expense, and consequently will return a greater net profit per head.

Remember, no animal approaches the sheep in converting weeds and waste into wool and mutton. There is a wealth of food and raiment in the wasted grass and weeds of corrals, fields and roadsides.

For some time an effort has been made to obtain consideration in Congress for a measure to place a Federal tax on all dogs in the United States as an item for war revenue. This would be largely effective in eliminating useless dogs, but it seems necessary to awaken Congressmen to the necessity for such legislation, and all sheepmen are urged to write letters to the members of Congress generally, and to the members of the Ways and Means committee especially, urging their support of this measure. Don't leave this to others. Do your part.

Grand Champion
BERKSHIRES



AMES RIVAL 70TH

We have in our herd the Grand Champion Boar, Grand Champion Sow and First Prize Senior Herd at State Fair.

Forty-three litters this year averaged ten to the litter. Let us supply you with foundation sows and boars to head your herd.

Your Live Stock Needs Help NOW

Keep your working and producing animals vigorous and healthy. This is the very foundation of stock profits. The changing season is a trying time for stock of all kinds. Protect your horses, cattle, sheep and swine. Prevent them from becoming diseased or "run down" by regularly using

Pratts Animal Regulator
The Original Guaranteed Stock Tonic and Conditioner

Not a food, but a scientific combination of medicinal herbs, roots, etc., a positive **health-builder and health-preserver.** It contains the natural tonics, appetizers, digestives, blood purifiers and worm-expellers needed to keep the entire system working smoothly and effectively.

Pratts Animal Regulator is used in such small quantities that the cost is practically nothing. But the results as measured in increased products, **in greater profits,** are amazing. Make a thorough test **at our risk.**

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

CONSERVATION OF SHIPPING SPACE.

A commission has been appointed to co-operate with the Chicago packers in experiments which may save up to 40 per cent of the tremendous cargo space now required for shipping fresh beef. The experiments contemplate not only the conservation of shipping space but also the problem of having the packages small enough to be handled by the class of labor available at unloading ports overseas and the quick and convenient issue at supply depots in France. They range from the mere cutting of the carcass into more convenient sizes and shapes to the entire boning of the carcass to be packed in boxes. Since fresh beef constitutes a considerable part of some 350,000,000 pounds of beef and pork products now sent monthly to allied countries, the saving by the new method may prove to be considerable if found practical. The bones and surplus fats salvaged by the operation will be converted into various by-products.

What is said to have been the largest shipment of hogs ever marketed was received at Chicago recently from Darlington, Ind. Three shippers sent 34 carloads, which were bought by Armour & Co. for $105,166.95. The hogs averaged 256 pounds and brought $18.50 straight—a record price for large shipments.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

SMALL CHICKS AND WINTER CARE.

Those having fall baby chicks should see to it that these cold nights are offset by extra heat. The general run of brooder houses are made of such thin lumber that every change of climate is registered in them to the discomfort of the chicks. When the nights are extra cold a little extra care is needed to see that the chicks are all protected. Crowding two hundred chicks under a one hundred chick brooder is poor policy. Some of those chicks will get chilled one night, but the day's warmth will revive them; the next night another lot will get chilled, and so on until the whole batch is weakened. Then they commence to drop off—a few each night—and the careless caretaker says: "Fall chicks are no good; they die off!"

The fact is they have been killed on the installment plan, which is much worse than leaving them out one night and letting them freeze. Since lumbermen began slicing lumber about on a par with an economic housewife spreading 70c butter, raising chicks in brooder houses has been quite a problem.

During the daytime the house is overheated and in the night it is difficult to hold the temperature at all even, for it fluctuates with the outside temperature in spite of all one can do. The only thing we can guard against is overcrowding. Leave plenty of room for the chicks to get under the hoover and see that all draft is shut out of the house. Also see that the water dishes are all empty at night; then there is no danger of chicks getting wet or drowning, or chilling from drinking very cold water.

These chicks will be worth money in spring if you give them the right care. On the other hand, if neglected, they will just eat lots of feed and never amount to anything.

AN INDISPENSABLE POULTRY BOOK.

"California Poultry Practice" is traveling around in widening circles. Last week a copy was sent to Toronto, Canada, and one to New York, while a professor of Spanish at the Louisiana State University has sent in inquiries about the book. Every reader of the Pacific Rural Press who is interested in poultry ought to include 50c with his subscription for a copy. The price of the book separately is $1. Then when anything ails his flock, nine times out of ten the remedy will be found in its pages. Of course, we learn more every day, or at least we ought to, and in caring for poultry, or any kind of livestock, every bit of knowledge is needed to score a success, and the latest knowledge sometimes fits the times just a bit better. In main, however, the general knowledge we get early always seems to come in handy and is never very far wrong.

POULTRYMEN GAINING COURAGE

The Eastern poultry journals are picking up in news of what poultrymen are doing in the East and Middle States. They report more unity among the producers—fewer quitters; in fact, they say there are no more getting cold feet, such as there were a year ago, when whole localities went out of business. Here on this Coast we have not fully realized the enormous losses sustained by Eastern poultrymen, in spite of the fact that their land is cheap and they are nearer to grain centers than we are. Nevertheless, hundreds of poultrymen were forced to sell their flocks and take up something more profitable.

With a possibility of obtaining damaged wheat for chicken feed next spring, everybody should now plan to hatch or buy spring chicks so as to be ready for the opportunity offered those who are ready to take it. It certainly is not the time to get discouraged, for there is great need of poultry and eggs, and peace does not curtail the demands but rather increases them. Our allies, who have had men in Germany who have been half-starved so long they are weak and emaciated, will need fresh eggs; our own sick and wounded will need them in greater quantities than ever; so everybody should brace up like the Easterners and take a fresh grip.

ELIMINATING THE MITE PEST.

To the Editor: Please tell me the best method of getting rid of chicken mites. They have simply taken possession of our ranch.—Mrs. J. E. B., Vacaville.

[The best, cheapest and surest method of eliminating mites in such a bad case is to spray every day for a week, or, if this is not possible, every other day for two weeks, if needed, with the following: Take a pound of common laundry soap (the yellow resinous kind is best), cut it up in the wash boiler and put on fire to dissolve in about two gallons of water. When it has dissolved, take from fire and take out doors and add, gradually, stirring all the time, three gallons of distillate or coal oil, whichever you can get cheapest; and to finish, add one gallon of crude carbolic acid. Keep stirring until quite cold—it will not hurt the wash boiler. When cold it will or should look like dark soft soap, but there should be no oil floating on it. All should be thoroughly mixed. A gallon of this mixture may be mixed in four gallons of warm water and it will be strong enough to destroy all mites it comes in contact with. Spray the ground around where they are and if you can find their breeding place burn it out.]

CLEANLINESS ALL ESSENTIAL.

"Cleanliness" and "sanitation" are different words, but with one real meaning, so if the poultry house is kept clean it may be said to be sanitary. And every man or woman who keeps poultry owes it to their customers to have clean houses, clean nests for the hens to lay in, because, next to milk, eggs are the most porous article of food we have; so you can readily see if the nests are dirty the egg will absorb the filth.

SCALE ON THE LEGS.

To the Editor: Please advise me how to treat chickens that are bothered with scale on the legs. When eating they cannot stand up—feathers stick up.—Subscriber, Sebastopol.

[It will be no use doing anything to the scale until you clean up your poultry house and yards and spade the ground up. Then if you doctor the scale you may hope for results, but treating such a bad case is quite a job and needs perseverance. First, if there are not too many of them, a good washing with soap and warm water softens the skin and opens the pores so that other treatment will penetrate better, but if there are a number of chickens in this condition it is too big a task. Now mix dry flowers of sulphur in lard and coal oil, and after the washing rub this well in. After three days rub in more sulphur ointment. About three or four treatments will cure if you keep things clean around them.]

KEEP THE FEET OF LEGHORNS WARM.

This is the most essential thing in keeping Leghorn hens fit during winter. They positively will not do their best unless they are kept dry and warm underfoot. Plenty of scratch material sends the blood circulating more quickly than running around can ever do. It is the only right way for hens to get exercise and still not run the flesh off them. Too much running around outdoors takes energy that should go to egg production, but gentle scratching, when the hens can pick up a grain or a seed, no matter how small, is building up. Hens must have a surplus of vitality and that comes from a well-nourished body. If ill fed and improperly nourished, the laying will be spasmodic, lasting only as long as the hen feels good. It is the poultryman's business to keep her up to the top notch.

TURKEYS HAVE SORE HEADS.

To the Editor: Your articles in the Rural Press are splendid, so also is the paper as a whole. Now I need some advice with respect to treating my turkeys for sore head. Some of the birds go blind. A kind of a kernel or growth forms in the eyes, heads swell up and are covered with sores like the chicken pox. We take them away from the others and have been using a solution of sheep dip to wash the sores, then vaseline afterwards. Have to feed some of the turkeys to keep them from starving to death.—W. B. W., Maxwell.

[Sheep dip is too hard on the eyes. Wash them in Creolin and water, a teaspoonful to a pint. Dry, then rub carbolated vaseline on and give ten drops of tincture of iron on sugar for full-size turk. Do this about three days, clean up yards and find out how they are getting their colds and apply the proper remedy.]

Poultry Breeders' Directory

Rate in this directory 3c. per word each issue.

BABY CHICKS—We want your business on this basis:—Reasonable prices—exceptional quality—truthfulness—keeping of promises. Big, and ofttimes false, claims of enormous egg yields, "the largest," "the finest," are not adjectives we use. Promises unfulfilled, humbug, bluff, are not our stock-in-trade. It takes common sense to succeed in poultry—use it in buying stock. We hatch and sell Rhode Island Reds, Barred and White Rocks, Black Minorcas, White, Brown and Buff Leghorns—up to our capacity (12,000 chicks weekly), and would like you to send for our circular and get acquainted. No matter how small or large your needs, we will try to please you. Will you risk a card? The Mission Hatchery, Box 17, Campbell, Cal.

EASTMAN'S BRED-TO-LAY, Hoganized and trapnested Barred Plymouth Rocks, Cockerels; Eggs. Fairmead Poultry Farm, Fairmead, Cal.

EGGS, MEAT, GOING HIGHER!—Great shortage. Big profit for years sure on really heavy laying strains. Our 200-290 egg Leghorns, Anconas, Reds, Rocks, Minorcas, Wyandottes, Orpingtons, ducks, turkeys, are more profitable now than ever, clearing $5 yearly. Some best Government trap-nested hens, 280-283-eggs. Hundreds breeders; laying, younger pullets; thousands chicks weekly; reasonable. Chicks scarce. Few open dates winter, spring delivery, last year's prices J. Beeson, Pasadena, Cal.

Save One Million Pounds of Turkey

In order to increase available food supplies and to discourage the wasteful practice of killing immature turkeys for the Thanksgiving market, the United States Food Administration has requested all growers, dealers and the public not to sell, buy or use birds of immature growth prior to December 7. Poultry licensees are specifically requested not to buy hen turkeys weighing less than eight pounds, nor gobblers weighing less than twelve pounds, prior to that date. Observance of this request, Food Administration Officials pointed out, would save millions of pounds of matured turkeys for the great Christmas demand.

THE HOME CIRCLE

Ode to a Gobbler

All hail! All hail! Oh, rare and antique bird
That lately on the venerable tree
Rolled in a ball of sleep, the chill winds heard
Moaning in mournful gusts thine elegy!
No more the sun will gild thy red cravat
Or ripple on thy wing,
For time hath caught thee, even as the cat
Catches the gray and agile whiskered rat,
And now thy praise we sing,
Gathered about the board, serene and gay,
Upon Thanksgiving Day.

With joy we see thee lying on thy back,
Thy chaste, lush drumsticks sticking in the air;
Thy wings in sweet peace folded and, alack,
The incense of thy stuffing, pungent rare,
Filling our souls with heavenly melody,
The while with fork and knife
Thy dark meat and thy white meat fondly we
Suffuse with gravy in our revelry
And then, with pleasure rife,
Each dainty morsel neatly tuck away
Upon Thanksgiving Day.

Thou'rt nobler than the canvasback or goose,
The lordly shanghai or the ortolan
Or any other minstrel that is loose
From Tuscaloosa to Cape Mary Ann.
Compared with thee the woodcock is a mere
Delusion—all in all;
The upland plover ne'er can be thy peer,
Beside thee to the epicure and seer
The prairie hen is small;
Thou art the bird of freedom anyway
Upon Thanksgiving Day.

—R. K. Munkittrick in New York Press.

A Thanksgiving Story

"What are we to do about Thanks-giving dinner.

Her mother looked up from the book she was reading. Her sister Lucy dropped her fancy work as a tribute to the interest of the question. And Leslie, the cousin who was living with them, making herself useful in return for her home, bent her head that the rising tears might not be seen.

"Eat turkey, I suppose," replied Lucy, flippantly.

"Whose?" persisted May.

"I don't think you need worry, children," said Mrs. Rogers. "Your uncle is sure to ask you there, as usual."

"Their table is going to be very crowded," suggested May, with a glance at Leslie. "They've four school friends of Dick and Ruth this year. Dick told me so."

Leslie's cheeks burned under the tears that had fallen. She knew that she herself was a problem when it came to festivities. No one wanted her. She was poor and plainly dressed. Her cousins, both here and at Bonniebrae, where Ruth and Dick lived, did not think her an adjunct of any value.

Making a big effort—a really courageous effort—she went on with the tiny buttonholes she was putting into Lucy's new shirtwaist. No one must guess that she realized her own loneliness.

A week went by, and no invitation came from Uncle Ben. Evidently he had decided that the Rogers's household was too large to be added to his own for the Thanksgiving dinner.

"Let's have a beautiful Thanksgiving of our own," suggested Leslie one afternoon, when her cousins were fretting. "We are four."

"And they are twelve," cried May. "They will have games and singing, and such a fine time! I don't want any Thanksgiving at all!"

Leslie had been feeling very much that way herself. But she had made a definite promise to her mother, far away in an Eastern sanitarium, to be brave, cheerful, and never to give way to moodiness or fretting.

The next day she went with a proposal to her aunt.

"It's very sweet of you, Leslie," replied Mrs. Rogers, patting the dark head with more kindliness than she had yet shown her not very well understood niece. "Just do what you like."

On the strength of this permission Leslie laid her plans. Lucy and May had declared firmly that they wanted no Thanksgiving at home. If they could not be with the merry party at Bonniebrae, they would mope at home—but they would not be thankful!

But Leslie knew that, when the day came, it would be very dull if no festivity marked it from the days preceding and to follow! So she made pies and cakes, dressed a turkey, secretly imported, and saw to it that the cranberry sauce was beautiful to sight and taste.

May and Lucy fretted openly. They knew nothing of the preparations going on, nothing of the branches of maple leaves and old man's beard that their cousin had risen so early to secure, and on Thanksgiving eve they went to bed almost in tears!

Just before supper a telegram came. It was addressed to May:

"Will it be convenient for me to have dinner with you tomorrow?" Am passing your home. Emily Gaites."

"Emily Gaites?" inquired Mrs. Rogers.

"She was in the class above mine at school," said May, impatiently. "Of course she can't come. I'll wire and put her off."

"Oh," cried Leslie, her hospitable instincts outraged. "Wasn't she the girl who was so kind to you?"

"Being kind at school doesn't give her the right to invite herself here," said Lucy, fretting. "It was a long time ago, anyway."

"We can't put her off," said Mrs. Rogers, decidedly.

"And we haven't even a turkey," wailed Lucy.

Leslie made a sign to Mrs. Rogers to keep silence. She wanted to give her cousins a big surprise.

"I'm going to the store," she said. "Shall I send the telegram?"

Luckily they left the wording to her, or it might not have been a very gracious one, and, when Leslie returned, her cousins had retired for the night.

Leslie's eyes sparkled when she found herself free to work openly. Mrs. Rogers admired her handiwork as she hung her clusters of crimson leaves and feathery beard on the picture frames, and laid the dining-room table with the best china and glass.

"They must know, early in the morning, that we're going to keep Thanksgiving," said Leslie to her aunt; "and why should not the breakfast table be beautiful?"

She was very late that night. Even Mrs. Rogers had grown tired, and left her to finish alone. When the last touch had been added, the girl smiled a little wistfully.

"If only someone were coming to see me!" she thought. "A friend of my very own! What a Thanksgiving I would have!"

The tears would rise, partly because she was very tired, but she dashed them away.

"Next year, perhaps, I'll be with mother again," she thought, "and it will be easy enough to be thankful! Now that it isn't easy, I'll try all the harder."

So she went to sleep with peace at her heart, after all; and, though she was quite tired and achey after her hard work, she was up early. She wanted to hear what May and Lucy said to the dining-room!

But she never did. Before they were down, Dick, her cousin from Bonniebrae, came over on his wheel.

"Why, aren't you coming?" he called out to May, who had looked from her window. "Father says he said 'breakfast.'"

"What?" almost shrieked Lucy and May together. Mrs. Rogers and Lelie went out on the porch.

"He never asked you!" said the boy, indignantly. "I mailed the letter myself two weeks ago. He thought it odd you didn't answer. Katie supposed you knew he knew you'd come!"

Katie was Uncle Ben's housekeeper. Dick and Ruth were motherless, and at boarding school for the greater part of the time.

"Hurry up!" he went on, impatiently. "They are waiting breakfast."

The girls assured him that they would be down and on their bicycles in ten minutes.

"My dears," said Mrs. Rogers, reprovingly, "remember your guest!"

"I didn't want her asked!" cried May.. "I don't admit that she's my guest."

"Well, she certainly isn't mine!" retorted Lucy. "I decline to stay at home for her!"

"You can go to breakfast," suggested Leslie, soothingly. "She won't be here for some time."

Consoled, they hurried over their dressing and were soon on their wheels and far away. They had never even entered the dining-room. Though Leslie had Mrs. Rogers's company at breakfast, it was a rather sad meal. She knew her aunt wanted to be at Bonniebrae.

"I'm afraid you and I will have to entertain Emily Gaites," observed Mrs. Rogers, with a sigh. "They'll never come back!" And they did not; but Leslie, seeing how wistfully her aunt's eyes strayed over the lawn to the gate, said:

"After all, Emily Gaites is only here for her own convenience! Suppose I entertain her, and give her dinner, and you go to Bonniebrae!"

Mrs. Rogers made one or two rather faintly conscientious protests, but Leslie soon overruled them. Before noon she saw her aunt go away and realized that her Thanksgiving dinner would be eaten alone, except for the presence of a stranger for whom she did not care in the least. Again she remembered her promise, and spurred herself to her task, putting on her prettiest dress and lighting the fire in the dining-room.

The dinner, all cooked by her own well-trained hands, was quite ready when she heard the sound of an au-

tomobile outside the gate. She ran to the window. Could that be Emily Gaites? Leslie had expected a girl like May or Lucy, but the only adult, except the chauffeur, was a young lady of about twenty. The only adult! But there were three children! They clambered out, almost before the car stopped moving.

The lady — Leslie was charmed with her sweet face and graceful figure — came up the steps, surrounded by her flock. Leslie ran to the door to meet them.

"Are you—Emily Gaites?" she asked.

The lady smiled.

"I am," she answered, "and I've come to apologize for not keeping my engagement to dinner!"

"What a day of broken engagements!" thought Leslie. Aloud she said—

"I'm very sorry."

"So am I," replied Emily Gaites. "But these children have to be hurried away—from measles! So I'm taking them to their grandmother's."

"But why not have dinner first?" cried Leslie.

Emily smiled.

"I can't inflict four uninvited guests on my friends," she explained. "We've come two miles out of our way to apologize and explain."

Leslie looked at the two little boys and their sister. They were delightful children, standing now in well bred but not easily maintained silence.

"Oh, do!" she cried. "Come in, all of you! I'm all alone—for—for"—she stammered her apology. "There was some mistake—about a lost invitation—and May and Lucy had to go!"

Emily flushed a little.

"I'm afraid I inconvenienced them," she began, but Leslie interrupted.

"I'm all alone — with dinner enough for six! You, and 'you-all,'" she smiled as she flung the Southern phrase at the silent, smiling children, "and—him," she glanced at the man at the wheel.

"My brother," explained Emily. She turned to him. "Jim, come here!"

An hour later the dining-room, so prettily decorated, was the scene of a delightful dinner party! Leslie felt like a bird set free from a cage. Emily seemed to open a new world to her. She had traveled, and could talk of her travels charmingly. "Jim," who had fought—or, rather, been ready to fight—in the Philippines, added his full quota of fun to the entertainment, and the children were as fascinating as only well-brought-up children can be.

Leslie enjoyed playing hostess thoroughly. All too soon the journey had to be resumed, that the children might be in bed betimes.

When Emily stood on the doorstep — the children were already tucked away in the car—she took Leslie's hands.

"We're going to be friends, you and I," she said.

"Well, did she come?"

May, rather tired and cross, asked the question as the Bonniebrae party came home.

"We had a beautiful time," Leslie said, her eyes shining. They listened to her recountal in surprise.

"You had a better time than we did," pouted Lucy. "I wasn't happy about Emily—she used to be so good to me—and I didn't care a bit about Ruth's friends, after all!"

Leslie went very happy to bed. How glad she was that she had fought down her own inclination to sulk because things did not look as if they would be what she wanted them to be! A quaint little phrase of her mother's came back to her mind, just before sleep engulfed her:

"Go along the path of Do-as-You-Ought if you would have the blossoms of the What-I-Want-Tree!"—Frances Harmer.

Ten-year-old James takes his father as a delightful joke, and does not always mind him promptly. One day his mother listened at the top of the stairs. "James," said the father's voice, "do what I tell you!" The boy looked up and grinned. His mother smiled and awaited the outcome. "Jim," said the father, solemnly, "you do what I told you, or"—he lowered his voice—"I'll sick your mother onto you!" As Mrs. Harrod put her apron over her head to stifle her mirth, she had a fleeting glimpse of Jim junior flying to do what his father had ordered.

Agricultural Summary

Imperial Cantaloupe Outlook.

There is considerable interest in the cantaloupe industry down in Imperial Valley, and a strong movement is on foot to increase the planting to 15,000 acres, as against 11,000 acres this last year. Growers, however, are demanding certain guarantees from shippers before proceeding with these plans. For instance, they demand an assurance of receiving $1 a crate, also that the crates themselves be furnished at not more than 20c each, and that certain concessions in freight charges be made. It seems to be the custom for shippers to finance the growers, and so certain money advances are also demanded. It is reported that these conditions are being met by the larger shippers, as a good year for the cantaloupe industry is anticipated.

Butter Market Firm East and West.

The San Francisco butter market continues firm and prices have attracted Eastern buyers. Two cars left November 19. Jobbing business is reported good. The market has shown a much healthier condition the last ten days and accumulations on the street are becoming lighter, indicating a better movement of goods. Street stocks are lighter now than they have been for a month. The Eastern butter market remained firm during the past week, with the higher grades in best demand. There is an increased demand also for medium grades. Last week's closing prices at the four principal Eastern markets were: New York and Philadelphia, 63c; Chicago and Boston, 61½c.

Future of Cattle Market Uncertain.

There has been some uncertainty in the minds of cattlemen as to the effects of the armistice upon the livestock market, more especially as this will make the markets of South America and Australia readily accessible. However, there are no alarming signs of weakness up to this writing. What little depression in prices has been felt is due to the lack of adequate killing facilities owing to the draft on labor and the influenza, rather than to the lack of a market for the output. Some skepticism, however, as to the maintenance of current values, with the prospect of peace, is more or less general.

Scramble for California Nuts.

California's almond crop is moving out to centers of distribution very rapidly. There is almost a famine in Eastern markets for these nuts. Nearly all of the better grades have gone to supply the holiday season. While prices are high, there are indications that they may go still higher, the demand is so insistent. The Santa Ana Walnut Growers' Association reports that a carload of No. 1 soft shell walnuts, containing 600 bags and weighing 30 tons, shipped to Ohio, brought the growers $16,800. Generally speaking, the nut situation this year is the best ever recorded in the history of the industry.

Expansion of Hog Exports Expected.

It has been arranged that the November minimum of $17.50 for hogs, under which Eastern packers are filling Government contracts for 200,000,000 pounds of hog products, will be continued through December. A broad expansion of our exports of hog products is looked for when peace conditions open up the ports of Germany and Austria, as our Government is already planning relief along this line to famine-stricken Europe.

Horse Buying Declines.

There is a decided diminution in the buying of horses for war purposes since the armistice was signed. The American and Italian Governments have ceased inspections altogether, and it is reported that the Italians will take but a fraction of the stock now contracted for. The British are still in the market for good horse stock and it is said they will continue to be indefinitely.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, November 20, 1918.

WHEAT.

The following are Government prices per bushel for wheat in bulk at San Francisco. The quotation for recleaned is the price per hundred and the charges are strictly regulated by the Government. Per carload the quotation is $4.15. Less than carload lots is $4.25.

Per bushel—
No. 1 hard $2.20
No. 2 .... 2.17
No. 3 .... 2.13
No. 1 soft 2.18
No. 2 .... 2.15
No. 3 .... 2.11
Club or Sonora, No. 1 .... 2.16
do, No. 2 .... 2.13
do, No. 2 .... 2.09

Recleaned for seed, per ctl.—
California Bluestem .... $4.15@4.25
Early Baart .... 4.15@4.25

BARLEY.

Barley is still being shipped from Port Costa, but the available shipping tonnage is too small to handle much of the crop. There is practically no demand in San Francisco and dealers say that $2.17½ is the top price that can be secured.
Choice feed, per ctl .... $2.10@2.17½

OATS.

There is no movement in oats. A sale of some oats of off standard is reported at $2.60.
Red feed, per ctl .... $2.30@2.50
Red for seed .... 2.80@3.00
Black for seed .... 2.80@3.00
Recleaned Red or Black for seed 3.35@3.50

CORN.

The corn market continues dead. A sale of a small amount of yellow Eastern is reported at $3.50, but there is not enough movement of any grades to establish market quotations.

HAY.

Receipts of hay for the past week were 496 tons, compared with 815 for last week. This decrease is probably due to the time lost in the celebration of the armistice in Europe. Most of the arrivals were by water, as has been the case for several weeks, and consisted mostly of alfalfa hay that was more or less damaged by rain. Damaged alfalfa has been moving fairly well and the alfalfa that was sound is being firmly held. The Government was in the market for about 6000 tons of hay, a contract for most of which is expected to go to San Francisco bidders.
Wheat No. 1 .... $25.00@27.00
do, No. 2 .... 20.00@24.00
Choice tame oat .... 25.00@27.50
Wild oat .... 20.00@22.00
Barley .... 20.00@22.00
Alfalfa .... 18.00@22.00
Stock .... 18.00@21.00
Barley straw .... .50@ .80

FEEDSTUFFS.

Feedstuffs were somewhat firmer this week on account of Government purchases. Prices were maintained.
New alfalfa meal, per ton .... $35.00@36.00
Coconut cake or meal .... Nominal
Cracked corn .... $86.00@88.00
Oilcake .... 77.00@78.00
Rolled barley .... 45.00@47.00
Rolled oats .... 55.00@57.00

POTATOES, ONIONS, ETC.

Owing to the growers being unable to get diggers the latter part of last week, the potato market was forced up for a few days. Potatoes are now coming in in a normal way again. Buyers are conservative and are taking only their daily needs. There is no speculation at the present time. Onions are somewhat stronger temporarily. No more East Bay cucumbers are coming in now and the hothouse description are the only ones on the market. These are selling for $2 to $2.25 for a box of thirty cucumbers. Eggplant is higher and not so plentiful. Celery is now coming in mostly in crates, which sell at $3. The tomato season is nearly over, apparently, and Monday's rain has greatly injured the supply now coming in.
String beans .... 5@7c
Wax beans, per lb .... 5@7c
Pole beans .... 5@7c
Carrots, per sack .... 85c@$1.00
Rhubarb, San Jose, per box .... $1.00@1.25
Pumpkins .... 75@90c
Cucumbers, hothouse, box of 30 .. $2.00@2.25
Eggplant, per box .... 1.25@1.50
Livingston $1.25
Lettuce, Sacramento, doz .... 25@40c
Celery, bunch .... 20@25c
do, crate $3.00
Tomatoes, per crate—
Bay .... $1.50@2.25
Potatoes—
Garnet, Chile, on street .... None
Fancy whites .... $2.10@2.20
Choice .... 1.75@2.00
Sweets, per sack .... 3.00@3.25
Onions—
River Reds .... None
Yellows .... 90c@$1.10
Australian Browns .... 90c@$1.10
Fancy .... $1.00@1.15
Garlic, new .... 15@20c
Green corn, Alameda, per sack .... Nominal
Okra, box .... $1.00@1.50

BEANS.

The market seems to be shrouded in doubt, but most of the local dealers are not hopeful of higher prices.
Bayos, per ctl. .... $7.25@7.50
Blackeyes, new crop .... 5.50@5.75
Cranberry beans .... 8.50@8.75
Limas (south, recleaned), new crop $10.25
Pinks .... $6.60@6.80
Mexican Reds .... $6.75@7.00
Tepary beans .... 5.00@5.50
Garbanzos .... 8.00@8.75
Large whites, new crop .... 8.10@8.25
Small whites, new crop .... 9.40@9.60

POULTRY.

Hens and roosters showed a decline this week on account of an oversupply from the East. Five cars arrived and several more are expected within the next few days. Live turkeys were somewhat stronger while the dressed bird was weaker. The differential between the two is now regarded as more nearly a reasonable figure than that of last week. Ducks and geese were higher.
Turkeys, live, young spring, lb 35c
do, old 33c
do, dressed, old .... 40@43c
Broilers, 1½ to 2 lbs .... 39@42c
do, 1¼ lbs 45c
do, ¾ to 1¼ lbs. 48c
Fryers 38c
Hens, extra, per lb., colored 35c
do, Leghorn 35c
Smooth young roosters, per lb. (3 lbs. and over) .... 34@35c
Old roosters, colored, per lb 24c
Geese, young, per lb .... 28@30c
do, old, per lb 28c
Squabs, per lb .... 55@60c
Ducks .... 30@32c
do, old .... 27@30c
Belgian hares .... 22@23c
Jack rabbits .... $3.00@3.50

BUTTER.

The butter market continued firm this week and last Monday's quotation was repeated this Monday as the price for the week. In San Francisco the receipts were heavier than the previous week, and more butter went into storage than was taken out for immediate sale.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	61	61	61	61	61	61
Prime first	59	59	59	Nom.	..	..
Firsts	58	58	58	Nom.	..	..

EGGS.

Extra eggs on the San Francisco Produce Exchange continue to be the feature. With the exception of Monday of this week extras have been quoted below the 80c standard. The reason for the jump of 5c over Sunday was stated to be to the small arrivals on Monday on account of the rain and also to the fact that the rain had dirtied many eggs to a degree that they could not be classed as extras. The Eastern markets continue strong and steady and the irregularity of the San Francisco quotations was entirely local. This week's quotations of extras below 80c is the first time they have reached a price below that figure since October 18, when the price was 76½c. Pullets followed the market leader throughout the week.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	75½	75½	77	82	78½	75
Extra 1sts			Nominal			
Firsts			Nominal			
Extra pullets	59½	60½	62	64	62½	63

CHEESE.

The cheese market continued quiet this week, with a half cent lower price for fancy California flats and a cent less for Oregon triplets fancy.
California Cheddar, flats, fancy 32c
Fancy California flats, per lb 32c
First California flats, per lb .... Nominal
California Y. A. fancy .... Nominal
Oregon triplets, fancy 34½c
Oregon Y. A. fancy .... Nominal
Monterey cheese .... 22@25c

FRESH FRUITS.

Apples continue in good demand, with somewhat higher prices on some descriptions. Berries are scarce on account of the rain and strawberries were sold as high as $15. Grapes are no longer coming in in lugs and sell at from $1 to $1.50 per crate. Alligator pears are selling much higher, with very little of the California description in the market.

Apples—	3½-tier	4-tier	4½-tier
Jonathan	$1.75@2.00	$1.50@1.75	
Newtown Pippin	$1.60@1.75	$1.40@1.60	$1.25@1.35
Bellfleur	1.50	1.60@1.75	1.50
Baldwin		1.25@1.50	1.00@1.25
R. I. Greenings		1.25@1.50	1.00@1.25
Wagner		1.50@1.75	1.25@1.50
Hoover		1.50@1.75	1.25@1.50

	Extra Fancy	Fancy
Spitzenberg (N.W.)	$3.00@3.75	$2.75@2.90
Jonathan (N. W.)	2.50@2.75	2.25@2.50
Baldwin (N. W.)	2.25@2.50	2.00@2.25
Winesap (N. W.)	2.50@2.75	....

Other Fruit.
Peaches, 4-box crate .... None
Figs, black, per box .... None
do, double layer .... None
do, Single Row Whites .... None
Strawberries, per chest .... $14.00@15.00
Blackberries, per chest .... None
Raspberries, per chest .... $9.00@12.00
Plums .... None
Cantaloupes, flats .... None
do, ponies .... None
do, standard .... None
Watermelons, per lb. .... None
Pears, Bartlett, per box .... None
Winter pears .... $2.00@3.00
Grapes, Tokay, crate .... $1.00@1.50

Alligator pears .... $6.00@7.00
Cal. .... 3.00@4.00
Pomegranates, small box .... None
do, large box .... $1.75@2.00

CITRUS FRUIT.

Citrus fruits are going down all along the line. Valencias are practically off the market and navels are selling from $7 to $9. Lemons have taken a decided tumble, due to the better supply.
Oranges .... Nominal
, Navels .... $7.00@9.00
Mandarins .... 2.50@2.75
Lemons, fancy .... 5.50@6.50
do, choice .... 5.00@5.50
do, standard .... 4.00@4.50
Grapefruit .... Nominal
Grapefruit, new .... $2.00@3.00

HONEY.

Honey is weaker due to the taking off of some of the sugar restrictions. However, prices for the present are maintained unchanged.

DRIED FRUITS.

The lifting of the embargo on raisins is announced by the War Trade Board and the United States Food Administration. This will release thousands of tons of California raisins for export. Otherwise there is no change in the dried fruit market and prices remain firm.

RICE.

Paddy rice, 1918 crop $4.32
Clear No. 1, 1918 crop, at mill 7.00

LOS ANGELES

Los Angeles, November 19, 1918.

BUTTER.

Los Angeles, November 19, 1918.

There was a firm tone to the market the past week. Receipts of fresh were again light, only 256,460 pounds, against 262,200 pounds the same week last year. At the prevailing prices there was a very good demand from the consuming trade. It not only took all the fresh arrivals, but there was withdrawn from cold storage during the week 35,748 pounds, while the same week last year there was taken into cold storage 73,388 pounds. The cold storage holdings now are only 135,748 pounds (and much of this sweet butter), against 237,085 pounds the same week last year.

We quote—
California fresh extra creamery 58½c
California fresh prime first 56½c
California fresh first 55½c

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	57	57	57	57	57	58½
1917—						
Extra	42	42	42	41½	41	41

EGGS.

This market is sharply lower than a week ago. While the receipts were the best for some weeks, they included a car of cold storage. The receipts by rail for the week were 637 cars, including a car of cold storage, against 505 cars the same week last year. The truck receipts continue to run much heavier than the arrivals by rail. The estimated supply for the week was 2000 cases, against 2500 cases the same week last year. There was withdrawn from cold storage during the week 2064 cases, against 7291 cases the same week last year. The cold storage holdings now are 37,634 cases, against 23,032 cases this time last year. At the fancy prices of last week for fresh ranch eggs consumers held back and the trade encouraged the consumption of cold storage. This, with more pullets laying and the fact that the moulting season with many hens is drawing to a close, all had a tendency to lower prices.

Daily quotations—

1917—						
Extra	58	57	56	55	55	55
Case count	53	53	51	51	51	51
Pullets	52	51	50	48	48	48

VEGETABLES.

There are few changes to note in this market from a week ago. Offerings were only fair and prices showed an upward tendency in some cases. Bell peppers are higher and in fair demand. String and lima beans also advanced. Potatoes and onions were steady. Onions were firm. Sweet potatoes are higher, but slow sale. Cabbage is dull and lower. Celery steady and in fair demand. Tomatoes are getting scarcer. Cauliflower is more plentiful and meets with a fair demand.

We quote from growers:
Bell peppers, per lb .... 5@6c
Chile peppers, per lb .... 4½@5c
String beans, per lb .... 7@8c
Lima beans .... 5@6c
Potatoes, northern, per cwt .... $2.25@2.50
do, Idaho Russets, per cwt .... 2.25@2.40
Sweet potatoes, per cwt .... 2.00@2.25
Garlic, per lb 20c
Onions—
Australian Brown, per cwt .... $1.40@1.50
White Globe, per cwt .... 2.50@2.85
Cabbage, per 100 lbs .... .90@1.00
Celery, crate .... 3.50@4.00
Tomatoes, No. 1, lug .... 80@90c
do, No. 2, lug .... 25@35c
Cauliflower, standard crate .... $1.75@2.00

POULTRY.

Local receipts were only fair, but there were two cars of Eastern poultry in for the Thanksgiving trade. While there was more life to the market, prices showed few changes. Hens were a little stronger and geese higher.

The following prices were agreed upon last Friday, November 1, and hold good until the coming Friday:
Broilers, 1@1¼ lbs 37c
Broilers, 1½@1¾ lbs 41c
Fryers, 2@3 lbs 33c
Roasters (soft bone), 3 lbs. and up 30c
Stags and old roosters, per lb 20c
Hens .... 28@32c
Tom turkeys .... 31@34c
Ducks .... 22@28c
Geese 28c

BEANS.

The past week was another dull one in this market. Now that the war is about over, the Government will want fewer beans. With this knowledge before them, the trade is holding back and only taking

such lots as needed for immediate use. Prices are quotably unchanged.

We quote from growers—

Limas, per cwt.	$10.00
Large white, per cwt.	9.00
Small white, per cwt.	8.00
Pink, per cwt.	6.50
Tepary, per cwt.	4.50
Blackeyes, per cwt.	5.00

FRUITS.

Grapes have stopped coming from the country. There is little being received aside from apples. They met with a good market and showed firmness. Japanese persimmons are also selling fairly well. Pomegranates are on the market.

We quote from growers:

Figs, Black Spanish, per lb.	10@12c
do, White, per lb.	10@12c
Apples—	
King Davids, 4-tier	$2.75@3.00
Black Twigs, 4-tier	2.75
Baldwins, 4-tier	2.00@2.25
Red Pearmains, 4-tier	1.75
White Pearmains, 4-tier	2.00
Rhode Island Greenings, 4-tier	1.50
Yellow Newtown Pippins, 4-tier	1.75
Apples, Bellefleur, 4-tier	$1.75@2.00
do, 3½-tier	1.70@1.80
do, Gravenstein, 4-tier	2.25
Japanese persimmons, per lb.	5@8c
Pomegranates, per lb.	5@7c

WALNUTS.

The market is hardly so firm this week. Independent growers, however, are holding for quotations. The association is still working on its contracts, though the bulk have been filled. Their shipments last week averaged about 15 cars a day.

We quote f. o. b. California points:

	1918	1917
Fancy budded	34½c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

HAY.

Market is dull. Receipts were light and so was the demand. Dairy people were buying some little alfalfa. Little else was moving.

We quote f. o. b. Los Angeles:

Barley hay, per ton	$23.00@24.00
Oat hay, per ton	25.00@27.00
Alfalfa, northern, per ton	20.00@21.00
Alfalfa, local, per ton	21.00@23.00
Straw, per ton	9.00@10.00

COTTON.

There was fairly active trading the past week and at times sharp fluctuations in prices. Our review week opened sharply lower, with Liverpool a free seller, but Thursday of last week under the official announcement that the export shipments are likely to exceed last year's by 2,000,000 bales caused a rush of buying and prices were forced up 200 points. Monday of the current week there was a disposition to take profits by a number of holders and the market eased off a little from Saturday's high point. In New York December closed at 28.65c and January at 28.10c. In New Orleans December closed at 26.35c and January at 26.35c.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, November 18, 1918.

Owing to the fact that last week's deliveries in most of the markets were in rather unsound condition, insofar as the grapes were concerned, the demand was somewhat sluggish and prices receded from the week before. Firm stock, however, was disposed of to good advantage and met with a ready sale. The arrivals were light and though a good proportion of the fruit was weak there was no difficulty experienced in disposing of it.

Practically all the wine grapes have been delivered, which is fortunate for the shippers, as the demand during the past week has been very inactive, owing to the cold weather.

New York: Grapes—Malaga, crates $1.92, lugs $1.58; Tokays, $1.31; Cornichons, $1.84; Emperors, crates $1.45, lugs $1.33, drums $4.58, kegs $3.50; Muscat, $1.22; Alicante Bouchet, $1.90. Pears—W. Nelis, $3.24; B. Clairgeau, $3.82; E. Buerre, $3.22.

Chicago: Grapes—Emperor, $2.07; Cornichon, $2.26; Tokay, $1.56; Malaga, $2.50.

Boston: Grapes—Malaga, $2.00; Tokay, $1.74; Cornichon, $2.14; Emperor, crates $1.97, kegs $2.78, lugs $1.79, drums $3.40. Pears—Glout Morceau, $3.95; E. Buerre, $3.27; Winter Nelis, $2.80.

Shipments from November 9 to 14, inclusive: 155 grapes, 21 pears. Shipments to date, 1918: 24,783 cars (incomplete). Shipments to date, 1917: 23,988 cars.

Special Citrus Market Report

Los Angeles, November 18, 1918.

While shipments from Central and Northern California are taking place about two weeks earlier than usual, the quantities moved are not large. The rainfall at the beginning of the week has retarded movement and slightly reduced the sugar to acid ratio. The fruit, however, still tests out high—as much as 13 to 1 and 14 to 1. Quotations on navels this week range from $6.50 to $7.50 per box f. o. b. Florida oranges, which are being offered at $3.50 shipping point, are now reaching Pacific Northwest and Canadian markets. A forecast of Central California's citrus production is placed at 1500 cars of navels and 1200 cars of Valencias.

The lemon market is well supplied, and prices show a downward tendency. The advent of cooler weather and the subsidence of the influenza epidemic are lessening demand. It is estimated that the lemon crop this year will be in the neighborhood of 10,000 cars.

Special Livestock Market Report

San Francisco, November 20, 1918.

CATTLE—The cattle market is strong, with an upward tendency of prices. Cattle of good quality and good weight are getting scarcer even than in the near past and command a premium.

Grass Steers—	
No. 1, weighing 1000@1200 lbs.	12¼@12½c
do, weighing 1200@1400 lbs.	12@12¼c
do, second quality	10½@11c
do, thin	8@9c
Cows and heifers—	
No. 1	8@8¼c
do, second quality	7@7½c
do, common to thin	5@6c
Bulls and stags—	
Good	6@7c
Fair	5@6c
Thin	4@5c
Calves—	
Lightweight	11c
Medium	10c
Heavy	8@8½c

SHEEP—There is practically no change in the mutton sheep and and lamb market. Most of the supplies are coming out of the feed lots. Prices stand.

Lambs—	
Yearlings	12@12½c
Milk	14@14½c
Sheep—	
Wethers	11½@12c
Ewes	9@9¼c

HOGS—Hogs are in plentiful supply and are of good weight and quality. Speculation as to the probable effects of the peace era being ushered in is that hog values will hold their own and may advance. There is no change in prices this week.

Hard, grain-fed, 100@140	16c
do, do, 140@250	16½c
do, do, 250@325	15½c

Los Angeles, November 19, 1918.

CATTLE—There were more good cattle offered the past week than for some time. The tone of the market in consequence was hardly so firm, though prices were not quotably changed.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs.	$9.00@12.00
Prime cows and heifers	8.00@ 9.00
Good cows and heifers	7.00@ 7.50
Canners, per cwt.	5.50@ 6.00
Calves, per cwt.	8.50@10.00

HOGS—A good supply of hogs was had the past week. Demand fair and prices were steady at last week's decline.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs.	$14.00@15.00
Mixed, 225@275 lbs.	15.00@15.56
Light, 175@220 lbs.	15.00@16.00

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—There were a few more to be had the past week, but killers had to reach out to get them. Receipts coming from California, Utah and as far away as Idaho. Prices steady.

Per cwt. f. o. b. Los Angeles—

Prime wethers	$9.00@10.00
Prime ewes	8.50@ 9.50
Yearlings	9.50@10.50
Lambs	15.00@16.00

North Portland, November 18, 1918.

CATTLE—Another rather liberal run of cattle came forward for today's market, 1700 head being in the pens this morning. The market opened fairly active, especially on cow stuff, which all cleaned up at steady to strong prices. The demand for lightweight feeders as well as good fleshy kind continues excellent at steady to strong prices. Thin off grade cows and light steers all found a ready sale to both butchers and packers. The extreme top of the steer market was $12.75, one bunch of choice 1350-pound steers getting this figure. Two other loads sold at $12.50, with a scattering of the strictly good steers from $12 up. A very good kind of steer sold on a $11 to $12 range, with fairly good killers getting from $10.25 to $10.75. Strictly good quality fleshy feeders are selling from $9.50 to $10.25 to both killers and to fill country orders. Thinner kind of off grade stuff sold on a $6.50 to $8 range, one load of extra choice lightweight heifers sold at $9.50, with a load of weighty 1100-pound cows bringing $9.20.

HOGS—Around 2500 head of hogs were on the market today, demand was fairly good and we had an active market at steady prices. Strictly good hogs sold up to $17.50, which was the day's top. The bulk of the sales ranged from $17 to $17.15. Pigs are finding a good outlet at steady prices, selling mostly two cents under top.

SHEEP—There were 1700 head of sheep all told here today, including 500 direct to packers. The demand for both sheep and lambs continues slow, although there is a marked improvement over two weeks ago. Strictly good lambs are selling around $12.50, with heavy stuff getting from $8 to $10. Yearlings are selling from $10 to $11, with a fairly good call, while ewes are bringing from $8 to $9.

Rates 3 cents per word per week.

MISCELLANEOUS.

SHIP YOUR LIVE AND DRESSED POULTRY to Campodonico, Lemos & Hanscom, 155 Washington St., San Francisco. We are the leading poultry firm of the city. Reference, Bank of Italy, S. F. The two old reliable commission firms of Chambers, Lemos & Hanscom and Chas. Campodonico united under the above name the first of this year.

FOR SALE—Holt 30 Caterpillar, ready for work, with engine completely overhauled and track in good shape, with Deere power lift plow, at a bargain; might consider roadster or light car as part payment. Box 116, Paso Robles.

CROLEY'S BALANCED DAIRY FEED—The cheap milk producer; and Croley's Calf Meal, the best California calf raiser. Geo. H. Croley Co., Inc., Eighth and Townsend streets, San Francisco, Cal.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. **Weissbaum Pipe Works,** 160 Eleventh street, San Francisco.

TRACTOR FOR SALE—Bean TrackPULL tractor. Nearly all improvements attached. Perfect order. Very little used. Price one thousand dollars. A. Ryder, Loomis, Cal.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

WANTED—From one to two hundred second-hand smudge pots. State price and condition of pots you have. John A. Then, Mgr., Festiva Ranch, Red Bluff, Cal.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

FOR SALE CHEAP—No. 3 Keystone tractor; well driller in good shape, including tools. Can be seen at San Jose. Address, E. N. Shaw, Route D, Box 155, Gilroy, Cal.

FOR SALE—Bean TrackPULL Tractor, $600. Tractor is offered because machine of larger capacity is needed. W. H. Ward, Morgan Hill, Cal.

FOR SALE—One light tractor Sanders four-disc plow. Price $200. Address, P. O. Box 111, Minden, Nevada.

WANTED TO BUY—Second-hand 8-inch pipe mold of standard make in at least fair condition. A. E. Lindstrom, Orland, Cal.

COUNTRY LANDS.

TO LEASE—20-acre irrigated farm, good 4-room house, windmill and tankhouse, good barn. Berkeley Securities Company, 218 First National Bank Building, Berkeley, Cal.

FOR EXCHANGE—I have a fine seven-room two-story house, nice residence section of Berkeley, with large sleeping deck, fireplace, hardwood floor in living room, kitchen finished in white enamel, fine bathroom, clinker brick exterior finish, and in yard there is garage, workshop, children's playhouse. Street work, sidewalks, sewer, macadamized street, gas and electricity are in. Two blocks from Key Route and S. P. electric trains to San Francisco and street car to Oakland. I will exchange above house for an improved ranch. Neil E. Munro, Berkeley, California.

FOR LEASE—SUMMER SHEEP RANGE—Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the Diamond Match Company, Grazing Dept., Chico, California.

FOR SALE—24¾ acres young orchard, apples and walnuts, coming into bearing. Very desirable home site; 4½ miles from town. Price $8000. Address Ogden Bolton, Route 4, Box 447, Santa Rosa, Cal.

WANTED—To hear from owner of good farm for sale; state cash price, full description. D. F. Bush, Minneapolis, Minn.

SEEDS AND PLANTS.

BUDDED AVOCADOS—Fuerte, Sharpless, Lyon, Dickinson, Blakeman, Spinks, Taft, Linda, Rey, Queen, Knight, and many others. A fine stock of field-grown trees. $2.50 for one. $2.00 each by the 100. Better order now. Newbery-Sherlock, R. D. No. 2, Pasadena. Nursery, Rose, and Palm, Altadena, Cal.

SUDAN GRASS SEED WANTED—We are in the market for Sudan Grass seed that is free of Johnson Grass, Morning Glory, and other noxious weeds. Send samples and state quantities of seed you have to sell. Bomberger Seed Co., Desk B, Modesto, Cal.

TO THE TRADE—Buy almond trees from an almond specialist. 100,000 almond trees on bitter almond roots, standard varieties. Car load lots solicited. Write for prices. W. T. Hohenshell, Le Grand Nurseries, Le Grand, Cal.

FOR SALE—Black oats for seed, direct from grower. Prices on application. Werner Bros., Watsonville.

WANTED.

OPPORTUNITY FOR MARRIED MAN—We want a married man who will live on our property (good house, barn and windmill), who will plant trees for us and farm between the trees for himself. For details apply to Berkeley Securities Company, 218 First National Bank Building, Berkeley, Cal.

BE A MANUFACTURER.

Your opportunity to develop a successful, profitable business. Make $3000 to $5000 a year. High grade, essential product. Universal demand. **Sells Like Wildfire.** Particulars free or enclose $1.00 for demonstrator and plan. Refunded if not satisfactory. **PYRO LABORATORIES, 4317 Melbourne Ave., Los Angeles, Cal.**

Campodonico, Lemos & Hanscom

155 Washington St., = San Francisco, Cal.

We are the united firms of Chas. Campodonico and Chambers, Lemos & Hanscom

Ship Us Dressed Turkeys / Live Turkeys / and Other Poultry

We Are the Leading Poultry Firm of San Francisco.

Checks sent as soon as produce is sold. Reference: Bank of Italy, S. F.

Dressed Turkeys Will Probably Range From **42c to 45c** THANKSGIVING WEEK

The Answer To Your Tillage Problems

is right here -- proved by forty years of bigger and better crop production since George M. Clark began to perfect the modern disk harrows and developed the "CUTAWAY" tools.

Produce your share by right disking -- be one of the up-to-date and prosperous farmers who rely on one of the complete line of

Clark "CUTAWAY" Disk Harrows

More CLARK "CUTAWAY" tractor harrows are sold than any other, because they are designed and built for tractor use -- for hard service and deep disking -- often taking the place of the plow. Rigid frame forces rear disks to cut midway between the cut of front disks, pulverizing every inch of the soil, and leaving it level and fine. Think what such thoroughness means in better crops! Once over does it!

A size for every tractor; universal hitch, adjustable; two levers set all four gangs; draft rods distribute pull; hardwood, oil-soaked bearings in dust proof boxes. These are but a few reasons why this is the best and most popular tractor harrow.

Save money -- make your tractor pay by looking up the light draft CLARK "CUTAWAY" Tractor Harrows today at your dealer's -- or write us direct for further information, with catalog and recommendation of proper tools for your tractor (or for the one you expect to buy.)

Write today for this free book on tillage. Tell us your problems. We will gladly advise you free.

Make certain they bear the name -- CLARK "CUTAWAY" to distinguish these genuine implements from many so-called Cutaways.

Greater Strength and Quality with Lighter Weight

Disks of cutlery steel, *forged* sharp -- cut better and easier; last far longer -- at no extra cost to you.

THE CUTAWAY HARROW CO.,

618 Main Street, Higganum, Connecticut

Makers of the original CLARK Disk Harrows and Plows.

The Hog Marketing Problem—Its Solution

Written for Pacific Rural Press by R. H. Whitten

THE SOLUTION of this problem, discussed on other pages of this issue, requires action along three different lines:

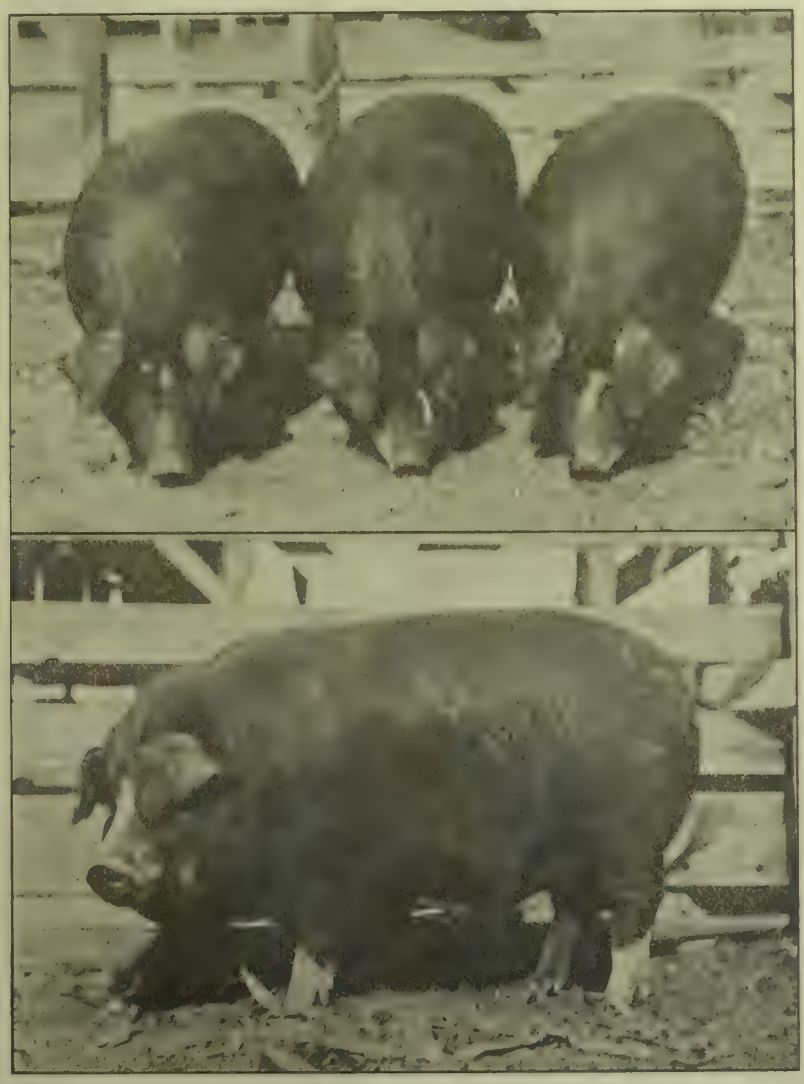
First—Eliminate Tuberculosis.

Then the packers will not be obliged to stand such heavy losses from condemnation. At present a heavy percentage of hogs received from the dairy districts where skim milk is fed are found to be tuberculous, and as no satisfactory way has yet been found to charge the condemnation back to the individual hog raisers, except in the case of carload shipments, the packers are obliged to pay a lower price to all. So either dairy herds should be tested and farmers should know positively that their cows are free from tuberculosis, or else the milk should be pasteurized before it is used as feed for the hogs.

Second—Finish Off the Hogs Better.

Many farmers don't seem to know what a properly finished hog is. Some think that their hogs are ready for market when really they are just ready for the fattening pen. Others have their hogs fat, but they are soft and flabby, and shrink heavily both in shipping and in dressing. It cannot be expected that hogs run on alfalfa and fed grain for only thirty or sixty days before they are marketed will command the same price as is paid for those that have received a little grain every day from their babyhood. The dressing percentage of the former is not as high, and in the end it is the dressing percentage that counts.

Just at the time when the farmers who consigned to the Napa County Farm Bureau sale (see page 598) received 13 cents for their hogs, Mark Bassett, the veteran Poland-China breeder of Hanford, shipped a carload of 58 fat hogs to the Western Meat Company at San Francisco. They had received a limited grain ration from the time they were weaned, and were finished off on a heavier grain ration. They were spring pigs; they averaged 246 pounds, and their flesh was hard. And that the packers want top-notch stuff and are willing to pay for it is proved by the fact that Mr. Bassett was paid 20 cents per pound for the entire carlot. This netted him better than 19 cents at Hanford, and it paid him handsomely to finish off his hogs so well. He was able to get a high price for his grain.



Barrows from a carload sold by M. Bassett for the record price of 20 cents per pound.

Third—Establish Stockyards.

But the average farmer does not have a carload of hogs to market at a time. Most of the hogs marketed in this State come from farmers who raise hogs as a side issue and have only six, or a dozen, or twenty to market at one time. They are the men who must be protected if the industry is to be put on a stable basis, and the establishing of stockyards is the only solution of the problem. The farm bureau sales were a step in the right direction, but often only two or three carloads of hogs were offered—not enough to induce competitive bidding from the larger packers. Consequently, the markets were localized and prices were demoralized. But at last

The Stockyards Are Coming.

A group of stockmen of Fresno, Kings, Tulare and Kern counties have organized under the leadership of W. E. Packard, California farm agent, and are looking about for a suitable site in Los Angeles. The Government is lending its support in the person of F. P. Allen, in charge of the livestock division of the Bureau of Markets. He endorses the need for such an establishment and is to meet Mr. Packard and make a tour with him to look over the available site. At first the stockyards will be devoted to hogs alone, as the hog marketing problem seems to be the most serious at the present time. Under the plan now in vogue, the growers assemble their stock at central points within the four counties and auction sales are held. At these sales the only opposition the representative assigned from one of the packing houses encounters is from local butchers, whose requirements are quickly met. Sometimes there is no bidding at all, and in such cases the stock is shipped to Los Angeles or San Francisco, where it takes its chances on the open market.

But with the establishment of stockyards in Los Angeles all hogs will be shipped there, where they will be properly graded, and then bidding will become really competitive. The hog raisers will receive better prices and the whole swine industry will be put on a stable basis.

At first probably not more than from four to six carloads a day will be handled at the Los Angeles stockyards, but Mr. Allen is of the opinion that before long the stockyards will become an important factor and will handle from 25 to 30 carloads of hogs alone. Later, cattle and sheep will be included; a shipping and export trade will be developed, and Los Angeles will become a real livestock center.

Los Angeles Market to Be an Open Market.

The business of the new stockyards will not be limited to shipments from the four counties mentioned. It will be an open market, and already Imperial and other southern counties have manifested interest in the proposition. The yards will be under State and Federal control, but their immediate management will devolve upon the Farm Bureau Associations. Unlike earlier attempts along similar lines, the movement will be devoid of promotion or real estate propaganda. It will be a straight business proposition—by the breeders and for the breeders.

San Francisco Also Should Have Stockyards.

Let the hogmen of the counties for which San Francisco is the logical marketing point organize and establish stockyards there, and the problem will just about be solved. Organization and co-operation are the keynote of progress in every line nowadays. The farm bureau sales are conducted along co-operative lines, and while the results of recent sales have been disappointing, this cannot be charged against co-operation. The principle is sound, but the work must be conducted on a larger scale. The packers cannot be forced to send buyers to small county sales. But they can be induced to bid on large quantities of hogs shipped to terminal points, and the sooner stockyards are in operation at both San Francisco and Los Angeles the quicker the farmers of California will get their full measure of profit from hog raising.

EDITORIALS

THE HOG IS NOT TO BLAME.

IF THIS issue does not sell pigs it will not be for lack of trying! Why should we thus exalt a beast which Pope condemns:

"The hog that plows not nor obeys thy call," but "Lives on the labors of this lord of all"?

Obviously our purpose is to promote a better relation between the hog and his lord—to the end that the hog may plow for his own barley and alfalfa and be obedient to the call to contribute to his lord's prosperity and not to live idly upon his labors. And we discern that it is not the fault of the hog that he is too often a slacker in the midst of the comfort and abundance which California affords him. It is the fault of man who, through lack of energy or failure to apply his intelligence and exercise his reasoning power, makes the capable hog a gluttonous loafer in the agricultural scheme of things. As the hog, when well bred and fed in California, is really not idle nor unresponsive nor disposed to seek an unrequited living, we have naught for him but a good back-scratching which evokes jolly, staccato music, and we address our homily to him who prevents the hog from attaining the efficiency which creative design requires of him. What a responsibility must that man assumes who not only fails of his own objective but makes it impossible for a hog to come through with his job!

But all is not yet lost. On the preceding page Mr. Whitten, who has a passion to deal with facts, describes the latest hopeful things. Ours is the philosophy, perhaps the reader may think, the sophistry of the situation.

LITTLE PIGS THAT STAYED AT HOME!

THERE may be found on another page of this issue a notable contribution from Farm Adviser Baade of Napa county describing in detail a pig-marketing proposition that failed to come through. The reader may perhaps think at first that there is too much local detail in it because local details in different counties must vary, but it seems to us that every detail is necessary to the picture which Mr. Baade paints for us and contributes to the real significance, and when the mind of the reader catches that significance he can substitute his own local details without losing it. The general significance is the inadequacy of any local effort at produce selling when it is looked upon as complete in itself. Some are prone to think that assembling produce, providing handling arrangements and inviting buyers will overcome all the wrongs and difficulties which now exist. They have in certain instances gone a long way in that direction, it is true, and in all cases they are fundamental to satisfactory trading—but they are only the beginning and not the end of things needful to insurance of the growers' interests.

In one way the attitude of the Napa co-operating pig-sellers reminds us of the Germans. They put up a fight: they invited the allies to make peace in their way and they became mightily peeved when they refused to do so. The Napa people got themselves together, they put up arrangements for competitive buying, they invited the buyers to come up and cut each others' throats to get their pigs, and when they did not promise to come they called upon all the gods of the Food Administration to make them come! If they had wanted pigs very much, they might have come—just as the allies might have accepted a German peace if the Teutons had blown up the Tower of London, destroyed the British fleet, captured all the French ports from Calais to Bordeaux and pushed the Italians off the heel of their boot into Scylla and Charybdis! But the Teutons never did this and never could do it, and so the allies stood pat. By the same sign the Napa pig-growers could not by themselves put the pig-buyers into similar desperate straits and so the latter stood pat. In fact, the buyers probably looked upon the whole frame-up of the producers as comedy, not tragedy, and their reply was in effect: We will not play on your cellar door! There is a much prettier little girl in the next block!

WHAT IS THE LESSON OF IT?

MR. BAADE has it clearly in mind and so the significance of all his details is embodied in the closing sentences of his letter to the Pacific Rural Press which suggest the need of a broader and more compelling organization than a county farm bureau. We continue that idea by following Mr. Baade's writing with an account of what is now being done by an affiliation of farm bureaus in the San Joaquin Valley. All farm bureau people should take up that idea and test it out. We were favorably impressed with it when it was advanced at a pig-growers assembly in this city last March and we have promoted it on several occasions—particularly in our issues of March 16 and June 1. It seems directly pertinent to give the idea a strong push in connection with the debacle at the Napa pig sale and so we have added the latest facts about its progress to Mr. Baade's communication. We do not know that this is the real answer to his question nor that it is the solution of the problem, but in this matter of satisfactory sale of produce to yield the producer his full share of the market value there must be agitation and experiment until the right thing to do is demonstrated. To our mind the thing to be done is very simple and clear, though the best way to do it is now obscure. The way to compel packers to get hogs in the way which is right to the growers is to make it impossible for them to get them in any other way. We do not believe in organization for co-operative packing in competition with corporate packing because that has been tried out and results indicate that it is impracticable. There is a whole lot more in packing economically and disposing of the product profitably than merely having hogs and when packers get hogs fairly to the growers it is well to let them have all the rest of the fun in the packing game. If they play it too hard, the consumers, the distributors and the Government can have cards dealt to them and take a hand in it. The hog-grower can play his end by making it sure that the packers get no hogs except at a fair profit to him and he can do that by having no tight fence-corners into which local buyers can drive his hogs. The hog-grower must have runways connected up in some way with all the places where hogs are sold and it must not be possible for buyers to enclose his product with the portable fencing which they have been in the habit of carrying around with them in the past. This is the answer to all the squealing which is being heard from Napa. The only way to make packers buy hogs at fair prices and when they are offered is to make it impossible for them to get hogs any other way. How to do that by co-operation is up to the producers to find out.

STANISLAUS PLAN PROCEEDING?

AS WE write on Tuesday the press dispatches tell of meetings at Merced, Madera, etc., at which the proposal emanating some months ago from Modesto is being promoted at other points in the San Joaquin Valley. It was that subscription among local merchants and other public spirited people should provide funds which were to be loaned to farmers who had no bank credit to enable them to increase production and it received wide approval as the "Stanislaus plan"—for making the wheels go 'round on land which could not be soaked as security for the loan. What we would like to know now is whether there is anything in the plan but hot air. We believe the bankers in the district are lending money on what they consider good risks to help people put in crops—that is what they are bankers for. Should money be loaned to those whom the banks do not recognize as being good risks? We are not arguing now that it should be. We are not sure that there is now any adequate reason why crops should be raised by assisted farming to endanger the profitability of crops which other farmers can stake themselves for. Considering the fact that it is still a question whether growers of several crops which were stimulated last year will pay the growers what they cost, we doubt if it is wise to undertake general crop boosting. But that is not what we are chiefly thinking of—possibly all the pushing is being done on wheat and that, we presume, is safe enough if growers get the wheat. What we are wondering about is whether money is really being furnished to people who cannot get it from the banks on their own good characters and personal securities, without making communities think that they are helping, or making farmers think they are being helped, by some beneficent bogey. Is not the money being loaned by bankers just about as they would loan it anyway? Is anybody who could not get money in the usual way getting any money now? If not, then the Stanislaus plan and any other plan which does not go beyond country bankers' ideas and requirements is simply hot air, which may defeat the patriotic purposes of its out-blowers because it may discourage those who can put in crops with their own labor and capital from going as far in the risks of production as they otherwise would. It seems to us at the moment possible that the proclamation of unrestricted credit may be doing nothing which would not ordinarily be done by country bankers and merchants individually, or it may be overstimulating production—in both cases it is hot air with the usual fakes and dangers involved in that commodity.

GOOD LINE OF WINTER WORK.

WE LEARN that E. E. Calvin of Omaha, Federal regional director of railways west of Chicago, was in Los Angeles last week and in conversation with interviewers forecasted great agricultural and industrial expansion for California when the country returns to a peace basis. Railroads, he said, are preparing to handle a greater business than ever before and they estimate that the winter crop of tourists will be up to ante-war volume.

We also read that there is much concern at the East lest in the dream of universal commercial reciprocity as one of the set dishes at the coming "peace table" may result in the sacrifice of the products which made this country an efficient helper in winning the war. This is what we read in the press dispatches:

American manufacturers are heartily in favor of the proposed league of nations for the prevention of future waste of life and property. But, according to President Stephen C. Mason of the National Association of Manufacturers, they do not believe it practical for the nations of the world to enter into any general agreement relative to commercial intercourse.

President Mason explained that in the production of manufactured products there is such a wide difference of conditions among the nations of the world that there can be no practical method of equaling so diverse "interests" in the field of world trade.

Fortunately the next Congress will be so evenly balanced politically that it cannot be possessed and made to run violently down a steep place into the sea of economic vagaries. There will be a chance to demonstrate that the industries which have made America great must not be sacrificed even to lift other peoples. Let every nation enjoy the fruits of its own labors, just as every man should have opportunity to do, without unfair competition. As our State promises to be well filled with capable and influential people from all parts of the country this winter, let us make them understand that California's development and contribution to American greatness are the product of

an American policy which has made our country capable of helping to save the world from barbaric domination.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

What Is the Matter with Milo?

To the Editor: Can you explain why there is no market for milo maize, feterita, etc., while the Government asks us to raise pork, and pork, and pork? It seems to me that corn should be in demand if hogs are raised. I am wondering what is left to the poor farmer after paying high wages and being unable to sell at a small profit. Is there no Gompers who could start the co-operation of the farmers and get rid of the profiteers. The middleman has the right to make a substantial living, but the farmer has the same right, and I, having been in the farm business for a short time, can see that more money is made in buying and selling than in farming.—P. B., Merced.

Why, yes: the immediate trouble with barley substitutes lies in the fact that barley itself is in the dumps—and though we have some faith in barley improvement before another crop can be gathered, we cannot say that we are optimistic enough to be very sure it will drag the substitutes out of the soup. We can only hope it may. Fortunately no more sorghums can be put in until next April and May and by that time we can see how much is likely to be needed next summer, in view of how barley is then visible. It is natural that there should be chill in the values of produce over the sudden stopping of the war. It remains to be seen how hungry Europe is likely to be. The exhortations now current are based on the assumption that the forlorn continent will be hungrier at peace than at war—for a year at least. Mr. Hoover has gone abroad to figure it out. The next crop of wheat is covered by the price fixed by the Government, but everything else is largely conjectural, though likely to be held out of a slump by the general course of high prices. Fortunately wheat is about the only thing that has to be hurried into the ground and we may all be wiser in the course of a few weeks.

We are not sure that middlemen are the cause of the present trouble, though it may do them good to be hit on general principles. The cause of the widest dissatisfaction at the present time is that all the farming phases of the war have been determined by farmer substitutes and not by real farmers. A change in that respect for the future is what has to be looked out for in reconstruction policies.

Fruit Trees After Eucalypts.

To the Editor: I have an acre of land on a western hillside on which I intend setting out an orchard. It was formerly a grove of eucalyptus trees. Will you kindly advise me as to the best means of starting out an orchard and, if possible, suggest what variety of fruit would do best?—Subscriber, Sebastopol.

How long since the eucalypts were cleared off and what has the land done since? We would not think of planting fruit trees on a fresh uncovering of land occupied for some time by eucalypts. The land needs lifting with dynamite, clearing of all possible roots and rubbish, deep plowing-under of a heavy covering of stable manure and a try at barley or oats to see what condition the soil is in. You can go at the land in those ways now and plant next year. If, however, the land has already shown reclamation by good crops after the gums were cleared off, you can plant this winter. The kind of fruit to plant is a variety of fruits which you need for family use, for an acre does not make much of a commercial lay-out. If, however, you wish to plant for sale, look through your neighborhood and plant the fruit which does best for others on such soil and exposure near by. If you have the same fruit as they, you can sell with them and get much advantage thereby. If you only have an acre of some fruit not commercially handled in your district, you may have to eat it up yourself.

"Groves" or "Orchards"?

To the Editor: I have just returned from the south. I was much perplexed by their fruit conversation, in which they used the word "grove" very freely. They kept speaking of having orange, lemon, walnut and other "groves." I did not hear of a "peanut grove," but I was expecting to. Why do they have so many "groves" at the south? Why do not we get a few into our talk up here? It sounds very swell.—E. H., Sacramento.

We hope they will ultimately have fewer "groves" and more "orchards" at the south, for orchard is a better term with which to designate a collection of trees which receives care and culture such as California-grown fruits of all kinds do. The dictionary aspect of the question is interesting, viz.:

Grove: "A group of trees smaller than a forest: a small wood especially when cleared of under growth: a collection of objects resembling a grove."

Orchard: "A collection of trees cultivated for their fruit or other product: said especially of such a collection of trees, as the apple or pear."

It is true that the dictionary as a concession to current fashion gives as a secondary definition this: "A collection of orange trees is usually called an orange grove." But it should be remembered that the term originated in Florida at a time when collections of seedling orange trees were really "groves"—that is, they were grown in a wild way. This was never true in California—except at the old missions, perhaps. The modern American way to grow fruit is a "cultivated" way: the word "orchard" expresses that: the word "grove" does not. The word grove suggests a picnic and California fruit growing in an up-to-date manner is no picnic!

Probably Not for Rye Grass.

To the Editor: We have a piece of land mostly very light sandy, though a little of it is medium heavy black ground. It is not practical to irrigate the piece and we are considering putting in Australian rye grass. Most of this land is too thin or poor (not shallow) for any ordinary crop. Will it grow rye grass?—E. B., Paicines.

Probably not. If you should start it now and get some growth during the winter, it would probably not live through next summer. Land that will not grow any ordinary crop is not land for rye grass. It might give you a winter growth of rye to be pastured or plowed under. If there is water at ten or twelve feet, you might get a stand of white sweet clover (melilotus) with a fall start. That will stand frost and bore down through a lot of sand to water, which will keep it going through the summer. If the land is dry underneath, get what winter growth of rye you can and let it go at that. If you pasture the rye, the soil will improve.

Painting Large Cuts.

To the Editor: I have a five-year-old prune orchard started with too many limbs and I have to cut out a good many big ones. Can I paint the wounds right away, or let them dry out and paint them next spring? Somebody said in the Rural Press that painting right after the cut was made would cause sour sap or gumming. Is Oronite roofing paint good as a tree paint? I was told that it is used in the Santa Clara Valley, but I want to be sure whether it is good or not.—G. B., Kelseyville.

Our observation is that it is desirable to let a cut dry thoroughly before painting, but we do not wait as long as you indicate, though you might wait some time for leisure without harm. It is certainly not desirable to paint a sappy cut, for the paint will either rot, harden or it will make gum pockets under it. We doubt, however, that it has any connection with the general condition known as sour sap. We have used several roof paints with good results. They harden solidly and remain in place a long time. We do not know the one you particularly mention.

Morning Glory from a Tenant's Eye.

To the Editor: Will an arsenic spray kill morning glory or is salt better? Can I remove six inches of soil and put on an inch or two of salt? Cultivating out morning glory will not go with a tenant.—R. G., Hanford.

You are the first tenant we ever heard from who could see morning glory after he has knocked down the rent with it. Killing morning glory with arsenic spray is rather an expensive and elaborate process, which the University experiment station is still working at and concerning which you can get publications from Berkeley. Arsenic must be used carefully or it will kill the land for a long time. Your salt method would also be very expensive and that much salt would kill the land for several years, and those who have tried it have said that the morning glory was the first plant to come back! We doubt if we can give you anything easy with morning glory unless you can use it for hog pasture.

Work That Pays

Now that the American farmer has a starving world to feed, his burden is a heavy one. He cannot meet the many new problems single-handed, and needs a good farm paper more than ever.

We are just starting a big subscription campaign and need a few more red-blooded men to attend to our renewals and secure new subscribers.

Experience neither essential nor objectionable; we give you the necessary training to insure your success. Must have an automobile, and be in a position to travel and devote your entire time to the work. Straight salary; permanent work, with advancement.

Write for our proposition and tell us a little about yourself. You will be glad you investigated.

Whitewash to Kill Bugs.

To the Editor: In the Rural Press of November 9, page 506, appeared a recipe for whitewash. Now I am thinking some of spraying my fig orchard with something that will cut the moss and clean out insect eggs, etc., and wondered if the whitewash in this recipe would do the business.—H. G. J., Dinuba.

The whitewash referred to is recommended to stick and hold on. It may naturally do the same things to insect eggs in such a way that they will never hatch out, but for the purposes you describe the trees should be sprayed with lime-sulphur used according to the manufacturers' instructions. It has biting power which a whitewash made simply to hold on does not possess. Clean your trees with it and afterwards apply a hold-on whitewash to all bark likely to be exposed to sunburn.

Himalayas and Japan Plums.

To the Editor: What is the easiest way to eradicate Himalaya berry roots? Also how can I prevent Japanese plum trees from blooming in the fall? They have done so several seasons and have never borne a crop.—A. M., Watsonville.

Snake out the berries with a horse or team and chain when the ground is soft and wet and grub out all roots which show up and break off. Grub out survivors whenever they appear. Trees generally bloom in the fall after they have been allowed to get too dry and become dormant in the late summer. Keep them green and growing later by better summer cultivation or by a mid-summer irrigation if necessary. Summer pruning will promote later growth if there is plenty of moisture in the soil to encourage it.

Prune Rust on Almond.

To the Editor: What pest is on the enclosed almond leaves? Trees thus affected are dropping their leaves while most of the orchard is free from it.—R. S., Metz.

It is a brownish deposit on the under sides of the leaves and is known as prune rust (puccinia pruni). It is usually not much of a pest on orchard trees, though sometimes bad on nursery stock. It is controlled by spraying with Bordeaux mixture, but as it comes on in the orchard late in season after the leaves have discharged most of their duty, no treatment is usually resorted to. It is probably worse when the soil is a little too dry in the fall.

Pruning Vines.

To the Editor: We have a two-acre vineyard that was not cultivated last season. Would it be all right to prune it soon and plow it?—H. K., St. Helena.

Prune and plow after the leaves fall—before the weeds get too high to turn under cleanly, but get under all you can.

Too Old to Move.

To the Editor: Would it pay to move six-year-old peach trees? I would move them only a few rods and they would be set in vacant places in trees of the same age.—F. R. D., Biggs.

No.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., November 26, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	1.04	7.60	8.60	58	38

The War Is Won

But the consumer of Food Must Still Economize

and the producer of Food

Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.

While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.

Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

Superiority of Citrus Fumigation Shown

[Written for Pacific Rural Press by F. R. Brann, Horticultural Inspector, Lindsay, Cal.]

Regarding the relative cost to the citrus grower of spraying and fumigation, you will often hear the remark that "spraying is cheaper than fumigation." This is vague and should be modified. Many of the growers of the Lindsay district have found spraying very much more expensive than fumigation when tree and crop injury was considered. The amount of efficiency, tree injury, and other results depend upon the formula used, date of application, and the manner in which it is applied. The cost of controlling the citricola scale should be considered by the grower as overhead expense, for it is, as yet, a physical impossibility to completely eradicate this pest. The best that can be done is to control it and thus put our groves in what we term a "commercially clean" condition. Therefore, in order to correctly figure the cost of a certain treatment, we must do so on a continual basis.

I agree that one application of spray is cheaper to the grower than one fumigation, provided no tree or fruit injury results from the use of the spray. This is counting merely the cost of material and labor, plus the profit to the operator. The real consideration is with regard to the amount of efficiency derived. One fumigation usually places a grove in a commercially clean condition for from two to four years, during which time the grower can reap the benefits of trees producing under clean conditions. The average efficiency of spraying would necessitate from three to six applications during this time, which would be much greater in cost to the grower and the trees would probably not be producing under clean conditions during this time. Of course, there is usually considerable difference, both in cost and efficiency, whether the spraying is done by the commercial sprayer or by the grower himself. The grower would naturally do the work to the best of his ability. There are cases of fumigation work of very poor efficiency, but these cases are decidedly in the minority.

Taking the total acreage sprayed and fumigated in Tulare county from year to year, the following figures tell us considerable:

Fumigation.			Spray.		
Year.	Acreage.	Approx cost	Year	Acreage.	Approx. cost
1914..	1117	$ 29 859	1914	.. 233	$ 4,190
1915..	2018	54 486	1915....	750	13,500
1916..	3530	95 310	1916....	1252	22,536
1917..	4060	109,620	1917....	2293	41,274
1918..	700	24,500	1918...	*1240	22,320

Note:—*Spraying is still being done, these figures are only for work done to September 1, 1918.

The figures under approximate cost are for material, labor and operators' profit.

LOSSES FROM THE TWO METHODS COMPARED.

Of a total of 11,425 acres fumigated in Tulare county during the five-year period 1915 to 1918, inclusive, only four cases came to my knowledge where, through poor efficiency, consideration of adjustment was necessary. These four considerations totaled slightly over $200 on a total of 50 acres.

Of the total acreage of 5768 sprayed in Tulare county during this five-year period dissatisfaction was considerable. From 27 growers whom I personally interviewed I found that on properties aggregating 238 acres a total estimated damage of $48,600 actually occurred. I believe I am conservative in my estimate of $100,000 loss in Tulare county from the use of sprays, in addition to the loss of time and cost of application. In a number of cases legal proceedings would have been undertaken by the growers had it been possible to recover costs.

SPRAYER AND FUMIGATOR OPERATORS SHOULD BE LICENSED.

I believe the State of California is very much in need of a legislative act which will require of all who apply for license to operate as a sprayer, fumigator or salesman of any material to be placed on orchard property to furnish a surety bond in the county from which the license is obtained. Such an act would protect the grower from the unreliable operator and his materials and would be an advantage to those possessing real merits. It would also give the grower an opportunity to recover damages in case of tree or crop injury.

In 1917 liquid hydrocyanic acid gas was first used in the Lindsay district for fumigation on a total acreage of 475, cyanofumers being used on a total acreage of 3585. In 1918 season found no cyanofumer work and about 700 acres were fumigated with liquid gas. The new liquid gas method appears to be the last word in fumigation, having the earmarks of a great improvement over all former methods.

The writer is at present engaged in the final inspection and examination work of the liquid gas fumigation in the Lindsay, Exeter and Porterville districts and will have a report to make giving results as he finds them.

FEDERAL LAND BANK OF BERKELEY.

Loans from this bank now amount to $8,800,000. Last month the excess of income over expenses amounted to about $5,000,000. Monthly expenses remain about stationary, while income gradually increases. It is now six months since income was enough to meet expenses. The bank is going strong.

NEW DEPARTURE IN APPLE PRUNING.

J. C. Phillips of Watsonville is pruning his apple trees on the Ames system of pruning peaches—no cutting back but only thinning out, with the idea of facilitating picking and spur sets apparently.

How Walnuts Are Prepared for Market

We recently visited the new processing and packing establishment of the Walnut Growers' Association (Diamond Brand) at Goleta, in Santa Barbara county. Members of the association were delivering their nuts and getting a door test, receiving 29 cents a pound for all grades but culls. The nuts immediately pass through a blowing machine that throws out all light or empty ones, and then pass on an endless belt along the center of a table, with girls seated on both sides, who hand-pick imperfect nuts not separated by the blower. They are then passed through a bleaching solution and scoured in revolving cylinders, dried, graded, and then binned or sacked.

The suction culler takes out 95 per cent of all light nuts, and the association controls the patent on this machine. These culls are cracked and sold under four grades to the sweetmeat trade and net the grower 16 cents a pound.

Cracking standard is guaranteed 88 per cent and 90 per cent on No. 1, and this guarantee commands the increased price over those sold independently "orchard run."

It is the standardization, inspection and guarantee of quality and prices to the trade that has placed this industry on such a firm footing. That and the evolution of the standardized use and marketing of by-products.

In the last two days we have received inquiries from two different sections regarding the marketing of walnuts "orchard run" in Northern California. In reply it will be apparent why unprocessed or merely sulphured nuts, ungraded, do not command the prices that are obtained by co-operation, which can claim the credit of placing the walnut industry where it is today.

TO CALIFORNIA FRUIT GROWERS

You are careful about the bank with which you deposit your money. You carefully investigate the tractor or other farm implement before buying. You want to know all about the automobile you buy. These are all important.

You should investigate and understand the quality of the tree spray you use. There's one way to be sure, and that is the brand. It is a well-known name. Have you tried it before? Have your neighbors tried it? Has it proved successful? Altogether successful?

We maintain a bureau of information concerning orchard operations, especially spraying. Bulletins giving the best available information concerning the treatment of insects and tree diseases will be sent you on request.

Our entomologist, Mr. S. W. Foster, was for many years with the United States Bureau of Entomology, in close relation with the fruit growers of the Pacific Coast.

Your trees and your next year's crop depends largely upon the quality of the sprays you use this winter. It is too serious a matter to leave to chance. Use the recognized quality for the sake of security. Here is one place where looks don't count. The brand is the whole thing. Know the brand. ORCHARD BRAND tree sprays are sold all over America. They are the Acme of fruit tree sprays.

ORCHARD BRAND SPRAY MATERIALS

ORCHARD BRAND Lime Sulphur Solution.

ORCHARD BRAND and Prepared Bordeaux Mixture, for spraying peach trees and almond trees to control blight and shot-hole fungus are the standard tree sprays of the nation.

UNIVERSAL brand oil sprays, for spraying deciduous fruit trees during the winter season, are highly concentrated, and the only quality you would buy if you knew all the facts.

Let us repeat: It doesn't pay to take chances with tree sprays. Nothing is so important as to be sure about the effect, before you use them. Afterward, regrets won't save the crop.

Write us about your orchard, all about it. Tell us your troubles. Our orchard service is at your command.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Kern's Prune Orchards.

Some of the young prune orchards in the Delano district of Kern county have made such good growth that they are not only large enough but will bear some fruit at four years old. November 17 they were still carrying a lot of foliage of good color, laying up a store of vitality for the coming season. We liked the way they were headed—low—and there is plenty of good wood to choose from as thinning and opening up proceeds. New pumping plants are being installed in various places here. Electric power is being used.

Correction re Pear Root Louse.

E. A. Bolster, manager of the California Mountain Fruit Co., says: "My plans call for a douche of blackleaf 40 (as described in article appearing November 18 in the Pacific Rural Press); at the same time an application of commercial fertilizer to stimulate the tree. While I do not expect to eradicate the root louse, I am in hopes of controlling and possibly greatly discouraging it." Also, with complete returns now in on pears, the average price has dropped to approximately $2.70 a box.

Butte's Large Fruit Acreage.

Early Mills, County Horticultural Commissioner, reports his county as having 5765 acres of almonds, 867 acres apples, 165 acres figs, 1871 acres oranges, 5080 acres olives, 2224 acres peaches, 6430 prunes (bearing and non-bearing), besides pears, plums, walnuts, cherries, apricots, etc. Also 35,000 acres of rice and 500 acres of cotton. The farmer who doesn't keep a car in Butte county is getting to be rather distinguished and exclusive.

Federal Land Bank Operations.

During the month of October $7,580,736 were loaned to 3075 farmers in the United States by the Federal Land Banks on long-time first mortgages. Loans applied for at the Federal Land Bank at Berkeley during this month amount to $609,450. Loans applied for at the Berkeley institution from the time of organization number 3889, of which 3499 were approved.

High Priced Fruit.

We have just received a letter from a friend in England who has some Comice pears grown on Cordons and Espaliers. He has sold his crop at 50c per pear to a dealer who has put them in cold storage, expecting to double his money at Christmas. He says the Comice is the last word in pears.

Penalties for Pest Introduction.

The Federal Horticultural Board recently published a warning to travelers, explaining the heavy penalties against the unauthorized movement into this country of oranges and other fruits and certain vegetables liable to introduce pests to the danger of our own industries.

Riverside's Orange Crop.

Riverside county will have about 65 per cent of a crop of oranges. They are of excellent quality and well sugared, but are a little slow in coloring this season, owing probably to weather conditions. Some of the tests already run 10-1, according to Horticultural Commissioner D. D. Sharp.

Goleta's Walnut Shipments.

The California Walnut Growers' Association at Goleta, Santa Barbara county, shipped their first car of nuts on October 9. The week ending November 16, 14 cars of nuts were shipped—from 250 to 600 bags to a car. This section will ship about the same tonnage as last year—say 1200 tons.

Uprooting Wine Grapes.

Stearns Rancho Company at Wineville, in Riverside county, is taking out all its wine grapes. It will replant the ground with peaches, apricots, alfalfa, etc. The company gets all the water it wants at 40-50 feet deep. It has 2000 acres in wine grapes.

Spraying for Peach Blight.

Don't forget that first spraying for peach blight. Now is the time and not later than December 15. It is not necessary to wait until all the leaves are off or pruning is done. Do it now.

Smut Demonstrations.

W. L. Sweet, county agent of Butte county, reports that smut demonstrations are being held at the Farm Centers of the grain sections with a view of definite control of this fungus. Influenza has prevented the holding of indoor Farm Center meetings.

WINTER SPRAY FOR APPLES.

[Written for Pacific Rural Press.]

From many expressions of opinion by various growers in the Watsonville district it appears that crude oil emulsion will be more used for a dormant winter spray this year than lime-sulphur. From the time the leaves are off to the middle of February is the time to spray with crude oil emulsion to get the best results, also to be on the safe side against injury to the buds. If conditions of the soil or any other reason arises to prevent spraying till after this, lime-sulphur or miscible oil will be used. Fred Nohrden likes to get his crude oil spray on by the end of December. Rodgers Bros. use crude oil emulsion and lime-sulphur alternate years for a dormant spray—a system that is the safest and best so far as we know at present. Miscible oil will be largely used also in this district to kill out an infestation of leaf roller, which showed up to a damaging extent in some orchards around Watsonville this year.

MISCIBLE OIL FOR LEAF ROLLER.

Miscible oil is undoubtedly the best spray for leaf roller and is strongly recommended by Mr. Penny, the Horticultural Commissioner of Santa Cruz county. It is applied any time during the dormant stage of the trees and penetrates the egg masses, which are laid on the branches and trunks of the trees, and destroys the unhatched worm. The leaf roller hatches out just as the first cluster buds appear in the spring and begins at once to feed on them and later scars the fruit.

George P. Weldon, chief deputy of the State Commission of Horticulture, says that miscible oil for this pest is ahead of anything else that has been tried and its efficacy is no longer in question, and Mr. Weldon has probably carried out and followed experiments in commercial apple and pear orchards to a greater extent than any one man in the State. These leaf rollers also appear on apricots, as well as other trees, but we heard of no complaints in the 'cot orchards when we were there. As transportation is in such a chaotic condition owing to military necessities, it would be a good plan not to postpone ordering spray material until it is needed, or there may be annoying delay in delivery.

Fertilize Fertilize Fertilize

HAUSER'S ORGANIC FERTILIZERS

Blood, Bone and Tankage properly applied will increase your crop production. It's your patriotic duty to do this for bumper crops are necessary in Our Country's program of winning the War.

Pear Blight on the Apple

[Written for Pacific Rural Press.]

To the Editor: I send you a few twigs from Yellow Newtown Pippin trees. Is the dying of these twigs caused by drouth of the soil, which has been poorly cultivated during the last two seasons, or is it a blight similar to that which affects pears, etc.? Would a spraying be beneficial, and what would be the best formula? Or would one need to go to such severe measure as digging out the trees?—Reader, Paso Robles.

Answer by Prof. W. T. Horne, University of California.

Two of the twigs I find with a definite dying back, the outer part of the twig being dead and the lower part alive, with a clear line of separation between. Other twigs seem to be dried without any very definite symptoms of disease. On one of these twigs which is killed back from the end I find an exudation which is dried down like a little gum on the side of the twig. On examining this gum-like material I find that it is composed largely of minute granules, which, without any reasonable doubt, are bacteria.

This is a genuine case of pear blight on apple, since apple does not ordinarily produce gum as do the cherries and other stone fruits generally, but when a twig is attacked by pear blight very often some drops of sirupy material exude and in dry weather, harden down in this way. Accordingly I conclude that your trees have suffered with twig blight early in the season. At this time of the year pear blight is not ordinarily active and the dried up drops on the surface of the twigs are not of any importance because the bacterial have long since been killed by exposure to the light.

It is possible that the trees have suffered from drouth late in the season and the treatment for pear blight consists of cutting out all of the affected twigs and especially in finding the blighted areas in the limbs and trunks. The earlier method of treatment of the blighted areas in the limbs and trunks was to cut off all of the bark down to solid wood and to disinfect the wound with a solution of corrosive sublimate in water, one part to one thousand. More recently it has been suggested that the outer bark can be cut away, leaving a little of the inner bark and disinfecting this cut surface. With this treatment, where only the outer bark is affected by blight, the inner bark is left alive and soon grows a new outer bark and there is not the same amount of trouble from large wounds on the trees.

Although most of the blighted twigs are harmless, it is nevertheless a good idea to clip them out at this season or during the winter, since the blight remains alive in some of them. Wherever cutting is done the shears should be wiped off after making each cut with the same solution used for disinfection. The surface and knives and chisels used in the work should be frequently disinfected. Importance is attached to getting out the blighted spots on the trunks and limbs. This work can be done at any time during the fall or winter by taking a sharp gauge chisel and making a very slight cut into any suspicious piece of bark. Wherever the bark shows a watery and red-streaked condition, all the affected bark should be taken off down to the inner bark at least. In this way the sources of infection may be eliminated and the amount of blight greatly reduced.

You should endeavor to discourage very succulent growth in the early part of the season by avoiding heavy pruning or any other stimulating measures.

[The reader will, of course, notice that Professor Horne's recommendation that the trees may be saved is based upon the assumption that they will be regularly treated for the blight and the disease held continually in check. If this is not done, they may be a menace to the pear and apple planting in their whole district. Such neglected trees are the factories from which the bugs regularly draw their munitions for district devastation.—Editor.]

Crops Decreased by Over-Pruning

[Written for Pacific Rural Press.]

The reason for so many failures in large crops of prunes in most orchards is because of too much pruning, says George Hill of San Jose. He claims that in his eighteen years' experience in the Santa Clara Valley, when he planted his orchard, that other orchards, heavily pruned, were almost total failures every two or three years, while his orchards, unpruned other than cutting out a little dead wood if there should be any, and a few interfering branches, bore a heavy crop each year. His trees began to bear at five years old—fruit averaging fifties and sixties for the thirteen years. His trees are planted 22 feet apart. Mr. Hill has very good soil.

OVERBRUSHY TREES DETERIORATE.

The writer remembers a similar orchard which had this treatment, also on excellent soil. Up to fourteen years old it was producing heavy crops each year, which I believe averaged fifties to sixties. In 1912 there was a very heavy crop and practically all the little fruit was on the outside of the tree, which was by this time so dense with brush that practically no inside fruit-bearing wood was living. The fruit then ran in the hundreds and it was a very unprofitable year for my friend, as the fruit did not sugar up well and consequently a lot of it did not fall freely and had to be batted off the tree. Though this orchard for the past six years has been heavily and well pruned, it is only now coming back into good bearing shape again and has not been producing anything like as profitable crops since it got overbrushy, as an adjoining orchard on the same quality of land that has been kept in good trim right along. Neither are the trees in as good shape as the ones mentioned. It is better to

DO A LITTLE JUDICIOUS PRUNING RIGHT ALONG

to induce new, vigorous wood-growth and keep the tree open enough to bear some fruit inside as well as out, than to carry a mass of brush starving out all inside growth and which necessitates a lot of heavy pruning later, which is a shock to the tree and an aggravation to the grower. A lot of fine brush means, sooner or later, a lot of small prunes. On a 2½c base, which was about an average for the years 1904 to 1910, to the best of our recollection, one ton of fifties would be worth $80, while two tons of hundreds would be worth a total of $60, with more than twice the cost of picking and handling, besides an unprofitable demand on the vigor of the tree and depletion of the soil. We are working for

QUALITY RATHER THAN TONNAGE

in all classes of fruits and to attain this scientific methods of orchard management must be observed—in pruning, spraying, cultivation and fertilization. On good soil, tonnage and quality can both be obtained by the let-be method for some years, but it is poor policy in the end for reasons above stated. The writer will go further and say that not only in the Santa Clara Valley, but in all prune sections, orchards are deserving of more time and expense in the pruning and care of cuts and injuries than is awarded them. Especially those that have been giving such fine returns during the last few years.

PEDIGREED
Prune Trees

When you plant prune trees, plant the best—trees that will grow, and produce, and pay! We make it a practice to bud our prune trees from parent stock of proven productiveness and quality. The scions are carefully selected by trained experts and the budding is done in the most skillful and scientific way.

Horticultural Jottings

Seventy-five per cent of Watsonville's apricot crop is dried each year.

Eighty cents a sack was paid for picking up walnuts in Orange county this year.

Pajaro Valley has 72 evaporators and 50 packing houses, besides an enormous cider and vinegar plant.

B. M. Dennison of Tehachapi received $3,114 for one carload of pears shipped to New York recently.

Nine hundred nurserymen were registered by the State Horticultural Commission in California last year.

Santa Barbara county's production of walnuts will be about 2200 tons—averages about half a ton of nuts to the acre.

About 30 carloads of Washington navel oranges have been shipped from the Exeter district (Tulare county) up to November 23.

The navel orange packing season is on now at the Elderwood establishment in Tulare county and about two carloads a day are being packed.

Jerry A. Gullett, near Imperial, is reported to have sold $4,000 worth of honey from his apiary, which only covers one-fifteenth of an acre.

Horticultural Commissioner Buku of Kern county expects a large planting of peaches and Thompson Seedless raisins in his territory this season.

The Sierra Vista Packing Co. of Riverside will ship the first navel oranges to the East for the Thanksgiving market. The fruit is testing up well.

Five carloads of prunes have been shipped from Santa Rosa for the American expeditionary forces in France—250 tons in one week from this center.

Fruit evaporators saved hundreds of tons of prunes and raisins this year that could not be finished in the usual way owing to the extraordinary season.

The American Defense Society says that the supply of black walnut trees is rapidly diminishing and urges further plantings — seeds to be planted in November.

The 1918 production of walnuts in Greece is 667,160 pounds, and of almonds 3,385,800 pounds, as reported (on estimate) by the U. S. Consul General at Athens.

Twenty farmerettes are picking olives at the Rialto ranch of C. C. Moore and another group is picking oranges at San Fernando for the Citrus Growers' Cash Association.

G. W. Walters of Exeter reports a gross return of $14,000 from his 14-acre vineyard of Emperors. They have been selling at $3 a drum on the Eastern market this year.

The Edison orange men (Kern county) began picking on November 7 and have shipped a number of cars. There are 400 acres bearing in this district and 200 acres not yet bearing.

L. W. Pray of Oroville has five or six tons of olives from his young four-year-old grove near Oroville and is getting $135 a ton straight for them through the association—no frost clause.

Tree pruning demonstrations are being given in the fruit sections of Kings county, says Farm Adviser Wallace Sullivan, by Dr. J. C. Whitton of the pomological department of the University of California.

Porterville beemen, together with apiarists of Visalia and Tulare districts, will hold a beemen's institute in Visalia, beginning December 9. Courses will be given by experts from the U. S. Bureau of Entomology.

Four thousand five hundred carloads of oranges will be shipped from Pomona Valley this year. Two years ago 5000 cars were shipped, but quality and prices promise to make this a banner year for the crop.

The big increase in shipments of fruit from the Livingston district (Merced county) was largely due to the increased acreage of young fruit and vines coming into bearing. The shipping report for the four principal months, August 1 to November 1, shows 737 carloads of products shipped, as compared with 567 carloads for the same period last year.

Apple buyers from Los Angeles have bought most of the apples at Mokelumne Hill section, paying $40 a ton for fruit delivered at Valley Spring depot and furnishing boxes for packing. About 100 tons were sold.

It costs from $125 to $150 an acre to care for citrus orchards, according to Horticultural Commissioner D. D. Sharp of Riverside. This year the crop will average about two packed boxes of oranges to the tree in that section.

Next year the bearing walnut acreage will be swelled to about 3500 acres in the Goleta district of Santa Barbara county. The Santa Barbara Walnut Growers' Association has shipped 48 carloads of nuts to November 22.

Tehachapi has about 3500 acres in pears, mostly Bartletts, and 1500 acres of apples, comprising Jonathans, Ganos and Arkansas Blacks. Good transportation for fruit, also the highway between Tehachapi and Bakersfield, is in fine condition.

A. L. Lindquist of Goleta has 100 acres of Caucasia Seedling walnuts that produced a heavy crop this year. There is one seedling in the orchard that has an especially fine nut on, which will be used in experiments to be carried out in the near future.

The Earl Fruit Company of Lodi claims to have the honor of securing highest prices for grapes sold this season. They state that one car containing 1120 packages sold for $4,551 in Boston and another containing 930 packages sold for $2,917 in Cincinnati.

Blight control in the Reed pear orchards of Sacramento and Yuba counties was far more satisfactory this year than last, according to Hayward Reed. The most satisfactory control yet worked is to cut out the blight and spray the cut surfaces with Bordeaux mixture or lime-sulphur.

W. H. Schrader has half a dozen young sugar prune trees at his ranch near Los Gatos that are loaded with young green fruit as large as grapes. The early rains and subsequent warm weather induced an unseasonable blooming and setting of the fruit. Mr. Schrader brought a double handful of it to the office as evidence of the endeavours of his young trees to give two crops a year.

"THE BEAN IS THE BEST."

Clean Trees Bring in The Money

Messy, scaley trees have no vitality. The mess and scale sap the very life from the trees—the crops are small—and the fruit inferior.

But trees that are clean—and healthy—produce BIG! It costs less to spray—than to suffer the loss that results from not spraying.

Do the Work Right!

You must have a sprayer that will drive the material onto the trees under heavy pressure, so that the job is thoroughly done.

You must have a sprayer, too, that will work right along day in and day out without trouble. That's why you should get a Bean.

The land around Fresno is particularly well suited to the growing of fruit-bearing trees. Here both tree and fruit attain their highest perfection.

We exercise great care in the selection of our buds and our trees—"From the Roots Up"—can quite properly be called thoroughbreds.

Write to us—let us know just what you are thinking of planting, character of the soil, water, etc. We are always pleased to advise with intending planters.

The demand for trees will be heavy again this year, so we would suggest that you order early.

The Farmers' Part in Winning the War

[Written for Pacific Rural Press by Hon. Gifford Pinchot.]

I do not believe that the farmers of America begin to realize that what they have done is the greatest and most splendid patriotic service rendered by any class of our people in the great war. Without adequate labor, credit, or farm supplies, neglected by the Government, misunderstood and abused by the city press, nevertheless the farmers produced the food we had to have. When it seemed to those who really knew that human strength could not suffice, American farmers grew the two great crops without which we would have lost the war.

THREE GREAT ERRORS OF POLICY.

Their wonderful achievement was accomplished in the face of difficulties that were wholly unnecessary. Three great mistakes were made in dealing with food production while we were at war. The first was in giving our principal attention to the conservation of what food we had instead of to the production of more food. If even a small part of the effort and exhortation which have been devoted to saving food had been given to growing more food, there would have been vastly more food available, and most of the painful need for saving would have been done away.

The second mistake was in failing to make it possible for the farmer to get enough labor, farm supplies and credit to give him a reasonable chance to raise the crops the nation and the world required.

The third mistake was in excluding the farmer from partnership in the conduct of the war, and especially from that part of it which had to do with food supply. Yet according to the United States census a full half of all our people live in the country and in small villages and towns, which are for the most part dependent on farming for their prosperity, and which have the same interests and the same outlook as the farming communities which lie about them.

In spite of all these handicaps, the farmers went ahead and won out. There has been nothing finer outside of the conduct of our men at the front.

WHAT FARMERS STILL MUST DO.

Although the guns are silent at last, for the American farmers the war is not yet ended. They have been fighting the Germans by sending men abroad and raising food at home. But now that our own splendid boys, side by side with the wonderful fighters of our allies, have beaten the Germans itno submission, the farmers of America cannot lay down their fighting tools. Two great enemies are still to be defeated. One is world-famine, which can be prevented only if the farmers of the United States keep up their marvelous record. The other is the persistent refusal of common justice and a fair share in our Government to the men who feed us all.

FARMERS' DEMANDS ARE DISREGARDED

Our farmers have seen their Government advancing hundreds (if not thousands) of millions of dollars to help other industries, but not to help them. They have seen a limit set on the price of what they have to sell, but not on the price of what they have to buy. Their own problems were decided for them, and very often wrongly decided, without their being consulted. Their legitimate demands for a share in the management of the war, voiced again and again through the National Board of Farm Organizations, were persistently denied. But looking beyond the ignorance and shortsightedness of officials, in the presence of the nation's need, they forgot everything but their duty as Americans, and they brought to pass what seemed altogether impossible.

FARMERS NOT PROPERLY REPRESENTED

Every farmer knows that since the Civil War this nation has been managed by city men for the advantage of city people. Laws and policies have been, and are still, in city hands. For example: There are today in Congress 531 members in both Houses; and only eight of them even claim to be farmers. One-third of our people live on the farm; and all of our people are dependent on the farm; yet only one and one-half per cent of our lawmakers are farmers.

It goes without saying that the farmers of America have no desire to deprive other classes in our population of the proper influence and just representation which is their due. Conditions which are unfair in the case of the farmers would be equally unfair if applied to others.

Every farmer knows that ever since the Civil War what the Government has done to help the farmer has been done still more to help the city man. Even in the matter of food production, the city man's point of view has been in control. What the city man wanted was cheap food. Therefore, what was done for the farmer was directed almost without exception toward helping or inducing him to grow cheap food. But what the farmer got for himself and his wife and family out of what he produced was a wholly different matter.

FARMERS SHOULD PLAN RECONSTRUCTION.

All this is wrong and ought to stop. That is why the National Board of Farm Organizations has undertaken, through its nation-wide Agricultural Reconstruction Committee, to find out just what the farmers of America believe they are entitled to in the reconstruction after the war. To find out just what you want is the first step toward getting it. When a farmers' plan of reconstruction, thus formulated, has been criticised, corrected and adopted by the organized farmers of America, there will be a real chance that justice for the farmer can be brought out of the great changes which must follow the conclusion of peace.

Guard your harness against decay

When the natural oils in your harness dry out, decay sets in. Dust, sweat and moisture attack the leather fiber and cause rot. Eureka Harness Oil takes the place of the natural oil and preserves the leather. Keeps harness strong, flexible and jet black. No animal oil in "Eureka"; rats, mice and other rodents dislike it and won't gnaw harness dressed with

EUREKA HARNESS OIL

J.I.CASE PLOWS

IN J. I. Case Tractor Plows the "drag" of furrow bottom and land slide pressure has been eliminated. All the weight of the frame is carried on J. I. Case dust-proof, easy-lubricating, long-distance wheels.

That's why this Tractor plow "rides" like a wheeled vehicle instead of dragging like a stone boat. That's also why more acres per day and deeper plowing are possible—and extreme fuel economy is attained.

In addition, the J. I. Case Tractor plow is easily handled from the seat of the tractor; has a simple, sturdy power lift; and enters and leaves the ground instantly, points first, like a walking plow. Thus less labor is required and a more uniform quality of work is done. The Tractor is made a more profitable investment.

See your J. I. Case dealer today. He is a dealer who will justify your faith as well as ours.

J. I. CASE
Horse Drawn Plows
Sulky, Gang, Walker models. World's lightest draft. Flexible beam and "floating" bottom insure uniform penetration and prevent snares from breaking. Strong, dependable, convenient.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Small White Bean for Delta.

The white "Boston pea bean" may take precedence over other whites grown in the Sacramento-San Joaquin delta as "bluepods" have over the small whites formerly grown on the Coast from Monterey to Santa Barbara counties. They are about the same size as small whites, but rounder. They are very prolific and do not shell out so badly as other pea beans, according to H. L. Pabst of Rindge & Pabst, who have been growing them experimentally in the delta. Since the first bag of seed was obtained from the East four years ago, seed have been selected in the field from earliest maturing, most prolific plants. This year about four acres were planted, but two of them were on so much alkali that they did not yield well. From the other two acres 40 sacks of 90 pounds each were threshed. They are ready to thresh early in September if planted at the proper time.

Bean Straw Fertilizer.

To the Editor: Will bean straw plowed under six inches deep benefit the next crop of beans on the same land next year?—J. T., Soledad.

[Bean straw is high in nitrogen and humus, both of which will be available for the next crop if plowed under thoroughly and if enough moisture comes to rot them before dry weather comes. If the vines are diseased as with rust, there is danger of carrying the disease over. If this year's crop showed no sign of disease, and if the vines can be rotted this winter, it is the poorest kind of farming to burn them. The best way, if feasible, is to feed them to cattle along with other roughage and spread the manure on the land.

Doesn't Plow Bean Vines Under.

No bean vines are plowed under by S. O. Pugh on his Monterey county hillside ranch for the reason that in two-thirds of the seasons not enough rain falls to rot them before summer. Then they hold the soil so loose that it dries excessively. This, together with the trouble of plowing them under, counter-balances in his estimation whatever fertility and humus the vines would add. He feeds the vines to cattle if they are good and, burns them in a year like this when they are spoiled.

Butter Beans in California.

Do you remember the butter beans of the Eastern States? They are pole beans, flavorous and rich to cook after drying, and fine to shell just before maturity, or to cook pods-and-all while green. The beans are about an inch long, plumper and longer in proportion than our limas. A. McCall of Santa Cruz county grew 110 pounds of them on a moist spot sixteen feet square last season. He planted them one bean in a place about a foot apart after frost danger was past. No poles were used.

Helping the Barley Market.

The barley market would be considerably improved if lots of people could do as G. W. Streeter and H. W. Hosmer of Sonoma county are doing. When they called at our office recently they had bought 65 hogs and were going out to buy 85 more, along with enough barley to feed them. They reported that it was not hard to find the hogs and they believed that cheap barley and high-priced pork make a winning combination for those who bring them together.

Government Bean Buying Starts.

The Government has been buying moderate quantities of all varieties of beans, according to H. Clay Miller of the Food Administration. Its needs are filled temporarily, but more will be bought later. Efforts are being made to relieve the bean growers' predicament and to keep prices at a fair level. The beans already bought were at the "common market prices," each lot having been offered at whatever the seller figured would move them.

Buying Barley for Pigs.

N. P. Mascovich of Kern county thought he was unlucky when a lot of his sows showed up too piggy to sell for pork. Those pigs are coming now and Mr. Mascovich is buying cheap barley to feed them. He now thinks he was lucky, for when all the pigs have come he will have about 1000 head. They will convert a lot of cheap barley into fair-priced pork.

How to Use Moldy Corn.

Several subscribers report that they had milo, kafir and other corns damaged by rain, and ask if it can be fed safely to horses, cows, hogs, sheep or poultry.

We would not advise feeding it to any stock except hogs, as it would be apt to cause serious digestive troubles. But it can be fed to hogs without any bad results, although the feeding value will be about doubled if it is ground.

Rains Hurt Rice But Little.

Rains had not damaged the rice crop materially up to November 21, according to a letter of that date from Secretary Frank B. Durkee of the Chico Chamber of Commerce. Most of the rice had been cut and a large part of it threshed.

Cleveland Tractor

Serviceable the year 'round

The Cleveland Tractor is serviceable *every season of the year.*

It is an all-purpose machine.

When winter weather or crop conditions make the Cleveland unnecessary in the field *its usefulness in other lines of work begins.*

It is tractor and stationary engine in one. It will saw wood, pump, drag logs, haul grading or road-making machinery and do practically everything formerly done during the winter months with horses and stationary engines.

The Cleveland lays down its own tracks, travels on them and picks them up again like the famous battle "tanks." It will go practically anywhere—over rough uneven ground, on the side hill or over soft plowed fields.

A traction surface of 600 square inches with a weight of less than 3200 pounds *effectively prevents the Cleveland from packing the soil.*

You can house the Cleveland in less space than is required for one horse. But in spite of its small size it develops 12 horsepower at the drawbar and 20 at the pulley for stationary work.

Under medium soil conditions the Cleveland Tractor plows 3½ miles an hour with two fourteen inch bottoms. This is eight to ten acres a day—equal to the work of three good three-horse teams and three men.

It burns either kerosene or gasoline.

Don't wait till spring to get your Cleveland Tractor. Order it *now* and get the full advantage of its all-purpose, all-season ability *this winter*—and be prepared for the first field work of early spring.

Write for descriptive matter and name of the nearest Cleveland dealer.

Rice Harvest Shows Wonderful Progress

[Written for Pacific Rural Press by R. E. Hodges.]

Thirty bags of paddy rice per acre as the average of 125,000 acres planted to that crop in California this year; and a price of $4.32 per hundred pounds for the No. 1 grade are plenty of reason for the enormously increased acreage to be planted to rice next year, as stated by Executive Secretary C. H. Merry of the California Rice Growers' Association. The crop now being harvested is estimated at 3,750,000 bags, after figuring on the loss of about 15,000 acres abandoned partly on account of water shortage and partly due to water grass. The 1918 crop is a million bags more than last year's. Harvest will be over about the first week in December. The rice is of especially good quality in spite of the temporary water shortage, which was expected to result in shriveled kernels, and in spite of the cool weather, which last spring was expected to cause poor germination and later on was expected to slow up the growth and delay maturity too long. The Japanese types, according to Mr. Merry, are supposed to need a great deal of hot weather; but they stand shortage of water better than the Honduras types.

In acreage grown, Butte county, the first to grow rice and for several years the leader in California, stands third this year. Glenn leads with 45,500 acres; Colusa has 37,000 acres; Butte 35,000; Yolo 15,000; Yuba 4000; Sutter 3500, and the San Joaquin Valley about 7000. The San Joaquin has this year emerged from the experimental stage, having proved herself as well adapted to rice as the Sacramento Valley. Stanislaus is the principal San Joaquin Valley rice county, with Merced second and Kern third. There is practically none in Kings and Tulare. Miller & Lux have 1500 acres in Fresno county.

New mills in California have added a capacity of 16,000 bags per 24 hours, and enlargements on mills previously run add 4000 bags more. The total capacity of the 12 or 15 mills in California is stated as 52,970 bags per 24 hours. The California State Rice Milling Co. already plans to double its present 6000-bag capacity in time to handle the 1919 crop. This company represents an investment of $400,000 of southern capital, being a branch of the biggest rice milling company in the United States—the Louisiana State Rice Milling Co., which has $10,000,000 capital.

Rice growers of 1916 and 1917 will not soon forget what was happening to them until the California Rice Growers' Association induced Louisiana millers to buy in California, bringing prices up to a living level . This year the price is fixed by agreement with the Food Administration; but next year it is not at all likely that the Food Administration will be in existence, and every man will have to sell at whatever he can get, unless the association exerts a powerful enough influence to hold prices to profitable levels. There is great likelihood next year of heavy importations from the Orient at Oriental prices, and the association will need all the support of a great majority of growers in order to accomplish its benefits to the industry in California. Growers are already realizing this, as shown by the great increase in association membership. On October 25, 1918, the association had 315 members, controlling 61,470 acres, as against 213 members, controlling 34,496, at the corresponding time last year. Along with this increased strength is also coming a realization on the part of both growers and millers that the business of both will be greatly advantaged by greater harmony between them.

MILO, GYP, KAFIR, ETC.

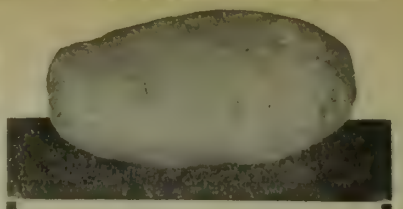
[Written for Pacific Rural Press.]

The market for sorghum grains, including milo, kafir, gyp, feterita, and similar crops is practically at a standstill, according to John M. Perry of Stockton, director of the State Agricultural Society, due to the cheapness of grains which may be substituted for them. Large quantities of weevily Australian wheat has been preferred for chicken feed and has sold at only three cents per pound. Good wheat also is available for chicken feed now. Barley, which is practically interchangeable with sorghum grains for livestock feed, has been still lower. The quality of a great deal of the late white sorghums was badly damaged by the fall rains; and despite all the recleaning possible there is a considerable percentage of discolored grains of practically no value. While the recleaned grain will probably not spoil further, there is a great deal that will continue to deteriorate. No more of the sorghum grains are to be milled as substitutes for wheat flour.

A considerable proportion of the crop will never be threshed, but is being fed in the head as usual. A great deal is sold from grower direct to consumer. Not enough of the sorghum grain crop is sold through dealers to give them much of a basis for estimation of total tonnage, but George H. McLeod of the Sperry Flour Co. believes that this year's California crop is between 75,000 and 100,000 tons, principally milo grown in Imperial and Tulare counties. As much of this milo is of early maturity, probably half of the crop has been sold by the growers either to dealers or consumers during the past two and a half months. The opening of a market for sorghum grains will come when the inferior wheat for chicken feed has been used up and when chicken men will have to pay so much higher price for the better grades that they will turn to the sorghums instead.

WAS NOT THAT TOO MUCH MILO?

To the Editor: I noticed in your issue of November 16 a report from C. E. C. of Van Nuys that he had grown 18,000 pounds of cured milo maize to the acre. My neighbor has a piece of ground that was idle for three years for want of water and he had put a heavy coat of hen droppings on it, and this year had all the water he could use from my well, and he claims he grew 6000 pounds to the acre of cured grain. I think our Van Nuys friend, to get 18,000 pounds, must have beat the scales or dug it out by the roots and took lots of dirt with it. That land would surely grow great pole beans if he could get a ladder long enough to pick them.—D. B., Earlimart.



Blue-Flowered

White Rose

Seed Potatoes

Just in—first carload of the season—genuine Oregon-grown blue-flowered White Rose Seed Potatoes. Best early variety.

True to name. Free from disease. Hill-selected.

Uniformly large, smooth-skinned, choice quality. Write for prices and Potato Catalog.

TRACTOR PLOW

Agricultura Notes

About 25,000 acres of Indian corn were planted in San Joaquin county this year.

The pumpkin and squash season is at hand. They are moving freely and at good prices.

The celery acreage in California for the season of 1918-19 is 3000 instead of 300, as misprinted in our issue of November 23.

Potato warts, a disease coming from Europe and first appearing in this country in Pennsylvania, has invaded California.

The Sutter Basin Co. proposes to plant 6500 acres of new land to rice next year, irrigating by gravity and pumps from the river.

Mandeville Island potatoes are bringing $2.25 f. o. b. ranch landings, while delta potatoes in general are bringing about $2.

A production of 3,750,000 sacks of rice in the Sacramento Valley is forecast. This is more than 36 per cent greater than last year's result.

Potatoes left in delta soil after New Year's are likely to get waterlogged, according to a well-known dealer, though they are safer on the higher lands.

Restrictions on the shipment of cotton from the United States except to enemy countries and to the northern European neutrals have been removed.

A specific act of Congress provides that 25 per cent of all National Forest receipts be returned to the counties within which the forests are located.

The rainstorm throughout the State this week brought more than six inches of snow to the summit of the Sierra Nevadas. Snow is still falling at this writing.

New crop Kotenashi beans, which correspond to our small whites, are now coming into the Japanese markets and will reach Pacific Coast markets about New Year's.

Members of the California Lima Bean Growers' Association will receive checks amounting to $2,000,000 as partial payment for beans delivered to warehouses during October.

A letter recently received by a San Francisco company from the Food Administration headquarters in New York says that the Government is in the market for beans from time to time and will be glad to get offers.

Cotton ginned prior to November 14 amounted to 8,681,005 running bales, including 127,812 round bales, 6873 bales of American Egyptian and 24,145 bales of Sea Island, the Census Bureau has announced. Ginnings by States include: Arizona, 13,226; California, 25,013.

Beans grown on 582 acres that had been growing hemp two years in the San Joaquin delta required only 25 per cent as much hoeing as where hemp had not been grown, according to H. L. Pabst of Rindge & Pabst. Hemp had shaded the ground so weeds were smothered out.

One thousand acres of rice in Stanislaus county, valued at $135,000, were saved by water secured through a survey made by a county agent, showing the imperative need of more water, and presented at a special meeting of the County Council of Defense.

The California Packing Corporation has under lease 800 acres located on the Sacramento Northern Railroad, between Beatrice and Marty station, in Yolo county. The entire 800 acres will be planted to onions, asparagus, carrots, tomatoes and other truck, and the crops hauled to Sacramento canneries and prepared for local and Eastern markets.

A. E. Way is scheduled to conduct a series of vine pruning demonstrations in various parts of Fresno county under the auspices of the Fresno County Farm Bureau, beginning December 9. Also Professor J. C. Whitton of the University of California will conduct a series of orchard meetings at which the chief subject will be pruning—in the same county. Both demonstrations will be followed with small group meetings throughout December and February.

The prosperity of an agricultural district is measured by the intelligence of its seedsmen.

A Progressive Seed House is a great asset to any agricultural community.

The Aggeler & Musser Seed Co. is such a seed house.

It is *The Seed House of and for the Great Southwest.*

This seed house has never slept since its incorporation in 1896. What it has done for the development of the Great Southwest ranks equally, or probably more, than any other of the many enormous industries.

Southern California is famous the world over for its fine vegetables—

Because the Aggeler & Musser Seed Company brought to the growers the seeds of these fine vegetables and educated the growers when and how to grow them.

Aggeler & Musser Seed Company have pursued the theory that there is some line of vegetation suited to each and every condition of soil and climate, and systematically went about to discover that vegetation, and systematically educated the grower how to plant, when to plant and where to plant each particular vegetable to attain success.

Their latest enterprise is the introduction of Grasses and Forage for the vast range lands that are now unproductive.

At their booth in the Agricultural Building, Liberty Fair Exhibition Grounds, you may see samples of Grasses, Sorghums, and Millets suitable for every condition of soil and climate.

Do not fail to see it, it may open some valuable suggestion to you.

Always on the alert for something better, some aid to agriculture, Aggeler & Musser Seed Company endeavored to grow potato seed perfectly free from disease, with only partial success; therefore, to make success complete, they have installed a large vat for the purpose of dipping all potato seed into a solution of Corrosive Sublimate, which will destroy the diseases of scale and Rhizoctonia, making clean seed, which will produce more and better potatoes. This innovation is a great boon to growers in Southern California, where it is so much needed.

The growth of the Aggeler & Musser Seed Company has necessitated larger quarters. They are now installed in their new store in the Meredith Building, 620 South Spring street. The retail department on the first floor, the offices on the second floor, and the mail order department on the second and third floors. Their mill and warehouse is at Sixth and Alameda.

Be sure to write for their catalog and remember the new address.

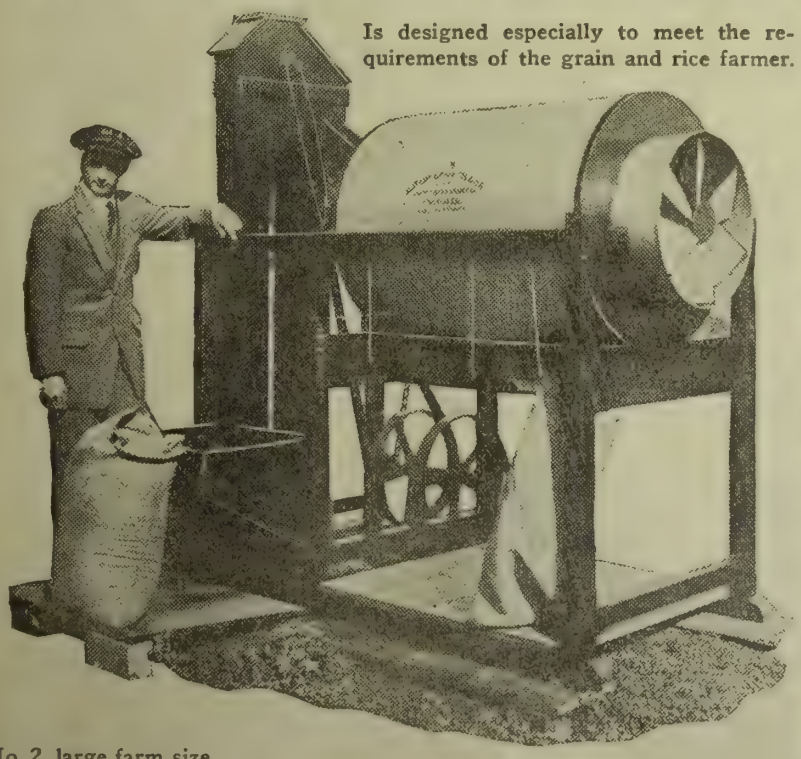
ROTARY GRAIN CLEANER

Is designed especially to meet the requirements of the grain and rice farmer.



No. 2, large farm size.
Capacity two tons per hour.
Latest improvement in grain cleaner line.
It has a principle all its own.
A new invention that has no equal for selecting the best seed for planting.
Cleans Wheat, Barley, Oats, Rice and Kaffir Corn.
Cleans thoroughly and quickly; is simple in principle and durable in construction.
A 2-H.-P. gasoline engine is all the power necessary to run it under full load.

Manufactured by

GRAVITY GRAIN GRADER COMPANY

28 N. East Street Stockton, California

The owners of one of the biggest ranches in the Southwest wanted the best Hairy Peruvian alfalfa seed that money could buy. They bought Germain's—the proven strain—five big truckloads—25 tons!

We've just published a large illustrated folder entitled "The Truth About Germain's Proven Hairy Peruvian Alfalfa Seed." It contains a photograph of the 50,000-pound order. Write or call for this free folder today.

The supply of Germain's "proven strain" is going fast. Better place your order now.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

LONG HITCH FOR TRACTOR PLOWS.

With a horizontal hitch from tractor to plow, several feet greater distance between them has great advantages and it does not increase the draft, says Prof. J. B. Davidson of University Farm. With a sloping hitch, it might make a difference because it would change the angle from drawbar to plow hitch. With a long horizontal hitch you can plow a straighter, more even furrow, because slight variations in steering the tractor do not affect the plow appreciably. In plowing around a sidehill there is a special advantage in a long hitch. There is a tendency for the tractor to creep sidewise down hill and it is necessary, therefore, to keep it pointed at an angle up hill from the furrow. Tractors have turned over on steep hills after sliding sidewise into the furrows. With a longer hitch the tractor can be kept on firm ground at a greater distance from the crumbly edge of the furrow and will not creep so much nor slide into the furrow with resultant difficulties. It makes steering easier, and while it increases the pull on the drawbar slightly, it actually decreases the power used, on account of the firmer footing. The chief objection to a long hitch is where frequent turns are made, as in orchard and vineyard work; but on straightaway plowing the long hitch makes a better job with no increase in power used.

WHY NEW TRACTORS NEED NEW OIL FREQUENTLY.

Castings used in interior parts of tractors are cleaned of the sand used in their molds not only by rolling over and over in a cast-iron barrel with flint rocks, but also by use of the sand blast. But it is impossible to get all the sand and scale off in those ways. When the castings are put to work in the crank case of an engine, the constant vibration, the shock of explosions, and the repeated expansion and contraction work them loose. They drop into the oil, and, being harder than the cylinder walls, will dig big scores if they happen to get between the pistons and walls. It is on account of this scaling and dropping of molders' sand that the oil should be removed every day from the crank case of a new tractor. It may be strained through several thicknesses of cheesecloth after settling a day or two and used repeatedly. Of course, this is in addition to the extra need of oil on new tractors due to the rubbing surfaces not having been worn precisely smooth and therefore causing greater friction than after they have been in use awhile.

HORSE TOOLS FOR TRACTORS.

"Success with tractors depends to a large extent on the kind of implements used with them," said Prof. J. B. Davidson in a lecture at the University Farm Tractor Short Course, November 21. Horse implements have not generally proved highly satisfactory, though the amount of work to be done may not always justify the expense of specially built tractor implements until the horse implements are worn out.

As tractors are designed to save labor, small ones need implements which can be operated by the driver from the front end rather than from the rear as with horse-drawn implements. If an extra man is required to tend them, the labor-saving purpose of the tractor is defeated. With larger tractors enough plows are used to justify the expense of a special man to attend to them. Here also horse implements are not satisfactory because they are not built strong enough to do the better work which a tractor is capable of doing.

PUMP PERMITTED COVER-CROP TO ATTRACT INSECTS.

An Oregon vetch cover-crop in 70 acres of bearing prune trees in Sonoma county seemed to be the reason thrips and red spider did not bother that orchard, while they were thick in surrounding orchards, according to H. W. Hosmer. The vetch was planted last fall after the first rain. A $5,000 pumping plant was installed during the winter. This permitted Mr. Hosmer to delay plowing until after May 15. While no thrips were noticed on the cover-crop, search was made for them in the prune blossoms, but none were found. Red spider, however, became so thick on the cover-crop that some of it was killed, while hardly any were to be found on the trees. G. W. Streeter, also of Sonoma county, found tent caterpillars far more attracted to the vetch than to the trees.

A big four-horse drayage truck got stuck recently on Market street in San Francisco because the horses could not get secure footing on the slippery streets. A motor truck came along, backed up against the rear end of the horse outfit and gave it a generous start.

Potato Outlook Rather Hopeful

[Written for Pacific Rural Press by R. E. Hodges.]

What about the potato market? Read these facts and judge for yourself. The normal world crop is around 6,000,000,000 bushels, according to the best figures we have obtained. Germany has normally produced one-third of these, but she didn't do it last season. Her crop, however, has recently been largely used for alcohol and has not affected the market for edible potatoes as figures would indicate. European Russia normally produces 1,000,000,000 bushels, but she is reported hungry. Austria-Hungary normally produces 600,000,000 bushels, but she didn't do it last season. France normally produces half a billion bushels, but her women had to do a large part of the farm work last season. Great Britain normally produces 300,000,000 bushels. The United States is credited with 450,000,000 bushels in the same set of figures. Last season the United States produced 390,101,000 bushels, a decrease of 52,435,000 from the crop of 1917, according to the U. S. Bureau of Crop Estimates. The principal producing States are Maine, whose 22,400,000 bushel crop represents an increase of 2,150,000 bushels over last year; New York, whose 1918 crop is estimated at 33,712,000 bushels, a decrease of 4,288,000 bushels; Pennsylvania, whose 23,180,000 bushels are 6,352,000 less than in 1917; Michigan, whose crop decreased 7,350,000 bushels to a 1918 total of 28,560,000; Wisconsin, with 32,482,000 or 2,516,000 less than last year, and Minnesota, whose crop decreased 1,344,000 bushels to a total of 32,256,000. The California crop is now estimated at 12,555,000 bushels, a decrease of 1,345,000 bushels. We do not have at hand the corresponding figures for Oregon, Washington, Idaho, Nevada, and Colorado, which are California's chief competitors; but we have the following information balanced up from the statements of potato dealers: The Idaho crop is about normal; the Oregon crop less than normal; Washington about normal; Colorado about normal; Nevada about normal.

POTATO PRICES.

Potatoes are about the most "fluid" produce in the world, according to Mallory E. Enos of the Ennis-Brown Co., one of the largest potato dealers on the Coast. He meant that whenever the price in one locality gets above that in another locality enough to more than pay the difference in freight potatoes would flow to the high-priced market until its prices were leveled down.

California potato prices have been higher than elsewhere, and perhaps justifiably so on account of the cost of production. This is rather high for two reasons: Our yield per acre of marketable stock averages low, and where most of our potatoes are grown they are the chief crop. In

TRACFORD

$185.00
F. O. B.
San Francisco
Ideal for Vineyards. At a small cost you can cut your Ford down to 3 feet wide and shorten to 48-in. wheelbase, for 8-ft. row vineyards. Will do as much work in a day as two two-horse teams.

$185.00
F. O. B.
San Francisco
Ideal for Orchards. Will pull any implement that four horses can successfully handle. The most economical implement made for the farm.

An attachment for converting any Non-floating axle automobile into an economical or horse-power Tractor.

Beginning the Third Year. TRACFORDS Everywhere. Every User a Satisfied Owner. Immediate Deliveries. Complete with Large Cooling and Five Roller Pinions.

HOW MANY ACRES CAN BE PLOWED WITH THE TRACFORD IN A WORKING DAY OF TEN HOURS?

This depends upon the width of cut. Pulling a two-bottom, twelve-inch plow, from four to five acres a day can be plowed.

WHAT IS THE WORKING LIFE OF THE TRACFORD?

It is practically indestructible. The side members are constructed of four-inch channel steel. The wheels of the TRACFORD run on a one and fifteen-sixteenths-inch solid steel dead axle, which carries the entire weight of the Ford, and to which the Ford frame is bolted. The Tracford wheel has a ten-inch face, equipped with angle iron lugs for field work, and is fitted with large grease cups, which thoroughly lubricate wheel, bearing and axle, sufficient for a full day's work.

IS THE CAR RUN ON LOW GEAR WHILE WORKING?

Never. It is run exactly as on the road. Low gear is reserved entirely for starting and for making unusual pulls of short duration. Wherever we say that the TRACFORD will do this work and that work, we mean that it will do it on HIGH GEAR. Any attachment which necessitates running a Ford car on low gear is not practical.

HOW MUCH GASOLINE WILL THE TRACFORD CONSUME?

About one gallon an hour. This depends on the work that is being done and the adjustment of the Ford car to which the TRACFORD is attached.

HOW MUCH OIL WILL THE TRACFORD REQUIRE?

About the same amount per hour that the Ford to which the TRACFORD is attached will require for steady road work.

the Northwest and in Colorado potatoes are a sort of side line on many scattered ranches, often fitting into a rotation, so their demands for labor are not so trying on the general labor situation at certain seasons nor so expensive as in specialized potato districts.

Mr. Enos notes that several hundred carloads of Idahoes have already come to California this season, with only an estimated 40 per cent of the crop moved. These are Rural New Yorkers and Netted Gems principally, and because of their boiling to pieces when cooked that way they do not seriously conflict with California "River" Burbanks, which do not boil to pieces. The Colorado crop of Downing, Brown Beauty, Pearl, Russett Burbanks, etc., is about half moved already. Nevadas are just starting to come, but the Washington and Oregon Burbanks, being later, are not yet moved in any quantity. Oregon sales are being made at $1.25 to $1.35 to the growers and Nevada potatoes are bringing as high as $1.50 to $1.60, according to a large buyer. One dealer remarks with some feeling that Northwestern growers are storing for the higher prices that are expected after January 1, but that they will get "bumped" not only by lower markets but also by rotting, shriveling, freezing, etc., in storage. Mr. Enos believes that when the Washington and Oregon potatoes do start they will not depress California markets greatly because the latter are now at rock bottom, the price of $2 per cental f. o. b. ranch landings being very close to the cost of production. This hope might seem to be justified also by the national and world shortage of potatoes this year.

WESTERN QUALITY IS FINE.

Whether potatoes will spoil in storage to any extent is questionable, for the Western crop as a whole is of exceptionally fine quality and freedom from disease. Idaho storage is generally in frost-proof cellars. Washington potatoes are stored largely in pits. Oregon growers store in the dry and California delta growers may safely leave their potatoes in the ground until New Year's.

DELTA CROP AND CONDITIONS.

As the Sacramento-San Joaquin delta produces most of the California crop, Mr. Enos' observations on its condition will be interesting. The acreage is estimated to be 20 per cent less than last year. The yield is very satisfactory in general, being probably 10 per cent better on the new lands than last year and about the same as last year on the old lands. "New lands" are defined as those which have been reclaimed within six or eight years and properly rotated with other crops. Their yield is averaged at about 160 sacks per acre. Seventy-five sacks is a good average on the old soil, and the quality is not so good where potatoes have been grown many years in succession. About half of the acreage this year is on "new land." The loss by fall rains has been only nominal, and there is very little disease in the present crop. The only serious disease has been the wilt, which has already developed in "leaky" potatoes and they have been sorted out. About half of the crop has been dug, and most of the rest will be out of the ground by New Year's.

POWER NOTES.

All war-time restrictions and regulations regarding highway building were removed November 14 by the U. S. Highways Council. Better roads and more of them mean more motor trucks and automobiles, which mean quicker transportation of freight and people.

The C. L. Best Gas Tractor Co. has recently appointed new dealers for its Sacramento territory north of San Joaquin county. They are M. K. Grant and Chas. H. Manning, both long identified with the Best company. They report the sale of about ten 75s and twenty 40s since the new arrangement went into effect.

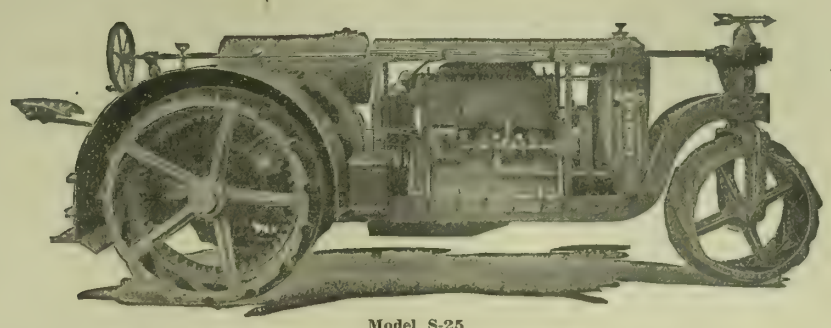
GMC TRACTORS SIEVE-GRIP GMC TRACTORS

Tractor



Model S-25

Simplicity, dominant feature of the **GMC SAMSON SIEVE-GRIP TRACTOR,** goes hand in hand with efficiency. Correct design and few and accessible working parts assure low up-keep cost and long life to the **GMC SAMSON SIEVE-GRIP TRACTOR.**

Thousands of owners testify that where the **GMC SAMSON SIEVE-GRIP TRACTOR** goes the farmer's trouble ceases. This is its record for nearly two decades of trying service here and in far corners of the earth.

Mere youths are successful operators of the **GMC SAMSON SIEVE-GRIP TRACTOR, and in the emergency, even women have proved equal to the task.**

The **GMC SAMSON SIEVE-GRIP TRACTOR** performs tasks requiring the power of ten horses and does the work better, faster and cheaper than any other power. It is also adapted for many farm labors for which horses are unsuited.

The **GMC SAMSON SIEVE-GRIP TRACTOR** is simplicity itself.

Further information is furnished by our illustrated booklet, Better Farming.

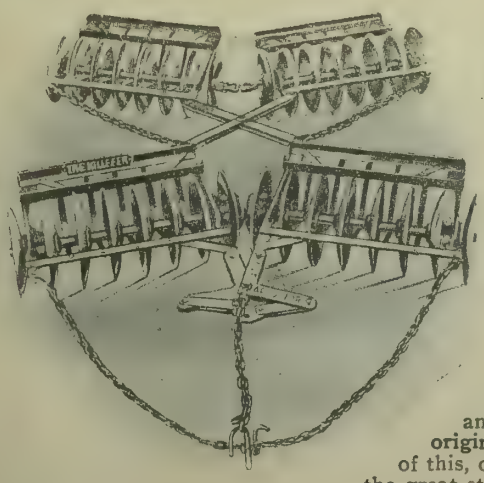
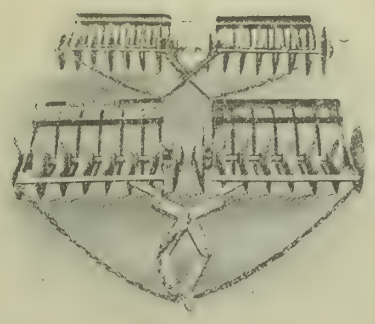
The KILLEFER
AUTOMATIC
Double-Disc Harrow





Automatically Straightened

The small cut shows the Automatic Double-Disc Harrow, automatically straightened. To accomplish this, the tractor is backed up until the hook on the draw chains can be placed in the hole on the front end of the adjusting swivel; then, by going ahead about 18 inches, the disc is drawn straight. To set for working position again, pull out the hook and go ahead. This can all be done by the driver from the seat of most tractors.

Without A Doubt

this is the most important development to be made in the manufacture of farm tools to date. This is the **only Automatic Double-Disc Harrow** on the market. It was designed and built in our own shops, completely; we are, therefore, the **originators** and have it **fully covered by patents.** In the development of this, our latest triumph in **Disc Harrows,** we have not only maintained the great strength and durability as originally designed, but have added two additional most valuable features, namely, our **Automatic Shifting Device;** controlled by the operator from the seat of his tractor, and a **greater flexibility,** so desirable in a **tractor Disc Harrow,** but not found in other makes.

This Harrow is built in all sizes from 5 to 12 feet, inclusive.

Purebred Stock Sales a Specialty

Sales Conducted in All Parts of California.

Ben A. Rhoades, Auctioneer

1501-3-5 So. Main St. Los Angeles, Cal.

J. Henry Meyer has recently purchased from William Hunter, Freeman, Ontario, Canada, the imported yearling Ayrshire bull, Holehouse Secretary, to head his herd at Watsonville. He is sired by Netherton Viceroy and out of Holehouse Nancy 6th, with a Scottish record of 11,370 pounds milk testing 3.87 per cent. His paternal grandsire is Brae Rising Star, champion of Scotland for three years. Canadian authorities state that this young bull is one of the best that ever left Scotland.

What Can the Farm Bureau Do to Enforce Marketing?

Written for Pacific Rural Press by H. J. Baade, Farm Advisor, Napa

The fat hog auction sale conducted by the Napa County Farm Bureau at St. Helena, Saturday, November 16, was a failure. The farmers lost money on the undertaking. It appears that several reasons can be given for such an unfortunate outcome. First, the packers failed to send buyers; second, the market is on the decline; third, the wrong day of the week had been selected for the sale.

The first condition was the one most feared by the committee in charge. In order that the packers might be notified in ample time, the packing concerns operating in the San Francisco bay region were written to by the auction sale committee, November 4. They were told that 200 or more grain-fed hogs would be offered for sale on November 16 at St. Helena and each firm was invited to send a buyer. On Wednesday, November 13, a member of the livestock committee of the Food Administration was called by telephone. He was told that the committee felt uneasy as to the buyers appearing at the sale. He agreed to take the matter in hand and notify the packers to attend the sale. Both letters and personal solicitation failed to bring the buyers.

The declining market is a condition for which no one is to be blamed. We are all glad to enjoy the sunbeams of a world peace and the return of normal conditions with normal prices.

As to the selection of Saturday for the day of this sale: Saturday has been the day of many of the successful sales in the State. It is convenient for the farmer and a satisfactory day for a sale, providing buyers are present. If, however, buyers are absent and it becomes necessary to ship them, Saturday is a bad day to select. The Farm Bureau had faith in the good will of the packers and expected them to send buyers, although a local buyer stated that he knew before hand the sale would be a failure. How he knew the Farm Bureau has not yet discovered. Had the hogs not been sold it would have been necessary to ship. They would then have arrived on the market late Saturday night. To hold them till Monday's market would have meant an additional expense, and, then, what was to be gained by such procedure? What assurance was there that the market would not have dropped a cent or two by that time? Had the hogs been assembled on any day but Saturday, the farmers would have taken a chance at shipping in in place of selling at the price they did.

We find that some farmers who had previously been offered 16c were obliged to take 13c. In fact, the one buyer who by chance attended the sale and bought most of the hogs did not care to take some animals at any price.

These results will no doubt mean no more fat hog sales in Napa county. The object of this sale was to group and grade hogs so as to enable the farmer to sell in quantity a superior product.

The result is that packers, with the monopoly of buying in their hands, refused to co-operate. The farmer had acted in good faith, the packers ignored him. The farmer had fed expensive grain at the instance of the Government's request for more and better pork. Could the farmer sell direct to the Government all would be well. Why this present system, whereby the producer is absolutely dependent on the packer to dispose of his livestock? The packer always takes his toll regardless of conditions, but what about the producer? The Federal Trade commission has made certain recommendations regarding the control of the situation. To counteract these recommendations the various packers are spending enormous sums of money in advertising and printing to accomplish what may be called "educating the public." Hardly a day passes but brings some of their printed material to my desk. All of it is skillfully prepared; but what will it profit them if, after their "educational process," they treat the farmer as they did at the St. Helena sale? Co-operation in California did not get a setback at this sale. We hope that the day may not be far distant when on the list of California's marketing associations will be found an association for the livestock producers. One sufficiently strong to make the packer come to terms or eliminate him.

WHAT CAN A BROADER EFFORT DO?

[In the foregoing detailed account of a local failure Mr. Baade clearly shows the need of something more than local effort. No local association can compel buyers to attend their sales nor do much of anything else if they conclude not to buy. As Mr. Baade suggests in closing, something much broader and stronger must be done. What it is we do not know at the moment and therefore cannot make any concrete suggestion. It is, however, a good time to consider carefully the greater proposition of the affiliated Farm Bureaus which we have just received from the Kern County Farm Bureau Monthly]:

For some time there had been a feeling that greater progress would ensue and increased efficiency be attained through the union of the marketing departments of the County Farm Bureaus in the southern portion of the San Joaquin Valley. Furthermore, the need had become apparent for a larger and stronger organization, which would be in a position to deal with the large packing house firms on a more satisfactory basis than had ever been possible heretofore.

The first definite step toward union and organization was taken on August 30, 1918, when delegates from Kern, Tulare, Kings, Fresno and Madera counties, representing the marketing and auction sales committees of their respective County Farm Bureaus, gathered together in conference in Delano. The plans formulated at this meeting were again taken up in a second conference held at Hanford on September 14. The outcome of an all-day session was the adoption of a constitution for the new and larger organization to be known as the California Farm Bureau Marketing Association. At the subsequent meetings of the boards of directors of the Farm Bureaus in Kern, Tulare and Kings counties the action of the conference was ratified and a director appointed from the marketing committee in each county to serve on the board of directors of the new association. Since that time the directors of the association have met several times in Visalia, which was selected as the official headquarters. A manager and secretary-treasurer have been appointed and a bank selected as the depository of the association's funds. The organization is in active operation and not only conducts the sales but, when need arises, bids in the hogs and ships for the protection

The Greatest Auction Sale

EVER HELD WEST OF CHICAGO

Tagus Ranch, Tulare, Cal. : December, 10, 11, 12, 13, 1918

200 Registered Duroc-Jersey Sows, Gilts, Boars.
200 High Grade Angus Breeding Cows.
15 Registered Aberdeen Angus Bulls.
100 High Grade Shorthorn Breeding Cows.
3 Shorthorn Bulls.
90 Registered Holstein Cows, Heifers and Bulls.
100 High Grade Brood Mares, Work Horses and Mules.
14 Registered Percheron Mares.
13 Registered Percheron Stallions.
3 Registered Belgian Mares.
3 Registered Belgian Stallions.
5 15-35 Sandusky Tractors.
2 Bull Tractors.
$50,000.00 Worth of High Class Implements and Equipment.

The Live Stock

The 90 registered Holsteins are headed by KING SADIE VALE ROSE, by King Korndyke Sadie Vale and out of a 27.98 lb. daughter of a 32 lb cow. There are many good record cows in the herd, including two 26 lb. 3-year-olds. Every animal guaranteed to be a breeder.

The beef cows are literally the selection from thousands of head that have been in the Tagus herds during the past few years. The Angus herd had an 85 per cent calving record last year and not a single death from disease.

The Duroc-Jerseys are headed by California's Defender, Junior Champion at Panama-Pacific International Exposition, and all of the younger animals in the herd are his get.

The Horses range from high class registered animals to high grade brood mares and work stock, mostly young, desirable animals with quality and substance.

The Implements

All implements and equipment on Tagus Ranch are strictly modern and mostly of comparatively recent purchase. Quality and utility have been the keynote in purchasing, and all equipment is in good condition, some of it perfectly new and unused, still in the original crates and cases in which it came from the jobbers or manufacturers. The list includes many first-class implements that are now out of stock with dealers and cannot be bought new at any price. Every implement goes absolutely without reserve or limit, as does everything else in this sale, for the entire ranch will be leased.

of the farmers, as has been the case several times recently.

The Farm Bureaus in many other counties of the State are taking steps to get started with auction sales, and, as rapidly as possible, it is expected they will come into the association. Fresno and Madera are already arranging to do so. The California Farm Bureau Marketing Association is just in its beginning, but hopes to do much to assist the farmer to market his products to better advantage. In the event that satisfactory and fair prices cannot be secured from the buyers in this State, the association may even undertake to ship fat hogs by the trainload to Eastern or Northern markets.

In union there is strength. As the association grows and as more county Farm Bureaus affiliate themselves with it, new lines of business in marketing and purchasing will be undertaken for the benefit of the farmer. Every Farm Bureau member should realize that the California Farm Bureau Marketing Association is his organization, as it is an outgrowth of the Farm Bureau itself. The success of this marketing movement will depend upon the farmers' backing and support.

The officers of the California Farm Bureau Marketing Association are as follows: H. G. Hull of Wasco, president and director representing the Kern County Farm Bureau; W. J. Fulgham of Visalia, vice-president and director representing the Tulare County Farm Bureau, and Roy M. Filcher of Corcoran, director representing the Kings County Farm Bureau. The manager and secretary-treasurer is D. H. Bitner of Bakersfield, already well known to the farmers of this county as business manager of the marketing department of the Kern County Farm Bureau.

LIKES HIS MILKING MACHINE.

The problem of milking 42 cows does not worry D. O. Mills of Monterey county. He bought a milking machine last summer and employed B. H. Dreyer to operate it. Mr. Dreyer is enthusiastic in telling how much of a labor saver it is for a man who uses it intelligently. Heifers are more easily broken to milk than by hand, the cows stand fine, and no garget has developed. Success depends on the man and on the cleaning, says Mr. Dreyer. He operates one unit, milking two cows at once, stripping them afterward, and getting through with 42 cows in two hours. After milking, he drops the cups into fresh water, which is drawn through the entire unit. They are left in clean water over night. Following similar rinsing after the morning milking, the outfit is cleaned out with a brush and warm water, not using hot water on account of its effect on the rubber. It is left all day in a disinfectant solution. Only once per week is it taken entirely apart for cleaning.

WOMEN MAKE GOOD AS COW TESTERS.

[Written for Pacific Rural Press.]

Recently in our livestock notes we stated that five women cow testers had been appointed in different parts of the United States. Since then, on account of the shortage of male testers, more women have been employed and now there are 27, who, according to all reports, not only have done satisfactory work but have achieved results above the average.

Considering that the testers get free board and lodging, the pay is thought satisfactory. The women are paid the same as the men and receive from $50 to $75 a month, besides board and lodging. Conveyance to the next farm is furnished in some associations, while in others the tester provides her own conveyance and the farmers furnish free stable room and feed for her horse. To keep the work on a satisfactory basis women must continue to receive the same pay as the men for the same work. Occasionally there may be an association in which it would not be advisable for a woman to work, but if such is the case the fault is with the association and not with the woman cow tester.

The work does not require great physical strength. It does demand some training, but this is easily acquired by women, and, even though with the demobilization of the army many male testers will be available for their old line of work, it is quite probable that, because women testers have done so well, they will continue to be employed.

LATEST ON THE FAIRS.

The Liberty Fair at Los Angeles will open two days after the influenza ban is removed. The fair authorities are daily expecting such action by the Board of Health, and it is hoped that the gates will be thrown open during the early part of the first week in December. Many fine exhibits are already on the grounds, and a great show will surely be pulled off in spite of the several unavoidable postponements.

The Pacific International Livestock Show, which was to have been held at Portland, has been called off entirely, except the fat stock classes and sales, which will be held as announced.

The Northwest Livestock Show, scheduled to be held at Lewiston, Idaho, has been postponed indefinitely.

There was an old woman
  Who lived in a shoe;
She had so many children
  She didn't know what to do;
So she gave them some pigs
  And bade them "raise more"
And they all made a fortune
  And helped win the war.

The Blatchford Calf Meal Company, Waukegan, Ill., is establishing a research and educational bureau and will co-operate with private individuals, State or Government agencies whose object is that of more and better livestock. The work, which will be in charge of Prof. R. E. Caldwell, formerly chief of the Department of Dairy Husbandry, Purdue University, will be to investigate all problems relative to the feeding of young farm animals, and Prof. Caldwell assures farmers that his work will not in any way be tainted with personal or commercial ambition. There will be no charge for the service, and farmers everywhere in the United States are urged to put their feeding problems up to Professor Caldwell for solution.

Calco Troughs for your hogs

Sour grain in troughs causes digestive disorders and scours. Sanitary troughs and surroundings prevent worms and disease. Calco Troughs are absolutely sanitary—are made of Armco rust-resisting iron, with smooth metal sides and round bottoms. Every particle of feed is used—none left to sour. They are light, durable and economical.

Get the Last Drop of Milk

[Written for Pacific Rural Press by R. H. Whitten.]

A young milker was particularly anxious to win promotion and be allowed to milk a string of cows on official test. He worked hard and faithfully to make his string produce heavily and test highly, but the milk sheet showed that his cows were decreasing more rapidly in milk flow than those in other strings, and the Babcock tester gave them a lower percentage of butterfat.

One morning, just as he was at the point of discouragement, the superintendent handed him a pint bottle and asked him to fill it from the heifer he was milking, taking equal portions from each quarter. Just as he was finishing the milking of that heifer the superintendent appeared with another pint bottle and a similar request. The milker said that he had milked the heifer clean, and protested that no more milk could be secured from her. But the superintendent insisted, and finally the attempt was successfully made.

Later the two samples were tested and the milker was amazed to find that the first sample tested only 2.3 per cent while the second tested an even 15 per cent. The demonstration proved to be the necessary lesson to this ambitious worker, and from that day on he was the best milker on the ranch. His cows always tested highest and milked most persistently because he had learned how to add to each milking of every cow a pint of milk, creamy in richness. And the method of securing it exercised, stimulated and developed the milk-making glands.

SKIM A RICH CREAM.

On other farms a great deal of the profit from dairying is lost because the one who does the separating skims a cream low in butterfat. There is a strong notion which prevails among many dairymen that it is more profitable for them to make a cream testing, say, 20 to 30 per cent rather than 35 to 45 per cent. But they are utterly wrong, and for two important reasons: First, the low testing cream robs them of a large amount of skim milk; second, rich cream keeps sweet much longer.

Creameries pay not for the actual weight of cream but for the butterfat it contains. And here is the way it works out: 296 pounds of cream testing 35 per cent contain as many pounds of butterfat as 500 pounds of cream testing 20 per cent. And the 35 per cent cream saves 214 pounds of skim milk, worth at present prices about $1.60 for feeding calves, hogs or chickens.

So set the separator to skim at from 35 to 45 per cent. A simple turn of the screw will put many dollars into your pocket.

PREVENT SEPARATOR LOSSES.

Are you keeping a cream thief in your dairy? In an investigation of 170 separators it was found that one out of every five was wasting valuable butterfat. When skim milk has a fat content above .02 per cent, the separator is a cream thief. If you are not sure about your separator, send a sample of the skim milk to your creamery or the Agricultural College at Berkeley and have it tested. Don't think that you can tell by eye; the cream thief will fool you. An accurate test is the only safe way.

WHY CREAM TESTS VARY.

Why does the cream test jump from 28 per cent one time to 36 the next, and then drop to 24 the next time, when apparently conditions are the same from day to day?

There are several different factors which may cause these variations, and the adjustment of the cream screw is an important one. Often these screws are so loose that they may be unintentionally moved in washing or handling. Find out just where a screw should be set to skim cream testing from 35 to 45 per cent, as you may prefer, and then mark the position of the screw by scratching the metal, so you will notice if the screw is accidentally moved.

The speed of the separator is another important factor. Each make is designed to do its best work at a certain speed, and the instructions furnished by the makers should be carefully followed. The only reliable way to maintain the proper speed is to count the number of revolutions of the crank by the watch.

An investigation on a number of farms disclosed the fact that 19 out of 20 separators lose fat in the skim milk because they are run too slow. The average loss is from 7 to 12 pounds of fat per cow per year. In a herd of 30 cows, with butterfat at, say, 45c this amounts to from $84 to $144 per year—a heavy fine to pay for failing to heed the directions accompanying the machine.

Changing the rate of inflow of whole milk without a change of speed will cause the test to vary. Reducing the inflow will give a high-testing cream. A float should always be used, as otherwise the height of the milk in the supply can will affect the inflow.

The separator should be securely fastened to a solid foundation, for any unsteadiness of the separator bowl, shaking or trembling, affects the amount of butterfat in cream, generally lowering it. In one series of tests there was a difference of 10.1 per cent in the average percentage of fat when conditions were normal and when the bowls were running unsteadily.

The temperature of the milk may affect the test. Most instructions state that the temperature should not be under 90 degrees, and that milk should be separated as soon as it is drawn. But often this is impracticable, and it has been found that if the temperature does not go below 70 or 80 degrees there is little effect on separation. But when the temperature runs much below 70 degrees considerable fat is lost in the skim milk. If old milk is to be separated, it should be warmed and stirred so that the cream will be well mixed with the milk.

The amount of water or skim milk used to flush the bowl at the end of the run will affect the cream test, as part of it will pass into the cream. Only a quart of water or skim milk added to 50 pounds of 30 per cent cream will reduce the test to 28.8 per cent. Of course, the smaller the lot of cream the more this effect is noticeable.

Insecure or sloping foundations, bowls incorrectly put together, out of balance or at the wrong height in the separator frame, bearings worn or out of adjustment, lack of oil, poor oil, uneven power—one or more of these may cause a vibration which will mean a loss. To get the best results, observe the following: (1) Fasten the separator securely to a solid foundation; (2) oil thoroughly before each running; (3) clean well after each running; (4) set screw to skim at 35 to 45 per cent; (5) feed according to capacity; (6) run at the speed for which it is adjusted; (7) separate the milk soon after it is drawn, and, if possible, when it is above 80 degrees.

Breeders of Milking Shorthorns will be delighted over the new record established in England for offerings of this breed. The average on 68 head was $1,062, with a top of $2,750. Forty-four cows and heifers averaged $1,395.

Annual Pacific International

SHORTHORN SALE!

Auspices of Pacific Northwest Shorthorn Breeders' Association

Thursday, December 12, 1918

At the

Pacific International Livestock Show, Portland, Ore.

Polled Herefords to Invade the Coast

[Written for Pacific Rural Press.]

Polled Herefords will make their bow before a California audience next April when an offering of about 30 head, selected from the leading herds of the Corn Belt, will be sold at the University Farm, Davis, at the time of the annual gathering of farmers and stockmen.

This will be a quality sale. It is in the hands of B. O. Gammon, secretary of the Polled Hereford Association, who has asked breeders to consign animals that will be a real advertisement to the breed. He plans to have about one-third bulls and two-thirds females, ranging in age from 12 to 20 months. The cattle will be assembled at some central point in the Middle West and the cars will be decorated with appropriate advertising matter exploiting Polled Herefords. Circulars will be distributed at all stopping points on the way, and extensive advertising will be done in this State, boosting the breed and calling attention to the sale.

America's Greatest Farm Auction Sale

[Written for Pacific Rural Press]

The four-day sale to be held at the Tagus Ranch, Tulare, December 10 to 13, will be the biggest event of its kind ever held. The great 6000-acre ranch is to be leased, and all of the livestock and equipment must be sold.

The offering includes all the famous producers and prize winners in the herds—animals that money could not buy except in a complete dispersal sale. There will be 90 registered Holsteins, many with official records; 200 registered Duroc-Jersey hogs; 15 registered Aberdeen-Angus bulls; 200 high-grade Polled Angus cows; 3 Shorthorn bulls; 100 high-grade Shorthorn cows; 33 registered Percheron and Belgian stallions and mares, and 100 high-grade draft horses and mules. Also there will be five tractors and $50,000 worth of high-class implements and tools.

Only the best of both livestock and implements has found a place at Tagus Ranch, and shrewd buyers will find at this sale a wonderful opportunity for investment and profit.

Portland Shorthorn Sale

[Written for Pacific Rural Press.]

The Shorthorn sale to be held at Portland, December 12, in connection with the Pacific International Livestock Show should attract the attention of every lover of the noble red, white and roans.

The consignments are from the leading breeders of Oregon, Washington and Idaho, and include a very select lot of breeding cows and heifers, sired by world-renowned bulls. Also there are some high-class young bulls, with individual merit and breeding combined, that should prove exceptional sires. Frank Brown, Carlton, Ore., is sales manager.

The University Farm School at Davis will give a short course in milking machine operating from December 2 to 13. Success with milking machines depends chiefly upon the operator. Machines have been in daily use at the farm school for several years, and this course should prove a most practical one. At the same time there will be a short course in cheese-making.

Our Aim is to Encourage and Assist in the Production of Beef

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

Toyon Farm Association of Los Altos and the Lewis Company of San Jose each contributed to a shipment of registered Holstein bulls which was made to Chili during the past month.

The Holstein cow, Piebe Laura Ormsby Vina, purchased by the Bridgford Company, Knightsen, at the Vina sale, has just made an official record of 32.76 lbs. in seven days as a five-year-old.

Burroughs Bros., who are operating a certified dairy near Santa Clara, Santa Clara county, have received a carlod of Holstein cows from the Lewis Company, which have been shipped from its Hollister ranch.

The Lewis Company reports the sale of the young bull, Prince Hengerveld Skylark Ormsby to William Fee of Santa Clara county. This bull is an excellent individual, son of the proven sire, Sir Skylark Ormsby Hengerveld.

Stanislaus Princess Cleopatra, the Holstein cow owned by Stalder Bros. of Rosamaine's Rancho, Riverside, has twice made better than 31 lbs. before reaching the age of five years. As a three-year-old she made 31.04 lbs. butter from 513.9 lbs. milk and as a senior four-year-old she made 32.07 lbs. butter from 528.8 lbs. milk in seven days.

Frank L. Morris of A. W. Morris & Sons, Woodland, reports that Tilly Alcartra is now milking 77 lbs. or more per day. She will complete her year January 10, and is expected to make over 33,000 lbs milk, thus breaking the world's record for the second time. She will average 30,000 lbs. milk for four years and 1100 lbs. butter for five years.

The Bordens have permanently closed their condensed milk factory at Elgin, Ill., as well as several in New York. But every time they close one in the East they open a new one in the West—generally on the Pacific Coast. Eventually this section will be the center of the condensed milk industry. Which, of course, will promote the expansion of the dairy business.

W. J. Higdon, Tulare, reports that Mona Fobes, a four-year-old Holstein, has made a record of 26.61 lbs. butter from 523.4 lbs. milk in seven days. Trout Brook Pontiac Starin, a five-year-old, has made 26.51 lbs. from 553.3 lbs. milk. Both are being continued on 30-day test. Pauline Soldine 3rd, with a record of 27.70 lbs. as a three-year-old, is being put on test again and promises to make 30 lbs.

Bridgford Company of Knightsen are jubilant because their Holstein cow, Spring Farm Pontiac Maid, has just broken the State record for a senior four-year-old, having produced 35.65 lbs. butter in seven days. She is still on test and on the fifteenth day she milked 105 lbs. This wonderful cow is by the 44-lb. bull, King Korndyke Pontiac Lass, who is out of the former world-record cow, K. P. Pontiac Lass. Her dam is a daughter of Spring Farm King Pontiac.

W. F. Mitchell, Visalia, reports that the Holstein cow, Dutchess Elizabeth Victoria, has produced nearly 17 lbs. butter in seven days at two years and ten months of age. She is being continued on 30-day test. Lady Zenobia 2nd, an aged cow, has just made 20.5 lbs., and Black Patti, with a 26-lb. record, is being put on test again and is expected to increase her record. Mr. Mitchell has several cows that will freshen soon, and all will be put on official test.

Beef Cattle.

The sale of Herefords recently held by the late Viscount Rhondda at Newport, Monmouthshire, eclipsed all previous records in the history of the breed in its home land. The general average for 204 head was $1,000, and eight new sales records for the breed were established.

E. K. Brown of the Santa Rita Ranch, Dos Palos, has purchased a carload of yearling Hereford heifers from the Carl Miller herd, Belvue, Kan., and a carload of yearling bulls from the Mortimer herds of Nebraska. Other purchases in Kansas, Nebraska and Colorado make a total of 400 head which are being shipped to Bloomfield Farm, Gilroy, where it is planned to establish one of the largest Hereford herds west of the Rockies.

Three years ago J. C. Andrew of Westpoint, Indiana, paid $5,000 for the Shorthorn bull, Lord Avondale, when only five heifers constituted his herd. Last month, at his first public sale, he sold 11 sons and daughters of that bull for $15,000, getting an average of $1,940. Other animals in the sale were heifers bred to the bull and two cows with his calves. The grand total received was $47,375, showing a pretty good start, and good evidence of the value of a high-class sire.

Swine and Swinemen.

Donald H. Graham of Lancaster is breeding 30 Duroc sows and 25 gilts for spring farrow—most of them to his great young boar, Orion's King Gano.

W. D. Trewhitt of Hanford had 26 head of Poland-Chinas in the top car that sold at $18.80 per hundred at the recent Farm Bureau sale at Hanford. The hogs averaged 225 lbs. and were hard grain-fed.

R. C. Sturgeon, secretary of the Tulare County Duroc Breeders' Association, reports that their first public sale will be held in the new sales pavilion at Tulare, January 10. About 50 head will be offered, and consignments will be made by Allen Thompson, C. E. Ellis, R. E. Clifford, S. A. Williams, Henry Cummings and R. C. Sturgeon.

Peters, Lamson & Walker, owners of the Windsor Ranch at Bonita, are carrying 2800 head of Durocs, of which 250 are now purebred. They plan on eventually having an entire purebred herd, carrying about 2000 head. Their plant has been developed along scientific lines and represents the last word in labor-saving devices.

John M. Bernstein, the Poland-China breeder of Hanford, reports a heavy demand for sons and daughters of his two great boars, President and Smooth Jumbo. He has recently made the following sales: Service boars to R. O. Deacon, Lemoore; J. I. Wagy, Maricopa, and Bertram Bros., Hardwick; six months boar to Blakeley & Woodward, Lemoore; eight months gilt to Mr. Dingley, Lemoore; six months gilt to C. H. Meyers, Laton.

WHY RAISE SHEEP!

Sheep in all countries of the world have decreased 50 million head since the war began.

There is a world-wide shortage of wool and mutton.

There is a growing demand for meat and wool.

Sheep have decreased 12,000,000 head in the United States in the past 17 years.

The range flocks of the West are rapidly being reduced.

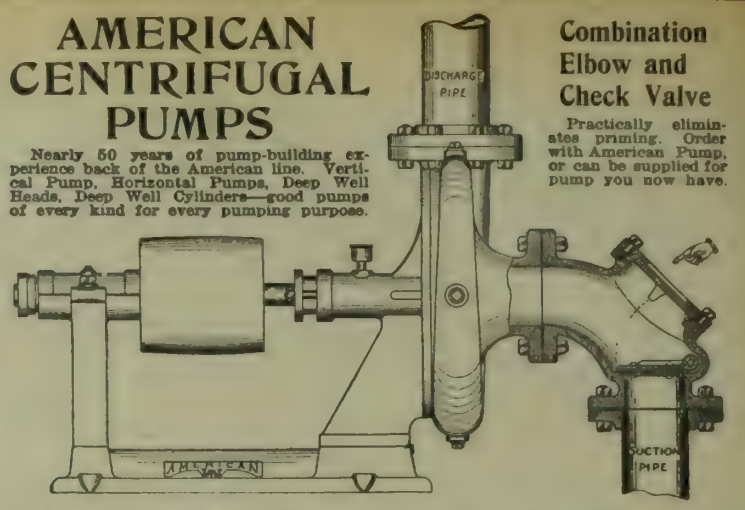
Pacific Coast farmers must help provide the future supply of wool and mutton.

AMERICAN CENTRIFUGAL PUMPS

Nearly 50 years of pump-building experience back of the American line. Vertical Pump, Horizontal Pumps, Deep Well Heads, Deep Well Cylinders—good pumps of every kind for every pumping purpose.

Combination Elbow and Check Valve

Practically eliminates priming. Order with American Pump, or can be supplied for pump you now have.



GAS ENGINES, OIL ENGINES, MOTORS, Etc.

Put your irrigation problems up to irrigation experts. We'll show you how to get the MOST WATER with the LEAST TROUBLE at the SMALLEST COST. Write for our catalogs of Gas Engines, Oil Engines, Motors, Direct-connected Motor-and-pump Outfits, or any of these in which you are interested. We'll answer your inquiry fully and carefully.

Breaking all Records

Right now—when milk prices are breaking all records—is the time to make new high records in milk production. It is surprising how effectively this can be accomplished by raising the health standard of your dairy cows.

The most prevalent cow ailments—Abortion, Retained Afterbirth, Bunches, Lost Appetite, Scours, etc.—arise from an impaired condition of the genital and digestive organs. Kow-Kure has remarkable medicinal properties that act directly on these organs, producing regular, healthy action. The cow thrives on Nature's food, and a full milk flow naturally follows.

An occasional use of Kow-Kure will prevent disease and pay for its cost a hundredfold. The best dairymen keep it on hand constantly. Feed dealers and druggists sell Kow-Kure, in 60c. and $1.20 packages.

TULARE SALE STARTS MANY NEW BREEDERS.

That the return of peace means the beginning of a new era of prosperity for purebred breeders was evident from the number of new herds of Holsteins that were started with stock purchased at the sale held at Tulare, November 20-21. It was strictly a farmers' sale. Very few breeders bid on the animals, and most of them went to dairymen in Tulare or adjoining counties.

In merit the offering was a grand one. Outstanding sires were represented by high record daughters, and the females were bred to the highest record sires ever represented in a sale in the West. Also there were some of the greatest young bulls ever offered in this State.

But the audience was slow to appreciate the merits of the stock and not until the afternoon of the second day was Col. Ben A. Rhoades able to get the people warmed up. The first day was made a holiday in Tulare and the townspeople turned out in large numbers, but they were spectators, not buyers.

It was honed that the new sales pavilion would be dedicated at this sale, but it has not even been started. The land is bought and paid for, and money is in the bank to build the pavilion, but on account of war conditions a permit could not be secured. It is expected, however, that work can proceed without further delay, and that the pavilion will be ready for the sale of Duroc-Jersey hogs to be held in January.

In all, 102 head of Holsteins were sold for a general average of $262, which was kept low on account of the number of calves offered. The top of the sale was Rose De Kol Cande, a wonderfully sweet heifer consigned by Bridgford Company. She has a butter record of 24.42 pounds at 26 months and is the highest record two-year-old ever offered on the Pacific Coast. She was bid in at $1,000 by W. J. Higdon, Tulare, who always has his eye open for the good ones.

F. M. Helm of Fresno secured the Yocum herd sire, King Ignaro Mead, for $675, and Fred Ross of Hanford paid $650 for a young Prince Gelsche Walker bull, out of a 29-pound dam, consigned by A. W. Morris & Sons.

In both numbers and total amount of purchases C. A. Miller of Ripon was the heaviest buyer. He secured 12 head for $2,985. H. C. Heitzig of Tulare took home 10 head, for which he paid $2,160. Alex. Whaley of Tulare, who consigned 6 head, bought an equal number, paying $2,335 for them.

Other prominent purchasers were H. L. Heard, McFarland; J. B. Monroe, Porterville; C. H. Hasker, San Francisco; A. E. Poston, Tulare; R. F. Guerin, Visalia; H. M. Hancock, Riverdale; C. R. Ogden, Kerman; Robt. T. Curtis & Son, Exeter; T. M. Calvert, McFarland, and W. D. Trewhitt, Hanford.

The consignment of 7 head by Bridgford Company was made up of outstanding individuals and averaged $535 per head. W. J. Higdon made an average of $373 on 11 head; A. W. Morris & Sons $305 on 16 head; Alex. Whaley $249 on 6 head; W. F. Mitchell $228 on 19 head; R. C. Sturgeon $215 on 2 head; Chas. Yocum $212 on 22 head; E. G. Wharton $155 on 13 head, and R. F. Guerin $143 on 5 head. C. L. Hughes consigned his entire herd of one yearling heifer, which brought $450.

Altogether the animals represented excellent value at the prices paid for them and they should make good money for their new owners.

C. E. Ellis, the Duroc breeder of Tulare, reports orders for 130 more sows than he can supply. He says that the demand for bred sows has never before been so good.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

THE SMILE THAT SAYS, "SHOW ME!"

The average farmer smiles when he is told that he can make a good profit on a flock of hens. Moreoyer, his smile has that look which says as plain as words, "Show me." This is because he can figure out how many bushels of barley, or how many pounds, he can grow a hog from farrowing to slaughter for, and just about how many pounds of pork the hog will weigh when it is killed. He can perhaps tell to a trifle how much a pound he will get for the hog. All these things he has sized up from practical experience in handling. But chickens—well, they are supposed to pick up their living on the average farm, and there is no account kept of either cost or profit.

Now, unless it is a large farm and there is much waste in feeding other stock, the living the chickens pick up is too precarious to enable them to startle the farmer enough so that the profits do really "show him." But if he would take the trouble to feed and care for a flock of poultry the same way he does his other livestock, giving them clean quarters, rainproof and decently sheltered, then keep accounts, the farmer would find that, taken as a whole, the poultry is more profitable than the hogs. Poultry profits, unless in the case of a large shipment of turkeys, come in small sums, hence are not conspicuous, and as a people we deal in large items.

AMERICANS LEARNING THRIFT.

If this war does nothing else but teach the American people thrift, it will not have been in vain. We are getting down to details and learning that "every little makes a mickle." It is not to our credit that we have wasted all the parts of an animal that were a little trouble to clean and make worth while. Last week a lady wrote me from Idaho telling me her little girl had just sold a yearling steer for $38.50, and she added: "We had the head for ourselves. Just think of us eating the head!" If she had said the real reason we never did eat a steer's head before was because we were too lazy to clean it or too indifferent, it would have been true. It is the same with chickens. Years of plenty, millions of acres of land in this big country, the very vastness of everything, and the prolific manner in which nature responds to our efforts, has trained the American farmer's mind to neglect the smaller details for the larger matters.

MAKING PROFIT IN POULTRY IS A MATTER OF SMALL DETAILS.

Leaks are allowed, the profit soon goes, and no one is any the wiser. A farmer soon spots a brood sow that bears but one or two pigs at a litter and fattens her up for market, but because he does not take much interest in his poultry he never learns how to spot the hen that lays but a few eggs, and those in spring time. So he keeps feeding her with the few good hens. Perhaps he has fifty hens and the good layers and poor ones are fifty-fifty. He is feeding and housing fifty hens for the bare product of twenty-five. "Bare," because if two-thirds the feed served to the fifty were given to the twenty-five good ones he would get a far more generous response from them in the number of eggs.

PICKING OUT THE LAYERS.

It requires a little judgment to pick out the good from the poor layers, but it can be done by anyone who is observant enough to watch the hens. A good layer is always a good eater. A hen that does not eat well cannot possibly lay many eggs, because the eggs are the sole product of what she eats. It is simply the hen's ability to convert feed into eggs or meat that concerns the one who is choosing, and a hen that has large capacity is registered by the distance between her pelvic bones and the breast bone by placing the hand cross-wise. Note how many fingers' width there is between the bones. If there is room for five fingers, or the whole hand, we say this hen has big capacity, but the capacity is or may be for either eggs or meat, unless this capacity is followed by other signs.

MEASURING LAYING CAPACITY.

A hen with this large capacity and thick, blunted pelvic bones, and narrow between the bones, will use all the feed you serve to her in making a good table fowl. She will lay a few eggs in the spring, just enough to perpetuate her specie, and then stop.

BLACK TURKEYS WANTED.

To the Editor: I have been watching your paper for an advertisement of black turkeys. Have been raising bronze for a long time and want to cross them with the blacks. Can you tell me of anyone who raises them?—Mrs. R. E. W., Healdsburg.

[Black turkeys are not very much in evidence on this Coast. Perhaps some of our readers may know of some which they will tell us about, but I do not know of any breeder who raises them.]

Poultry Breeders' Directory

Rate in this directory 3c. per word each issue.

Raynster

A Label That Defies Weather

The Raynster Label means the best in weather-proof clothing. It is the identifying mark on a complete line of raincoats for men, women, boys and girls—heavy rubber surfaced coats for outdoor workers, extremely dainty silk coats for women and girls, or fine imported cloth coats—suitable for overcoats or ulsters. These coats do double duty, they protect against rain or cold.

Be sure the Raynster Label is in the coat. That is the sign of full value for your money. In a garment showing the Raynster Label there is no question about materials or workmanship. It is the signature of quality. Look for the Raynster Label when you want a reliable raincoat.

Get a Raynster today. It is good insurance of health and clothing to provide a Raynster for each member of your family.

If you wish, we will send you the Style Book showing many Raynster models. Drop us a postal

THE HOME CIRCLE

"GOOD-NIGHT."

The strenuous day is past;
The march, the fight.
The bugle sounds at last.
Lights out. Good-night.

The sky is white with stars;
The tents gleam white.
Tired captain from the wars,
Sleep through the night.

Sleep till the shadows take
Their endless flight;
Until the morning break,
Good-night! Good-night!

THE RAINY-DAY VISITOR.

Probably Ernest was as scarlet as grandma's tomato pincushion by this time! Minnie watched the little rivers run down the garden path into the little lake at the gate. She sighed. Scarlet fever was the only thing Ernest had not divided with her in all the nine years of their twin lives.

Grandpa was asleep on the sofa, with a newspaper over his face; grandma dozed in her easy-chair by the fireside. It seemed as if they were always asleep. She thought of Mrs. Todd's baby, who was always taking a nap when she wanted to take him riding. "People seem to sleep a good deal at the top and bottom of their lives," she said to herself, and sighed again.

Grandma sat up with a start. "Why, child," she exclaimed, picking up her knitting, "I must have closed my eyes for a second. I was just wondering," she went on briskly, smiling down at the doleful little face, "if you wouldn't like to read the diary your mother wrote when she was ten years old."

Minnie with wide eyes followed grandma to the bookcase. A mother only ten years old made one feel solemn. After a few minutes' search the book was found. It was of faded red leather with "Diary" printed across the back in gold letters. There was a red pencil tied to it with a ribbon that had once been blue.

As soon as she began to read, Minnie forgot that it was raining, forgot that she was lonesome and homesick.

"Ester Brown and me are going to kepe a diry," it began. Minnie stopped reading. Could that possibly be Aunt Esther Brown, who lived at Waterlee, "our adopted aunt," as the twins called her?

"That is just who it was," said grandpa, waking up from his nap in time to hear Minnie's excited question.

She could hardly let the book go long enough to eat her dinner. At the very end of the book came the most exciting part. She was going slowly to make it last as long as she could when she read this:

"Ester Brown and me are too old to play with dolls eny more, so we are going to put our paper dolls all in the seekerit drawer of the old sekeritaree, and never look at them again. Cross youre harte and hope to di."

"Grandpa, grandma, grandpa!" cried Minnie, dancing up and down. "Is there a secret drawer in the secretary?"

"Yes, yes," said grandpa, rubbing his chin. "Let me see. Pull out the second drawer from the top. It's right in back of that."

Minnie did so, trembling with excitement. She found a little narrow drawer, but it was empty.

At the sight of her disappointed face grandpa came to help her. They hunted for half an hour, but no other secret drawer could they find. They were about to give it up, when grandma, who had joined in the search, said suddenly:

"Father, didn't she mean the 'old' secretary? You know we bought this one the spring after she was nine, and she and Esther had the other in the attic to play with."

Up into the dark, musty attic went the three. There in the dormer window stood the secretary, covered with dust and cobwebs. If Minnie had hard work to keep from screaming downstairs, she had harder work now, as at last grandpa opened the secret drawer and handed her a pile of what seemed to be dusty papers.

It was indeed the paper doll family put there so long ago by the two little girls.

When they were dusted, they appeared as good as new, and Minnie spent the rest of the day playing with them. She laughed and laughed at the queer style of the clothes they wore. At bedtime, when she gathered them up, she said to her grandmother, "It was just like having my little girl mother come to play with me."—Anna Louise Berray.

CONSERVATION WEEK—DEC. 1-7.

At a meeting held in San Francisco last Friday, which was addressed by Dr. R. L. Wilbur of the National Food Commission, he said that the United States would be called upon this year to furnish 20,000,000 tons of food for export to Europe. To do this the utmost caution must be used in order to make the supply stretch out so that all nations may participate in its use. Dr. Wilbur stated that it is planned to enlist the aid of churches, schools and civic and quasi-public organizations of all kinds to spread the gospel of conservation during the national week, December 1-7. Further than that, the administration heads will send out instructions to housewives, restaurants, big camps and to all persons in charge of food supplies, mapping out ways and means for the further conservation of essential foodstuffs.

Restrictions prohibiting the sale of powdered and bar sugar have been rescinded. All grocers are now permitted to sell powdered and bar sugar on the same allotment basis as that regulating sale of other sugar, which is three pounds per person per month until December 1, when the quota will be increased to four pounds per month.

Replace Your Old-fashioned Plumbing Fixtures

The added convenience of modern plumbing fixtures will more than compensate you for the slight cost involved in replacing them for your present fixtures.

The attractive designs of Pacific Plumbing Fixtures will make you proud of your bathrooms.

Pacific Plumbing Fixtures are guaranteed forever against any defects in workmanship or materials, and although their quality is higher, cost no more than any other reputable brand.

Peaceful Thanksgiving

The heart strings have been pulled to the breaking point, but the strain has been removed. We can breathe again and resume the normal, for "daddy boy" is coming home. So, mother girl, keep the home fire brighter than ever, the same old stove with a wonderful fire, but without the muss and fuss and expense. Let's turn it into a gas stove; a clean gas of your own making, in the simplest way, with "The Simplest Thing in the World"—a "Premier" Burner.

Tell us about your stove, its size and make, and ask for Circular "B," drawing of stove and installation.

THE BURNER ALONE MAILED ANYWHERE—$5.00
STANDARD CONNECTIONS AND TANK EXTRA—$4.85
All questions carefully and promptly answered.

Premier Burner Co., 246 So. Spring Street, LOS ANGELES, - CAL.

CALIFORNIA FRUITS.
525 Market St. San Francisco.

Agricultural Summary

Grain Price Situation Murky.

Replying to the inquiry of one of our subscribers relative to the report current that the Government was buying barley at $2.38 cwt. for export to England, the Food Administration Grain Corporation sent the following answer, which illustrates the condition of confusion which beclouds the existing grain marketing situation:

Answering your letter of the 19th inst., the Grain Corporation is buying barley from time to time, as orders are received, for export, in parcels of 1000 tons or more, of certain grades only, delivered at Port Costa warehouses, inspected and certificated by the San Francisco Chamber of Commerce. The barley must be No. 1, weighing 44 pounds or more to the bushel. In order to fulfill these requirements a large percentage of the California crop of this year has to be cleaned and graded by the machines at Port Costa. Would advise that you offer your barley through regular channels to the grain trade, and if the grain is suitable any of the exporters will be glad to buy same, in making up parcels for sale to the Grain Corporation. As exporting firms are working on a competitive basis, business is done on a close margin, and producers will receive just as much for their barley through the grain trade as if we were buying direct, in which case it would be necessary for us to charge a selling commission for attending to the many details connected with the purchase of many small lots.

To Permit Dried Fruits Exportation.

The War Trade Board announces, after consultation with the United States Food Administration, that it will now consider applications for licenses to export canned vegetables and dried fruits, with the exception of dried apples, dried peaches, and dried prunes, to all countries, except the United Kingdom, France, Italy and Belgium proper and the Central Powers. Purchases of the above-named commodities for shipment to the United Kingdom, France, Italy and Belgium proper will continue, as heretofore, to be made by the Allied Provisions Export Commission, acting on behalf of the governments of these countries.

Thanksgiving Turkeys Fly High.

So high that only an aviating pocketbook could reach them. At 50c a pound "and up," the redolent odor of this aristocrat of the poultry yard was missing from the Thanksgiving table of many of provident habit rather than epicurean taste. The demand for the bird was good, nevertheless, and the market not oversupplied. It is generally believed that the scarcity of supply will continue over the Christmas holidays with the correspondingly good prices.

Hop Growers Smile Again.

The end of hostilities in Europe has meant a cash asset for California hop growers. A few months back hops were quoted at 10c on a draggy market. A dispatch from Santa Rosa dated November 25 notes a sale of 2190 bales of hops at 26c a pound, spot cash. This sudden change in market values has caused some hop growers to think they have uprooted their vines prematurely.

Who Gets the Money?

Late investigation at Chicago into the reasons back of the present unprecedented high cost of butter and eggs have brought forth assertions from produce dealers in Chicago that the farmer is receiving 80 per cent of the abnormal increase. The remainder was said to be divided among manufacturer, jobber, wholesaler and retailer.

To Stabilize Egg Quotations.

In order to prevent baseless fluctuations and advances on all grades of fresh eggs, the San Francisco Dairy Produce Exchange, at the suggestion of the Food Administration, is considering making the market quotations once weekly only, instead of daily.

Breeding Ewes on the Toboggan.

The market for breeding ewes has undergone a decided drop in the last year, notably in the Pacific Northwest. They are now quoted at $15 to $16 a head, as against $18 and $19 at that time.

THE MARKET REPORTS

Where commodities are consigned on a commission basis, the only price obtainable is the San Francisco price, from which customary charges are deducted to ascertain actual price paid to producer. Lines of commodities sold on exchanges, as butter, eggs, cheese, grain, etc., are priced according to exchange figures, which are not the prices paid to grower. From these figures must be deducted the legal percentages permitted to be taken by wholesalers before remitting balance of sale price to shippers. Schedules of discounts governing these transactions may be obtained from the offices of the Food Administration or of various exchanges.

SAN FRANCISCO

San Francisco, November 27, 1918.

WHEAT.

Per bushel—

No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 2	2.09

Recleaned for seed, per ctl.—

California Bluestem	$4.15@4.25
Early Baart	4.15@4.25

BARLEY.

The growers are holding their stock firmly and choice feed stiffened up a little this week. One reason for this condition is the fact that the bulk of the stock on hand is not regarded as choice and this is causing the farmers to hold the latter more firmly.

Choice feed, per ctl	$2.12½@2.22½

OATS.

Oats are inactive and unchanged, although there has been some inquiry for seed.

Red feed, per ctl	$2.30@2.50
Red for seed	2.80@3.00
Black for seed	2.80@3.00
Recleaned Red or Black for seed	3.35@3.50

CORN.

The corn market continues dull, although the brokers and dealers are now quoting choice white Egyptian at $2.75 to $3 and milo at $2.70 to $2.75. The removal of restrictions regarding the feeding of wheat to poultry has had a depressing effect on corn. This, added to the changes regarding substitutes for wheat flour, will, it is believed, keep the price of corn at a much lower level than last year's crop.

Egyptian, choice	$2.75@3.00
Milo	2.70@2.75

HAY.

Receipts for the past week were 731 tons, compared with 644 the previous week. These are small receipts for the time of year and normally would make a very strong market, but in the present condition of trade the arrivals are ample to take care of the demands. Late arrivals have been less damaged by the rains. Alfalfa has been more or less stained. While this is excellent for feed, its appearance is not such as to allow its being sold without concession in price. The purchase by the Government of several thousand tons of hay in this market has been of considerable benefit to the holders of hay in interior districts.

Wheat No. 1	$26.00@28.00
do, No. 2	20.00@24.00
Choice tame oat	25.00@27.50
Wild oat	20.00@22.00
Barley	20.00@22.00
Alfalfa	18.00@22.00
Stock	18.00@21.00
Barley straw	.50@ .80

FEEDSTUFFS.

There was no change in the feedstuffs market this week. The early rains are reported to have brought up the grass in many sections, which may have a later effect upon the general market.

New alfalfa meal, per ton	$35.00@36.00
Coconut cake or meal	Nominal
Cracked corn	$86.00@88.00
Oilcake	77.00@78.00
Rolled barley	45.00@47.00
Rolled oats	55.00@57.00

POTATOES, ONIONS, ETC.

Potatoes are reported without demand. Prices on the wharf sagged and there is no prospect of an immediate advance. Fancy onions were strong and in good demand. Garlic is strong and some fancy is said to have sold at 35c, but the bulk is selling at 20c to 25c. The holiday demand for vegetables has been good, but hardly up to the expectations of the commission men.

String beans	10@12c
Lima beans	7@8c
Carrots, per sack	85c@$1.00
Rhubarb, San Jose, per box	$1.00@1.25
Pumpkins	75@90c
Cucumbers, hothouse, box of 30	$2.50@3.00
Eggplant, per box	1.25@1.50
Livingston	None
Lettuce, per doz	25@40c
Celery, bunch	20@25c
do, crate	$3.00
Tomatoes, per crate—	
Bay	$1.50@2.25
Potatoes—	
Garnet, Chile, on street	None
Fancy whites	$1.75@2.00
Choice	1.40@1.65
Sweets, per sack	2.90@3.00
Onions—	
River Reds	None
Yellows	90c@$1.00
Australian Browns	90c@$1.00
Fancy	$1.15@1.30
Garlic, new	20@25c
Green corn, Alameda, per sack	Nominal
Okra, per box	None

BEANS.

The Government has been in the market this week for beans and these sales have had a strengthening effect on the whole market. Several descriptions were advanced somewhat in price, but unless purchasing for shipment East begins in the near future it is expected that prices will quickly slump to the former level and that they may go even lower.

Bayos, per ctl	$7.25@7.50
Blackeyes, new crop	5.50@5.75
Cranberry beans	8.50@8.75
Limas (south, recleaned), new crop	$10.50
Pinks	$6.75@7.00
Mexican Reds	$6.75@7.00
Tepary beans	5.00@5.50
Garbanzos	8.00@8.75
Large whites, new crop	8.20@8.30
Small whites, new crop	9.40@9.60

POULTRY.

The turkey market has been very strong this week, as was expected. However, not so many turkeys arrived as were looked for and prices were somewhat higher than expected. In the meantime 12 carloads of general poultry arrived from the East this week and depressed the market for hens, roosters and broilers.

Turkeys, live, young spring, lb	36@40c
do, old	36@38c
do, dressed, old	45@48c
Broilers, 1½ to 2 lbs	39@42c
do, 1¼ lbs	43c
do, ¾ to 1¼ lbs	45c
Fryers	35c
Hens, extra, per lb., colored	33c
do, Leghorn	33c
Smooth young roosters, per lb. (3 lbs. and over)	33c
Old roosters, colored, per lb	24c
Geese, young, per lb	28@30c
do, old, per lb	28c
Squabs, per lb	55@60c
Ducks	30@32c
do, old	27@30c
Belgian hares	22@23c
Jack rabbits	$3.25@3.75

BUTTER.

Butter continues strong, with an active trade. Receipts are about normal. The price was advanced a cent on Monday.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	61	—	61	62	62	62
Prime firsts	59	59	59	Nom.	..	..
Firsts	58	58	58	Nom.	..	..

EGGS.

After the slump of last week, eggs resumed their upward tendency and again passed the 80c mark, closing at 81c. This strength on the last day before the holiday was not expected, as eggs have receded in price on that day for several years past. Some of the San Francisco papers last week announced that the exchange had decided to confine the call of eggs to Monday of each week, as is now the case with butter. The matter was informally discussed by some of the members, but as yet no action has been taken. It is stated also that there is no official communication from the Food Administration regarding the matter, as the local dailies claimed.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	76½	—	80½	79½	80½	81
Extra lsts			Nominal			
Firsts			Nominal			
Extra pullets	62½	—	63½	63	64	65½

CHEESE.

Cheese is quiet, with small demand. Changes in prices are but slight this week.

California Cheddar, flats, fancy	32c
Fancy California flats, per lb	32½c
First California flats, per lb	Nominal
California Y. A. fancy	Nominal
Oregon triplets, fancy	34½c
Oregon Y. A. fancy	Nominal
Monterey cheese	22@25c

FRESH FRUITS.

Apples have been arriving in good volume this week and prices have been maintained firm and unchanged. There has been a good demand throughout the week. There have been but few berries in the market this week and these were sold by the drawer. There has been a fair demand for other fruit.

Peaches, 4-box crate	None
Figs, black, per box	None
do, double layer	None
do, Single Row Whites	None
Strawberries, per drawer	90c
Blackberries, per chest	None
Raspberries, per drawer	50@60c
Plums	None
Cantaloupes, flats	None
do, ponies	None
do, standard	None
Watermelons, per lb.	None
Pears, Bartlett, per box	None
Winter pears	$2.00@3.00

CITRUS FRUIT.

The holiday demand for citrus fruits, especially oranges, has not been sufficient to keep navels or mandarins at last week's high standard. Lower prices are looked for next week. Lemons and grapefruit are unchanged.

Oranges	Nominal
do, navels	$6.00@8.00
Mandarins	2.00@2.25
Lemons, fancy	5.50@6.50
do, choice	5.00@5.50
do, standard	4.00@4.50
Grapefruit, new	$2.00@3.00

HONEY.

Honey dealers say that the removal of some of the restrictions regarding the sale of sugar and the probable further extension of this action has had the effect of making honey very much cheaper. Bakers and confectioners are no longer buying honey and many of them are offering some of the stock that they had already bought. This has caused honey to sell at 3c or 4c cheaper than a week ago.

DRIED FRUITS.

Dried fruits continue firm at unchanged prices. Apples are somewhat slow, but there is a good movement in all others.

RICE.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop, at mill	7.00

LOS ANGELES

Los Angeles, November 26, 1918

BUTTER.

The market is higher this week. The receipts were much better, 336,604 pounds, against 251,400 pounds the same week last year. This increase in the fresh supply was without influence upon price making, as the cold storage stocks have been pretty much exhausted and the Eastern markets are all higher. Chicago advanced 2½c on extras up to Monday and New York 3c. There was taken into cold storage during the week 261 pounds, while the same week last year there was taken out of cold storage 54,918 pounds. The cold storage holdings now are 136,009 pounds, against 182,167 pounds this time last year. Under this showing and a good markets, extras sold on 'change Monday at 60c, an advance of 1½c, and what was offered was soon disposed of.

We quote—

California fresh extra creamery	60c
California fresh prime first	58c
California fresh first	57c

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	58½	58½	58½	58½	58½	60
1917—						
Extra	41	41½	42	43	42	42

EGGS.

There was a firmer market had the past week and what few fresh ranch eggs came in were gobbled up as soon as offered. It was pre-Thanksgiving demand and brought on only by scarcity for the moment. The receipts for the week were 1905 cases, against 2345 cases the same week last year. To make up this shortage in the supply of fresh eggs there were withdrawn from cold storage during the week 4580 cases, against 249 cases this time last year. The cold storage holdings now are 33,054 cases, against 23,281 cases this time last year. The advance in San Francisco, Chicago and New York had a sympathetic influence upon the market here.

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	72	72	72	72	72	73
Case count	60	63	63	63	63	69
Pullets	58	58	58	58	58	60
1917—						
Extra	55	55	55	54½	54	54
Case count	51	50	50	50	51	51
Pullets	48	48	48	48	48	48

VEGETABLES.

Offerings were light of everything save winter vegetables, which were in good supply, but most of them were slow of sale. Receipts of potatoes were heavier and the market was slow and lower. Onions, on the other hand, were scarcer, higher, and in good demand. White Globe were especially scarce and firm at the higher range of prices. Lima beans were steady but dull; so were string beans. Peppers are steady and selling fairly. Cabbage is dull and lower. No. 1 tomatoes are in fair demand. Cauliflower is coming in more freely; demand fair. Celery is steady at last week's prices.

We quote from growers:

Bell peppers, per lb	5@6c
Chile peppers, per lb	4½@5c
String beans, per lb	7@8c

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, November 25, 1918.

On account of considerably lighter offerings during the past week, the highest prices for the season were obtained on good stock of both pears and grapes, but a decided slump was noticeable and a falling off in the demand on ripe fruit.

The market on storage Emperors did not react over the week previous, the trade still being skeptical as to the keeping quality.

Lugs of Emperors and Malagas seem to have first call and the demand was spirited throughout the week for this style of package; in fact, Cleveland paid the highest price of the season—$4,600 for one car of mixed varieties.

Grape shipments have discontinued for the season, and it is estimated that there still remain but five cars of pears, which will wind up the season, which was the heaviest in the history of the fruit industry and unquestionably, all things being considered, one of the most profitable.

Averages for the week:

Chicago: Grapes—Emperors, crates $2.63; Cornichon, crates $2.93; Malagas, crates $2.79; Tokays, lugs $2.60, crates $2.17; Malagas, lugs $3.65.

New York: Grapes—Emperors, lugs $1.67, crates $1.87, kegs $4.63, drums $4.07; Malagas, crates $1.83, lugs $1.93; Tokays, $1.33; Cornichon, $2.03; Alicante Bouchet, $2.27. Pears—Winter Nelis, $3.66; E. Buerre, $3.55; Glout Morceau, $4.30.

Boston: Grapes—Emperors, drums $3.52, crates $2.19; Malagas, $2.25; Tokays, $1.56; Cornichon, $1.90. Pears—Winter Nelis, $3.05; Glout Morceau, $3.15.

Total shipments from November 14 to 20, inclusive: 10 cars pears, 81 cars grapes. Total shipments to date, 1918: 28,975. Total shipments to date, 1917: 24,139 cars.

Livestock Shipments Heavy; Must Be Heavier

Contrary to the general impression, receipts of livestock at stockyards have increased during the past year. For the ten months' period ending October 30, 1918, 44 markets show an increase of 8.9 per cent in cattle, 14 per cent in hogs, and 7.2 per cent in sheep compared with the corresponding period of 1917, as will be seen from the following table:

	1918 CATTLE	Increase or Decrease	1918 HOGS	Increase or Decrease	1918 SHEEP	Increase or Decrease
September	2,638,806	+18.19	2,219,768	+44.4	2,238,589	+21.55
October	2,564,686	—11.01	3,190,927	+25.5	2,791,325	+ 3.29
Ten-month period	19,027,934	+ 8.91	33,004,456	+14.0	15,770,012	+ 7.22

These figures, however, must not be taken to indicate that there is an over-abundance of livestock, or even an adequate supply. Peace demands for meat and fats will be so much greater than war demands that, as Secretary of Agriculture Houston puts it, "We should not fail to adopt every feasible means of economically increasing our livestock products."

Lima beans	5@6c
Potatoes, northern, per cwt.	$2.10@2.35
do, Idaho Russets, per cwt.	2.00@2.15
Sweet potatoes, per cwt.	2.00@2.25
Garlic, per lb.	20c
Onions—	
Australian Brown, per cwt.	$1.50@1.60
White Globe, per cwt.	3.00@3.25
Cabbage, per 100 lbs.	.75@ .90
Celery, crate	3.50@4.00
Tomatoes, No. 1, lug	80@90c
do, No. 2, lug	25@35c
Cauliflower, standard crate	$1.50@1.75

POULTRY.

There was more life to the market the past week than for some time. Dealers took all offerings at good prices in preparation for the Thanksgiving trade. In some instances turkeys brought a little more money, but the premium will be off after this week. Receipts were light.

The following prices were agreed upon last Friday, November 22, and hold good until the coming Friday:

Broilers, 1@1¼ lbs.	37c
Broilers, 1½@1¾ lbs.	41c
Fryers, 2@3 lbs.	33c
Roasters (soft bone), 3 lbs. and up	30c
Stags and old roosters, per lb.	20c
Hens	28@32c
Tom turkeys	31@34c
Ducks	22@28c
Geese	28c

FRUITS.

Little is now coming in from the country save apples, which are meeting with a good demand. There are no more figs or grapes, and what pears are on sale are out of cold storage. Some Japanese persimmons and pomegranates are selling fairly well.

We quote from growers:

Apples—	
King Davids, 4-tier	$2.75@3.00
Black Twigs, 4-tier	2.75
Baldwins, 4-tier	2.00@2.25
Red Pearmains, 4-tier	1.75
White Pearmains, 4-tier	2.00
Rhode Island Greenings, 4-tier	1.50
Yellow Newtown Pippins, 4-tier	1.75
Bellefleur, 4-tier	$1.75@1.85
do, 3½-tier	1.75@1.90
Gravenstein, 4-tier	2.00
Japanese persimmons, per lb.	5@8c

BEANS.

There is no shipping demand and the approach of the holidays caused the home trade to hold back.

We quote from growers—

Limas, per cwt.	$10.00
Large white, per cwt.	9.00
Small white, per cwt.	8.00
Pink, per cwt.	6.50
Tepary, per cwt.	4.50
Blackeyes, per cwt.	5.00

WALNUTS.

The trade is pretty well stocked up and the market is hardly so firm. The association is finishing its deliveries, shipments running only about three to four cars a day. What few nuts to be had from independent growers sold about 1c lower. Culls are the only walnuts to be had now in any quantity and they are bringing 14@15c a pound.

We quote f. o. b. California points:

	1918	1917
Fancy budded	33c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

HAY.

Prices were advanced $1 a ton all 'round. The rain checked shipments, which influenced higher prices. There is a feeling that present prices will not last.

We quote f. o. b. Los Angeles:

Barley hay, per ton	$24.00@25.00
Oat hay, per ton	26.00@28.00
Alfalfa, northern, per ton	21.00@22.00
Alfalfa, local, per ton	22.00@24.00
Straw, per ton	9.00@10.00

COTTON.

After a weak opening of our review week, the market took on renewed strength upon the announcement that all restrictions on exports had been removed and the early weakness was recovered. The ginning report showed that there had been ginned so far only 8,681,005 bales. This is considered high and added to the firmness of the market. On Saturday, December cotton in New York sold up to 28.50c and January to 28.35c. In New Orleans December closed at 27.58c and January at 27c. Monday opened the current week with good buying both in New York and New Orleans. December closed in New York at 28.45c and January at 27.65c. In New Orleans December closed at 27.95c and January at 27.15c.

Special Livestock Market Report

San Francisco, November 27, 1918.

CATTLE—The cattle market is strong and advancing, a situation due to the abnormal scarcity of good cattle. This advance has been anticipated for some time. California has been pretty well drained of good beef cattle, and Oregon is offering but few. At the present time slaughterers are looking to Nevada and Utah for their supplies. This week's quotations are:

Grass Steers—	
No. 1, weighing 950@1050 lbs.	12½@12¾c
do, weighing 1050@1200 lbs.	12¾@13c
do, second quality	11@11½c
do, thin	9½@10c
Cows and heifers—	
No. 1	9@9½c
do, second quality	8@8½c
do, common to thin	6@6½c
Bulls and stags—	
Good	6½@7½c
Fair	5½@6½c
Thin	4½@5½c
Calves—	
Lightweight	11@11½c
Medium	10½@10¾c
Heavy	8½@9c

SHEEP—The sheep and lamb market is steady. Better pasturage has enabled buyers to get more easily what they need to supply the consumptive demand, which continues comparatively limited.

Lambs—	
Yearling	12@12½c
Milk	14@14½c
Sheep—	
Wethers	11½@12c
Ewes	9@9¼c

HOGS—Hogs are coming in in good supply and of very good quality, but the packers are not able to handle all that are offered. The agreement entered into between the San Francisco and Los Angeles packers and the Food Administration, whereby packers agree to buy hogs between now and January 1, 1919, on the basis of a minimum drove cost of 16½c for No. 1 hogs weighing between 150 and 300 pounds, will, it is believed, serve to stabilize the hog market and furnish growers with a fixed basis to work on.

Hard, grain-fed, 100@150	16c
do, do, 150@300	16½c
do, do, 300@400	15¾c

Los Angeles, November 26, 1918.

CATTLE—A steady and firm market was had the past week for all choice steers. The few fat steers offered brought full quotations. The market for thin and medium cattle is still dull and weak.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs.	$9.00@12.00
Prime cows and heifers	8.00@ 9.00
Good cows and heifers	7.00@ 7.50
Canners, per cwt.	5.50@ 6.00
Calves, per cwt.	8.50@10.00

HOGS—A very good run of good hogs was had the past week. Cooler weather improved the demand for fresh pork and encouraged active buying. Last week's prices were fairly sustained throughout the week.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs.	$14.00@15.00
Mixed, 225@275 lbs.	15.00@15.50
Light, 175@220 lbs.	15.00@16.00

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—A better quality of sheep and lambs was had this past week. Demand fairly active for all good fat stuff and prices steady.

Per cwt. f. o. b. Los Angeles—

Prime wethers	$9.00@10.00
Prime ewes	8.50@ 9.50
Yearlings	9.50@10.50
Lambs	15.00@16.00

Portland, November 25, 1918.

CATTLE—Weak; receipts, 1780. Steers, prime, $12.25@12.75; good to choice, $11.00@12.00; medium to good, $10.00@11.00; fair to medium, $8.50@9.50; common to fair, $6.00@8.00; cows and heifers, choice, $8.00@8.50; medium to good, $6.50@7.50; fair to medium, $5.50@6.50; canners, $3.00@4.00; bulls, $5.00@7.50; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—Weak; receipts, 4280. Prime mixed, $17.00@17.15; medium mixed, $16.75@17.00; rough heavies, $15.00@16.00; pigs, $14.00@15.00; bulk, $17.00.

SHEEP—Steady; receipts, 1660. Prime lambs, $11.50@12.75; fair to medium, $8.50@10.50; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@8.50.

What Co-operation Has Done for Prunes and Apricots

Written for Pacific Rural Press by John J. Fox

THE DRIED PRUNE (and apricot) industry, which has grown in forty years from very small beginnings to a giant industry, found itself, after many discouraging vicissitudes, when the leading growers in each prominent county gave up their time and united energies to form an organization on the co-operative plan, whereby they might have some voice in the marketing of their own products. This State-wide organization followed many former minor attempts of prune districts, some of which were so small that they amounted to pools only, but none were of sufficient magnitude to make an appreciable impression on the market.

> "Competition is the soul of trade." This was a true saying when selling was not undermined by intrigue to restrain competition and distribute the market to the few large buyers. Competition is now transferred to the production of quality in our orchards.
>
> A growers' organization is democratic, in that its aim is to benefit each one of its members and to serve the public with the best that can be produced; and to guarantee its quality and price, the latter within stated times, thereby freeing the market of speculation and consequent fluctuation at growers' expense.

"It Is Naught," Saith the Buyer.

Now, it takes money to conduct any business, and money was one thing that was difficult to get under earlier trials. Growers were entirely ignorant of the market and distribution of their own wares, of foreign and home demands, of foreign crops and of competing commodities. So in 1916 a Prune and Apricot Growers' Information Bureau was established—members paying a small fee for working expenses—that they might be enlightened as to the above and general crop conditions and thus be in a position to market their wares intelligently. Up to this time growers had been compelled to get this information—more or less—from the buyer. Well, no live man is in business for his health, least of all such strenuous work as fruit buying.

Leading Up to a Selling Organization.

The growers after one season found the information bureau so useful that they asked themselves the question: "Why should we hand over our affairs to a few private buyers who appear to have apportioned the territory amongst them for the purpose of controlling our output of fruit, and who are able thus to manipulate the market for their own benefit? We can do as well and divide the profits of processing and marketing amongst ourselves instead of handing them over to a disinterested party. We can, if enough growers unite, do this business ourselves. We can then standardize our fruit and guarantee its quality. With control of the market we can guarantee prices and do away with unholy speculation and reduce relative cost to the consumer. We ourselves can do business through the brokers, jobbers and wholesalers that form a part of the great distributing system that has grown up. And, more than that, we can, by co-operation, advertise our wares under a brand that has the whole industry back of it as a guarantee and thus extend our markets into unserved spheres to keep pace with our rapidly increasing product."

Let's Do It Ourselves.

Then why keep on selling to the independent packer, whose only reason for being in the business is to rake off the difference between what he can squeeze the grower down to and what he can work the market to pay? He never advertises and if we are to depend on him to open markets for our gathering tonnage we are truly in a parlous state! Also, as it takes less capital to handle cheaper fruit, the disinterested marketer sees that prices are made accordingly.

This Growers' Information Bureau, established at San Jose, was the beginning by which the growers learned that by co-operation and combination in a selling agency they could stabilize and increase their profits and at the same time reduce the relative cost of their fruit to the consumer. They looked into the modus operandi of the Raisin Growers' Association and received aid and encouragement from that young giant. They found that only through control of a large majority of the output of prunes and apricots would they be able to carry out their desire of establishing a growers' selling organization. After a good deal of spade work, a mass meeting of growers was called at San Jose and, to make a long story short, the Prune and Apricot Growers' Association, Inc., was formed and legally established on May 1, 1917.

The First Season of the Association's Activities

a large proportion of the dried prune and apricot production of the State was marketed in the face of most adverse conditions. At the opening of the European war the burthen of the packers' plaint was "export trade was shut off," and later that transportation could not be provided, so that a large proportion formerly exported would be left on hand for home consumption, thus weakening the prices. Yet the seasons of 1914, 1915 and 1916 have shown us that export markets were maintained and fair prices ruled. But in 1917, after the United States entered the war, an embargo was placed on all shipments to neutral and Scandinavian countries, all shipping space was commandeered for the allies and we were practically excluded from export trade. Buyers would not buy and sellers could not sell.

The handsome offices and headquarters of the California Prune and Apricot Growers' Association at San Jose; built and owned by the growers—a monument of co-operative achievement and progress.

The First Year's Business.

For six years prior to the season of 1917 more than 70 per cent of the dried apricots were shipped abroad. Of about 190,000,000 pounds produced in the six years previous to 1917, some 115,000,000 pounds were exported, leaving an annual consumption in the domestic market of from 10,000,000 to 12,000,000 pounds. In 1917 it became necessary to market over thirty million pounds of dried apricots at home, yet this great crop was marketed at prices not materially lower than those of recent years.

In the season of 1917 the production of prunes in California was over two hundred million pounds, probably the largest crop ever harvested in the State—possibly equalled in tonnage but not in quality by the crop of 1912. This large crop has been marketed by the association with a net average result to the grower of slightly over a 6c basis on the better grades.

Effects on the Market.

The most important effect of the co-operative marketing under the new association was the stabilizing of prices under guarantee while still giv-

EQUILIBRIUM.

THE world-pendulum swinging between autocracy and anarchy seems to be tracing shorter arcs this week and discloses a very promising disposition to rest ere long upon the central point of democracy. The kaiser can be pulled out of the cottage-cheese whenever he is wanted and his heir is fastened up in a parsonage on a sea-girt island where he can meditate on his immoralities and general worthlessness. The better-minded Germans have frustrated a plot to restore the militarist regime and seem really to be in earnest to fix the blame and properly punish the crime of causing the war. The allies have established their occupation of Germany for twenty miles beyond the Rhine and are maintaining beneficent supervision in the interests of law and order. The great world-feeders, Mr. Hoover and his associates, in allied countries are writing menu cards for all the hungry Europeans they can reach, and food cargoes are already arriving from this country. There is, of course, deplorable political conflict ahead in all the liberated countries east of the Rhine and some of the liberated clans seem to be persecuting the weaker groups which they enclose in campaigns of frightfulness which they have themselves experienced. All this is grievous and will be suppressed and punished so far as the very crackers on the whips which the allies are wielding can reach—but revolutions are hard to regulate. It is the ultimate outcome in which beneficence is to be hoped for and that is increasingly promising.

EQUALITARIAN.

AS WE write on Tuesday, President Wilson goes afloat on a good old Yankee boat, topped by a powerful wireless outfit and under-run by a private cable so that if it becomes necessary to appoint a couple of postmasters or talk with Sammy Gompers about the threatened Mooney strike it can be easily done without stopping his world-job. No one can doubt the efficiency of our chief magistrate: he rates about 101 per cent—all there is and then some! It is to be hoped that the captain of the ship has a good tank of oil along to keep the sea quiet, for our President surely has no time to overhang the rail. The President gave Congress a good talking to before he sailed and he set forth grandly American plans and purposes in eloquence which will surely ring down the ages. But we must express the wish that he had been a little less self-conscious and had given the American people a little more credit for the principles of permanent peace which all the world's pigeons seem disposed to perch upon. If we remember correctly, personal humility and self-forgetfulness have clothed our great statesmen of the past. We are perhaps too near the event to see clearly, but we have a notion that if the President had called to sail with him as American representatives our two ex-Presidents, Roosevelt and Taft, he could at least have tripled the scenic impressiveness, in European sight and thought, of the world's new sunrise in the West! Not for half a century, if ever, has the United States had three men of presidential grade in active life at one time. What a chance we have lost to show the Europeans that in the midst of their throne-wrecks and skull-cracked potentates there is a land where men may come and men may go, with one love of country and devotion to humanity to inspire their thoughts and impel them to public service. If the "George Washington" could have sailed for Europe in this supreme official way with three great Americans, wide apart in politics but one in patriotism, on the hurricane deck, the wireless above them sizzling with godspeeds from Cape Cod and Norfolk, and the "kitchen cabinet" below stairs helping the cook with the garnishment of a truly American bird for the Paris thanksgiving, would not the world have gained new realization that Americans are broadly equalitarian in their mutuality of purpose and devotion?

EQUATIONISM.

BUT there are many things which the President set forth in his address to the Congress on Monday which the country will enthusiastically approve and some things which California will echo as a world policy and of which, as anticipated in her own civic experience, she is justly proud. California is an equationist of the equality of the sexes in public affairs because her theoretical belief therein, which actuated her adoption of the policy some years ago, has now become a durable conviction based upon full proof of wisdom and practicability. Therefore, we quote with great satisfaction this declaration of President Wilson:

> And what shall we say of the women—of their instant intelligence quickening every task that they touched; their capacity for organization and co-operation, which gave their action discipline and enhanced the effectiveness of everything they attempted; their aptitude at tasks to which they had never before set their hands; their utter self-sacrifice alike in what they did and in what they gave? Their contribution to the great result is beyond appraisal. They have added a new luster to the annals of American womanhood.
>
> The least tribute we can pay them is to make them the equals of men in political rights, as they have proved themselves equals in every field of practical work they have entered, whether for themselves or for their country. These great days of completed achievement would be sadly marred were we to omit that act of justice.

When we remember how women have almost on their knees for decades besought Presidents and Congresses for recognition of their rights, this noble declaration will be appreciated. There is, however, chagrin that the United States as a whole has to follow other nations in such justice to women when it should have led them to it.

EQUANIMITY.

THERE is another grand thing about President Wilson's farewell address to the Congress and that is the evenness of temper and composure of spirit which it manifests. He is unaffected by the dreams of visionary reconstructionists who wish to regulate everything even to the "infiltration" of soldiers who have finished their job abroad—which has recently given us some concern. Those who believe in regulating everything should consider these paragraphs:

> I have heard much counsel as to the plans that should be formed and personally conducted to a happy consummation, but from no quarter have I seen any general scheme of "reconstruction" emerge which I thought it likely we could force our spirited business men and self-reliant laborers to accept with due pliancy and obedience.
>
> While the war lasted we set up many agencies by which to direct the industries of the country in the services it was necessary for them to render. * * * But the moment we knew the armistice to have been signed we took the harness off. Raw materials upon which the Government had kept its hand for fear there should not be enough for the industries that supplied the armies have been released and put into the general market again. * * * It is surprising how fast the process of return to a peace footing has moved in the three weeks since the fighting stopped. It promises to outrun any inquiry that may be instituted and any aid that may be offered. It will not be easy to direct it any better than it will direct itself. The American business man is of quick initiative.

President Wilson is evidently appreciative of individual initiative and the services it has rendered in the development of this country and does not propose to displace it with paternalism, and that may be a good thing to remember.

EQUALIZATION.

THERE is, however, one thing which seems to have escaped his mind at the moment and that is the declaration of a year ago that "food will win the war" and the exhortation to farmers to produce it in unlimited quantities. If food did win the war, he forgot to mention the fact. He did, however, say this, in connection with removing restrictions from manufacture and trade:

> It has not been possible to remove so rapidly or so quickly the control of foodstuffs and of shipping, because the world has still to be fed from our granaries and the ships are still needed to send supplies to our men overseas and to bring the men back as fast as the disturbed conditions on the other side of the water permit; but even there restraints are being relaxed as much as possible and more and more as the weeks go by.

It would have been very pertinent to have stated what farmers are expected to do in view of the fact that "the world has still to be fed from our granaries." Perhaps Mr. Hoover has not yet had time enough to measure up that matter and we may get an exposition of it later. It should, however, be remembered that all possible speed in the matter of buying either by the Government or releasing private buyers from their holding restrictions should be realized. It may be thought that as most of the farmers' holdings are edible he cannot starve while holding them—but the farmer cannot eat his tax bills: they are more apt to eat him, and they are coming on him with sharper teeth than ever, as a detailed statement on another page of this issue indicates and as the internal revenue collectors will still further remind him next month. If there is to be a great call for feeding Europe, the Government ought to remember the injunctions of its light-brigade and "shop early." It ought to fix a price which it will pay for all commodities its purchasing agents will need on European account and thus start up the markets which are now listless, or it ought to set commercial buyers free to gamble on the European demand and start movement that way. If something is not soon done, farmers will have no money for large cropping in 1919 and no courage to start crop growing for a dead market, even if they have money enough. The price which they had to pay for labor and all other supplies to get the crops they are now holding is making them very shy. It is hard to hold back a man who has made a good crop-sale and just as hard to start up one who has not. Therefore, though it was perhaps very wise for the Government to tie up the speculative trade last year and to help the farmer by fixing prices and buying direct, there is a dog-in-the-manger aspect of the way in which several staples have been forced to drift during the last few months. Relaxing restraints on consumption is, of course, helpful, but what the farmer needs is relaxation of restraints on trade in his products and exports of them, or much freer Government buying than that which has recently started things up a little. It is all right to praise manufacture, trade and labor as possessed of initiative to best do their own reconstruction, but it is surely as important to equalize praise and privilege so the farmers can also come through with their jobs in the ways they wish to do them.

EQUABLENESS.

WE HAVE been reading so hard on President Wilson's philosophy of removing irregularities by putting people up against each other and reaching equable adjustment of strain thereby that we are disposed to invoke it on the settlement of a problem which a mail-carrier brings us as we write. But first President Wilson's way:

> So far as our domestic affairs are concerned, the problem of our return to peace is a problem of economic and industrial readjustment. That problem is less serious for us than it may turn out to be for the nations which have suffered the disarrangements and the losses of war longer than we. Our people, moreover, do not wait to be coached and led. They know their own business, are quick and resourceful at every readjustment, definite in purpose and self-reliant in action. Any leading strings we might seek to put them

in would speedily become hopelessly tangled because they would pay no attention to them and go their own ways. All that we can do as their legislative and executive servants is to mediate the process of change here, there and elsewhere as we may.

It looks to us like a workable and very equable policy. Try it on these two letters which have just arrived:

To the Editor: I do not like your continual knocking of tepary beans. In nearly every bean article you have you give this bean a cheerful knock. They are worthy of serious consideration both as to food value and the ease with which they can be raised. They are a sure crop and when cooked right are not inferior to any other bean.—R. G., Salida.

To the Editor: I note that A. T. G. of Chico advises making the Germans eat barley to get rid of our surplus. My suggestion is to make them eat tepary beans. In that way we would not only get rid of beans that are hard to sell but we could partially get even with the Germans!—S. A. S., Thermal.

We have, then, the President's assurance that these two responsive readers "would become speedily entangled" if we attempted to put them in leading strings and "would pay no attention to them and go their own ways"—and that is really the American way, and the only people who do not seem to get anywhere with it are the American farmers. They do not agree even on beans.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Peanuts a Problem.

To the Editor: How about growing peanuts? I have some fine sandy sub-irrigated land that I think would be good for peanuts and, judging by a few bunches I have seen growing in this vicinity, they should yield a heavy crop. What time are they planted and how—that is, by a hand planter or bean planter? How far apart are the rows and how far apart in the row? What variety is best for market? How many does it take for an acre? How are they threshed off the vine? Would an ordinary bean thresher thresh them as set up for beans or by changing the teeth in the cylinder?—Reader, Hughson.

Peanuts as a commercial crop are a thing which should be undertaken with great care and hesitation unless one has a good deal of experience to guide him and such experience is very likely to guide him toward not undertaking it at all. There are two reasons for this. First, to get a good crop of large, light-colored, well-filled nuts, the soil must be light enough not to bake and crack and fine enough in texture to hold moisture well and to bring moisture up from a good supply in the subsoil, which is most apt to be found in river-bottom lands, but wet lands are not suitable. Second, we are in sharp competition with Japanese peanuts and in danger of prices so low that they will not meet the cost of hand labor, which is largely required and very high-priced in this State. The variety called "California" is best for local conditions. Peanuts are started by planting shelled kernels in rows from three to four feet apart, with the kernels about sixteen inches apart and covering in proper soils about three or four inches. About 30 pounds of seed are required to drop an acre. They must be planted after frost danger is over in the spring and they require about six months before fall frosts. They are cultivated like corn and kept clear of weeds in the rows until the bloom-spikes appear and are not disturbed afterwards. If irrigated, the water must be applied in furrows between the rows and not flooded. The ripe crop can be plowed out, lifted to the surface and cured under the tops for ten days and then combed off the roots by hand or special picking devices and sacked. They cannot be handled with such machinery as you describe. A bean thresher might have to be modified as much to handle peanuts as to pack eggs.

Winter-Growing Peas.

To the Editor: I have a very productive sandy soil, under irrigation, and am considering planting some variety of field peas for a spring crop. What would be the best and what are the market conditions for the same?—Subscriber, Chowchilla.

You do not say whether you are thinking of growing peas for a dry seed-crop or for a green crop for the market or the canneries. If the former, the varieties available are the Niles and the Canada. Dry peas are usually rather low in price, for the local demand is not large and chiefly filled by by-product threshings from the green pea acreages. If you are thinking of a green pea product, do not go far before you get a contract from some cannery to buy them and plant the variety which they desire to buy. There are two other reasons why we should go slow on peas in your district: first, peas are better suited with coast than interior valley conditions; second, for a good winter growth the crop should have been started a couple of months ago to make a fall growth before cold weather. Peas are hardy against injury by frost before podding, but the way they can stand still during dry, cold weather almost passes belief. We should not risk more than enough to get experience from, or to be satisfied with if you finally had to plow them under for the good of the soil. If you are willing to risk them as an investment for a cover-crop with a chance of leaving them for seed if they look well in the spring, go to it: it is reasonable.

Silo Sorghum: Not Beets.

To the Editor: Can good silage be made from sorghum and should it be put into silo as corn or should there be some straw cut with it? What stage of ripeness, also what variety, is best? How about beets for silage, and which is the best variety? Are they cut alone or with straw?—J. A. S., Wells, Oregon.

Good silage can be made from any kind of sorghum by waiting until the seed is ripe. Cut too early, there is apt to be too much acid developed. Unlike corn, sorghum retains enough moisture in the stalk after the grain matures. It is not necessary to cut in straw. Let the stock have the run of the straw pile. If there is much dry leafage on the sorghum, it is desirable to cut in some water. There is no object in siloing stock beets—especially in a country where they can be kept fresh without pitting or cellaring. Beet pulp is siloed in shallow receptacles. It siloes itself by crusting over. The best stock beet is the one which grows largest in your location, because the more of it that grows above ground the cheaper it can be handled. Any large mangold or tankard is good if it gets big enough.

How Much for One Irrigation?

To the Editor: How many gallons of water to the acre is required for one irrigation of alfalfa?—I. S., Templeton.

There is great variation in practice according to the character of the soil and the heat and dryness of the atmosphere of the region. It is usual to state the amount in acre-inches, which is in depth of application—like measurement of rainfall. One acre-inch over the whole surface of an acre is equal to 27,150 gallons. The number of acre-inches at each irrigation in the Sacramento Valley is 6 to 9 on medium loams; 3 to 4 on gravelly or sandy soils, and 2 to 4 on heavy soils. In the latter two soils from 2 to 3 irrigations are given per cutting, because sandy soils will not hold (and heavy soils will not take) so much at a time as a deep loam. Multiply the number of acre-inches by the gallons in one acre-inch and you have your answer.

Value of Grape Pomace.

To the Editor: What is the approximate value of grape pomace as fertilizer, apart from its humus? What is the best time and method of application?—F. P. I., Sebastopol.

Fresh grape pomace, after fermenting and pressing, may be worth $4.60 per ton. This includes its nitrogen content. Old grape pomace, but not too long exposed, may be worth $8.67 per ton. The difference is mainly due to the greater water content of fresh pomace. These calculations include the nitrogen content and are based upon mixed barnyard manure at $3.15 per ton, so you can make comparisons for relative value. Fresh pomace is often very sour and has to be used carefully unless treated with lime. Now is the best time to make application, to be plowed under at once or later in the season.

Alfalfa and Overflow.

To the Editor: I have a piece of ground bordering on a creek which overflows from three to five days during the winter months, before draining off, that I wish to plant to alfalfa. Would I be safe in doing so? How long will alfalfa stand overflowing during the winter months?—H. G. T., Sacramento.

Alfalfa will stand much longer overflow than that when it is dormant. It may endure for weeks, but there are two things you ought to be sure of: One is that the plant will really be dormant at the time of submergence; the other is that after the overflow disappears the land will not stand waterlogged too long, for that will rot the roots. What you need to know is how near the surface the water stands and how long after the overflow. If it remains a long time, red clover is a safer plant.

Almond Planting.

To the Editor: I wish to plant ten acres of almonds near Orland. The soil is medium clay loam, with just a little gravel. The piece is 1250 feet long and has a fall of three to three and a half feet and can be irrigated from one end to the other. Is there fall enough? Why do they use the peach root? Has it any advantages and is it better for wet soils? What three varieties would you plant?—R. G., San Mateo.

Your land has grade enough for the length of water-run which you propose, but the desirability of it depends upon how the soil takes water. If it takes water freely, it is likely that the higher part of the tract would get too much while it is being run long enough to get through. If you find that the case, stop off the ditch across the top of the tract and carry the water along to another cross ditch half way down and fill the lower ends of the furrows from that. You must learn how your soil takes water by experience unless you can borrow results from some neighbor who has become locally wise in the same way. The peach root is better on a soil underlaid by a tight layer because it is not quite so sensitive to too much water at times underneath. If your soil is open all the way down, the almond is well suited. Probably the three best varieties for you will be Nonpareil, Ne Plus Ultra and Drake.

Bark Cleaning Spray.

To the Editor: I have apricots and peaches six to ten years old. They have not been sprayed and are in good health. I would like to spray this for the first time to prevent the bark from cracking or drying. What shall I spray with, and what time to apply, and how strong without injury?—C. B., Senger.

Presuming that you are right that your trees are not infested with scale or some other pest which causes the bark to crack, gum and be otherwise diseased, you can clean the bark of algæ which have a tendency to crack the bark by spraying with caustic soda, one pound to ten gallons of water, after the leaves have fallen. This gives the tree a very clean appearance.

A Willow Borer.

To the Editor: I have a four-year-old weeping willow tree affected with some kind of worm in the heart of the limbs, causing them to die. Can you give me a remedy to destroy the pests?—G. K., Linne.

We are not acquainted with such a pest. Mail us a piece of wood with the worm inside so that we can determine its kind and we may then be able to indicate a treatment.

Sell Us Your Time

During the past six months a large number of our subscribers have taken up our work of attending to renewals and securing new subscriptions. They have done well—many making more than they ever earned before.

We are just starting a big subscription campaign and can use a few more ambitious, energetic men. Experience not necessary; we give you proper training. Must have an automobile, and be able to devote entire time to the work.

Straight salary; permanent work. Write for particulars and tell us a little about yourself. You'll be glad you investigated this money-making opportunity.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., December 3, 1918:

Stations—	Rainfall Data: Past Week	Rainfall Data: Seasonal To Date	Rainfall Data: Normal To Date	Temperature Data: Max'm	Temperature Data: Min'm
Eureka	...	7.60	10.38	60	34
Red Bluff	...	12.72	6.01	68	36
Sacramento	.01	5.77	3.92	62	36
San Francisco	.02	8.30	4.41	64	44
San Jose	...	8.84	3.52	68	32
Fresno	...	2.39	2.15	66	32
San Luis Obispo	...	5.47	3.67	82	36
Los Angeles	...	2.50	2.50	86	46
San Diego	...	2.59	1.44	78	42

Cover Crops for Citrus and Deciduous

Written for Pacific Rurul Press by John J. Fox

WE HAVE recently mentioned having seen citrus and deciduous fruit orchards with alfalfa growing between the trees. The reasons given by some men for doing this are that they get that much more from the land; or it shades the ground; or, with citrus men, that it helps prevent the cracking of fruit. So far as we have been able to observe, some orchards get away with it all right and others do not. The man that grows trees and alfalfa together has to be a very careful, painstaking man, with his first consideration for his trees. He must also have plenty of water and absolute control of it. For the one thing any tree needs, and particularly citrus trees, is as nearly an equable condition of soil moisture as can be obtained. A growing crop of alfalfa through the hot days of summer is evaporating the moisture through its dense masses of foliage at a very rapid rate, which moisture must be replaced very regularly by irrigation — and judiciously. If the farmer has some stock to help out in keeping up the fertility of the soil, the alfalfa generally receives more attention than it is entitled to—especially at haying time, when the surface of the ground needs to be dried out to harvest the crop quickly. Then, if there is a layer of clay or hardpan three or four feet down, in nine cases out of ten the land will be waterlogged for a day or two when water is applied, to be followed regularly by a drying out process. No living tree is going to enjoy such conditions, though some will put up with it. We have seen orange trees dug up that looked sickly and have found water had practically rotted off the roots where there was a pocket in the red clay.

Heavy growth of Malva or Mullen in a citrus grove. Ready to turn under before it becomes woody.

THE CRACKING OF FRUIT.

We know that plums, prunes and cherries crack from late irrigations, and the dryer the ground has been before the worse they crack after irrigation. Yet they can be irrigated quite late if moisture has been kept in the soil throughout by early irrigations. This is a long preamble, but is intended only to emphasize the fact that alfalfa and fruit don't jibe with a man who has his eye on the alfalfa. Therefore, on a small 10- or 20-acre fruit ranch something besides stock must be relied upon to furnish the humus necessary to the well-being of the orchard. We lately had a talk with D. D. Sharp, Horticultural Commissioner of Riverside county, in which he remarked that even at present prices alfalfa hay (loose) was the cheapest form of organic fertilizer that could be applied.

For his district he would apply three tons to the acre in orange and lemon groves in the following way: Say three irrigations a year are given, he would apply one ton of chopped alfalfa hay at each irrigation—chopped in an ensilage cutter so that it would not interfere with subsequent cultivation.

This would provide three tons to the acre each year. The mulch of humus would help to prevent evaporation. It could be supplemented with artificial manures or a winter cover-crop, or clean cultivation could be practised. Mr. Sharp suggested that if four men with 10-acre orchards each owned jointly 12 acres of good alfalfa it could be cut and hauled to the orchards loose and then chopped and applied as desired.

FRUIT SETS BETTER WHERE THERE IS AMPLE HUMUS.

We noticed at the experiment station at Riverside that where humus had been supplied to the soil adequately the trees looked better and there was a much better set of fruit. On one section that had no aid at all in the shape of fertilizer there was no crop at all, though the trees were adjacent to those that had a fair setting across the road. We noticed also at Porterville, Lindsay and Exeter that the set of fruit was much better in groves where there was plenty of humus. Here we also noticed that where manure had been applied the cover-crops were already luxuriant—mullen knee-high in some places and both trees and crops looked well. We saw in various orchards barley, rye, vetches, peas and clovers, also in some a natural weed growth that appeared to have followed dressings of manure. It all looked good to us deciduous men as we drove by. We all want to add humus to our soil at the cheapest possible rate for the most valuable form, and we think Mr. Sharp's suggestion worth passing on.

Alfalfa hay spoiled by the rain has a distinct shipping value for manurial purposes which can doubtless be dealt with by the growers' organizations. Chopped alfalfa applied as a manure certainly appears to the writer more than growing it between the trees—for the average man—because the experience of many years has taught us that moisture conservation and distribution is of paramount importance in California. We can mention one orchard that we have seen recently that did not seem to have suffered from alfalfa having been planted between the trees. It is in East Bakersfield and belongs to Dr. C. W. Kellogg—18 acres of nine-year-old oranges. The trees were carrying a fair crop of good fruit and we did not notice any split fruit; also the drop was said to have been negligible. It is watered very regularly. We also recently mentioned another near Lodi. But these orchards have had exceptionally careful treatment in the matter of applying water and do not represent the average care.

ANOTHER REASON WHY ALFALFA AND TREES DO NOT MIX.

In the case of alfalfa in deciduous fruit orchards, it makes summer spraying (for red spider, thrips or what not) difficult, as the crop would have to be trampled to get through with the spray outfit and the spraying would probably be delayed till the crop was off. Bad policy, as every fruit man knows.

Then if the orchard happens to be prunes, walnuts or almonds, there is bound to be a big added expense in harvesting the crop.

Some of the crops of mullen and weeds we saw were advanced enough to turn under and then there would probably be another good crop to turn under by spring.

Cross-Pollenization of Pears in Nevada Co.

[Written for Pacific Rural Press.]

Accompanied by D. F. Norton, Horticultural Commissioner of Nevada county, we visited some of the young pear orchards in the neighborhood of Grass Valley and Nevada City just at the close of the season. The one which interested us most was the Loma Rica Ranch, under the management of A. L. Wisker. In addition to apples, cherries and plums, Mr. Wisker has 130 acres of young pear trees that will produce heavily in a few years, being on a deep sandy clay loam soil. He will plant out 150 acres more (60 acres are already cleared and ready to plant), using the new Chinese root, Pyriurisiensis, whose native habitat is Manchuria. This stock is said to be blight-resistant and the young tree will be built and top-worked to Comice, Winter Nelis, Beurre d'Anjou and Bosc, as well as Bartletts. The varieties will come in multiples of two rows, so as to facilitate working and harvesting, and their alternate distribution is calculated to increase the setting of fruit—a practice now generally recognized as being advantageous. At least 40 per cent of the entire orchard will be in fall and winter pears, which make a firm, well-colored, shapely fruit in this section.

VARIETIES.

The Beurre d'Anjou is such a shapely pear and easy to pack, of good quality and apparently as prolific as the Bartlett, that it seems strange more have not been planted. It forms a strong, thrifty, shapely round-headed tree and the fruit is of a beautiful complexion — clear, whether green or tinted, and does not "go" so readily at the core. The Bosc pear has been bringing good prices, but the shape makes them harder to pack, being long in the neck. The Comice is a good all-around pear and has been bringing good prices. Mr. Wisker says the Bosc does especially well at Placerville.

He also told us that 92 per cent of the shipping fruit from Grass Valley is pears, 95 per cent of the older orchards being Bartletts. As this is a late district, many of the new orchards are set to late varieties, especially those mentioned above—not more than six rows of Bartletts being planted to two of the other varieties for cross pollination. Mr. Wisker also told of the Forelle pear having sold at $7.95 per half box (25 pounds), as they color very beautifully here. It is probably color that sells this second rate pear. This section is 3000 feet above sea level.

Mr. Wisker is keen on cover-crops in his orchard and we noticed a good stand of vetches among the trees, which has appeared since the rain. When all the young trees in this section come into bearing a few years from now, there will be busy times in Grass Valley. Probably also a large evaporation to take care of the culls.

The Sperry Flour Co. sold over 5,000,000 pounds of seed wheat during October, 1918, from the Stockton mills.

The War Is Won

But the consumer of Food
Must Still Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.

While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.

Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

Sec'y of Agriculture on Livestock Problems

Written for Pacific Rural Press

The report of the Secretary of Agriculture, just issued, shows striking results of efforts to secure an ampler supply of meat and dairy products. Milch cows increased from 20,700,000 in 1914 to 23,300,000 in 1918; beef cattle from 35,900,000 to 43,500,000; hogs from 58,900,000 to 71,400,000. Sheep decreased from 49,719,000 to 48,900,000, but showed an increase over 1917 of 1,300,000. In spite of the large exportation of horses and mules, the number remaining on farms is estimated to be 26,400,000, compared with 25,400,000 for the year preceding the European war.

In terms of product the results are equally striking. The amount of beef for 1918 is given at 8,500,000,000 pounds, as against 6,079,000,000 for 1914; pork, 10,500,000,000, as against 8,769,000,000; and mutton, 495,000,000, as against 739,000,000; a total of all these products of 19,495,000,000 for the last year and 15,587,000,000 for the year preceding the European war.

An increase is estimated in the number of gallons of milk produced of 922,000,000, or from 7,507,000,000 to 8,429,000,000, and in the pounds of wool of 9,729,000, or from 290,192,000 to 299,921,000. The figures for poultry production have not been accurately ascertained, but it is roughly estimated that in 1918 we raised 589,000,000 head, compared with 544,000,000 in 1914 and 522,000,000, the five-year average, 1910-1914, while the number of dozens of eggs increased by 147,000,000, or from 1,774,000,000 in 1914 to 1,921,000,000 in 1918, and, in the last year exceeded the five-year average by 226,000,000.

These figures, however, should not be taken to indicate an over-production. The records of stock on farms in 1918 is for January 1, and the figures for meat production for 1918 are tentative estimates based upon 1917 production and a corresponding comparison of slaughter under Federal inspection for nine months of 1918 with the corresponding nine months of 1917. It is not thought that livestock production has kept pace with consumption during recent months, and now that we have a starving world to feed and many more ships will be available, it is expected that the demand for meat, dairy products and breeding stock will be greater than ever, and will continue heavy for a long time. Even with our increased production we shall not be able to supply the demand, and still further expansion along livestock lines will be necessary.

STOCKYARDS AND PACKING HOUSES.

The comments of Secretary Houston on the stockyard and packing house situation are interesting, and he makes some excellent suggestions, as follows:

"Under the authority conferred upon the President by the Food Control Act, substantial progress was made by the Department of Agriculture in the regulation and supervision of stockyards and of commission men, traders, order buyers, packers, and others handling or dealing in livestock in or in connection with stockyards. The important results already accomplished in the improvement of livestock marketing conditions, and in the elimination of many uneconomic and unfair market practices demonstrate the effectiveness of the form of control which has been exercised under the war power and the desirability of continuing it or a similar form of supervision. Not only the stockmen who patronize these great centers of livestock trade, but also some members of the trade themselves, have recognized the possibilities for betterment of marketing conditions through their regulation by the department, utilizing its corps of supervisors clothed with the requisite authority. Besides the protection thus extended to consignors of livestock for sale at the markets, the opportunity is afforded for improvement in methods, facilities, and trade practices incident to the handling and sale of livestock involving many millions of dollars daily.

"Closely associated with the supervision of livestock markets is the problem of a similar authority over the slaughtering, meat-packing, and related interests which are centered at the principal livestock markets. Under the regulations applied to meat-packing establishments by the Food Administration, limitations have been placed on profits on meats and by-products handled by these establishments, the installation of uniform accounting systems has progressed with comparative rapidity, and the centralization of control by a small group of packers has been materially checked. The economic welfare of meat production and distribution would be promoted by the continuation and development in some form of the supervision over the packing industry. Such control should be closely co-ordinated with that over the livestock markets. There is need, in connection with this supervisory system, of a central office to which packing concerns should be required to report currently in such form and detail that it would be constantly informed concerning their operations. Such an arrangement would afford protection to producers and consumers.

"The restoration and maintenance of conditions which will justify confidence in the livestock markets and meat-packing industry is the greatest single need in the present meat situation in the United States. It seems desirable, therefore, that the necessary legislation be enacted at the earliest possible moment. The assurance of open competition and the stabilizing of prices in the livestock markets, the elimination of evil practices, the adjustment of charges for market services, and the restoration of confidence in market conditions generally, apparently require three remedies, namely, regulation, information, and voluntary co-operation. Federal regulation, organized and administered as indicated above, exercised in close harmony with the regulatory bodies of the various States, is the most essential feature.

"Constant publicity, under Government direction, of current market prices, supplies, movements, and other conditions pertaining to the marketing of livestock, meats, and animal by-products, would add immeasurably to the effectiveness of any form of regulation. It would also be a means of stabilizing the marketing of livestock and its products and of making available the information required by producers and distributors for the most intelligent and economical marketing of their products. Progress already has been made in the creation of machinery for such service at market centers in all parts of the United States. Legislative authority for its further development in connection with livestock market supervision should be continued and extended.

"Finally, better organization of livestock producers and closer co-operation between their organizations and those representing the different classes of intermediaries, all working in harmony with agencies of the Government directly concerned, will also increase the effectiveness of regulation and publicity, make for the maximum of efficiency, and conduce to the welfare of the packers and distributors as well as of the producers and consumers."

A FEDERAL FEED LAW.

Secretary Houston's suggestions for a Federal feed law are equally valuable, and will be read with interest by California livestock men, as it has been planned to put through a State law of this kind at the coming session of the State Legislature. He says:

"At present, in order to secure for the public the benefits of the provisions of the Federal Food and Drugs Act with reference to animal feeds, it is necessary to rely on the appropriate statutes of the different States. These are not uniform, and there are a few States which have no laws that can be invoked. It is believed that it would be wise to have a comprehensive Federal feed law placed upon the statute books, under which the Government could proceed in a uniform manner and secure to consumers adequate protection against misbranded, adulterated, and worthless feeds entering into interstate commerce. It is probable also that similar legislation would be feasible and valuable with reference to fertilizers passing into interstate commerce. It is obvious, of course, that if such laws could be enacted they should result in the protection not only of the consumer but also of the honest manufacturer and distributor."

National Survey of Field Crops

[Written for Pacific Rural Press by R. E. Hodges.]

Farmers certainly outdid themselves in acreage planted to the leading field crops in 1917 and again in 1918, as shown in figures given by U. S. Secretary of Agriculture D. F. Houston in a report dated November 15, 1918, and now on the press. In the first year of the war 283,000,000 acres were planted—22,000,000 acres more than in the preceding year and 35,000,000 acres more than the five-year average, 1910-1914. In 1918 5,600,000 acres more were planted than in 1917.

In wheat acreage that of 1917 was slightly less than in the record year of 1915, but it exceeded the five-year average, 1910-1914, by 7,000,000 acres. In 1918 the wheat acreage was increased by 3,500,000 acres, and the indications are that acreage planted during the current fall season will considerably exceed any preceding fall planting. What the Government shall desire with regard to spring wheat planting will be announced in plenty of time but after as much as possible of the winter effect on fall planting has been observed. This will not affect the California planting much anyway, as only in the northeastern part of the State is there usually any considerable spring planting. The 1918 season was good for wheat generally and 918,920,000 bushels were harvested. The previous year had not been so favorable, and the yield was 650,828,000 bushels. The 1916 yield was 636,318,000.

KING CORN.

Corn has long been the leader in acreage planted and in yield. The 1918 acreage in the United States was less than 1917, being 113,835,000, as against 119,755,000, and against the five-year average, 1910-1914, of 105,240,000. The 2,749,000,000 bushel crop in 1918 exceeds the five-year average preceding the war by 17,000,000 bushels. It also exceeded by 3.4 per cent the quality of the 1917 crop, when about 900,000,000 bushels were soft, due to early frosts. Stocks of corn on the farms November 1, 1918, were 118,400,000 bushels, as against less than 35,000,000 bushels in 1917 and 93,340,000 bushels as a five-year average. Only 12 per cent of the corn crop is used as human food, according to Secretary Houston, and not more than 26 per cent ever leaves the farms.

BARLEY.

Acreage of barley planted in the United States in 1918 was 9,180,000, as against 8,835,000 in 1917 and

Don't Let Surplus Apples Go to Waste

Written for Pacific Rural Press by W. V. Cruess, University of California

The apple is often called the king of fruits and apple juice the queen of drinks. True it is that few fruits approach the apple in popularity, and few fruit juices compare with fresh apple juice or sweet cider in flavor and thirst-quenching quality. It is good on any sort of a day; the weather does not have to be hot for one to enjoy sweet cider.

SWEET CIDER is of course best when it first comes from the press, although many of us may have a failing for "sharp" cider—that is, the juice that has stood several days and has just begun to develop fermentation. It is possible to retain nearly all of the flavor and apple aroma of fresh cider by bottling or canning it. This bottled or canned juice can be kept many years if necessary, and if we put up a stock of it in the fall we can have it throughout the year for use on the table or as a summer beverage. No expensive apparatus is necessary. Most of the needed equipment will be found in the kitchen or about the place. Because of its food value and its pleasing qualities, apple juice should be made from the sound fruit that cannot be packed because of size or slight blemishes.

CRUSHING.

Apples for sweet cider should not be overripe but should have a moderate degree of acidity. The Newtown Pippin produces better cider than does the Bellflower. If a small amount of juice is to be made, an ordinary food chopper or grinder can be used to crush the apples. The apples must usually first be cut in half or quarters when crushed in this way. An Enterprise fruit crusher will crush and press the apples in one operation. It is not expensive and can be had from any hardware store. We have found such a press very useful in making up a few gallons of juice from any variety of fruit. Where a large amount of juice is to be made, an apple crusher will be needed. These cost from $25 upward. They consist of a crusher and press mounted on the same frame. The smaller outfits are operated by hand while mechanical power is necessary for the larger units. These machines may be had in San Francisco from one of the large cannery supply firms.

PRESSING.

In the household the apples may, after crushing, be pressed in a small fruit or meat press that many kitchens possess. The Enterprise meat press is suitable. The crushed fruit should be placed in the press between layers of cheesecloth and the layers of crushed fruit should be about two or three inches thick. The fruit will press much more completely and easily if it is heated to about 150 or 160 degrees Fahrenheit before pressing. A dairy thermometer must be used to test the temperature. Heating to boiling will spoil the flavor. The pressed pulp may be broken up with the hands and pressed a second time to recover all of the juice.

Special press cloths and racks are used in the large presses and very high pressure is applied to the crushed fruit. A ton of apples will yield by heavy pressing 160 gallons or more of juice.

CLEARING THE JUICE.

Apple juice owes a great deal of its flavor to the flavor contained in the particles of pulp suspended in the juice. To improve the appearance of the product most of this pulp, however, should be removed. The juice will have a more pleasing flavor if it is not made perfectly clear, although a moderate amount of filtering does not injure it.

The juice contains a large quantity of material that becomes coagulated on heating and settles to the bottom of the container. This should be removed before the juice is placed in the bottle or can.

Heat the juice to 160 degrees Fahrenheit, using a dairy thermometer to observe the temperature. Allow the juice to stand over night. This will permit the coagulated material to settle. Pour the juice from the sediment and strain it through a jelly bag or heavy cloth. Usually two or three filtrations are desirable.

BOTTLING.

The most satisfactory bottles for fruit juices are those that are sealed with what is known as the crown cap. A special capping machine is needed for this style of bottle. Small hand power cappers for crown finish bottles can be bought from bottle dealers. Most drug stores have them or can order them on request. They cost about $5 each. Caps may be had from the same dealers at about 30c per gross. They are much cheaper than good plain corks and more satisfactory. The crown bottle is the one used commonly for soda water, commercial fruit juices, beer, etc. In Oregon home-made cappers are made from a short piece of water pipe and a wooden mallet; at least it is rumored that many a man who cannot give up his "hopped beverages" makes his own beer and bottles and seals it with the home-made device just mentioned.

Ordinary bottles and plain corks can be used. In this case boil the corks in water for ten minutes before using them. This will destroy all molds that would otherwise almost certainly spoil the product after the juice has been bottled. The corks must be tied down with a string to prevent their being blown out during sterilization. The bottles in any case should not be filled to more than about 1½ inches below the cork for quarts and pints and about 1 inch for half pints and quarter pints. The bottles must be clean and should preferably be scalded before use.

PASTEURIZING.

The juice will not keep unless it is subjected to a sterilizing temperature in the sealed bottles. This process, when applied to juice, is spoken of as pasteurization.

A wash boiler or large pot makes a satisfactory pasteurizer. Place a false bottom in it as for canning fruits or vegetables. A few slats cut to the length of the boiler and nailed together in the form of a grating will serve. A dairy or other thermometer will be necessary. Drug stores carry these.

Place the capped or corked bottles in a horizontal position in the pasteurizer. They may be piled several layers deep. Fill the pasteurizer with cold water sufficiently to completely cover the bottles with water. Heat the water, carefully watching the temperature during the heating until the temperature reaches 170 degrees F. Keep the water at this temperature for 20 minutes. Remove the bottles and if plain corks have been used, seal them with melted paraffin by dipping them in the paraffin immediately after the bottles have come from the sterilizer and once again when they are nearly cool. Store in a dry place. The juice will keep indefinitely.

CANNING SWEET CIDER.

Sweet cider is put up in great quantities in Oregon commercially in ordinary fruit cans. Two styles of cans are suitable for farm use. These are the sanitary cans and the solder top cans. The sanitary cans may be sealed with a special capper which may be had in hand-power size. This size costs about $15. Cans cost at present about 4c each. The strained cider is placed in the cans after it is heated to about 150 degrees F. The cans are sealed at once and sterilized in a pasteurizer as described for bottles.

Solder top cans are more difficult to use than are the sanitary cans. A capping steel, tipping steel, gasoline blast lamp, soldering fluid and wire solder are necessary. The use of the outfit really requires personal instruction from a plumber or someone else familiar with the use of soldering outfits. The sealing of cans will be found well illustrated and described in Circular 158 of the University of California Experiment Station. This will be sent free of charge on application to the College of Agriculture, Berkeley. Heat the strained juice to 150 degrees F. and fill cans with hot juice. Seal cans and pasteurize as directed for bottles.

Wax top cans and ordinary fruit jars can also be used. In the case of wax top cans, merely heat the cider to 180 degrees F. in a pot and fill the cans immediately from it. Seal at once with wax. If jars are used, fill them with the strained cider, which has been warmed to about 130-140 degrees F. Seal the jars, hot, with rubbers and caps. Place them in the pasteurizer in an upright position. Cover them completely with water. Heat the water to 170 degrees F. and keep it at this temperature for 30 minutes.

SUGGESTIONS.

Temperatures above 170 degrees F. badly injure the flavor of the cider. If a thermometer is not at hand, heat the water in the pasteurizer to the simmering point. This will be a little too high for the best results as regards flavor, but a fairly good product can be obtained if the juice is not kept at this temperature too long.

The pulp obtained after pressing the apples may be used for jelly. The pulp may be boiled with sufficient water to prevent scorching; the softened pulp may be pressed, and the resulting jelly juice pasteurized in jars or bottles as described above for fresh apple juice. This material can be used at any time for jelly or can be added to other fruit juices to increase their pectin content.

Electric blasting easier and cheaper

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

The use of an electric blasting machine results in economy. It reduces the amount of powder required often by 10% to 20%. With it you can shoot several stumps or other blasts at one time. You can fire several lighter shots under a difficult stump or rock with better effect and less trouble than with a single large charge. It is the only reliable means of exploding charges under water.

Safety favors electrical blasting. There are fewer misfires and no hang-fires. Should a misfire occur, all danger of explosion is over when you disconnect the wires from the machine. As you can time blasts to the second, traffic along roads is not held up unnecessarily.

The smallest Electric Blasting machine fires five charges or fewer at a time, weighs but six pounds and cost is saved on a job in a very few days. Anyone can work all sizes of this simple, handy machine.

Send coupon (or postal mentioning this paper) for big free book "Better Farming." Tells you scores of money-saving ways of doing farm work.

Horticultural Jottings

Apple prices continue to range fairly strong on Eastern markets in consuming markets.

Elmer Bros., nurserymen of San Jose, report orders coming in for nursery stock pretty fair and inquiries coming in by the dozens.

Albert F. Etter of Briceland writes us that he has made arrangements for the Kellogg Co. of Michigan to distribute his strawberry plants through the East.

Owing to scarcity of labor, H. A. Hyde, the nurseryman of Watsonville, has sent a crew of men to Shasta county to dig and pack his banner berry plants for his trade.

In the orange business at Porterville experienced workers are making from $8 to $10 a day. Pickers where crop is short are working on a minimum guarantee of $4.50 a day. Ten cents a box is paid for packing.

The saving of fruit pits of all kinds and shells of nuts, which was urged by the Government in the aid of the manufacture of gas masks for the soldiers in France, may now be discontinued, it is officially announced.

Governors of all States have been asked to co-operate in a plan to plant memorial trees to the nation's dead heroes along transcontinental highways and public roads as a perpetual reminder of their sacrifice in the cause of liberty and humanity.

Information is not yet available whereby the peach growers can arrive at any decision as to their prorata deliveries made necessary by the season's shortage in the crop of that fruit. Some definife announcement is expected by the end of this month.

Walnut thieves have been operating in Los Angeles county, stealing the harvested product by the sack. In one instance, it is said, the thieves stole two sacks after having been shot at. This was at Santa Paula. These nuts are worth probably $27 a sack.

It is expected that the orange standard may be altered next year. The general opinion among experts is that color test must be added. Experience shows, according to O. W. Newman of the State Commission of Horticulture, that the 8-1 test cannot be accepted arbitrarily.

The Rio Vista Canning Co. will build a reinforced concrete fireproof cannery. Also 40 first-class bungalows are to be erected at once in connection therewith and extensive improvements are planned for the comfort and entertainment of employees and their families.

In the recent war fund drive at Lindsay, Tulare county, it was decided by the members to send greetings and a box of oranges each to President Wilson and General Pershing. President Wilson received his at Thanksgiving and General Pershing will be regaled at Christmas.

The California Associated Raisin Co. applied for a partial relaxation of the embargo on raisins shipped to Canada. It has been lifted as the result of an agreement between the War Trade Board and the Food Administration. More than 4000 tons of orders for raisins are affected. Good news!

The Butte County Citrus Association reports the first two carloads of oranges shipped as bringing $7.50 a box f. o. b. Thermalito—believed to be a record price for this section. Their "Gold of Ophir" brand is earning a reputation for quality. The next four cars sold at $6.50 a box f. o. b. Thermalito.

H. F. Ellis of the Stewart Fruit Co. at Lodi reports a carload of grapes sold in Chicago, November 9, for $2,683—the highest price ever paid for Lodi packed grapes. Tokays averaged $2.15, Missions $1.95, Cornichons $2.40, and Emperors $3.15. The grape season is now over for this section.

Professor F. Flossfeder of the University of California has been demonstrating the pruning of Sultanas, Thompsons, Muscats and Malagas at some of the Farm Bureau Centers in Fresno county, and A. E. Way has demonstrated at others. Mr. Way is in charge of the experimental vineyard at Kearney Park.

Prices paid for California fruits this year are unprecedented. Some fruits sold for twice as much as they bring in normal years and the buying public have had the money to spend. Grapes have sold at from $1,600 to $2,500 a carload. Cherries brought up to $3,500 a car and peaches reached from $800 to $2,200 a car.

Word is received of the appointment of H. J. Ryan to fill the vacancy caused by the death of Horticultural Commissioner William Wood of Los Angeles county. Mr. Ryan has been stationed at Alhambra and his appointment by the County Supervisors is noted with satisfaction, as his experience with citrus pests will contribute largely to his work in the new capacity.

Bulletin No. 732 from the U. S. Department of Agriculture, by G. P. Rixford, covering "Smyrna Fig Culture" in California, has just been received. Mr. Rixford has made a most intensive study of figs for a number of years and the results of his observations are embodied in this bulletin. Fig growers should send to Washington for a copy, which is sent free upon request.

A chemically imperfect liquid furnished to the Palermo Citrus Association to test oranges under the 8 to 1 test made it necessary for 200 boxes of oranges to be sold for marmalade, entailing a loss upon the grocers. The question of the liability of the wholesale druggists who furnished the Palermo association the liquid for damages for the loss of the oranges is now being investigated.

Tulare county has constructed many miles of paved highway particularly to serve the highly productive fruit sections. Very few growers have long hauls over dirt roads, so that fruit can be taken to the packing houses on trucks, no matter what the weather conditions are. Kings county has also a large section of county-owned paved highway. This looks business-like and spells prosperity.

This year's estimates on honey production indicate that there will be near twelve millions of pounds or approximately 100 carloads. California furnishes 90 per cent of all the honey domestically consumed in the United States and 25 per cent of the country's crop, including exports. Four carloads of honey from Southern California were recently shipped in one week. A large part of this year's crop is being shipped to Europe because of sugar shortage there.

The "Palm Ranch Company," a concern capitalized at $480,000, recently filed its articles of incorporation. George W. Henderson, president of the company said: "We are merely putting the ranch on what business men call a business base." The company will own, operate and manage orchards, vineyards and farming lands. It will grow, pack and carry on a general commerce in fruits and other products without dependence on outside firms or corporations. Office headquarters will be at Fresno.

For a Fruitful Crop—

See that your dormant spraying is done properly. Remember—it takes a long time to grow your crop. A little care now will mean better fruit and bigger profits. Right now you need a general clean-up spray that will not only kill the insects but will tone up your trees. In other words, you need—

Crude Oil Emulsion

No matter what Universal Spray you order you can be sure that it is dependable—uniform in quality—and made under the direction of trained laboratory and field men.

Here are some of the other sprays manufactured or distributed by us: Dormant Soluble Oil; Lime Sulphur Solution; Bordeaux Mixture; Arsenate of Lead; "Triumph" for Citrus Trees; Miscible Oil No. 1 for Olives; Miscible Oil No. 2 for Thrips.

Don't hesitate to write our Service Department—in charge of Paul R. Jones, Entomologist—for expert advice. This service costs you nothing.

Sprouting Walnuts for Planting

[Written for Pacific Rural Press.]

To the Editor: Please state method for sprouting black walnuts. I failed to read of any in your weekly.—H. O., Ingomar.

In case others may also have overlooked the descriptions we have previously given, we give the detailed suggestions which Prof. R. E. Smith has compiled from wide observation of California experience:

"Walnuts to be used for planting should, after gathering, be kept in sacks or other receptacles in a cool, not too dry place until planting time. If allowed to become extremely dry after gathering the nuts germinate much less easily than otherwise. They will usually keep in good condition if tied up in sacks and piled in a cool, shady place. It may be found desirable to allow the outer hulls to dry somewhat before sacking up the nuts, especially in the case of large hybrid nuts, since if sacked and put away quite green the hulls decay and become extremely soft and mushy. Early in the winter, not much later than January, the nuts should be layered in sand or light strawy earth in order to sprout them and segregate the best ones from those that germinate feebly or not at all. This is most conveniently done by constructing a frame about 18 inches deep, either above or below ground, in the bottom of which should be placed three or four inches of sand, then the layer of nuts, which may be either one or several nuts in depth, according to the available space. The nuts are then covered with three or four inches of sand, which should be washed down thoroughly between the nuts by means of a stream of water. The whole bed will thus be in a well-soaked condition by the time it is done. Instead of placing the nuts directly in the bed, it is more convenient in getting them out to put them in shallow boxes or flats, imbedding these in the sand as above described. If this is done it is much easier to get the nuts out for planting than if they are placed directly in the sand. Other materials may be substituted for sand, such as earth mixed with fine straw or manure, or any substance which holds moisture well, and from which the nuts can be easily removed. The bed should be so arranged that water will drain away from it and not accumulate sufficiently to rot the nuts, and it should be protected from rain if there is any danger of such an effect from that source. The nuts need to be constantly well moistened, however, in order to start germination, and if drainage is good there is not much danger of getting them too wet. The bed should be located in a place where it will receive the heat of the sun in order that it may not be too cold for germination, and it may be underlaid with manure if it is desirable for any reason to hasten the sprouting of the nuts. Nuts of the different species vary quite widely in respect to freedom of germination, those of the Southern California black walnut being especially quick to sprout. These also rot more easily than other black walnuts. They need not, therefore, be put into sand so early and should not be kept as wet as Northern California blacks or Royals. The latter especially need much moisture and warmth to make them sprout. For prompt and uniform germination they should be put into the sand quite early, in a single layer of nuts, and be kept well moistened and as warm as possible. Otherwise many will not sprout until the second or even third year, if they be put into the ground before starting to germinate."

Sulphuring Rain-Damaged Prunes

[Written for Pacific Rural Press.]

Directly after the big rainstorm in November we visited the various prune-growing sections and at Napa, amongst other methods, we found W. D. Butler, Horticultural Commissioner of the county, conducting experiments with sulphur in an effort to salvage rain-damaged prunes. The fruit he was working on had been fully exposed to the whole storm and was a very hopeless looking bunch of stuff. We asked him to let us know the results of his experiments and have received the following letter:

To the Editor: In compliance with your request, I wish to let you know the results of the experiments with the wet prunes after the September rain.

As you know, we gave eight different lots a sulphur bath, beginning with fifteen minutes and ending up with the last batch remaining in the fumes two hours. The results were not satisfactory. No noticeable effect in the killing of the fungus on the short exposure batches was evident and while the long exposures dried fairly well and fairly quick they were bleached to the extent that they were rusty and off color, which, together with the effect of the rain, made them no more merchantable than those which received no treatment.

If there was a market for the bleached French prune and the equipment was at hand, I am certain that heavily rained-on prunes could be saved without loss by a very heavy sulphur bath such as is given to the silver and 'cot.—W. D. Butler, Horticultural Commissioner, Napa county.

Rodent Control in Tulare County

[Written for Pacific Rural Press.]

Horticultural Commissioner Chas. F. Collins reports as follows: "There has been a lull in the rodent control work recently for two reasons—first, the past few weeks have not been the most favorable time and conditions for this work, and, secondly, owing to my inability to secure efficient help, I have been compelled to transfer several squirrel inspectors to the orange inspection during the interval of a few weeks.

"The county has recently purchased two carloads of carbon bisulphide and sufficient waste balls for use of same, and we are now prepared for a strenuous winter campaign with this material, with which we hope to finish the good work which has been done with poisoned barley during the past year. Now that the results of our work are apparent, we are securing much better co-operation and consequently encountering much less difficulties. Many of those who bitterly opposed the work at the start are now enthusiastic in securing a complete eradication of the pest.

EXPECTATIONS FROM PEARS.

To the Editor: How much of a crop can be expected from mature pear trees and how old are they before their crops pay the cost of caring for the orchard.—H. L. P., Stockton.

[Hayward Reed, whose pear orchards in Sacramento and Yuba counties have been among the best known in California, says that with variations due to climate, soil, drainage, variety, etc., a pear tree is mature at 12 to 15 years of age and will average eight or nine boxes of 50 pounds each. It pays for its care at seven to ten years of age.]

Condition of the orange crop in Florida is 84 per cent—the same as October. California estimates 72 per cent, as compared with 66 per cent in October.

Maximum Yield Big Profits

the result of reading our new illustrated catalog and planters' guide.

Fruit growers, whether experienced or not, will profit greatly by reading our new catalog.

It contains practical articles on preparation of soil—selection of proper varieties—pruning—shaping—irrigation, and many other items of particular interest to the planter.

Write to us and let us know your local conditions—what varieties you have in mind—whether citrus, deciduous, or ornamental trees, roses or vines.

Many years of experience will enable us to give you helpful suggestions.

Our new catalog, just off the press, will aid you materially in making your planting more successful.

THOS. F. DUANE

MARTINEZ CALIFORNIA

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

The Muscat Raisin Crop.

There is 40 per cent of No. 1 and 35 per cent more of the total crop of raisins injured by rain safely harvested, according to Horticultural Commissioner F. P. Roullard of Fresno county, who has his force now busy testing oranges. The Associated Raisin Company estimates the loss in San Joaquin Valley by rain at between five and six million dollars. Most of the seedless raisins had been safely harvested. The damaged fruit will have to be sold on sample and will undoubtedly all be disposed of at good prices. The weight loss on damaged goods is at least 15 per cent.

Pruning for Fruit.

We recently went into the young orchard of Richter & Crane, comprising 160 acres of plums, peaches, apricots and nectarines, and found them forced into fruiting at a very early age before the trees had made the growth we thought they should have. The reason given—and a satisfactory one—was that the owners wanted to take off as much fruit as possible while prices were high. I was not able to get figures on production, but was assured that an enormous quantity of fruit had been shipped from these precocious young peach trees at four years old.

Best Walnut Stock; Experiments.

E. S. Kellogg, Horticultural Commissioner of Santa Barbara county, has experimented largely with hybrids and says that the "Royal" crossed with the "English" makes the best stock for Santa Barbara. Russell Rowe of Goleta has 10 acres of black walnuts which will be used as an experimental orchard and M. Kellogg is doing the work—grafting over to different varieties and cross pollinating. Mr. Rowe had 17 tons of Santa Barbara soft-shell walnuts this year from a 20-acre orchard—clean, smooth fruit, of good quality.

Fighting Brown Rot.

"Remove all mummified fruits and burn them. Don't bury them in the orchard. The fungus will live on the old plums for 18 months when buried in the ground. This also applies to mummified peaches." This is the advice of Horticultural Commissioner D. F. Norton of Nevada county. The State Commission says of this: "There is no single factor which so largely promotes "brown rot" as that of permitting infected fruit to lie on the ground—to incubate the following spring and give off their spores to infect the new crop of fruit."

To Prevent Breakage of Fruit Boxes

This year, owing to excessive overloading on the cars, the amount of breakage in packed fruit boxes has been unusual. One car inspected by George P. Weldon of the State Horticultural Commission had about 50 smashed boxes. He says: "There were 1000 boxes in the car—5 per cent loss. Who pays for it?" It is suggested in the North that box strapping may be resorted to next year to prevent breakage.

Durham State Settlement.

Twenty-eight more farms have been awarded to applicants on the State Land Settlement at Durham, as reported by Superintendent George C. Kreutzer. This is the second drawing for tracts in this colony and there were 82 applicants for the 28 farms, which vary in area from 20 to 160 acres. There were also a number of two-acre tracts allotted as homesites for laborers at the colony, who will find all the work they can attend to right at hand.

Storm in the South.

November 24 a very heavy windstorm was experienced in Southern California, said to be the hardest in thirty years. The orange crop suffered to some extent, ripening oranges being blown off the trees. At the Los Angeles Liberty Fair several stock sheds were blown down, also one of the large tents and several small ones. The loss to the fair was estimated at $25,000.

This Is Good News.

"California canned and evaporated fruits are very popular, and it is believed, when the direct steamship line between Bristol (England) and Pacific Coast ports—using the Panama Canal—is restored this trade will meet with a very satisfactory increase. California dried fruit has also been received to take the place of that heretofore received from Turkey." This message, through the Bureau of Commerce, comes from Bristol, England.

The Red-Humped Caterpillar.

Horticultural Commissioner A. L. Rutherford of Stanislaus county reports that the infestation of red-humped caterpillar, which made its first appearance in June, appeared again in October and attacked the foliage of walnuts, apples, plums, cherries and apricots. A number of orchardists sprayed with Paris green with good results; finding this form more economical than arsenate of lead.

More Peaches Wanted.

The demand for drying peaches both by the association and the trade is strong and will lead to an extended area of planting. The canners also want more cling peaches—the whole crop was absorbed rapidly this year. They all hope that commercial varieties of peaches will be adhered to.

Kern County Oranges.

Horticultural Commissioner Norman G. Bulin reports the run of oranges in Kern county as of fine quality, uniform in size and smooth. The first carload sent out tested 12.6—1.

Pruning of Peaches.

The pruning of peach trees so as to concentrate all the energies of the tree in fruit wood is becoming more and more widely practised. Less time is consumed in pruning the tree and in thinning the fruit, which is also easier to harvest.

Your Soil Needs Amboy GYPSUM

APPLY IN FALL. Almost every soil is deficient in limes, sulphates. Supply these with Gypsum. Mix with manure to hold valuable ammonia. Gypsum Book Free.

Massachusetts Plans Farms for Soldiers

[Written for Pacific Rural Press by Prof. B. J. Morris, Ph. D., of Harvard University.]

The national back-to-the-farm movement inaugurated by Franklin K. Lane, Secretary of the Interior, which I see you have commended in the Pacific Rural Press, has met with a ready response on the part of Massachusetts. Governor McCall has appointed a committee composed of the State Commissioner of Agriculture, the Landscape Gardener, the State Forester and the Chief Engineer for the State Department of Health to serve as a commission to gather information in regard to the acquiring of land by the State to be improved and sold on very reasonable terms to returning soldiers. It is the plan of the commission to recommend the acquisition by the State of about 200,000 acres of farm land which, allowing for roads and other improvements, would provide about 4000 farms of forty acres each.

When the United States entered the war there were in Massachusetts more than 30,000 farm laborers, many of whom have enlisted and are now at the front. Leading public men of the State are of the opinion that many of these men will be glad to avail themselves of an opportunity on their return home to obtain a farm of their own. At the present time Massachusetts has about 36,000 farms. Unless the State can do something to assist the returning soldier in buying a farm, it would be impossible for many of the men with their limited means to ever think of owning a farm. Many of them will not be content to become common farm laborers again. For this reason the State proposes to acquire one or two tracts and divide them into small farms, prepare the ground for cultivation, provide farming implements and offer to sell the improved farms to ex-soldiers at reasonable terms extending over a period from thirty to forty years.

A MODEL FARM.

To guard against possible failure the commission will recommend to the Legislature the establishment of a central farm, where a school will be maintained for the purpose of training men in modern methods of farming. Each returned soldier or sailor will be allowed to attend the school and while there decide for himself whether or not he wishes to buy a farm. Those who, after completing the school, decide to settle on farms will be given the opportunity to select a farm and pay for it as mentioned above. In addition to the school, the State proposes to establish a supply depot at which modern farm machinery will be stored ready to be rented to ex-soldiers at cost. While the commission has not as yet purchased any land, they have in mind several large tracts which are available and as soon as the commission receives the approval of the Legislature the tracts will be taken in charge and a plan drawn up for improvements. Work will be started as soon as possible. It has been suggested that the soldiers be allowed to improve the farms before being discharged. This is a matter that will have to be settled by the Federal Government. If the Federal Government does not wish to do the work in this way, the State may provide the means whereby the men could be employed by the State while they are doing the work of improving the farms.

Another plan has been suggested which proposes to loan money to the men at a small rate of interest and let the men improve the farms themselves. This proposal has not met with ready response because of the unsatisfactory conditions that followed the Civil War when soldiers were given unimproved land. The leaders in the project in Massachusetts hold that the farms should be well improved and turned over to the men in such a way that a crop could be harvested the first year. Other States of the Union will no doubt be much interested in the plans as Massachusetts works them out.

A QUARANTINE OFFICER BORROWED.

George Compere, deputy quarantine officer at San Francisco, has been borrowed from California at the request of the Federal Horticultural Board in the port of New Orleans to institute an inspection service at that port similar to that conducted in San Francisco. Mr. Compere will be gone three months.

Increased planting of barley is being urged around Modesto because that section is able to double-crop to barley.

"When They Go To Market"

"This is the best fruit that you have ever sent us.—It's *prime* and should bring the 'top notch' price. What's happened,—land improved down your way or do you grow 'em by magic?"

"No, not by magic—and the land's the same old stuff.—I've been using my head a little and planting my new orchards in *blasted* holes instead of by the old 'spade dug' method. It's easier, takes less help, and the trees grow better and bear sooner. You can see for yourself that the fruit has improved in quality. Wish someone had told me about dynamite twenty years ago;—I'd be richer than I am now."

HERCULES DYNAMITE

can be used for planting trees, clearing land, digging ditches or cellars, breaking up stubborn subsoils, or cultivating between the rows of bearing orchards,—in fact, it can be used in so many ways and for so many purposes that you would find it the most valuable "hired man" that you have ever employed.

At this time of food and labor shortage it is not only good business but good, patriotic common sense to use every means at your command to produce the largest and best crops at the least possible expenditure in time and cash. And this can only be done by using the best modern methods.

Fill out and mail the coupon printed below and we will gladly send you, free of charge, our 68 page illustrated book, "Progressive Cultivation." This book tells you all about the uses of explosives on the farm and in the orchard.

Officials Did Not Take Rice Waters

To the Editor: We note in your issue of November 9, in an article entitled "Rice Harvest Shows Good Conditions," by M. S. Cowen, the following statement:

"Lack of water some two months ago caused considerable consternation to the growers—this was caused by some water companies closing their canals by order of the Railroad Commission. This resulted in lack of irrigation to a considerable acreage, but a large portion of same was rescued before it had gone to utter ruin, as other ways and means for securing water were obtained, but at great expense. The major portion of the crop was not affected, however."

May I ask permission to correct the impression that the statement leaves? Both the Railroad Commission and the Food Administration were called in in a number of instances during the past season to safeguard water supplies for rice crops, in case of Yolo county, water being obtained through the instance of the Food Administration for 10,000 acres of rice that otherwise would not have been planted. In every instance the efforts of the Railroad Commission and the Food Administration were directed toward increasing the supply of water available to rice rather than in taking any water away from rice. In a few instances where rice areas had been overplanted—that is, where more land had been planted to rice than water was available for under terms of the existing agreements or orders—owners found it necessary to eliminate some land in order to have a sufficient supply for the remainder of their holdings. This was true in both Yolo and Glenn counties. In a few instances some land planted to rice was not matured through lack of water in the expected sources but not through withdrawal of water by the Railroad Commission or any other public agency. In Butte county, at one time, it seemed as if a large acreage of rice would have to be sacrificed through shortage of water, but a representative of the Railroad Commission and the Food Administration was able to adjust matters between the two main companies supplying water so as to be able to save not only all of the rice acreage but also furnish water to general crops. In order to mature the rice crops, however, water was withdrawn from general crops to a certain extent in both Yolo and Glenn counties and also in a small way in Oakdale Irrigation District. This withdrawal was acquiesced in very patriotically by nearly every user and in the long run very little substantial damage was done to anybody.—Frank Adams, Berkeley.

Beans Increased on Worn-Out Land

[Written for Pacific Rural Press.]

How worn-out hillside grain land that would not produce more than six or seven sacks of barley or five sacks of small white beans per acre in a favorable season was induced to yield 12 sacks of small whites per acre on 30 acres during the past unfavorable season, is told by S. O. Pugh of Monterey county. This land has raised beans in three of the past four years and part of it has raised beans during all four seasons with no irrigation or fertilization. The soil is a clay loam, formerly covered by timber. It yielded 16 bags of wheat per acre for three successive seasons after Mr. Pugh cleared it, nearly 30 years ago. Twenty-five years of grain cropping practically destroyed its humus and fertility until the crops were hardly worth harvesting.

In 1915, a more favorable season for small white beans than that of 1918, 30 acres of this worn-out land were planted to small whites and pinks. They yielded five sacks per acre. In 1916 bluepods were planted and they yielded about eight sacks per acre. The 1917 crop of bluepods was about 10 sacks per acre, while in 1918, after a very dry winter, the yield was 380 sacks on 30 acres.

The increased crop has been due to Mr. Pugh's system of farming the soil under his old barley field. Here is how he describes the work:

The first operation is a good plowing, 10 inches deep, in January or February. Rains would then pack the humusless soil; and the late rains, which are most desired, would be likely to run off. To avoid this, as well as to sprout weeds so hoeing will be minimized, a disk cultivator is run over the ground after every rain that would crust it. This season it was harrowed and then disked only twice. When rain is scarce but weeds come, an underground weed cutter keeps the ground clean. This was used four times in the spring of 1918. A duckfoot cultivator would be fine, for the object is to stir the soil without turning it up to the surface where it would dry. No cultivation was necessary after the beans came up except two hoeings, and the crop was free from weeds at harvest time. Too much packing of the sub-surface soil is bad practice where it contains any clay, says Mr. Pugh, so no extra effort is made to pack it here. Only 12 pounds of seed are used per acre.

Proposed Seed Law

[Written for Pacific Rural Press.]

In sowing a certain lot of alfalfa seed at the rate of 20 pounds per acre, a test recently showed that a man would have planted 483 weed seeds per square rod!

After two or three years of study and consultation with seed growers, dealers, and users, the State Horticultural Commission has prepared the draft of a proposed law enabling users of field seeds but not of vegetable or flower seeds to know with considerable accuracy just what they are buying. If enacted into law as proposed, it will compel sellers to label their seed "not clean seed," or "not tested seed," or to label the containers with a statement showing (1) the commonly accepted name of the seed, (2) the name and address of the seller, (3) the approximate percentage of germination, with the month and year it was tested, (4) the approximate proportion by weight of foreign matter and other seeds distinguishable by their appearance, (5) the proportion by weight of weed seeds alone, (6) the names and approximate number per pound of noxious weed seeds (which are named in the bill, with provision for the State Horticultural Commissioner to name others).

Enforcement of the law is put into the hands of the State Horticultural Commissioner and his deputies, including trained botanists to conduct the tests in laboratories to be provided.

Any citizen of the State would have the privilege of submitting to the State seed laboratory samples of agricultural seeds for such test and analysis as the Horticultural Commissioner may find desirable. Any person may guarantee the approximate percentage of purity and viability of seed he wants to sell, but the seed must come reasonably close to the guaranty. If you want to know what sort of seed you are buying, let us hear from you!

Little Rock, in Los Angeles county, is turning her attention almost exclusively to pears. The elevation here is about 2800 feet and is pumped from 200 feet. Over 50 carloads were shipped this year and are said to have realized an average of $80 a ton—all Bartletts. Two irrigations a year are given.

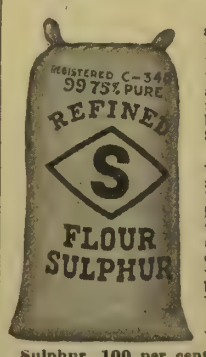
SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur.

It has been proven that sulphur has increased various crops up to 350 per cent.

SAN FRANCISCO SULPHUR CO.

624 California St., San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet; price list and samples and please state for what purpose you use the sulphur, quantity needed and date of shipment preferred. Tel. Kearny 871.

The State Moves to Reduce Taxation

[Written for Pacific Rural Press.]

Retrenchment in the operating expenses of the State, which in the past few years have been growing by leaps and bounds and which, as a direct result, have boosted tax rates and made possible the expenditure of vast sums of money, is indicated by the action of Governor William D. Stephens in appointing a committee "for the improving of the administration of the State's affairs and for introducing such economies as are possible without prejudice of the public welfare or impairment of present efficiency."

The committee is as follows: A. E. Boynton, president of the Commonwealth Club, San Francisco; Herbert W. Clark, director Taxpayers' Association; Frank P. Flint, former United States Senator; Dr. John R. Haynes, Los Angeles; Percy V. Long, San Francisco; Lee A. Phillips, Los Angeles; U. S. Webb, Attorney-General; John S. Chambers, State Controller; Marshall Demotte, Clyde L. X. Seavey, Edward A. Dickson, members of the State Board of Control.

Necessity for such action on the part of Governor Stephens has long been apparent, the many committees, bureaus, commissions and State officials having of themselves become a maze of conflicting and overlapping effort. This duplication of duties has become so marked that it has in reality in some instances amounted to something only short of chaos, and in the meantime the expenses and costs have been mounting with alarming regularity.

INCREASE IN EXPENSE.

So much so is this the case that a comparison of the cost figures during the past several years, from 1902 to 1917, shows gains in operating and maintenance expenses out of all proportion to the increasing population of the State and with the labors and duties performed.

From 1902 to 1913 a consolidated statement of expenses and outlays, recently compiled by the Taxpayers' Association of California, shows normal increase of expenses and population. From 1914, however, the costs and expenses assume a ratio entirely out of balance with the growth of the State either in population or in the matter of added industry and developed resources and commercial endeavor.

In the year 1914 the expenses and outlays of the State for permanent improvement amounted to $6,830,040.70. This jumped in 1915 to $11,012,387.99, and has since slightly fallen off, so that in 1916 we find the expenses amounting to $9,631,167.98, while in 1917 the figure was reduced to $5,461,073.49.

PER CAPITA COST GROWS.

During this time the population of the State increased year by year, from 1,673,343 in 1902 to 3,029,032 in 1917, the figures being estimated by the United States Bureau of Census, and the expenses increased from $8,611,719.04 in 1902 to $28,727,932.02 in the year just passed. As in the case of permanent improvements, however, the peak of the expense column was reached in 1915, when, with a population of 2,938,654, nearly thirty-one million dollars were spent. Cost per capita has also increased at an alarming rate, from $5.146 in 1902 to $9,484 in 1917.

The cost of the big exposition was, of course, responsible in a certain degree for the increase during the years 1914-1915, and a comparison of the amounts spent for expositions in the State since 1913 shows to just what degree this is the case. The following figures illustrate this statement. For expositions:

1913	$ 906,925.47
1914	2,034,478.11
1915	2,280,261.61
1916	11,893.10
1917	301.70

There are at present 126 officers, boards, bureaus and commissions existing in the State. In the duties of these there are many duplications.

HEAVY OVERHEAD EXPENSE.

Relative to this, a bulletin published by the Tax Association, says:

"The presence of great numbers of independent boards, bureaus, officers and commissions indicates undue overhead expense, and where it is shown that two or more bodies perform all or parts of functions that could be performed by one the absence of efficient organization and the certainty of needlessly high expenses becomes still more readily apparent."

A further recommendation of the Tax Association is contained in its report:

"These departments should, of course, be divisionally organized," it says. "Excepting those which deal largely with important matters of policy, the departments should be single headed. Responsibility for executive and administrative action would thus become fixed and localized. The functions now or hereafter to be performed by the State should be transferred to the proper department. Inasmuch as a very large number of the governmental units here considered exist by statute, the next Legislature could go far toward effecting the reorganization suggested."

COST OF STATE GOVERNMENT FOR ELEVEN YEARS.

Year—	Population	Cost	Cost Per Capita
1907	2,125,238	$12,117,671.93	$5.701
1908	2,215,618	12,448,176.53	5.618
1909	2,305,999	15,570,076.81	5.884
1910	2,396,379	15,791,904.11	6.589
1911	2,486,758	14,889,071.30	5.987
1912	2,577,137	16,430,140.69	6.375
1913	2,667,516	20,397,961.78	7.646
1914	2,757,895	26,176,787.57	9.491
1915	2,848,275	33,719,461.74	11.838
1916	2,938,654	30,797,387.97	10.480
1917	3,029,032	28,727,932.02	9.484

INCREASE RATE HUGE.

Referring again to the cost of the many boards and commissions, it is discovered that the rate of increase in expense in the last decade has been colossal, the cost to the State for such bodies in 1907 having been $319,637.69, against $2,597,672.14 in 1917, each of the years in question showing a marked increase out of proportion with the earlier years of 1900 preceding. Figures of expenses for commissions in 1902 show that $228,416.83 was spent in that year, and the rate of increase to 1906, when $283,223.24 was expended, was gradual.

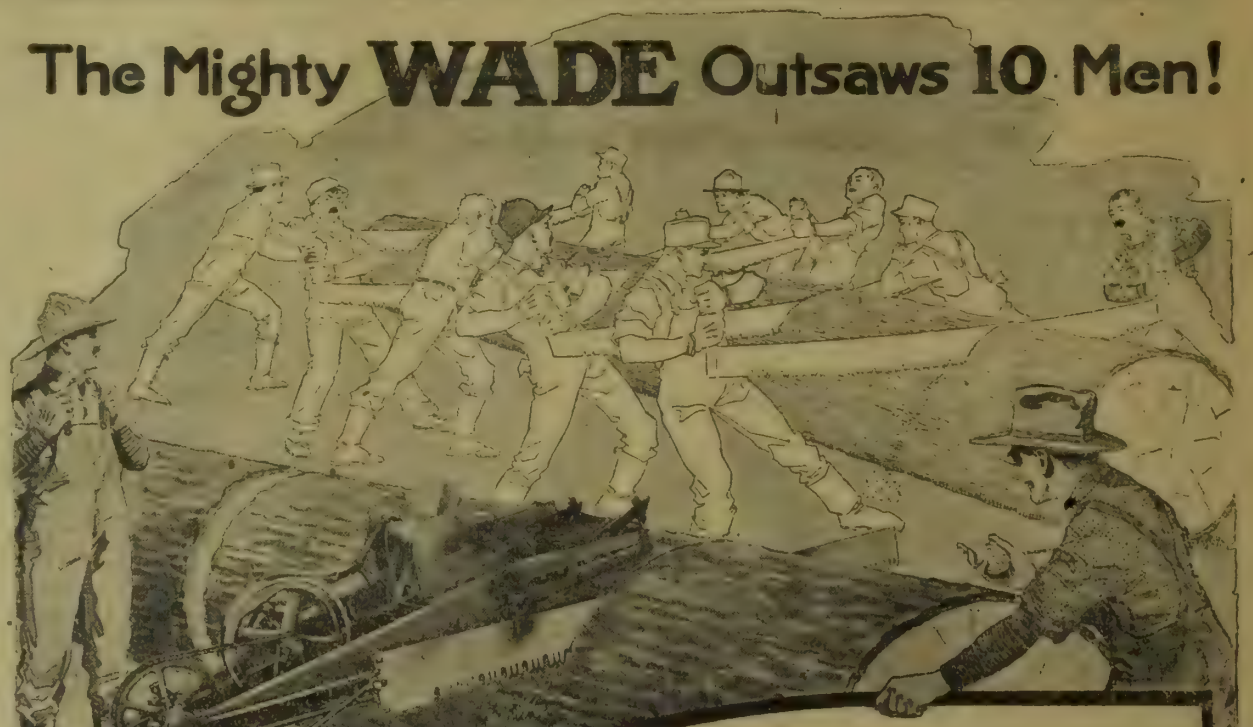
LINDSAY ORANGE GROVE RETURNS.

A gross return of $15,000 from his 10 acres of Valencia oranges is claimed by Charles O. Cowles on this year's crop. The crop was allowed to ripen thoroughly and graded high.

A GOOD WALNUT CROP.

About 30 tons of walnuts from a 40-acre orchard is expected by Mrs. Julia Hogan of Santa Ana this year. The fruit is of excellent quality and she has sold it at 27c a pound—orchard run.

The Mighty WADE Outsaws 10 Men!



A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the United States—in the woods of the Pacific Northwest, California, Minnesota, Arkansas, New York. When not in use for wood cutting the 4-H.-P. motor will run feed mills, feed cutters, pumps, etc.

Read What These Owners of WADE DRAG SAWS Say:

"One afternoon my brother-in-law and I took my WADE into the woods and sawed three hard maple trees into 16-inch blocks, the trees averaging about two and one-half feet at the stump. He expected it would take me from eight to ten hours to do the job, but it was all done in three hours.—F. W. Hiller, Vernon, N. Y.

I cut thirteen and one-half ricks of cottonwood in six hours. —J. W. Stratton, Atkins, Ark.

One gallon of gasoline will cut six to ten cords of wood; it depends on the kind of timber you cut.—W. D. Thomas, Bull Run, Or.

My WADE saw paid for itself six times over.—F. W. Taylor, Swisshome, Or.

I am making $250 a month with my WADE.—F. A. Storts, Orville, Cal.

Thirty-six inches in diameter, yellow birch, is the largest I have cut and I cut down to six inches.—P. L. Cote, West Duluth, Minn.

I cut down to eight inches in diameter.—F. T. Swank, Park Falls, Wis.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free book, "How Dan Ross Cuts 40 Cords a Day." Full details and special price.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Onion Crop Survey.

California led all the States except New York in acreage of onions harvested in both 1917 and 1918. In 1917 the total acreage, not counting those grown for seed, was 7100; and the total yield greater than any other State, being 2,797,400 bushels of 57 pounds each. This year, as estimated by the U. S. Bureau of Crop Estimates about November 1, the California acreage was reduced to 6900 and the production to 2,415,000 bushels. Our yield per acre is 350 bushels in 1918, as against 394 in 1917. Utah and Idaho beat us in 1917 with 400 bushels per acre. Nine States beat us in 1918 on yield per acre, the highest being Idaho and Utah with 575 and 510 bushels per acre respectively. Their acreage, however, is nominal. States having over 1000 acres in 1918 are as follows, named in order as to amount: New York, California, Ohio, Massachusetts, Indiana, Minnesota, Colorado, and Michigan. Total acreage harvested in the United States was 35,830, as against 39,500 in 1917. Total yield in the United States was 13,438,200, as against 12,308,900 in 1917. With a smaller acreage and larger crop in 1918, the season was in general very favorable.

Rose Bushes to New York and Back

A carload of 55,000 rose bushes was shipped to New York, November 30, by Gill Bros. Nurseries of Santa Clara county, who grow a quarter of a million rose bushes annually, according to J. P. Moniz. These will be put into cold storage and sold in the spring. The company who bought them says that California stock does not die back in cold storage as the European stock does. The latter in normal times can be laid down in New York cheaper than California rose bushes can be bought on the Western coast. Ruehl-Wheeler Nurseries joined Gill Bros. in shipping a carload East earlier in November. Many of these will be bought back to California by innocents.

Drastic Potato Wart Measures.

Eight or ten years at least will be required to stamp out the potato wart disease recently found in Pennsylvania, according to Economic Zoologist J. G. Sanders of that State. This is one of the diseases whose importation from Europe has long been dreaded by horticultural quarantine officials. Fortunately, it has not been found in the United States outside of certain Pennsylvania mining districts surrounded by wild, uncultivated territory. The entire section will be quarantined with certain districts designated as "prohibited areas," where no potatoes may be grown. Growers elsewhere in the quarantined territory will be licensed and their crops kept under close surveillance from growing to marketing.

No Government Bean Prices.

The policy of the Government in buying beans this year is to take advantage of the lowest bids; and no prices will be fixed. The recent buying announced in last week's issue was not for the army and navy, but for allied governments, and it included 10,000,000 pounds of pintos, all or practically all from Colorado. Late reports to the California Bean Growers' Association indicate that already about three-fourths of the Michigan crop has been sold. The U. S. Shipping Board is providing ships for shipment of our beans from Port Costa, and the ocean market is sure to become stronger.

Celery Prices East.

Carlot shipments of celery reported by the U. S. Bureau of Markets, November 29, were 18 from New York, 4 from Michigan and 10 from California. Most of this is called the "Golden Heart" and the "Golden Self-Blanching." The California stock runs 4 to 6½ dozen bunches per crate and selling mostly at $5 to $6.50 per crate in Eastern and Central Western markets.

What One Farm Ass'n Has Done.

The Acampo National Farm Loan Association, operating in one supervisorial district of San Joaquin county, has secured loans for its members aggregating $75,000, with applications pending for $30,000 more, as stated November 29, 1918, by Secretary-Treasurer J. B. Jorz. Our readers will remember that this association was used in our issue of November 18, 1916, as an illustration of how farmers could secure loans from the Federal Land Bank.

Bean Production Cost Doubled.

To the Editor: Answering your request for a statement of the cost of raising beans now and before the war: In 1913, taking 20 sacks per acre as an average yield and $20 per acre rent, I could raise an acre of beans for $41.60. This year it will cost me $76.90. Rent has raised to $35 and $50 an acre cash or one-third to one-half share rent. Wages for horses and men are twice as much. Machinery costs twice as much. Seed was 4c in 1913 and 11½c this year.—A. L. Roddick, Soledad.

Cost of Raising Barley.

When labor was cheap a few years ago and sacks not over 10c, it cost $1.35 per 100 pounds to raise barley, according to E. Clemens Horst, one of the largest barley handlers on the Coast. That cost price did not include compensation for reduced fertility.

Red Oats Preferred in Hills.

Red oats do better in the hills than black oats, according to C. J. Lundgren of Santa Clara county. Mr. Lundgren has cut hay from one field of 14 acres every year for 24 years. He used to bluestone the seed, but now he insists on buying clean seed and does not treat it.

RURAL PRESS IN OREGON.

To the Editor: While we have some good farm papers in the Northwest, the Pacific Rural Press is valuable here in Bates county.—J. A. S., Wells.

WITTE IRRIGATING ENGINES

Kerosene-Distillate 2 to 30 H.P.

Pump your water with a WITTE. All you need is a centrifugal and my Special Model Kerosene-Distillate Engine. I can lay your engine down at least cost. Save the middleman's profit—Get your engine NOW, while prices are favorable. Have reliable power for all your work. Made in standard sizes—2, 3, 4, 6, 8, 12, 16, 22, and 30 H. P. Battery or magneto equipment. I am in a position to offer you the best prices and make Quick Shipment. 90-Day Trial — 5-Year Signed Guarantee. Western Electric POWER and LIGHT

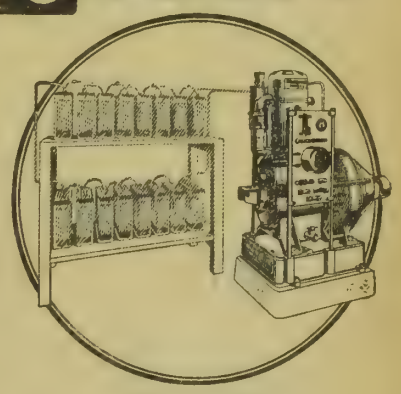
Belted

Careful Buyers Prefer to Have a Choice of Plants



Direct Connected

Get the plant that fits your needs. Don't fit your needs to any particular plant.

A "bull-tongue" plow won't do good work in meadow land; neither can a strong arsenate spray be used on budding trees. The right tool for the work—that's the right idea! And it is this idea that's behind our selling plan for electric plants.

If a man has an engine, we are content to sell him the necessary electrical equipment; no reason why he should buy another engine. If, however, he wants a complete plant, we offer him two kinds:—(1) the belted type where the engine is belted to the generator and is readily available to drive other machinery. (2) the direct connected type, with engine and generator built in one unit.

We are not interested in selling any one particular type of plant. You can choose the one that will best serve your needs.

And remember that the Western Electric Company with its forty years experience, offers you not alone its line of power and light plants, but its motors, water system, milking machine as well as a complete line of electrical labor saving appliances for the home—all bearing the familiar trade mark, Western Electric, your guarantee of satisfaction.

There is a Western Electric man near you. Mail the coupon for Booklet No. PRR-11, and we will tell him to get in touch with you.

What Co-operation Has Done for Prunes, Etc.

(Continued from first page.)

ing a fair return to the grower. Commercial packers, in competition with the association, found it necessary to pay prices materially above that paid by the association in order to secure any proportion of fruit from non-members. The trade can now buy with confidence and fill their orders to cover business up to the guaranteed date without fear of a fluctuating or speculative market, instead of buying in fear and trembling from hand to mouth. The guarantee also covers the "pack" under the "Sunsweet" brand. The business handled by the association at the end of the first year was, in round numbers, about nine millions of dollars.

It now possesses thirteen packing houses in different districts of the State, equipped with machinery for manufacturing and packing the finished product. During the first year this work was done by contract at private plants, but, recognizing the lack of economy under this arrangement, a subsidiary corporation was formed, known as the Growers' Packing and Warehousing Association, Inc., which financed the purchase of plants to the extent of some half a million dollars.

BY-PRODUCTS.

In addition to the packing of dried prunes and apricots, the association has widened out into the handling and manufacture of by-products, which must also become a vast industry. Apart from the apricot pits which the association now handles and which will probably net growers $40 a ton this year, it has developed a plant where the kernels are extracted for sale to the trade. In another plant the small, undesirable apricots are being manufactured into jam and prunes are being canned. There is a wonderful future for these products and the jamming and preserving will give an outlet for fruits that would be otherwise difficult to dispose of—fruit of good quality but small in size.

It had been the intention this year to carry out an elaborate scheme of advertising and educating the consuming public in the value and quality of its products. This plan will have to be considerably curtailed now, owing to the season, but will be carried out so far as means will allow and will increase as time goes on.

The association has at present over six thousand members with whom it holds contracts for fruit delivery. Naturally the recent catastrophe suffered by the prune growers by the unseasonable rains and bad weather caused a corresponding setback to the association. Instead of handling products of a potential value of twelve million dollars, it will handle probably less than half that value, but will go through the trouble with the same dogged persistency as was displayed in the formation of the organization. Expert accountants auditing the books of the association at the end of the first fiscal year reported most favorably on its finances and business methods.

Every thinking prune and apricot grower must recognize that this association, of all the leading men in their business.

GIVES STRENGTH AND STABILITY TO THEIR ENTERPRISE.

It has relieved them of the anxiety of wondering whether the prune buyer was going to show up at blossom time or wait till the fruit was on the trays—of wondering what sort of a telegram was going to be pulled on them from foreign parts describing the deplorable state of the market and the enormous overproduction in Servia—all very entertaining but unconvincing. Or, as Pooh-bah said, "Merely corroborative detail, to give artistic verisimilitude to an otherwise bald and unconvincing narrative."

Now we feel that when we get official reports from our associates they can be relied upon to be as accurate as any that can be furnished. And, above all, we feel that we are in charge of our own affairs.

The writer has followed and taken part in prune growers' troubles and vicissitudes for many years and regrets that space forbids a more detailed account of their earlier troubles and endeavors. As a summary of the foregoing article regarding growers' returns during the two seasons the association has been operating, it is not claimed that they have vastly improved the industry from a standpoint of growers' returns. War conditions and a mandate from the Government (this last year) have done that. But it is clear that the credit of trade relations has been established for an organization through which it will be possible to develop and maintain markets vastly better than might result from continuance under the old speculative system. This particularly in view of enormously increased production due in the next few years, as tens of thousands of acres of young prunes come into bearing. The organization by co-operation can find markets for this by going after them and by advertising—the latter being denied to the efforts of private firms for obvious reasons.

FARMERS' FEDERATION LAUNCHED.

[Written for Pacific Rural Press.]

Affiliation of California farmers' organizations for the purpose of securing due consideration of producers' interests in the reconstruction which is to follow the war was definitely inaugurated at Modesto, December 4, after threshing the question all day in a meeting of 100 to 150 people representing all who responded to invitations sent to 98 California farm organizations by the Farmers' Union. A committee of five was appointed to draft by-laws and submit them to every farm organization in the State, with a call for each to send a delegate to a meeting to thresh them over, adopt them as amended, and elect officers. The name proposed is "California Federated Farm Organizations." Urgent need for such a body was shown, to look after such questions as affect farmers in general. Among these are (1) disposition of railroads, (2) control of ocean boats and rates, (3) development of electric power by irrigation districts and others, (4) control of the crude oil which supplies power for our gas engine machines, (5) tariff, (6) taxation when Liberty Bond liquidation begins, etc.

The proposed Federation is not expected to concern itself with marketing and will not duplicate nor compete with the "California Federation of Farmers' Co-operative Marketing Associations," which is studying those questions especially with relation to shipping our products in entire cargoes and developing markets in Europe, South America and the Orient for California products.

No partisan politics will be countenanced, but it is hoped that legislators and commission members may be chosen and supported with regard to their sympathy with producing interests.

Representatives of the State Federation of Labor spoke at the meetings, but so far as we could learn no attempt was made to form closer affiliation of farmers with labor unions than now exists in the California Union of Producers and Consumers.

A strong resolution was unanimously adopted endorsing a proposal to erect a "Temple of Agriculture" near the Capitol at Washington, D. C., to serve as headquarters for representatives of American farmers' organizations in looking after their interests in Congress and gathering information vitally needed by them as commercial interests and labor are already effectively represented at Washington.

The rains of the last month have caused much rice to become soft and therefore not fit for milling.

Agricultural Notes

Twenty-five sacks of rice per acre on 800 acres is the yield reported by T. P. Mortimer of western Merced county.

Eastern Merced county grain warehouse reports recently showed 23,500,000 pounds of barley awaiting a market.

Wind following recent rains in Stanislaus county dried the beans and rice, so the threatened damage did not materialize.

Farm implements and garden tools may now be imported into Mexico, all restrictions having been removed from these articles by the War Board.

The renewal of sugar land leases on the Hawaiian Islands this year are being made at a considerable advance, in some cases as high as 100 per cent.

The Hollister Canning Co. recently shipped a carload of canned tomatoes to Duluth, Minn., having been released from part of their Government requisitions.

The United States Department of Agriculture calls the attention of farmers to the fact that they are now free to buy all the lime needed for fertilizing their soil.

The Farm Bureau of Imperial county is stimulating an interest in the raising of sorghum cane and the manufacture of honey sorghum as a profitable side issue for ranchers.

Forest Supervisor J. R. Hall has announced that all rangers in the service of the Santa Barbara Forest Reserve who are now in the army will be given their old jobs back as soon as they are discharged.

The signing up in Yuba county of leases amounting to 5000 acres for rice culture in 1919 is an indication of the popularity of this industry. The terms of the leases all run for three years, with an option to purchase at the end of the first year.

The California rice committee of the United States Food Administration has sent out notice to California growers that hereafter a deduction of 2c per bag will be made for all rice sacked in nine-ounce bags and 3c for all rice sacked in second-hand ten-ounce bags.

Farmers have borrowed $159,378,000 from the twelve Federal Farm Loan Banks since their organization in March, 1917. Farmers are making payments promptly. Report shows only $86,000 in loans was overdue. Delinquency occurred almost entirely in sections where there had been crop failures.

This season's cotton crop on the plantation of the Dodge Land Company seems to justify the belief that the climatic conditions of certain districts of Northern California are well adapted to cotton culture. Effort is being made to concentrate on the variety best suited to that section.

The J. I. Case T. M. Company will hold a Short Tractor Service School at their branch at Fifteenth and Kansas streets, San Francisco, from December 10 to 14, inclusive. The course will include study of the motor, ignition system, fuels and carburetion, cooling system, tractor chassis, operation, work and implements.

Big increases in all classes of freight rates (with three exceptions between California points) have been announced by the State Railroad Commission. With San Francisco or Oakland as a basic point, the rates to or from Sacramento were increased 130 per cent; to or from Stockton, 220 per cent; to or from Fresno, 66 per cent; to or from Los Angeles, 143 per cent; and to or from San Jose, 514 per cent.

ORCHARD BRAND
Lime Sulphur Solution
AND
Prepared Bordeaux Mixture Paste

ORCHARD BRAND Lime Sulphur Solution, and ORCHARD BRAND Prepared Bordeaux Mixture Paste are our proved remedies for spraying peach, almond, and deciduous fruit trees; to control blight and shot hole fungus.

These prepared tree sprays are ready for use. They are scientifically blended. Just the right proportions to accomplish your purpose, as proved by years of experience.

ORCHARD BRAND tree sprays are the materials we sell and the measure by which the price is gauged. But the service that goes with them is next in value. Beneath it all is the solid foundation based on General Chemical success with tree sprays all over America, wherever fruit is grown.

When you get it fixed firmly in your mind that ORCHARD BRAND is the dependable tree spray, shipped in carloads and trainloads to the big fruit growing sections all over the land, you will want to make inquiry as to what it opment of the trees.

You will want authoritative information on such matters. Hence, will do for your orchard.

You will want to make inquiry, to learn how to counteract tree diseases, and how to control the harmful elements which destroy devel- we invite you ta write to us, giving the condition of your trees as you understand it. Our entomological department will then send you bulletins and authoritative data that will aid you in solving your problems.

Many years of scientific research, and practical experience on the Pacific Coast, beside the nation-wide experience, and the proper laboratory equipment, are at your service. Write to us now about your tree troubles.

NATIONAL SURVEY OF FIELD CROPS.

(Continued from page 613.)

7,593,000 for a five-year average, 1910-1914, preceding the war. The yields are estimated at 236,505,000 bushels in 1918, 208,975,000 in 1917, and 186,208,000 in the pre-war five-year average.

OTHER CEREALS.

Rice acreage planted in the United States jumped from a five-year pre-war average of 733,000 acres to 964,000 in 1917 and 1,120,400 in 1918. Rice yield jumped from the five-year average of 24,378,000 bushels to 36,278,000 in 1917 and 41,918,000 in 1918.

Rye acreage planted in 1918 was 6,119,000; in 1917, 4,480,000; and in the five years preceding the war it averaged 2,562,000 acres. Yields jumped from 37,568,000 bushels pre-war average to 60,145,000 bushels in 1917 and 76,687,000 in 1918.

"Kafirs" were planted on 3,944,000 acres in 1916; on 5,153,000 in 1917, and 5,114,000 in 1918. The yield jumped from 53,858,000 bushels in 1916 to 75,866,000 in 1917 and dropped to 61,182,000 in 1918.

FIELD VEGETABLES.

Potatoes lead all other vegetables. The five-year pre-war average planted was 3,686,000 acres. In 1917 4,390,000 acres were planted. This figure was reduced in 1918 to 4,113,000 acres. The average yield in the United States during the five pre-war years was 360,772,000 bushels. In 1917 442,536,000 bushels were produced. The 1918 crop is estimated at 390,101,000 bushels.

Fall onions produced in the United States jumped from 7,833,000 bushels, as reported in 1916, to 12,309,000 in 1917, and 13,438,000 in 1918.

The sugar beet average for five years, 1910-1914, was 5,391,000 tons. Production in 1916 was 6,228,000 tons; in 1917 it was 5,980,000 tons; and in 1918, 6,549,000 tons.

THE DEMAND.

"During ensuing months, we know," says Secretary Houston, "that the nation is likely to be called upon for large quantities of available foods and feeds to supply not only the peoples with whom we cooperated in the war, but also those of neutrals and the central powers. This will involve a continuance of conservation on the part of our people, and probably the maintenance of a satisfactory range of prices for food products. It is impossible to say when the nations of Europe will return to somewhat normal conditions and resume the planting of bread and feed grains enough to largely meet their requirements. It is impossible now to say whether the shipping will open up sufficiently to permit the free movement of grains from distant countries like Australia, India, and Argentina.

"While the problem of immediate distribution of available foods demands urgent consideration, the production program for next harvest should also receive no less common and urgent attention. We must not fail to secure an adequate supply of feedstuffs for fat livestock, of which the world will be certain to have a particular need."

NURSERY NOTES.

Tehachapi is increasing her acreage of pears and apples—the fruits best suited to this section, which has an elevation of over 4000 feet.

The Peak's cling is coming into vogue on its merits. It is very much like a Phillips cling, but matures two or three weeks earlier and is claimed by its admirers as the best midsummer cling peach. It originated at Selma.

An increased area will be planted to almonds in the Paso Robles and Templeton districts this year. El Pomar, east of Paso Robles, looks like a promising country for the industry. It is better suited to the almond root stock than peach.

William P. Stark, formerly of Louisiana, Mo., has associated himself with the Cottage Gardens Nursery of California. He takes the position of operating manager and sales director and will have entire charge of both production and sales. He will dispose of his interests in Louisiana and give this his entire attention. We welcome Mr. Stark to California.

There is an increased demand for Muir peaches in the Fresno section. The reasons are that the present prices for dried peaches are now profitable and the Muir is one of the best dryers because of its small pit and firm flesh. Also the pit is so easy to take out. The chief reason, however, is that the new peach-peeling machine, for which the Peach Growers' Association has the patent, can do better work on the Muir than any other peach, and this has given the above variety a boost by creating an increased demand.

Pear Trees

There's money in pears if you get started right.

Elmer Bros. Trees are the best you can plant. Grown on virgin soil and

Blight Resistant

Pears have been grown in this valley for forty years and blight has never made its appearance. That's why our pear trees are so much in demand.

RUMELY OILPULL TRACTOR LA PORTE IND.

Proved by 10 Years Farm Work

Breaking virgin sod, sun-baked for years, on the prairies of the West—deep-plowing the much tilled land of the smaller farms of the East—year after year of the hardest kind of farm work has proved the supreme fitness of OilPull Tractors.

This dependability and service has been remarkably demonstrated by the first OilPull built, that is still working in South Dakota, and by old OilPull No. 11 still on the job in Michigan—year in and year out continuous performance that gives the only real basis upon which a tractor can be judged. In these ten years the OilPull Tractor has built up a record of continuous, reliable, economical operation unequaled in the tractor industry.

Backed by a Written Guarantee

As if it were not enough that throughout all these years the OilPull has proved its ability to operate successfully on all grades of kerosene, the makers give you an absolute guarantee that it will do so. The fact that this is the only tractor company that gives such a fair and square, iron clad written guarantee tells a big story in itself.

And you will find near at hand Advance-Rumely service—established and maintained through 26 branch offices and warehouses, where complete stocks of machines and repair parts are always on hand.

The Rumely OilPull Tractor may be had in sizes from three to ten plow, standard as to design and construction. A post card will bring you the OilPull catalog.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles

SUCH PLOWING ONLY AFTER TRACTORS.

[Written for Pacific Rural Press.]

Clods of hard, dry adobe that would not go into a moderate-sized wash tub were turned by the tractors at the Los Angeles Tractor Demonstration last fall. Only a tractor could plow such ground. The advantages of plowing most

Showing a plowing operation in hard, dry, refractory adobe, possible only with the modern tractor.

California soils dry at greater expense possibly than after they become wet by fall rains are distinct and numerous. (1) The plowing gets done. Any acreage desired can be plowed before seeding time. (2) Ground thus plowed up in hard clods will weather and slack and "melt" in the average fall and early winter rains, forming a well-aerated, well-compacted sub-surface seedbed as good as any implement could reasonably make it and at absolutely no cost. After such weathering the surface inches can be worked down easily and fine to receive the seed. (3) All fall and early winter rains are caught and held in a soil reservoir under the seedbed. As the amount of moisture is probably the greatest factor in California grain farming determining the yield, dry fall plowing in average seasons or locations of limited rainfall should far more than repay its greater cost except in cases where other factors may counter-balance even this advantage. (4) The power required in dry plowing where the tractor has good footing is not so much greater on many soils than that required for plowing after those soils become moist, sticky, slippery or boggy.

TRACTORS FOR WET PLOWING, TOO.

Now, the tractors' advantage is not ended when dry plowing ends, for they keep on going as long as the plows will work; and in cases we have observed they have worked when the ground should not be plowed. With the great bearing surface of long, broad tracks or with the multi-various forms of grouzers and additions to width of drive wheels on wheel types, most tractors have footing enough to pull all that should be expected of them. Most tractors do not exert greater pressure per square inch than horses, though they exert it over more square inches. It is, however, no trick to fasten some small-toothed cultivators behind the wheels or tracks to loosen the soil if it be packed too much.

It is not inhuman nor cruelty to animals to work the iron horse in rain, mud, storm, and darkness; nor is it difficult to fix up sufficient protection for the driver, carrying all the equipment necessary for his comfort in varying conditions of weather.

TRACTOR SCHOOL PROVED WORTH SUPPORTING.

[Written for Pacific Rural Press by R. E. Hodges.]

Fresh from the latest of the University Farm Tractor Short Courses, the writer has lost no whit of the enthusiasm born at the first of them two years ago and increased by attendance throughout the course last year. A few other 1917 students came again to review some of the numerous details then given, but not all of which any human brain could retain. One hundred and sixty-five men and women paid their registration fees and took the course November 11 to 21, 1918. They represented Nevada and most of the counties of California from Lassen and Mendocino south to San Diego and San Bernardino, besides several foreign countries, including Chili, British Columbia, Peru, Japan, Mexico and India.

There seemed among them, as noted by Prof. J. B. Davidson, head of the Agricultural Engineering Department at University Farm, an outstanding idea that they were there for business. Students approached by the writer were unanimous in their endorsement of the practical nature of the course—both in the lectures and the practice work. The Agricultural Engineering Department has for a couple of years operated a number of tractors and stationary engines on the several hundred acres in the University Farm, using them for instruction and for Farm work. So the school has not only the advantage of investigations made among users and manufacturers of gas power machines, but also its own experience and experiments.

WHAT SHOULD FARM SCHOOL DO?

When Prof. Davidson undertook to organize the University Farm Agricultural Engineering Department three or four years ago, he planned to carry out experiments and investigations which could not economically be carried out by individuals. There are multitudes of questions that prospective and experienced tractor users ask, that simply cannot be answered because the desired information has never been accurately determined. Questions by the thousands have had to be answered by mail and in person by the staff of this department more or less fully, having been asked by farmers of this State to solve their vital problems. Even in the simple matter of plow adjustment, no one can estimate the colossal loss of energy in California because farmers and even plow manufacturers have rather generally not known how to adjust their plows to best advantage. Thousands of gas engine machines have gone prematurely to the scrap heap because their operators did not know principles that should be known, and could be learned by the proper kind of more or less expensive investigation.

But Prof. Davidson early gave up his hopes of doing much research work. The people of California have rapidly been awakening to the need of it, but their representatives in Legislature and University have not realized the pressing need and have not provided the necessary funds. The work of the department has included the instruction of hundreds of tractor operators—500 students were taught tractor operation last year in this University school of a State where about 1700 tractors were sold. Cheaply constructed laboratories and shops have been put up. For each of the three splendid tractor short courses that have been held at Davis with attendance far exceeding all the other short courses combined, the great University of California has had to approach the tractor manufacturers and dealers with a plea to send their machines to the school free of charge, pay the freight on them, pay mechanics to come with them and help instruct the students. Be it said to their credit that they have responded nobly, 12 or 14 different makes being there this year for students to operate with various tillage implements, and with mechanics to answer all students' questions.

Aside from salaries of the staff, only $1,050 was available for the year's activities of this Agricultural Engineering Department. If the war had not taken so many students—if the normal number had been taught, supplies for the forge shop alone would have cost $500. This $1,050 had to cover postage on thousands of letters answering farmers' questions, pay office incidentals, buy all experimental equipment and all supplies for shops and laboratories, pay all traveling expenses and the cost of special instructors. How far did it go? Some of the most expensive equipment used there is the personal property of the staff and of commercial concerns who have loaned it to the University of California! Over a year ago Prof. Davidson considered organization of moving tractor schools such as are now launched by the State Board of Education, and turned down the idea reluctantly because he had no funds to use that way!

POWER FARMERS SUPREME.

The outstanding significant, characteristic feature that has made American agriculture produce more food per man engaged in it than has been produced anywhere else in the world is power farming. When the world crisis arose, Europe sent to America for men and machines, teachers of American methods of using power and equipment. A former student of agricultural engineering is in France today for the purpose not of fighting Germans or of telling French farmers how to conserve or restore fertility, but to teach them how power farming as practiced in America can solve their food problems. Another graduate of agricultural engineering is teaching Englishmen in England American power farming. The old world looks to America for this information. Educational institutions have lagged far behind the farmers in recognizing the value of this power farming now so widely realized. Other States have beaten California in this respect. Nebraska has just completed a $180,000 plant for agricultural engineering. Iowa has one that cost $110,000. Minnesota has a $225,000 plant: Manitoba has an agricultural engineering plant 160 feet long, 110 feet wide, and three

Dependable, Economical Power Under All Conditions

WATERLOO BOY

ORIGINAL KEROSENE TRACTOR

Whether your soil is hardpan, black-wax, timothy sod, gumbo or just loam, the Waterloo Boy Kerosene Burning Tractor has the necessary power to farm it. Our thousands of satisfied users all over the United States have given this tractor rigid tryouts in every possible soil condition, and the Waterloo Boy has always pulled through with a record.

Perfect Lubrication Necessary to Efficient Work and Long Life

The teeth of friction get busy quicker on a tractor than on other machines, because of the trying circumstances under which it must work. No matter how well your machine is built, it can not do good work unless the lubricating system is right.

The Waterloo Boy is equipped with the well known circulating splash and pump system of lubrication, which is employed on high class automobiles generally. This constantly maintains a substantial oil flow between all friction points. With dust-proof gears and bearings, it prevents wear, increases power, keeps down repair expense, insures smooth, steady work.

High quality material and workmanship throughout guaranteed.

Write us for illustrated catalog showing many photographic views with letters from users, also details of construction.

JOHN DEERE

stories high. Dean Van Norman of the California University Farm School is modestly asking for a $50,000 building and $28,500 per year for operating expenses to build up a department that could answer farmers' power questions with precision. The State Board of Education, using $50,000 of the war emergency money of the Council of Defense, has launched moving tractor schools as a separate organization. Such moving schools are much needed and likely to prove the money well spent, but in a day of attempted reduction of duplicated effort, why, wonders the writer, should not this activity and this money be placed under jurisdiction of the University Department, which has proved itself so eminently practical and popular among those interested in power farming!

We are not in favor of an increase in State expenses, but it seems like there is much money spent nonproductively that might yield a hundred-fold if invested in an adequate Agricultural Engineering Department at University Farm.

Now, if you have been a student at any of these Agricultural Engineering Courses, or if you have not been there but believe that farmers of this State need an experiment station to answer your power-farming questions with precision, clip this article and send it with a letter endorsing it to the Dean of the Agricultural College at Berkeley, that he may use it in convincing the University Regents, the State Board of Control, the Governor, and the Legislature that power farming in California deserves the support asked. You can get it if you want it enough to make this little effort.

REPLACING SPIT-HUB FLYWHEELS.

After removing a split-hub flywheel from any machine, be sure that it is put back with no dirt between the bearing surfaces and with no offset between the halves of the hub. Anything which throws the flywheel ever so slightly out of balance will crystallize its shaft and then the flywheel will surely fly. There is an awful strain on the shaft of a 500-pound flywheel running 500 r. p. m., unless it is perfectly balanced. A piece of dirt on the flange .002 inch thick will throw the rim of the wheel several thousandths out of true. Often the bearing surfaces may be clean, but when the bolt is driven through, even with a light hammer, it may shave off a bit of steel and leave it between the bearing surfaces. Then the flywheel itself may be wrongfully blamed.

KEROSENE EQUIVALENT OF OAK WOOD.

To the Editor: Will you please let me know through your paper how many gallons of kerosene are equal to one cord of oak wood? Also, how many pounds of coal are equal to one cord of wood? —A Subscriber.

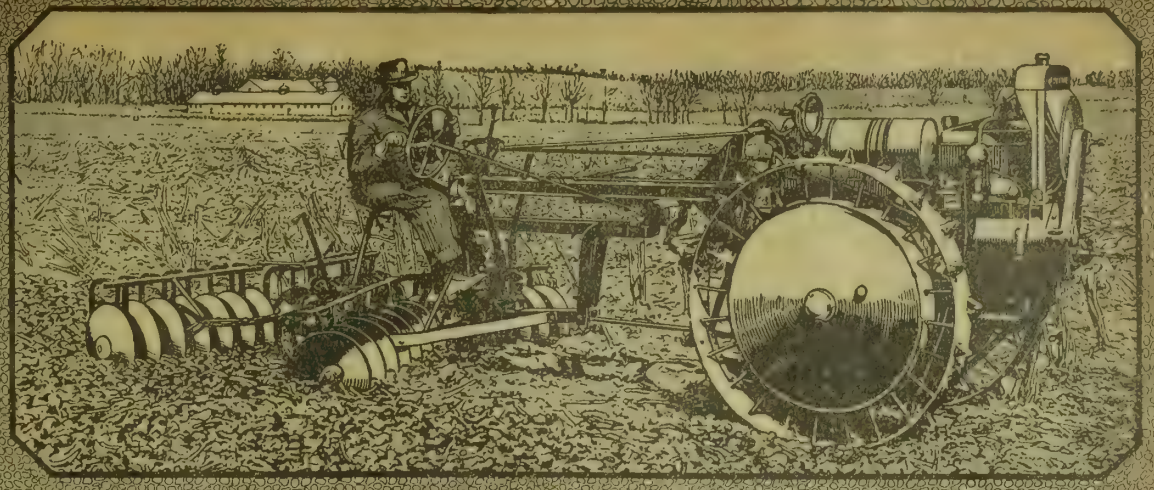
According to Kent, a cord of white oak (air dried) equals from 1540 to 1710 pounds of coal. One barrel of oil (42 gallons, or 315 pounds) equals 499 pounds of coal.

FREE TRACTOR COURSE.

A free service school to cover every phase of tractor equipment, operation, overhauling, and repairing is to be held at the San Francisco office of the J. I. Case T. M. Co., December 10 to 14. The Case company invites all of its customers and others interested in the operation and care of tractors.

About twenty Fageol tractors are now being manufactured every week, and with the loosening of steel restrictions the output is soon expected to reach 40 per week. The Fageol people have been awaiting the results obtained from about 25 of their machines put out in various parts of the State about a year ago for tests by farmers under common farm conditions.

Graphite on the engine gaskets will permit them to be loosened easily when desirable next time.



Moline-Universal Power Lift Gang—Extra strong construction, simple power lift operated by foot lever, equipped with quick attachable shares and combined rolling coulters and jointers. In average soil conditions this outfit will plow 9 acres a day

Moline-Universal Disc Harrow—Strongly constructed with 18-inch blades. Each gang has 3 large dust-proof bearings equipped with wood bushings. Easily and quickly adjusted. Built in 6 and 7-ft. sizes double cut, or 8, 9 and 10-ft. single cut.

Moline Grain Drill—Operator sits behind the drill where he can see work being done. Furnished in a great variety of sizes either as plain or fertilizer drill. Deposits seed with unvarying accuracy. Equipped with either single or double disc furrow openers.

Moline-Universal Tow-Row Cultivator—With this outfit 10 to 20 acres a day can be cultivated. Entire outfit easily handled. Tractor speed easily regulated from ½ to 3½ M. P. H. Cultivator is extra strong and has pendulum foot gang shift.

THE TRACTOR
for ALL Your Work
AND ALL THE IMPLEMENTS to Do It With

Mr Nile Kinnick of Adel, Iowa, operates a 400-acre farm and all the work is done by two men, two Moline-Universal Tractors and one team of mules. This is what he says about the Moline-Universal:

"I was agreeably surprised with the ease with which we could cultivate corn, and for harvesting it far surpasses horses or mules. It appeals to me as an ideal tractor. It will actually replace horses, something that most farmers must consider when they plan to buy a tractor. The ease with which it is handled and the advantage of operating the outfit from the seat of the implement are facts that cannot be appreciated until one has tried it."

This expresses in a nutshell the advantages of the Moline-Universal. It does *all farm work* including cultivating; *one man* operates both tractor and implement from the seat of the implement; it has *ample power* for heavy field and belt work, yet can be operated economically on light work.

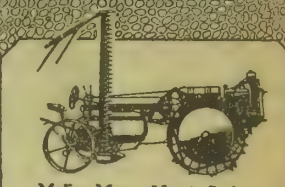
Another big feature that makes the Moline-Universal superior to all other tractors is the complete Moline Line of Implements to be operated in connection with it. This does not mean it is necessary to purchase all of these implements with the tractor, as many horse drawn implements can be used successfully. But it does mean that a Moline-Universal owner can operate his tractor to full capacity at all times and make the best use of the operator's time by using Moline tractor implements. They do better work with the Moline-Universal, are of larger capacity, stronger construction, are designed to run at higher speeds than horse drawn implements, and will pay for themselves in a short time.

For full information Address Dept. 97.

Moline Plow Co., Moline, Ill.

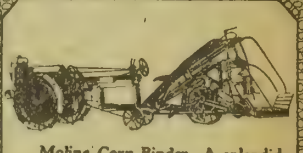
Manufacturers of Quality Farm Implements Since 1865

MOLINE UNIVERSAL TRACTOR



Moline Mower No. 4—Built in 6, 7, 8 and 10-ft. cuts. The largest capacity mower in the world. Proportionately larger and stronger than ordinary mower. Equipped with spring draft rod. One man operates both tractor and mower.

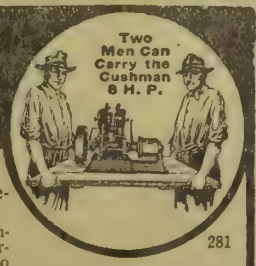
Moline Grain Binder No. 11—Cuts a 10-ft. swath. Extra strongly constructed throughout. Cuts 35 acres a day. Equipped with power bundle carrier. One man handles the tractor and binder easier than he could a binder and horses.



Moline Corn Binder—A splendid outfit for cutting corn easily and quickly. Power bundle carrier deposits bundles away from the path of the tractor. Strong and durable. One man operates the entire outfit easier than with horses.

Moline-Universal Tractor Attachor—A great variety of equipment can be attached to rear crossbars, so that majority of operations in orchard and vineyard work and cane growing can be performed with this one outfit.

A Dwarf in Size A Giant in Power



Only 40 to 60 lbs. per H. P.

Cushman Engines weigh only 40 to 60 pounds per horsepower, yet have plenty of surplus power.

They weigh only about one-fourth as much as ordinary farm engines, but they are balanced so carefully and governed so accurately that they run much more steadily and quietly. They are also the **most durable farm engines** in the world, on account of their improved design and better material and construction.

Easy to Move from Job to Job

CUSHMAN Light Weight Farm Motors

4 H. P. on Binder

This is the famous All-Purpose Cushman that has been used on so many binders. Just as successful for all stationary jobs.

4 H. P. weighs only 190 lbs., being only 48 lbs. per horsepower. Besides doing all ordinary jobs, it may be attached to any grain binder, saving a team, and in a wet harvest saving the crop. Also it may be used on corn binders and potato diggers.

8 H. P. weighs only 320 lbs., being only 40 lbs. per h. p. For all medium jobs. Also may be attached to hay presses, corn pickers, saw rigs, etc.

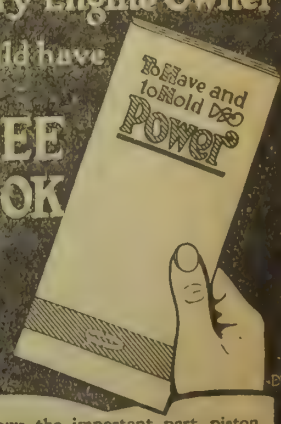
15 H. P. weighs only 780 lbs., being only 52 lbs. per horsepower. For heavier farm jobs, such as 6-hole corn shellers, ensilage cutters, large feed grinders, small threshers, etc.

20 H. P. weighs only 1200 lbs., being only 60 lbs. per h. p. For heavier duty jobs, such as shredders, shellers, grain separators, heavy sawing, etc.

Cushman Engines do not wear unevenly and lose compression. Every running part protected from dust and properly lubricated. Equipped with Throttling Governor, Carburetor, Friction Clutch Pulley and Water Circulating Pump. Ask for Book on Light-Weight Engines.

Cushman Motor Works 956 N. 21st Street Lincoln, Nebraska

Every Engine Owner should have this FREE BOOK



It shows the important part piston rings play in producing power, saving gasoline and oil. Tells how you can have a clean, dependable motor. It will enable you to judge for yourself the claims of all types of piston rings. For your own satisfaction, profit and protection—send for your copy today.

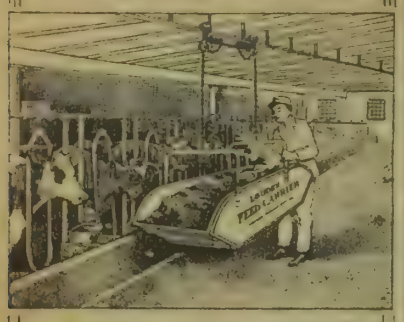
QUICK FEEDING—Without The Waste and Labor



Why hitch up a team twice a day to feed the stock, or make innumerable trips with a wheelbarrow?

With a Louden Overhead Feed Carrier you can carry at one trip enough dry feed or ensilage to feed from thirty to forty head of cattle. There's no waste of feed, no wasted effort, and the feeding is done in half the time required by any other method.

We have Louden Feed Carriers in various styles and sizes, at a wide range of prices that puts them within easy reach of every barn owner.

We have a carrier suitable for YOUR barn, and we'll guarantee it to earn its purchase price again and again in its saving of time, labor and feed.

Ask us for Feed Carrier booklet and prices.

Louden's Litter Carrier Outfit

—save labor, time, and money, same as Louden's Feed Carrier. One man with a Louden can clean the barns in half the time that two men would take without it. Think of that! There's economy for you.

Send today for free book on manure uses, and catalog of Louden's Litter Carriers, Sanitary Steel Stanchions, Cow Stanchions, etc., for modern barns.

HOLSTEINS ARE RUGGED.

The Holstein-Friesian Cow is large strong and vigorous, full of energy and abounding vitality. It is able to turn to best advantage the roughage of the farm, converting it into large quantities of excellent milk for all purposes. She perpetuates herself through strong, healthy calves, and when useless in the dairy fattens readily and makes excellent beef.

For Profits Sake Feed Cows Liberally

[Written for Pacific Rural Press by R. H. Whitten.]

As pastures wane and it is necessary to furnish other feed to cows, it is the custom of many dairymen to feed lightly and permit the cows to get in a run-down condition. They figure that they are saving money, but it is really an expensive practice, and as pastures give out other feeds should be used liberally so as to keep the milk flow constant.

Liberal feeding does not mean the lavish use of high-priced concentrates, although under average conditions it well pays to supplement alfalfa with a moderate grain ration.

We have just received from Prof. Woll of the University Farm, Davis, a copy of his valuable paper, "Alfalfa as a Sole Feed for Dairy Cattle," which was read at the annual meeting of the American Society of Animal Production at Ames, Iowa. It gives the results of experiments carried on for several years at the University Farm to determine the effect of an exclusive alfalfa diet on both the body development and the production of dairy cows.

The investigation was begun in April, 1914, with heifers taken about a year before their first freshening dates and carried through two lactation periods. One lot was fed alfalfa alone—green and cured—and another lot received silage and grain in addition to alfalfa.

GRAIN INCREASES SIZE AND WEIGHT.

Larger average daily gains in body weight were secured on mixed rations than on alfalfa alone. The heifers receiving a mixed ration gained 1.11 pounds daily before freshening and 0.60 pound daily for the entire period, as compared with gains of 1.05 and 0.50 pound respectively for those receiving alfalfa alone.

Records were also kept on the measurements of the animals, with the percentages of increase, and the tendency of those on mixed rations was toward a larger body development than those on alfalfa alone. For instance, the former gained 18 per cent in body length and the latter 17 per cent. The former gained 14 per cent in girth and the latter 12 per cent.

INFLUENCE ON CALVES.

The calves dropped by the alfalfa heifers averaged 59.8 pounds at birth, and those by the heifers on mixed rations averaged 64.4 pounds—an increase of 8 per cent in the average birth weight of the latter calves.

The records are not sufficiently complete to show whether or not the heavier calves continued to have the advantage as they grew older, so far as body weight is concerned, but a good-sized, thrifty calf is always considered a desirable asset, no matter whether it is to be raised or vealed.

INFLUENCE ON DAIRY PRODUCTION.

The mixed ration proved decidedly superior to alfalfa in point of production. During the first lactation period the heifers on the mixed ration produced 45 per cent more butterfat than those on alfalfa alone, and during the second lactation period 23 per cent more. The latter figure was considerably reduced because of the failure of one heifer to make a satisfactory production during this period. For some unaccountable reason she fell from 352 pounds during her first period to 167 pounds during the second.

The average daily production for the two lactation periods on alfalfa alone was 17.6 pounds of milk and 0.71 pound butterfat, and on the mixed ration 22.7 pounds milk and 1.00 pound butterfat. Each hundred pounds of dry matter in the alfalfa ration produced 70.7 pounds milk and 2.82 pounds butterfat, and in the mixed ration 79.4 pounds milk and 3.50 pounds butterfat, an improvement in the latter ration of 1.2 per cent in milk and 23 per cent in butterfat.

DOES IT PAY?

But do the benefits obtained from a mixed ration pay for their higher feed cost? That's the important question. The answer depends largely upon the comparative cost of the two rations. The average prices per ton during the years of these investigations were: Alfalfa hay, $10.50; barley, $29; dried beet pulp, $24; coconut meal, $27; wheat bran, $27; and corn silage was figured at $4 per ton. Using these figures and considering the increased production alone, it was about an even break in the economy of the two systems of feeding. But when the development of the heifers, the greater value of their calves and the larger amount of skim milk are taken into consideration, it certainly paid to feed the mixed ration.

Since then the price of alfalfa has increased more in proportion than that of nearly all the other feeds, consequently there is all the more reason now why a mixed ration should be given. Remember how we figured this out for you in a recent issue. The average cow receiving alfalfa alone eats 30 pounds daily. By reducing the alfalfa 10 pounds per day and adding a grain ration of two pounds each of barley, dried beet pulp and coconut meal, you will add 5c per day to the cost of the daily feed. But the cow will give you additional milk worth 16c, so you will make a net profit of 11c per day per cow on production alone. In a herd of 30 cows this means an extra profit of $99 per month.

Suppose you can't buy beet pulp, or you have a large amount of barley that you prefer to use. Go ahead and use it. You can make it pay. One hundred pounds of alfalfa contains 50.7 pounds of digestible material, and at $22 per ton this makes the digestible part cost 2.17c per pound. One hundred pounds of rolled barley contains 79.4 pounds of digestible material, and at $45 per ton the digestible part costs 2.83c per pound. This makes the barley really cost a little over a half cent per pound more than alfalfa, but the feeding of a reasonable amount will increase the flow of milk enough to pay the additional cost and show a good profit besides.

That is, if a cow is giving at least 20 pounds of milk a day. It will hardly pay to grain cows giving less than this. Prof. Eckles of the Missouri Experiment Station, one of America's leading dairy authorities, recommends the following schedule:

For Jersey cow producing 20 pounds of milk daily, 3 pounds grain; 25 pounds milk, 4 pounds grain; 30 pounds milk, 5½ pounds grain; 35 pounds milk, 7 pounds grain; 40 pounds milk, 8 pounds grain.

For Holstein cow producing 25 pounds milk daily, 3 pounds grain; 30 pounds milk, 4 pounds grain; 35 pounds milk, 5½ pounds grain; 40 pounds milk, 7 pounds grain; 50 pounds milk, 9 pounds grain.

For Guernseys and Ayrshires all amounts would be about half way between those for Jerseys and Holsteins.

FEED COWS LIBERALLY AND WELL.

Feed your cows a mixed ration and feed them well. Don't keep them so thin that you can hang your hat on them anywhere. They will not produce as heavily and will not hold up as long as those in better flesh; also they will prove more susceptible to disease.

A good producing cow naturally carries a well-rounded frame—filled out with flesh, not fat—and if kept in this condition she will return a better profit than when fed only enough to make the milk she is producing.

You can bank on this—a liberal mixed ration will pay in the long run in increased production, persistency, greater size and vigor of calves, more regular breeding, and better general health.

Anchorage Farm, Orland, has sold several Berkshires to E. T. Hale of Orland, who is starting a registered herd. He already had a son of Star Leader.

Advantage in buying a
DE LAVAL
NOW

Butter-fat is now worth twice as much as it was two or three years ago.

So is labor.

A De Laval saves both.

And never before was there so urgent reason for saving every ounce of butter-fat and every half-hour of time and labor.

A De Laval will now pay for itself in half the time, compared with former years.

Buy it now and it will save its cost in a few months.

See the nearest De Laval agent right away and let him show you what the De Laval will save for you.

Cottonwood Hog Sale a Big Success

[Written for Pacific Rural Press.]

Old timers said it couldn't be done. Timid ones said they were afraid to try. But Parker Talbot, Farm Advisor of Shasta county, said that a successful Farm Bureau auction sale of hogs could be held, and he got busy.

He found the farmers reluctant to consign their hogs at first, many fearing that the buyers would combine against them and queer the sale. But he secured enough hogs to make up three carloads and the sale was announced for December 3 at Cottonwood.

Ord L. Leachman, the live-wire auctioneer of Sacramento, was engaged to cry the sale. There was a large attendance of spectators as well as buyers, many farmers coming just to see what would happen.

Mr. Talbot warmed the people up with a good talk and the sale was on. The first carlot was made up mostly of small feeder hogs, and went to the Willard Commission Company of Portland for $13.50. Then came a carlot of fine big fat hogs, which went to the same buyer for $14.55. The third carlot also was good, but a little light, averaging 187 pounds, and went to the Western Meat Company of San Francisco for $14.50.

The consignors were well satisfied, as the prices mean about $2 more at terminals, and many farmers who were afraid to consign wished they had done so. Another sale will be held soon, and will include cattle as well as hogs.

A prominent breeder who attended the sale said that this moral was impressed upon the farmers: "Don't be afraid to trust your Farm Advisor. He is working for your best interests."

Bull Beauty More Than Skin Deep

[Written for Pacific Rural Press.]

The value of a good sire as proved by the evidence-producing Babcock test is shown in the production of the daughters of the Jersey bull, St. Mawes. He has 20 daughters in the register of merit with a yearly average of over 500 pounds of fat. One of his daughters, St. Mawes' Poppy, made three official yearly records, the highest of which was 952 pounds.

The most interesting fact is that four of his daughters, all out of the same dam, made an average of over 600 pounds of fat. The highest record was 713.84 pounds and the lowest 410.98 pounds.

But St. Mawes went the way of many good bulls — the beefsteak route—before he had had a chance to prove his worth. His owner didn't like his looks and sold him to the butcher before his daughters had been tested.

Perhaps you, Mr. Reader, have just as valuable a bull in your herd. No? How do you know if you haven't tested his daughters? Don't judge by appearances. The Babcock test is the only safe way to determine such things, and it is just as valuable in discovering a good sire as in determining the best females in a herd.

Discovering a good sire is like finding a buried treasure on the farm. Prepotent bulls are none too plentiful, and it is not always the best looking individuals that make the best breeders. Remember what the fellow said when someone asked him if he didn't think the skunk was a beautiful animal. He replied that "handsome is as handsome does." No matter whether you like your bull's looks or not, give him a fair chance to prove his worth. Test his daughters before thinking of disposing of him. You may be on the verge of giving up a gold mine.

LIBERTY FAIR IS ON.

At last the gates of the Liberty Fair at Los Angeles have opened. The fair started on Wednesday of this week and will continue for ten days. The opening was announced by a military salute, followed by a parade through the business district. Governor Stephens was the guest of honor at the formal dedicatory services.

Of course you are going. The judging will have been finished by the time you read this announcement, so you can see the prize winners. The exhibits in all of the departments are high class. You will learn a great deal by spending a few days there.

CALIFORNIA STOCK WINS AT THE INTERNATIONAL.

Three cheers and a tiger! Word has just been received that California Marvel, the Shorthorn steer entered at the International Livestock Exposition at Chicago by the University Farm of Davis, has captured the championship.

This is the second time that this championship has been won by a California steer. The University Farm did not show at Chicago last year, but in 1916 they won with California Favorite, a half-brother of this year's champion.

Other stock being shown at the International this year includes seven other steers, a carload lot of Duroc-Jersey hogs, pens of Berkshire and Poland-China hogs, and 18 fat wethers. A fuller report of the winnings will be given next week.

Prof. Gordon H. True of the Livestock Commission of the local Food Administration states that cottonseed hulls are available in the Imperial Valley at $20 per ton f. o. b.

The JER$EY DOLLAR

JERSEYS make a dollar worth more because they give the biggest yield with the least amount of feed. The only breed for the working farmer. The least expensive breed to keep, the most satisfactory breed to have. Buy one Jersey and you will want a herd. Write to Breeders for pedigrees and prices. Ask us for the facts that have changed many a cow barn from a liability to an asset.

Feeding Barley for Best Results

[Written for Pacific Rural Press by R. H. Whitten.]

When grain is not self-fed it should be used in the form of a slop.

"You advise us to feed barley to hogs, but you don't tell us how it should be fed," write several subscribers who read our article in a recent issue, entitled "Hogs Convert Barley into Bank Accounts." Right you are, readers, and we are glad to furnish the additional information.

No one is wise enough to be able to say with certainty, "If you feed your pigs exactly this way you will make the greatest possible profit." Home-grown feeds should be used as far as possible, and as crops and conditions on different ranches vary greatly, our suggestions must be general rather than specific.

Several subscribers ask if barley should be fed whole. Because the kernels are so small and hard, they are not thoroughly masticated if fed whole, and they pass through hogs without being digested. Consequently, barley should be rolled or ground. It is preferable in the latter form, although rolled barley gives excellent results.

BARLEY ALONE NOT SUFFICIENT.

But barley alone is not sufficient. It is high in carbohydrates, which give strength and animal heat, but it is low in protein, ash and other properties which are necessary to replace wasted tissues and promote growth. Skim milk is the ideal supplement, and when available it should be used in the proportions of three pounds of milk to one of grain.

Tankage is a desirable substitute for skim milk for brood sows, herd boars and growing pigs. It is also good for fattening, but other feeds high in protein, such as coconut meal or oilcake meal, generally can be used more economically. For regular use, add 10 per cent of the tankage or substitute to the grain ration; for finishing off, 5 per cent will be sufficient.

SELF-FEEDER WILL INCREASE PROFITS.

For fattening hogs the self-feeder will give excellent results. In an experiment conducted at the University Farm, pigs averaging 60 pounds each were divided into five uniform lots. The first lot was fed ground barley alone at the rate of 1 per cent of their weight daily. The second lot received 2 per cent and the third received 3 per cent. The fourth lot was fed all the barley it wanted in a self-feeder, and the fifth lot was fed the same except that the pigs also had free access to coconut meal. The test was carried on for 114 days, with the following results:

Feed—	Weight
1 per cent	95 lbs
2 per cent	125 lbs
3 per cent	155 lbs
Full feed	180 lbs
Full feed and coconut	190 lbs

Of course, the hogs on full feed consumed more grain than those on limited feed, but the important part is that they required less grain for each pound of gain, and consequently made the greatest profit.

SOME ROUGHAGE NECESSARY.

It will not be found profitable, however, to either develop or finish [illegible] alone. It should be used as a supplement to pasture or hay. Pasturage is preferable, and the pasture should be alfalfa if possible. If not, clover, Sudan grass, rye, millet or rape, or a mixture of these, will answer. Rye, millet and rape can be seeded right in with an established stand of alfalfa in the fall or early winter, and will furnish good winter pasturage during the months when alfalfa is dormant.

If no pasture is available during the winter months, alfalfa hay may be fed, but hogs do not eat the stems readily and the waste is great. Chopped alfalfa is better; alfalfa meal is better yet.

BARLEY CHEAPER THAN ALFALFA.

But don't make the mistake of attempting to substitute alfalfa meal for a large amount of barley. Because you can buy alfalfa meal at $36 per ton and ground barley will cost you $47, don't think that alfalfa meal is cheaper. One hundred pounds of barley contains 79.4 pounds of digestible material, which makes the actual cost of digestible material utilized by the hog 2.95 cents per pound. In 100 pounds of alfalfa meal there are 50.7 pounds of digestible material, which makes the cost 3.55 cents per pound. This means that barley at $47 per ton is actually cheaper than alfalfa meal at $36.

So the only object in using alfalfa is to provide a balanced ration, and the best results will be secured when one part of alfalfa to six of grain is used for fattening hogs, one part to five for growing stock, and one part to three or four for a maintenance ration.

SOAK THE GRAIN WHEN NOT SELF-FED.

When the self-feeder is not used, most hog raisers get better results by soaking the barley, using water when skim milk is not available. Tankage or coconut meal should be added to the slop, and if alfalfa meal is used it also may be added.

Don't be afraid to feed barley liberally, even to the young fall pigs. Experiments conducted at the University Farm show that the method of growing pigs on pasture alone and using grain afterwards to secure sufficient weight and finish, actually requires more grain than does the system of feeding grain continually from weaning time, and does not yield as big a profit.

Remember, a hog is a machine for converting grain into gold. But the amount of gold you get out will depend largely upon the grain you put in.

BANKS LEND TO BOYS' PIG CLUBS.

Eight California banks have loaned money to members of boys' pig clubs this year. The average amount loaned per bank was $409.39, and the average number of boys dealing with each bank was about 25.

Our good friend, H. C. Carr, of the First National Bank of Porterville, who is chairman of the boys' club committee of the State Bankers' Association, says: "The consciousness of the banker that he is developing the boy into an independent thinker and actor, and the fact that he is laying a foundation for his clientele for the future, is ample compensation to him for the trouble and investment.

Sheep Health Means Sheep Wealth

[Written for Pacific Rural Press by R. H. Whitten.]

Puzzle: Find the lamb infested with stomach worms.

Before reading the article, gaze on the illustration which accompanies it. All of the lambs are of the same breeding and the same age, and have been fed exactly the same. The only difference is that the larger ones have been kept free from stomach worms, while the poor little fellow at the left has not. Which kind do you want to raise?

The statement has often been made that stomach worms have done more to reduce the number of sheep than all the stray dogs and other predatory animals. While there may be some question about this, it certainly is true that of all sheep diseases stomach worms cause the greatest losses. There is no moist climate in America in which the crops are not seriously infested with stomach worms, and even the ranges of the West are beginning to be affected.

The stomach worm is reddish-brown, thread-like, about a half inch long and as thick as a horse hair. It lodges in the fourth stomach of the sheep, where it lives and grows by sucking blood from the blood vessels and arteries in the walls of the stomach. It matures within two or three weeks after its first appearance in the stomach. Eggs are laid which pass through the intestines and are voided in the feces. If the temperature is below 40 degrees, the eggs do not develop, but if above that they will hatch. This requires from a few hours to a week, depending on the temperature.

A small worm, or larvae, hatches from each egg, and grows until it is about one-twelfth of an inch long, after which it becomes practically dormant until swallowed by an animal. After being swallowed, it feeds on the blood of the animal, as already described.

A peculiar habit of the larvae which aids in its chance of being swallowed by grazing animals is its ability to crawl up grass stems while they are wet with dew. That is why the ravages of the stomach worm are greater in wet seasons than in dry. Also it explains why the shade in the pasture becomes a serious source of infection for stomach worms. Sheep lie in the shade and naturally a great deal of manure is collected there and the grass becomes rich and luscious. The young lamb, after a rest, jumps up and starts to eating the choicest grass in the pasture, and this grass is heavily infected with the stomach worm larva because so much manure has been dropped there.

I say "the young lamb" because stomach worms rarely cause death in mature sheep, as the latter have considerably more ability to resist them than lambs have. So I shall confine myself mainly to a treatment of the lamb phase.

SYMPTOMS OF STOMACH WORMS.

To the experienced eye there is little difficulty in discovering cases of stomach worms. The infected lamb does not keep up with the rest of the flock, and indicates a general debilitated and languid appearance. It is what shepherds call "off color." There is a marked loss in weight, the walk becomes hesitating and the lamb droopy and feeble. The wool becomes rough, harsh, dry to the touch, and without luster. The skin, instead of being pink, is of a pale color, and a bloodless appearance is noted, particularly about the eyes. The mucous membranes of the mouth also are pale in color. In advanced stages a watery swelling appears under the jaw, and scours ensues, with feces of a dark color.

THE GASOLINE TREATMENT.

One of the best remedies is gasoline. For lambs the dose is two-thirds of a glass of warm, sweet milk, to which has been added a tablespoonful each of gasoline and raw linseed oil. The milk is necessary to prevent the fumes of the gasoline from getting into the lungs of the sheep, and the oil acts as a laxative.

This should be given to each lamb in the form of a drench on three successive mornings, keeping the lambs off feed for at least twelve hours before and three hours after the dose is administered. The amount is sufficient for a 75 to 80 pound lamb. For older sheep increase the gasoline 50 per cent, but use the same amount of the other ingredients. Great care should be exercised in giving a drench. Don't give it too rapidly or hold the head too high because of the danger of getting the liquid into the lungs. This will cause immediate congestion, which frequently proves fatal.

SULPHATE OF COPPER ALSO GOOD.

While the gasoline treatment is effective, the fact that three consecutive doses are necessary makes it laborious and expensive, and the sulphate of copper (blue vitriol) treatment is preferred by some. Dissolve 1¼ ounces of sulphate of copper in a gallon of hot water, and give 1½ fluid ounces of this solution to a lamb or yearling, or a little more to a mature sheep. Administer with a small syringe or a drenching bottle.

PREVENTION MORE IMPORTANT THAN TREATMENT.

The old proverb that "an ounce of prevention is worth a pound of cure" is particularly applicable to the sheep, which is one of the most difficult of domestic animals to treat. Of course, not all infested animals succumb to the disease. Many lambs have strong enough constitutions to withstand the presence of stomach worms and outlive and outgrow their weakening effects. Still it is unfortunate that any lamb should have to fight against the ill effects of internal parasites, and for that reason every effort should be made to keep the lambs growing fast and to lessen to the utmost degree the chance of worm invasion.

Frequent changes of pasture is recommended—every ten days or two weeks if possible, as this is about the time required for the stomach worm to complete its life cycle under ordinary conditions.

The surroundings should be clean and dry, and pure, fresh water is equally important. The all too common practice of allowing the flock to drink from stagnant pools and water holes cannot be too strongly condemned. Water from such sources is almost certain to be contaminated with the eggs of parasites affecting sheep. The water should come from some source where there is no possible chance for pollution with these eggs or with germs of infectious diseases.

Take care also to prevent fouling of the ewe's udder with filth from old sheep pastures, as lambs often become infested at an early age by taking in the larvae as they suckle their contaminated mothers.

A GOOD SHEEP TONIC.

Salt should always be kept before sheep, or, better yet, provide them with a combination of ingredients which will act as a conditioner, a developer and worm preventive, as well as satisfying their natural craving for salt. An excellent tonic is made as follows:

100 lbs. stock salt.
10 lbs. air-slaked lime.
10 lbs. bone meal.
5 lbs. copperas.
2 lbs. powdered sulphur.
1 lb. ginger.

Remember, though, that some lambs become seriously infected before one realizes it. An alert shepherd will sense the trouble before it gets beyond his control. He will catch a few of the lambs occasionally and examine their skins. A clear, bright, pink skin indicates good general health. A dead, light-colored or anemic skin is one of the tell-tale symptoms of stomach worms. A lamb in this condition should be treated at once. Get the worms quickly or they'll get the lamb.

Butte City Ranch has sold a daughter of the Epochal boar, Onward 4th, to Daniel S. Pearson of Sacramento.

Grand Champion
BERKSHIRES

AMES RIVAL 70TH

We have in our herd the Grand Champion Boar, Grand Champion Sow and First Prize Senior Herd at State Fair.
Forty-three litters this year averaged ten to the litter. Let us supply you with foundation sows and boars to head your herd.

Imported and American Bred Stallions
Percherons - Belgians - Shires

My Fall shipment of stallions has arrived. These horses were personally selected by me in the best breeding districts of Iowa, Illinois, and Indiana. Two, three, and four-year-olds that will weigh a ton or over.

The largest collection of Percherons, Belgians, and Shires west of the Rocky Mountains. State certificate of soundness and life insurance with each stallion. Every horse priced to sell according to his individual worth. Any reasonable terms will be given. I also have a carload of Heavy Draft Mares and Geldings for sale—age 4 to 7 years, weighing from 1400 lbs. to 1700 lbs. Matched teams in black, bay, or chestnut.

Correspondence invited and visitors always welcome.

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

S. B. Morrison of Ferndale has recently bought a fine registered Guernsey bull calf to grow out and use on his herd of 20 grade cows.

Grade cows are in great demand and are bringing higher prices than ever before. At a recent sale in Southern California the highest priced grade cow brought $305.

The Associated Dairymen of California have representatives in Napa county interesting dairymen in a branch of their association, which they plan to have include Napa, Sonoma and Marin counties.

The San Joaquin Valley Milk Producers' Association has started work on a new unit to be added to its creamery at Modesto. This unit, which will cost $40,000, will turn out milk sugar and will handle 100,000 pounds of milk a day.

Official Holstein records show that 2028 two-year-olds have been tested and that among the thirty highest the Bridgford Co. of Knightsen have five heifers. This is a record of which both the Bridgford Co. and the entire State of California should be proud.

The annual convention of the California Creamery Operators' Association, originally announced for October 17 to 19, but postponed on account of the influenza, will be held at Visalia, December 12 to 14. A most interesting program has been arranged.

We are sorry to announce that Karl Gotshall, the well-known member of the firm of Gotshall & Magruder, Holstein breeders of Ripon, was an influenza victim. Mr. Gotshall was an enthusiastic Holstein booster and his loss will be keenly felt by all members of the fraternity.

Hereafter Holstein-Friesian dairy cattle will be known as Friesians in England. At a recent meeting of the Breed Association the name Holstein was dropped. New Zealanders call the cattle Friesians and South Africans call them Frieslands. How would it do to call them Liberty Cattle in America?

F. J. Zeehandelaar, Consul for the Netherlands in Los Angeles, announces that there will soon be a considerable immigration of Hollanders to Southern California, nearly all of whom will take up dairying. These people will want good dairy cows. Who will be ready to supply their needs?

Two records above 30 pounds have recently been made in the Holstein herd of James J. Jeffries at Burbank. The senior three-year-old, Piebe Canary Belle De Kol, made 30.61 pounds butter in seven days, and Novelty Pauline 2nd made 30.94 pounds. Six other cows have been on test and made good official records.

In the report of November 16 issued by the Holstein-Friesian Association, the cow Creamcup Vogelschen Cornucopia, owned by K. W. Abbott, whose herd was taken over by Gotshall & Magruder when he joined the colors, holds first place in the full aged class with a record of 28.02 pounds fat from 342.2 pounds milk. K. P. Tola, owned by McAlister & Son, Chino, holds fourth place with 27.18 pounds fat from 569.2 pounds milk. In the junior four-year-old class, K. P. Idyl Segis, owned by McAlister & Son, holds first place with 28.48 pounds fat from 510.8 pounds milk. In the senior three-year-old class, Netherland Tolia, owned by A. J. Stalder, Riverside, holds third place with 20.23 pounds fat from 441.7 pounds milk. Notice that these records give the butterfat and not the butter, which would be considerably greater.

Beef Cattle.

At the annual sale of Shorthorns recently held by Owen Kane, Wisner, Neb., an average of $1,202 was reached, with a top bull calf at $2,500 and a top cow at $5,000. Forty-four head were sold.

Jack Doyle, well known to the sporting fraternity of Los Angeles and Southern California, has decided to go into the raising of beef cattle and will bring out from the Middle West a herd of high-grade Hereford cows and registered bulls.

King G. Gillette, the razor king, has extended his livestock operations to Santa Barbara county and has purchased approximately 3200 acres of the old San Julian ranch. A quarter of a million dollars was involved. Beans, grain and cattle are raised on the ranch.

At the sales held in connection with the American Royal Show at Kansas City 42 head of Shorthorns brought an average of $790, with the winning futurity bull calf topping the sale at $2,575. Sixty-five Herefords averaged $1,350, and the top, the winning senior yearling bull known as Repeater 7th's Model, brought $24,000, the highest price reached since the sale of Ardmore.

Murphy Bros., Shorthorn breeders of Perkins, report three extra fine young bulls coming a year old that are hard to beat. They are grandsons of Cumberland's Type, the great herd bull of C. A. Saunders of Manilla, Ia. This bull was 36 times grand champion when three years old. The Murphys also have some choice young heifers by this same bull and three nice heifer calves just recently dropped.

Swine and Swinemen.

R. C. Sturgeon of Tulare has increased his registered Duroc herd to 85 head. He will consign a fine lot to the Tulare Duroc sale to be held in January.

James Mills Orchard Company, Hamilton City, recently shipped a boar and two sows to Chili, South America. Foreign purchasers are learning to come to California for good stock.

B. E. Nixon of Yountville has offered to donate a Guernsey bull calf to be used as a prize at the Berkshire show to be held in connection with the San Francisco Livestock Show in February.

A. D. McCarty of San Francisco, owner of Riverina Farms at Modesto, has just sold a very fine Poland-China gilt to be shipped to Guatemala and a cracking good boar to F. W. Woods, Jr., Menlo Park.

Poland-China records are being broken almost every week back in the Corn Belt. The Chancellor, a son of Severe's Big Timm, has recently been sold for $5,500—the record price for an under-year boar.

The Food Administration at Washington recently had called to its attention the need for an order permitting farmers to purchase sugar for the home-curing of hams and bacon and immediately issued a statement that farmers desiring sugar for such purposes could obtain it on application to the local Food Administrators or to their county deputies.

Walter T. Gatton, who has been superintendent of the swine department of the Liberty Fair, Los Angeles, has been made manager of the swine department of the Diamond Bar Ranch, which is being established at Spadra by F. E. Lewis 2nd, one of the owners of the Norwalk tire factory. The ranch consists of 7500 acres and Mr. Lewis will take up the breeding of Herefords, Shorthorns, Arabian horses and Duroc hogs. He will start with 100 brood sows and eventually will maintain a herd of 200 matrons.

Sheep.

Four thousand sheep have already been placed on California farms, through the Farm Bureaus, which take large bands of sheep from the grass ranges and place them in small "Liberty flocks" on individual farms.

Butte City Ranch has started Frank B. Anderson of Sacramento in sheep raising by selling him a foundation flock of registered Shropshires. Mr. Anderson will continue to raise good Berkshire hogs, and is starting a small herd of registered Holstein cows.

A sheep owner of Ft. Bidwell, Modoc county, was recently fined $133.33 for allowing a band of 1020 ewes to wander casually over range which had not been assigned to him, while only a short distance away a second band paid a social visit to a nearby cattle range.

Government records show an increase in consumption of approximately 1,700,000 pounds of wool for October over September, grease equivalent. On September 30 stocks of wool in hands of dealers and manufacturers were 182,000,000 pounds, grease equivalent, less than on September 30, 1917.

At a recent meeting of the Live Oak (Sutter county) Farm Bureau, a resolution was passed requesting the Supervisors to establish a dog license ordinance and fix the license at $10. It was pointed out that the killing of sheep by dogs involves a heavy loss and that many farmers are not keeping sheep on this account.

Livestock Miscellaneous.

Secretary Houston has announced that sheep will be allowed to graze in national forests beginning March 1. Effective at the same time, he authorizes five-year grazing permits. The new charge for grazing will be from 80c to $1.50 a head for cattle; for sheep and goats, 25 per cent of the rate for cattle; horses, 25 per cent more; swine, 25 per cent less.

Calf Profits

Are you getting them? Calf profits mean more to you now than ever before.

Blatchford's Calf Meal

has been known since the year 1500 as the complete milk substitute. Costs less than half as much as milk—prevents scouring—promotes early maturity. Sold by dealers or direct from the makers.

Write for New Data See actual figures showing you how to increase your calf profits.

SATISFIED USERS wrote this Ad for Us—

Their Experience is worth real Money to YOU!

I have owned three spreaders in my time. The first two I didn't think much of. Then I got one of yours and now I am more than pleased with the spreader proposition. I find by hauling manure in the winter time on clover sod and letting the rains leach it down before plowing it under will oftimes double the corn yield or even wheat. Where I used commercial fertilizer and barnyard manure together on 12 acres of wheat last year I got 600 bushels of wheat, an average of 50 bushels per acre. A farmer that owns ten acres can't afford to be without a spreader.

WILL HENSEL, Ohio.

I have had several spreaders on my farm, but there are none like yours. I could not farm without it. Last fall I put six acres to wheat, first putting on 30 loads of manure. This spring I put on 20 loads more. You just ought to see that wheat. The manure made it stool out very good, and it will give 35 bushels per acre. If I had not used the Spreader this spring I am sure I would not have gotten over 15 bushels. Your spreader is one of the best investments you can put on the farm.

C. E. HUPRICH, Ohio.

I would not be without your Spreader, because it saves so much labor, puts the manure on the ground evenly, and I can spread any kind of straw or cornstalks. I believe my spreader will pay for itself in two seasons. With the proper use of manure on my place and using lime, I have increased the yield of my farm 25% in six years.

E. M. PHILLIPPE, Virginia.

Have been using your spreader on two different farms for a year and find them lightest in draft of any I have ever used. Two horses will pull them anywhere when the ground is not too soft. The straw attachment is ideal for top dressing wheat ground or any kind of small grain. It gets rid of a great deal of straw which goes to waste and this alone will pay for the spreader in a year's time.

J. D. BLACKWELL, Sec'y.
Missouri Angus Assoc.

"NISCO" One-Man Straw Spreader Attachment.

THESE letters answer every question you may have about the Nisco Spreader. We will gladly send you the writers' addresses and copies of similar letters from many others, if you want further proof. These letters, like the Nisco itself, stand every test. They prove that you yourself should have a

NISCO The New Idea

THE ORIGINAL wide spreading spreader that revolutionized old fashioned methods—that has always been the leader. Has solids bottom with chain conveyors. Pulverizes thoroughly and spreads evenly. Drives with heavy sprockets and chain—no gears. Low down, light draft. Loads and pulls without undue strain on man or team.

When you buy insist on the "Nisco"—the machine you are sure of. If you don't know our dealer, we'll send you his name and a copy of a splendid book on soil fertility. Send your name today.

The JOHNSON HERD OF DUROCS

We have for sale at the present time 20 Spring Gilts, daughters of JOHNSON'S DEFENDER, the 1917 Junior Champion, and out of winning sows; 5 Spring Boars old enough for service, and weaned boar pigs. Also 700-pound prize-winning Junior Yearling Boar, a grandson of ORION CHERRY KING, dam by Joe Orion II.

Frederick M. Johnson, Napa, Cal.

BERKSHIRE BUSINESS BOOMING AT CASTLEVIEW RANCH.

There are two chief reasons for running a ranch — pleasure and profit. Of course, to make a profit should be a pleasure, and any legitimate pleasure can be called profitable. However, it is possible to conceive of a single-purpose venture. It might be run as a recreation or a philanthropic enterprise, or it might be a mere money mill with nothing but cold-blooded balance sheets to rule the output.

But up in Sonoma county there is a ranch that seems to embody all of the best reasons for being—a ranch that pays in both money and pleasure: a ranch that gives off its philanthropic radiance just as the ideal institution should. Yes, you guessed right the first time—it's the Castleview Ranch at Santa Rosa, owned by J. Francis O'Connor.

Here is a recent chapter from the ranch history: When the wonderful Berkshire herd developed by Frank A. Brush was transferred to the Santa Rosa National Bank it was decided to sell the animals at once for cash. A prominent butcher of San Francisco was about to close for the entire lot when Mr. O'Connor stepped up and purchased the herd, thereby saving these national prize winners from the block.

It ought to be mentioned right here that Mr. Brush had always found it difficult to dispose of his stock—that is, at the prices he asked. But Mr. O'Connor didn't endeavor to make a big clean-up on this deal. He offered the hogs to the nearby ranchers at reasonable prices, and within ten days the entire ninety head were sold in lots of one and two at prices ranging from $125 for sows to $25 for weaned pigs. The eagerness with which the stock was picked up shows that the average rancher is ready to buy purebred stock if both quality and price are right.

Now that these great animals have been placed on scores of different farms, and their new owners will have an opportunity to see from first-hand observations the additional profit that there is in purebred stock, it is certain that there will be a heavy demand for registered Berkshires in Sonoma county.

And it is just as certain that Mr. O'Connor will get most of the orders, for trade stays where it pays. Instead of holding up the ranchers, he charged them prices they could afford to pay. The hogs will make good for them and they will be back for more. They'll tell their friends, too, and pretty soon Mr. O'Connor will have to work his herd overtime to turn out stock fast enough to supply the demand.

In fact, right now he is completely sold out of all surplus stock, and is trying to buy other herds to supply the demand. His total sales for October amounted to more than $7,000, and probably they would have gone to above $10,00 in November if he had been able to fill all orders. Success comes to him because he deserves it.

Later.—Just as we go to press word has been received that this live-wire breeder has purchased the entire herd of Hopland Stock Farm Berkshires, owned by A. W. Foster. Fuller particulars will be given later.

W. J. Kenney, Assemblyman-elect from the Twenty-sixth District, will endeavor to have a bill passed to re-establish county fairs. His proposal that the State set aside 20 mills upon each $100 valuation and apportion it to the counties raising the money and providing for an annual county fair.

DAIRY CATTLE.

Holsteins.

STRAIGHT, deep-bodied sons of Finderne Soldene Valdessa (whose dam and sire's dam are both world's record holders) and of Segis Pontiac Acme, from 30-lb. dams. Toyon Farm Association, First National Bank Bldg., San Jose, Cal

HIGH-CLASS HOLSTEINS—I have for sale some sons of Sir Veeman Korndyke Pontiac from A. R. O. dams. Write for particulars or come see them. R. F. Guerin, Visalia, Cal.

REGISTERED HOLSTEINS—Sires in service, Prince Butter Boy, King Mead of Riverside, and Yolo Valdessa Hengerveld. J. H. Harlan Co., Woodland, Cal

FANCY GRADE HOLSTEIN COWS and heifers from herd testing 100 per cent. Animals qualified for certified dairies. The Lewis Company, San Jose.

BREEDERS OF REGISTERED HOLSTEIN cattle and Berkshire pigs. Whittier State School, Whittier Cal

YOUNG SONS of Prince Gelsche Walker 11th and out of A. R. O. dams, for sale. Write me for prices. J. M. Campbell, Escalon, Cal.

PALO ALTO STOCK FARM, Palo Alto, breeders of registered Holsteins. Heifers and service bulls. Reasonable prices.

GLORIETTA STOCK FARM, WOODLAND, CAL.—Registered Holsteins. Special offering of fine heifers and young bulls.

REGISTERED HOLSTEIN BULLS with world's record backing. Kounias' Registered Stock Farm, Modesto.

CREAMCUP HERD — Registered Holsteins. Pontiac bull calves. M. Holdridge, Rt. A, B. 437, San Jose, Calif.

F. H. STENZEL, SAN LORENZO, CAL.—Breeder of Registered Holsteins. High test producers.

EL DORADO HERD OF HOLSTEINS—Alex Whaley, Tulare, Cal

HENGERVELD DE KOL BLOOD. High producers. T. B. King, Visalia.

GOTSHALL & MAGRUDER — Breeders of registered Holstein Friesians Ripon, Cal

BREEDERS OF REGISTERED HOLSTEIN cattle. McAlister & Sons, Chino, Cal.

CHOICE HOLSTEIN bulls for sale. No females. Millbrae Dairy, Millbrae, Cal.

HOLSTEIN BULLS and bull calves from A. R. O. cows. C. A. Miller, Ripon.

REGISTERED HOLSTEIN CATTLE—E. E. Freeman, Route B, Modesto, Cal.

THE McCLOUD RIVER LUMBER CO., McCloud, Cal.—High class thoroughbred Holstein bulls for sale. Write for prices and pedigrees.

REGISTERED HOLSTEINS—A. W. Morris & Sons Corp., Importers and Breeders, Woodland, Cal.

REGISTERED HOLSTEINS—Best blood lines of the breed. R. L. Holmes, Modesto, Cal.

SUNNYBROOK RANCH, Willits, Cal — Registered Holstein-Friesian bulls for sale.

Jerseys.

REGISTERED JERSEYS—Young bulls and bull calves. T. B. Purvine, Petaluma, Cal.

YOUNG BULLS from Register of Merit cows. W G. Gurnett, Orland, Cal.

SUNSHINE FARM JERSEYS—Young bull ready for light service, for sale. E. E. Greenough, Merced, Cal.

FOR SALE—Young registered Jersey bull. Sire, Valet's Peter of L. Dam, Rebekah's Foxy Girl. O. J. Ames, Oakdale, Cal.

Guernseys.

EDGEMOOR FARM GUERNSEYS — First in the show ring and in official records Few animals of either sex for sale. Edgemoor Farm, Santee, Cal.

HIDDEN VALLEY FARM offers for sale 2 young Guernsey bulls, ready for service, out of high record advanced register dams. A. J. Welch, proprietor, Redwood City

CLAREMONT GUERNSEYS—Young bulls of serviceable age from A. R. dams. L. D. Smith, 333 Vicente Road, Berkeley.

PALO ALTO STOCK FARM, Palo Alto—Breeders of registered Guernseys; both sexes; prices reasonable

FOR SALE—Guernsey bull, Raymonds St. Saviours Prince No. 41396. M. Dye, Visalia, Cal.

Ayrshires.

NORABEL FARM AYRSHIRES—Purebred young stock for sale at reasonable prices. Le Baron Estate Company, Valley Ford, Cal.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Building, San Francisco.

MILKING SHORTHORNS.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain; choice young stock for sale John Lynch Ranch Box 321, Petaluma.

INNISFAIL DAIRY SHORTHORNS—Registered young bulls for sale Alexander & Kellogg, Sanger, Cal

BEEF CATTLE.

SHORTHORNS — Carruthers Farms, Live Oak, Cal.

AM A SPECIALIST in registered beef cattle and familiar with the best herds in the country. If you need Shorthorns or Herefords, make use of my experience, save money and be satisfied. R. M. Dunlap, Hotel Land, Sacramento.

ALAMO HERD REGISTERED HEREFORDS (founded by Governor Sparks). Herd and range bulls. Reasonable prices. W. D. Duke, Likely, Modoc county, Cal.

REGISTERED YEARLING SHORTHORN Bulls—Heavy-boned, thick-meated Scotch and Scotch-topped breeding. Ormondale Co., Route 1, Redwood City, Cal

RANCHO SAN JULIAN SHORTHORNS—Purebred range bulls, unregistered, for sale. Estate Thos. B. Dibblee, Santa Barbara or Lompoc, Cal John Troup, Supt

GEORGE CALLAHAN, Breeder of registered Herefords, Milton, Cal.

THE NEVADA HEREFORD RANCH, Jno. H. Cazier & Son Co., props., Wells, Nevada Registered Hereford cattle. Breeding stock for sale.

REG. SHORTHORNS—Calves and yearlings for sale, both sexes, reds and roans. Choice Goods breeding. Fair Oaks Ranch, Willits Cal

REGISTERED MILK AND BEEF SHORTHORNS, bulls and heifers for sale; catalog free. Thomas Harrison Glen Ellen, Cal.

JACK LONDON RANCH—Breeders of prize-winning beef Shorthorns. Glen Ellen, Cal Eliza Shepard, Supt.

MISSION HEREFORD FARM—J. A. Bunting, Mission San Jose, Cal. Registered Herefords.

HOPLAND STOCK FARM—Registered Shorthorns Prices on application. Hopland, Cal

REGISTERED HEREFORDS—H. H. Gable, Diamond G Ranch, Esparto, Cal.

SIMON NEWMAN CO., breeders of Registered Herefords, Newman Cal.

GEORGE WATTERSON—Breeder Registered Herefords, Bishop, Cal

SHEEP AND GOATS.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and importers of Shropshire, Rambouillets and American Merinos, both sexes Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch

WANTED—500 to 1500 head of sheep on shares on good coast range, with an abundance of feed. Address, Sheepman, care Rural Press.

DORSETS AND ROMNEYS — Dorset ram lambs for sale. John E. Marble, South Pasadena, Cal.

BISHOP BROS., SAN RAMON, CAL.—Breeders and importers Shropshires.

KAUPKE BROS., WOODLAND, CAL.—Breeders, importers of Hampshire sheep

CHAS. KIMBLE—Breeder and importer of Rambouillets. Hanford Cal

CALLA GROVE FARM, MANTECA, CAL.—Breeders and importers of Hampshire sheep

MISCELLANEOUS.

BUTTE CITY RANCH—Shorthorns, Shropshires, Berkshires and Shetland ponies. Write for prices and descriptions before buying. Butte City Ranch, Box P, Butte City, Glenn county, Cal. W. T. Dwyer and W. S. Gulford, owners.

MULE-FOOT HOGS, large type; booking orders for spring litters. These are the farmers' easy feeding, profit-producing kind. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums."

FOR SALE—Twenty first-class dairy stock grade Jersey, Durhams and Holsteins, one to two years old. L. W. Flanders, 124 Homestead Road, Cupertino, Cal.

WANTED—Brusher goats—Angora does. Give price F. O. B. cars and particulars. F. B. Plant, 178 Kempton Ave., Oakland.

FIFTY HEAD of Angora goats for sale. Address F. W. Nason, Jamesburg, Monterey county, Cal.

Made $1,000 by Keeping Farm Accounts

[Written for Pacific Rural Press.]

A farmer who kept accounts for two years as recommended by the University of Missouri College of Agriculture made over $1,000 through better hog feeding alone. Like many others, he knew better than to do as he was doing, but he was Missourian enough that not only he had to be shown, but he must do the showing himself. This is where the farm accounts system came in. He adopted hog feeding methods that animal husbandry experiments have shown beyond question to be practicable. And his accounts convinced him that such methods were practicable for him.

The first year the farmer's hogs made a return, after all other expenses, including labor, had been paid off, of $1.03 per bushel for the corn fed, while corn sold locally for 89c. That was not so bad, but he determined to do even better the next year, and made the hogs net him $3 a bushel for the corn fed, while it sold locally for $1.40. However, hogs were higher in price, so to be conservative the difference due to better methods was counted at an even dollar a bushel. Eleven hundred and thirty bushels of corn were fed, so the farmer really made $1,130 by keeping books and knowing where he was at.

The difficulties of farm bookkeeping are generally overestimated. Complex forms and methods do not necessarily mean successful accounting, and often a few pages of well-selected records are of more value than volumes of figures. It is not necessary for a farmer to have any knowledge of commercial bookkeeping in order to keep good farm accounts. Little time is required, also. The work soon becomes a regular habit, and from five to ten minutes a day will be found sufficient.

There are hardly two farms that should have exactly the same system of bookkeeping, so the best way to get started right is to get all available information on the subject and then devise a system suited to your particular needs.

The Department of Agriculture has covered the matter fully in a series of very practical bulletins. Write to the Division of Publications, Department of Agriculture, Washington, D. C., and ask for Farmers' Bulletins: 511, "Farm Bookkeeping"; 572, "A System of Farm Cost Accounting"; 661, "A Method of Analyzing the Farm Business"; 746, "The Farmer's Income"; 782, "The Use of a Diary for Farm Accounts."

When Cattle "Lose Their Cuds"

[Written for Pacific Rural Press.]

Although the relation of the act of chewing the cud to the natural process of digestion in cattle is probably quite generally understood, farmers frequently inquire concerning the proper treatment for cattle which have "lost their cud." Apparently the impression is that the cud is something which can mechanically disappear, and when so lost must be replaced in order to restore the animal to health.

Rumination or chewing the cud is a natural process in connection with the digestion of cattle and other ruminant animals. In ruminants the food, when first taken into the stomach, is imperfectly chewed, and is returned to the mouth for remastication. This returned ball of food is termed "the cud."

So-called loss of cud, the Department of Agriculture explains, is simply a suspension of chewing, frequently one of the first indications of sickness in any kind of ruminant animal, since ruminants generally stop chewing the cud when feeling out of condition. Any condition affecting the general health of cattle may result in suspension of chewing, and there is almost certain to be an interruption of this process when there is any pronounced disturbance of digestion.

Placing wads of hay in the mouth, the use of salt pork, and similar methods for restoring the cud are the outcome of local superstitions and a lack of knowledge concerning the digestive process of the cow. Instead of such treatment an effort should be made to determine the exact nature of the illness affecting the cow with a view to applying proper treatment.

It will be found that with an approaching return of the animal to a state of normal health there will be a restoration of the process of digestion, including the function of rumination or cud-chewing.

Early Rains and Grass Out-look

[Written for Pacific Rural Press.]

After the early rains experienced over nearly the whole State, good grass and plenty of it was expected. In the warmer sections and coast counties of the north there is good grass, but, speaking broadly, the ranges of the State are still very shy of feed. We have noticed it after a trip down the coast and back through the interior.

The Cholame district generally furnishes pretty early feed during a good year, but it is shy now. In the bottoms, where grass did start well, many men have turned their cattle in and fed it down close, because the rains had spoiled so much stubble and roughage. So, although there is a very good setting of grass, there won't be much to bank on before about February. For the frosts are upon us, the days are short and the ground cold. The outlook is a big improvement on last year, though, as the rain has softened the brush and cattle are browsing where it was too hard a year ago.

In the north the browse is particularly good and there is enough of it to offset any harm that might have followed another large acorn crop. Cattle can get away with a good many acorns as long as they have something to eat with them. A most encouraging sign is the fact that every man is saving his roughage and stover and a great many new silos have been erected by cattlemen. This is a big step forward, as it will not only increase our stock-carrying capacity but carry it through in better condition and at less expense.

BREED BETTER HORSES.

An investigation of the horse industry shows that many nondescript and plug horses are glutting the market. The real good animals are still commanding satisfactory prices, but the misfits are being sold for considerably less than the cost of production. The saving of additional feed bills is said to be the motive which prompts the producer to dispose of this class of horses, regardless of price.

One of the conclusions which the Department of Agriculture draws from the present situation is that indiscriminate breeding of horses is an unprofitable enterprise. It is essential, the department specialists add, that farmers use wise discrimination in selecting the proper type of stallions with which to mate their best mares and thus materially aid in producing only efficient horses which are capable of giving the service required of them and which consume less valuable feed for the amount of work performed. Such horses have a ready market and always bring good prices.

It is imperative that the breeder who proposes to compete with the domestic and foreign demands should begin now to stock up his stables with desirable better-bred horses.

Hill Crest Stock Farm

KING LANCASTER.

Shorthorn Cattle

Shropshire and Merino Sheep

I have used more grand champion bulls in my range herd than any other California breeder has used in his foundation.

My offering of range-raised bulls for the coming season is exceptionally good.

T. S. GLIDE, Prop. Davis, Cal.

ROSELAWN STOCK FARM

SHORTHORNS

Headed by Ringleader, by Ringmaster, three times Grand Champion at Chicago International.

Crescent Dale, by Whitehall Rosedale.

Roselawn Champion, by Eastlawn Champion.

Roselawn Champion, the Junior and Reserve Grand Champion, and his dam,

Mischief E. 3rd, Senior and Grand Champion at the California State Fair in 1918.

We have for sale a choice lot of young bulls, reds and roans, five ready for service now and eight more will be ready by spring. We can also spare a few females.

A VISIT WILL INTEREST YOU.

Treatment for Caked Udder.

To the Editor: I have a cow that was fresh August 19 and one quarter of her udder is caked. She gives only about half the usual flow of milk from this quarter. How can I cure her?—S. B. C., Ripon.

[Answered by Livestock Editor.]

It will require some effort to remove cake in the udder when it is of such long standing. Give the cow internally at each milking two teaspoonfuls of saltpetre and two teaspoonfuls fluid extract of poke root in about a pint of water and use as a drench. Then rub the udder with a salve made of two ounces of fluid extract of belladonna, four ounces of poke root, eight ounces of melted lard. Mix thoroughly, let stand until hard, and when using rub very thoroughly, remembering that it is the elbow grease as much as the salve that does the work.

Keep your cow on green laxative feeds, or if this is impossible give her an occasional physic of Epsom salts—a pound in a quart of water and used as a drench.

Cow Has Hematuria.

To the Editor: I have a cow that passes blood with her urine. Sometimes these discharges occur as often as once a day and there is usually about a teacupful of a light red color. What is the cause and cure? —J. F. R., Albion.

[Answered by Dr. E. J. Creely, San Francisco.]

Your cow has what is called hematuria, which may be caused from injuries or from certain acrid diuretic plants in the food eaten. This causes the escape of blood from the kidneys. The blood may be present either in small clots or mixed in with the urine. Remove the cause by changing the food. Keep at complete rest and give mucilaginous drinks such as whole flaxseed boiled, and put with the feed or drinking water. Apply cold water over the loins. Give the following: Formaline, ½ ounce; cottonseed oil, 25½ ounces; turpentine, 4 ounces; tincture of bucha, 2 ounces. Mix and give two ounces twice daily.

Horse Has Abscesses.

To the Editor: Underneath my horse, running from each foreleg to about the navel, is a ridge, each about two inches wide and one-half inch high. If I tighten the belly band, he seems to have great pain. He has been that way for a month or more. What is the trouble and remedy?—G. B. H., Corning.

[Answered by Dr. E. J. Creely, San Francisco.]

A careful examination will reveal an abscess and from the abscess radiate inflamed lymph glands. I am suspicious of glanders and would recommend a careful examination by a qualified veterinarian, or, better yet, call upon Dr. John P. Iverson, the State Veterinarian, at Sacramento. In the meantime paint the affected part with iodine and give saltpetre—a tablespoonful daily in the feed or water. Keep harness away from inflamed parts.

Probably Cowpox.

To the Editor: About two weeks after calving, pimples broke out on the udder and abdomen of one of my cows. She showed little effects at first, but later on lost her appetite and her milk flow has decreased. The sores are spreading and seem quite painful.—W. M. H., Turlock.

[Answered by Livestock Editor.]

The symptoms you describe are typical of cowpox. It is difficult in milking such a cow to keep from breaking the scabs which form on the teats. This naturally prevents healing, and unless considerable care is taken regarding cleanliness the healing will be slow. The milker should wash his hands thoroughly before milking, and every time after finishing he should bathe the sores with glycerine (four parts) and pure carbolic acid (one part).

Pumpkin Seeds Good for Cows.

To the Editor: In feeding pumpkins to milch cows, should I remove the seeds or feed them seeds and all?—H. G. M., Paso Robles.

[Answered by Livestock Editor.]

The tradition among farmers that pumpkin seeds increase the kidney excretions, tend to dry up cows, and should be removed has no good foundation. The seeds contain much nutriment and should not be wasted.

A TIP TO CALIFORNIA BANKERS.

William L. Coale, president of the People's Savings Bank of Warren, Ohio, has purchased for $3,500 the Holstein bull, Walnut Crest Rag Apple Mutual De Kol, and offers his services free to all members of a calf club he is organizing. This certainly will be a great stimulus to the farmer boys who live near enough to take advantage of Mr. Coale's generosity. Our Stetson is off to Mr. Coale. May his tribe increase, and may many of his kind locate in California.

DO NOT SLAUGHTER ANIMALS WHEN OVERHEATED.

Occasionally it is necessary to slaughter farm animals which, through accident, have become injured. In many cases the flesh is edible if the proper precautions are taken before killing the injured beast.

The essential point is to allow the animal to become thoroughly cool and recovered from any excitement caused by the injuries. To slaughter an animal that is overheated is prohibited in all Government supervised packing plants, for carcasses of such animals will not bleed out properly, nor will the meat have keeping qualities, no matter what methods are afterwards used to preserve it.

Shoot or knock the animal in the head, if you prefer, but follow this by cutting the throat at once. Sever the main arteries so that the animal will bleed out thoroughly. Pelts are generally stripped from sheep and should be removed while the carcasses are warm. Hides may be removed from cows and calves with a knife after the carcasses are cold.

At Chicago a load of Hereford yearlings made a new record recently at $19.70, equaling the highest point up to that time on mature cattle. They averaged 1108 pounds.

Do *you* think there is no competition?

If anyone thinks there is no competition amongst the big packers he ought to go through a day's work with Swift & Company.

Let him begin at the pens when the live stock comes in; let him try to buy a nice bunch of fat steers quietly and at his own price, without somebody's bidding against him.

Let him realize the scrupulous care taken at the plant that not one thing is lost or wasted in order that costs may be held to a minimum.

Let him go up into the office where market reports are coming in — and reports of what other concerns are doing.

Let him watch the director of the Swift refrigerator fleet, maneuvering it over the face of the country like a fleet of battleships at sea.

Let him take a trip with a Swift & Company salesman and try to sell a few orders of meat.

Let him stay at a branch house for an hour or two and see the retail meat dealers drive their bargains to the last penny as they shop around among the packers' branch houses, the wholesale dealers, and the local packing plants.

And then, when the day is over, let him have half an hour in the accounting department, where he can see for himself on what small profits the business is done. (Less than 4 cents on each dollar of sales.)

If he still thinks there is no competition in the meat business it will be because he wants to think so.

Swift & Company, U. S. A.

A nation-wide organization owned by more than 23,000 stockholders

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

EARLY VS. LATE MOLTING.

To the Editor: Do you agree with the following statement? – Subscriber.

"The early molting hens are the ones that can be depended upon to fill the egg basket this winter. If a hen does not get through the molt before cold weather sets in, the chances are ten to one that she will not get to laying until spring. From the fancier's standpoint, however, where eggs for hatching are made a specialty, it is not always desirable to have the hens lay heavily through the winter, and in this case the late molting hen is perhaps most desirable."

Certainly I agree with the statement made above. Do you find any late molting hens on the nest these days? If you do, you have hens that are exceptions. The early molting hen commences to lay about late September or October. These hens and the pullets are the reliable egg producers for the early winter, when eggs command the best price, while the late molting hens are only just commencing to change their clothes. These late hens will not lay until January or more likely February, and some not utnil March. Now, how can they fill the winter egg basket?

Mind, I do not claim that the early molting hen is the "best layer." Often she is not. But I do claim that she will lay the most eggs during the three months when eggs are at a premium, and then if she is not a top-notch layer you can get more for her carcass during the first three months of the year than at any other time. This is the right way to plan—have your eggs when they bring the most money, then sell the surplus hens at a time when they bring the best price. It is similar to the "sucker game"—you catch them going and coming. Still it is perfectly legitimate and honest, but it needs brains to plan. That is why I always say that, no matter what branch of farming a man engages in, he needs more brains to make a living from the land than for any ordinary business.

TUBERCULOSIS.

To the Editor: Please comment on the subjoined clipping, as I have never heard anything like it before.—M. S., Planada.

"Tuberculosis in a large flock of chickens on the Wolfsen ranch near Merced occasioned a visit today from Dr. J. R. Beach, poultry veterinarian from the State University, who conducted tests to determine the extent of the disease, which was found to be close to 100 per cent. The chickens affected were Leghorns."

Certainly chickens have tuberculosis, just like other animals—only more so. In numbers of cases what passes muster as rheumatism is tuberculosis of the joints. Another phase of it is when chickens "go light." Possibly you know of this kind, but not under the right name. You may depend on it that Dr. Beach knows his business. He is one of the best chicken diagnostics in the State, and what he recommends is safe to do.

It is to be deplored that so many people hide these things instead of getting expert advice concerning them so that they can work intelligently to exterminate the trouble. Whenever a chicken of any age or size that has the opportunity to eat does not do so, and mopes by itself in corners instead of getting out and rustling and is losing flesh all the time, going lighter instead of heavier, it's time to suspect tuberculosis.

Sometimes, in the first stages, it appears to be a general inactivity, both of the chicken and its organs, the liver being the first to suffer. If the chicken can be coaxed or driven to exercise at this stage, there is a little hope that it will throw off the disease; but if it is neglected, why, it will end in a little bunch of feathers and bone.

When there is any suspicion of tuberculosis on the premises, all chickens that are not thrifty should be segregated from the healthy and all dead ones should be incinerated, never buried. The germs or bacilli get in the ground and multiply galore. The runs should all get a good spraying at short intervals as also the houses. All good sanitation helps to keep this dread away and to kill it if present.

THE HIGH EGG PRICES.

The National War Emergency Poultry Federation sends out the following note of explanation in relation to the prevailing high prices of eggs, regarding which there has been much comment both East and West:

"The high prices of fresh eggs in the Eastern cities is explained by many as due to the unfavorable early hatching season last year, causing few early laying pullets to come out for fall production. It is said also that the influenza epidemic has caused a big demand for the real fresh egg. Again, in past years many eggs that were held for thirty or more days at a slightly higher temperature than commonly required for cold storing were sold as fresh. Under the Food Administration rulings this was not allowed this year and helped to keep up the price for the good article. Yet even with eggs wholesaling at 90c a dozen in New York, still the price is not increased in proportion to many other food products. Fancy white eggs have nearly always brought around 60c to 70c a dozen for the past five or six years, and the 90c a dozen is really only a 30 per cent increase, while most food products have more than doubled."

CHICKEN POX.

Just lately I discovered a new cure for chicken pox. It is so simple that most people will not believe it is true, but it is. A chicken was brought to me with one eye closed and the other partially closed. It had big brown warty knobs on the beak, comb, wattles and head generally and was a pretty bad case. Now it happened that I had a bottle of Benetol on the kitchen table at the time, so I said, "Leave the chicken with me and I will experiment on it. If I don't cure it I will pay for it." So, taking two parts Benetol and one part boiling water, I washed the chicken's head well with the liquid, put it in a box right outdoors, with a cover over it, fed and watered, then left it until the next day, when I repeated the washing and gave the bird a teaspoonful of the weak solution to drink. In three days the whole of those warty scabs were dead and falling off. Then I just washed it once more in a weaker solution and at a week-end I heard a cackling in the box and my biddy had laid an egg and was perfectly cured.

BLACK TURKEYS FOR SALE.

Mrs. R. E. W. of Healdsburg, who last week asked for the address of anyone having black turkeys for sale, may find what she wants by writing to Mrs. J. P. Indart, Hollister, R. F. D., or to A. McCall, R. D. 3, Box 93, Watsonville.

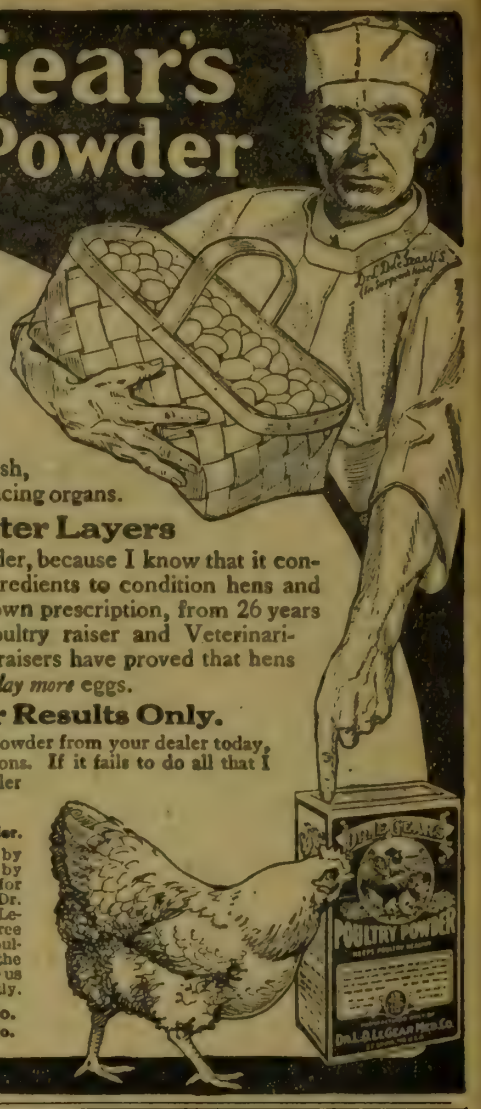
Poultry Breeders' Directory

Rate in this directory 3c. per word each issue.

WHITE LEGHORN CHICKS—hatched in January and February are money-makers if stock is good and right care given. We are equipped to fill large as well as small orders—and to your satisfaction. Write for special letter on them, also circular describing Brown and Buff Leghorns, Rhode Island Reds, White and Barred Rocks, Black Minorcas. Price and quality will both please you. Booking orders now for 1919 season. Be forehanded. The Mission Hatchery, Box 17, Campbell, Cal.

BRONZE TURKEYS—Young toms and hens for sale; also yearling hens. Order breeding toms now and have them shipped when wanted. Eggs in season. Albert M. Hart, Clements, Cal.

Dr. LeGear's Poultry Powder



Get more eggs

This is the slacker season for hens. They need boosting. Give them Dr. LeGear's Poultry Powder. It will tone up their systems, *put more of* the feed into flesh, and stimulate the egg-producing organs.

I Guarantee Better Layers

if you use my Poultry Powder, because I know that it contains the best scientific ingredients to condition hens and make them lay. It is my own prescription, from 26 years actual experience as a poultry raiser and Veterinarian. Thousands of poultry raisers have proved that hens given my Poultry Powder *lay more* eggs.

You Pay For Results Only.

Get a package of my Poultry Powder from your dealer today, and use it according to directions. If it fails to do all that I claim for it, I authorize the dealer to refund your money.

FREE SAMPLE – Ask Your Dealer.

Dr. LeGear's Remedies are sold by 40,000 of the best dealers—never by peddlers. Ask your dealer today for liberal *free sample* package of Dr. LeGear's Stock Powders or Dr. LeGear's Poultry Powder, and get a free copy of Dr. LeGear's Stock and Poultry Book. If your dealer hasn't the samples and books, ask him to write us for them. We will supply him promptly.

WANTED—Position as dairy foreman; familiar with efficient and modern methods, productive feeding, testing milk and sanitation. Box 1290, Pacific Rural Press.

WANTED—Job on dairy or stock ranch in Humboldt county, Cal. E. J. Carroll, Yucaipa, Cal.

KILLING POULTRY FOR MARKET.

The Department of Agriculture, in issuing instructions for killing poultry, states that 30 per cent of the poultry finding its way into the New York market is incompletely bled.

"Grasp the chicken, when killing, by the bony part of the skull. Do not let the fingers touch the neck. Make a small cut with a small sharp-pointed knife on the right side of the roof of the mouth, just where the bones of the chicken's skull ends. Brain for dry picking, as in turkeys, by thrusting the knife through the groove which runs along the middle of the roof of the mouth until it touches the skull midway between the eyes. Use a knife which is not more than two inches long, one-fourth inch wide, with a wide, flat handle, a sharp point, and a straight cutting edge.

Anyone living out of range of market far enough to make expensive shipping alive should follow these instructions and dress their turk. All poultry should be boxed dry, so if they are washed be very sure that you wipe them very dry with clean cloths, then if they are bled correctly and picked clean you may depend upon getting the best price for your product.

FORMULA FOR RABBIT FEEDING

Seeing inquiries as to feeding of rabbits in the Rural Press, I forward the feed formula that I received from the secretary of the Giant Breeders' Association, and he is also the rabbit doctor for said association, and I believe in passing on for the benefit of others what I have found to be good.

In feeding, give alfalfa at night and barley in the morning and a good mash of the following: Two parts carrots, two parts potatoes, two parts sugar beets, two parts bran, two of alfalfa meal, one part shorts, one part corn. Grind this together, moisten it just a little; dont' make it wet. This feed will give you good, healthy, large stock.

Now as to their care: Put tincture of iron in the drinking water once a week, three drops, then scald their drinking vessels, keep fresh water before them; once a week put a little salt in the water or the salt can be put in the feed. The iron and salt keep their blood in good order. Clean the hutches at least three times a week, as foul hutches cause disease.—Mrs. M. Johnson, Paso Robles.

HENS DUMPY.

To the Editor: My hens' combs are all swollen and they have blood blotches all over them. Their eyes are closed and they just mope all day and don't lay. Please give me a remedy.—W. N. B., Thalheim.

[This information is not full enough for proper diagnosis, but the blood blotches are evidence of some bad condition of the digestive organs, or it may be intestinal parasites, as worms. Try giving the hens a small amount of warm moist mash in which you mix a teaspoonful of tincture of nux vomica to 20 hens, in just enough mash for them to clean up in a few minutes. Do this for three or four days. If there is no improvement, try the tobacco cure for worms, but before doing so I would kill and open one of the dumpy hens so as to be quite sure it was worms. The nux vomica will most likely be the best remedy and it will not harm anything.]

WIND-PUFFS.

To the Editor: I have a Black Minorca rooster whose breast is all ruffed up. It feels as if it were full of air. Please advise.—Subscriber, Acampo, Cal.

Probably wind-puff. Prick with a needle, at same time working with the hand gently to expel the wind, then close the puncture with a little piece of adhesive plaster. These wind-puffs often return and nobody knows why or how.

A "365" Day Liniment

YOU ARE SAYING TO YOURSELF—"If I only knew of something to stop that Backache—help my Rheumatism—cure my Neuralgia, I would send and get it at once."

Get It. Relief. Gombault's Caustic Balsam will give you immediate relief. A Marvelous Human Flesh Healer and a never failing remedy for every known pain that can be relieved or cured by external applications. Thousands testify to the wonderful healing and curing powers of this great French Remedy. A Liniment that will soothe, heal and cure your every day pains, wounds and bruises.

Gombault's Caustic Balsam
The Great French Remedy Will Do It

It Helps Nature to Heal and Cure. Penetrates, acts quickly, yet is perfectly harmless. Kills all Germs and prevents Blood Poison. Nothing so good known as an application for Sores, Wounds, Felons, Exterior Cancers, Burns, Carbuncles and Swellings.

"I had a bad hand with four running sores on it. The more I doctored the worse it got. I used Caustic Balsam and never needed a doctor after that."—Ed. Rosenburg, St. Ansgat, Ia.

Mrs. James McKenzie, Edina, Mo., says: "Just ten applications of Caustic Balsam relieved me of goitre. My husband also cured eczema with it, and we use it for corns, bunions, colds, sore throat and pain in the chest."

A Safe, Reliable Remedy for Sore Throat, Chest Cold, Backache, Neuralgia, Sprains, Rheumatism and Stiff Joints. Whenever and wherever a Liniment is needed Caustic Balsam has no Equal.

Dr. Higley, Whitewater, Wis., writes: "I have been using Caustic Balsam for ten years for different ailments. It has never failed me yet."

A liniment that not only heals and cures Human Flesh, but for years the accepted Standard veterinary remedy of the world.

Price, $1.75 per bottle at all Druggists or sent by us express prepaid. Write for Free Booklet and read what others say.

THE LAWRENCE WILLIAMS CO., Cleveland, Ohio

Make Poultry Pay

One of our subscribers was completely disgusted with poultry raising. Every morning forty of his hens would brag about what they were going to do, but at night he would find that only about eight had laid. The rest had simply lied.

So he bought a copy of our poultry book and in less than two weeks his hens had quit lying and gone to laying. They were shelling out enough extra eggs to pay for the book in less than two days.

California Poultry Practice Tells How

This great book will do as much for you. It was written by a Californian for Californians. The author, Mrs. Susan Swaysgood, after years of successful experience, has succeeded in showing the farmer how to make poultry raising more profitable. She knows what to tell and how to tell it. She deals out hard-headed poultry sense and still has every paragraph full of snap and sparkle.

The book deals with actual conditions—not theories—and covers every phase of the industry. It gives advice about location, buildings, equipment, choice of breeds, best way to begin, how to select stock, etc. There are valuable instructions for incubating, brooding, culling, feeding, breeding for heavy laying, showing, treating diseases, marketing products, etc. You will find everything necessary to insure your success.

Now Is the Time to Start

Never was there a better time to take up poultry raising in earnest. The nation's supply of meat animals is not keeping pace with the increase in population, and the people must turn to poultry raisers for nitrogenous foods. Eggs will be the cheapest concentrates, and table fowls the cheapest meat.

A golden market awaits all poultry products here on the coast, where we don't even produce enough to supply the local demand. As a government expert puts it: "The Pacific Coast offers a wider and more inviting field for future development in poultry raising than any other section of the United States."

Costs Only a Dollar

But play safe. Start right by getting this book and following the methods which have already proved successful. It will cost you only a dollar; you would not sell it for ten.

THE HOME CIRCLE

GOD'S TRUE WORD.

The highest truth is ever word of God.
"My doctrine is not mine," said he of old.
"But His that sent me"; and the fabled rod
Which Moses wielded was not his, 'twas told.
But symbol only of a vaster Power
Which feebly he forthshadowed for an hour.

Too much our human selves we separate
From the divine effulgence which is all!
A deity far off we paint, and prate
Of God as hid behind dividing wall.
Such dream as this is shadow drear and dun—
A glow-worm dimness, not the wondrous sun.

No word of good was ever breathed not God's!
No stroke for freedom but God held the arm!
Lo, then, today, these creeds' o'erturning sods—
They token heaven's rejoicing, not alarm.
O let us deem man's own best word of hope
Still God's true word, and man's best horoscope.

—James H. West.

A SILENT WITNESS.

"Mother, why are you hanging a looking-glass there?" asked James, looking at it curiously. "Such a pretty one, too," he continued. "It seems to me, I should want it where it would be seen oftener."

"I want it right here in the dining-room, where it can see," answered his mother, laughingly. "I am putting it here for a witness."

"A witness!" scoffed James. "It can't tell anything."

"We shall see. It will tell your faults to you as well as to others."

"I'd like to know how."

At supper James found that he and his brother Ned were to sit side by side, facing the glass.

"What's that for?" demanded both at once.

"Your father and I think best to have it so," explained their mother.

The boys sat down with scowls on their faces and an air of great injury. Ned happened to raise his eyes, when the ludicrousness of those frowning reflections struck him so forcibly that it provoked a shout of laughter.

"What is the matter with you?" growled James, looking up to make an ugly face, when his attention also was arrested by the truthful mirror. His startled stare added so much to Ned's glee that, he began to thrust out his tongue at James. The silent reminder brought him to a sudden stop.

"I see you are caught also," remarked his father, quietly.

The boys were silent. The day following, their experiences were repeated with such good results that their mother was beginning to congratulate herself on the success of her plan. In her absence from home of several weeks, while attending her mother in a serious illness, the boys had acquired the habit of bickering at the table, greatly to the humiliation of their parents.

Their silent witness had been with them two days when their cousin, a bright, manly little fellow, came to visit them.

At dinner Mrs. Lane said, "William, you may sit between James and Ned, where you can all enjoy yourselves."

But, oh, how two boys reddened as the mirror showed them how beautifully William's hair was combed and how their own touzly locks looked in comparison! Their mother had remained discreetly silent and allowed them to see for themselves.

Ned spoke first.

"Mother, will you excuse me for a minute?"

"Certainly," agreed his mother.

"And me, too?" questioned James.

They returned with shining faces and well-brushed hair and smiled at each other over the changed reflection. If William noticed, he was too much of a gentleman to say anything, but three pairs of eyes returned often to the pleasing picture.

"It is nice, isn't it?" said Mr. Lane.

"What?" asked all three at once.

"Three good-looking boys in a row."

"Oh," answered William, "I believe auntie had a reason for putting the glass there."

After William's visit was over and he had returned home, James came to his mother.

"Mother," he said, "your witness is all right. I couldn't understand before, but I do now, and I vote that we keep it there."

"Vote carried by a big majority," shouted Ned.

"Very well," promised mother; "it shall stay with you as long as you want it. A silent witness, but a good friend.—Baptist Boys and Girls.

CRANBERRIES.

Cranberries are a valuable food because of the iron and acid they contain, and, because of their acid content, sweeteners such as sorghum, cane or corn syrup may be used even more successfully than in other fruits. The most satisfactory way to make cranberry jelly is to make it in quantity and seal it in glasses, then it is ready for use as any other jelly. To 2 quarts of cranberries take 1 quart of water, cook for 20 minutes and then put through a sieve. Add sugar or sweetening, from 1 to 1½ cups, and cook about 10 minutes or until it will give a jelly. If to be used at once, turn into molds. Cranberry and apple juice may be combined in equal parts to make a jelly, or raisins, figs or coconut may be added to an unstrained cranberry sauce to add variety.

Dr. Eaton, a former president of Madison University, was beloved by the students. One day a student who had spoken in debate asked him what he thought of the effort. The doctor looked at him and then said slowly, "Edward, if you would pluck a few feathers from the wings of your imagination, and stick them in the tail of your judgment, you would make better speeches."

WHEN WE COME BACK

When we come back, remember * * the things we planned to do;
The little house upon the hill with room enough for two;
The casement with the ivy, the grass so soft and deep,
The singing roof where drops of rain would lull the night to sleep.

You said you'd hold me tight and never let me go again,
You'd kiss each scar upon my face, and every mark of pain;
When we come back, remember—you laughed when it was said—
I might be out an arm, but you would hug me twice instead.

I'll know you will have suffered far more than even I,
I'll know the sleepless nights when you could only walk and cry.
Remember, proud of heart, dear, if I should chance to fall,
You'd rather I had not come back, than never go at all.

Remember all the nonsense we said we'd talk at night
When, leaning on the swinging gate, we'd watch the stars in flight;
And don't forget the roses, the tinkling, leafy brook,
And how, you did, you know it—you said you'd learn to cook.

When we come back, remember * * the things we planned to do;
The little house upon the hill with room enough for two,
The casement with the ivy, the road a winding track,
The little house upon the hill, and * * and—when we come back.

—Charles Divine.

A Message to the Women Readers of the Pacific Rural Press

—about this marvelous laundry Soap that women everywhere are praising

No Boiling
Less Toiling
Solves the Wash Day Problem

WE know that all of you are interested in improved methods that will save labor and make the daily task lighter. So we bring this message about wash-day—the day that most women dread.

A great many laundry soaps do not work well in hard water. But that is the first problem we solved in making Cocoa Naptha Soap. It works well in either hard or soft water.

Wash Clothes Without Boiling

You might think this impossible, but it is not—for those who use Cocoa Naptha Soap say they get just as good results without boiling as they do with.

It's quite simple. First, wet the clothes thoroughly—in either cold or warm water—and rub them well with Cocoa Naptha Soap, making sure that the soiled places get plenty of soap. Then soak clothes for 30 minutes—or over night. In the morning you will find the dirt all loosened and a very little bit of rubbing necessary. Rinse, blue and hang out to dry. You will be surprised at how clean and white they become with so little work.

COCOA NAPTHA SOAP

THE THREE PIRATES.

(With apologies to the shade of Charles Kingsley.)

Three pirates went sailing away toward the west
On the crest of Ambition's most turbulent tide.
They recked not of honor, nor virtue, nor right.
The cargo they carried was lust, greed and pride.
Und Bill vas von, und Austria two,
And the murderous Turk said, "Me stick-ka by you";
And the heart of the world went a-moaning.

Three Allies disputed the pirates' career—
Disputed it long, and disputed it well.
They gave of their wealth and they gave of their life,
And struggled to rescue a comrade from hell.
And France was one, and Britain was two,
And Italy did all that honor can do;
And the Jap and the Yank stood a-honin'.

Three pirates lay out on the desolate sands,
Tossed there like kelp by the turbulent tide.
For little they recked that the Jap and the Yank
Could ere enter the fray with so mighty a stride.
Then up Billhelm blew, and Austria flew,
And the Turk feebly muttered, "Da got-ta me, too";
And the old world ceased from its groaning.

—H. W. Jones.

HOME PICKLING OF OLIVES.

Will you give us a recipe for pickling olives in small quantities for home use?—W. H. B., Thalheim.

[Gather the fruit by hand when it is cherry red or darker. Place in an earthenware or wooden vessel (not metal). Make a solution of one pound of lye to five gallons of water and pour over the olives, keeping them under with a loose wooden cover. Stir and examine olives every hour. When the lye has gone through the skin of the olive (cut one and notice discoloration), say from three to eight hours, according to fruit and temperature, pour off lye and let olives darken by exposure to air and stirring—from one to three days. Then pour on fresh lye solution and leave with occasional stirring until it has penetrated to the pit, or flint will be better. But if left long after reaching the pit the flesh will be softened and color bleached. Then replace the lye with fresh water, which should be changed twice daily until all taste of lye is removed—five to seven days. Then put in brine for 24 hours—five ounces of salt to a gallon of water. After which heat olives and brine to boiling and pour hot into scalded jars or cans. Cover and seal and place in a pot or wash-boiler sterilizer and heat for one hour. Before sterilizing the brine may be poured out of the jars or cans, which are then sealed immediately while still hot and sterilized as above. They keep quite as well without the brine. This is Prof. Fred T. Bioletti's formula.]

RAISINS OR BEEFSTEAK.

The Rural Press has been asked as to the relative value of raisins and beefsteak. At bottom, the food problem resolves itself into supplying the body with digestible stores of energy in sufficient quantity. Under present-day standards, food energy is measured by "calories," the calorie being a standard unit of heat measurement. Measured by calories, the average raisin contains considrably more energy per pound than the average beefsteak—perhaps twice as much. But it is not safe to take the calorie standard too seriously, for the human system requires, besides "calories," certain mineral salts and a certain amount of bulk, or "roughage," as well as variety.

Both raisins and beefsteak are highly nutritious, and the determination of one or the other as an exclusive article of diet would depend largely upon location. If the person so restricted lived in a tropical or subtropical climate, the raisin would be the preferable article of diet; if, on the other hand, such a person were an inhabitant of the frigid zone or the northern belt of the temperate zone, he would undoubtedly prefer and thrive better on a diet of beefsteak. In this climate it is well to partake moderately of both, for the human being is an omnivorous animal and fares best on a variety of diet.

SWEET POTATO RECIPES.

Sweet Potatoes "Southern Style."—Boil and peel potatoes; brush them over with syrup diluted with water; brown in oven or under blazer of gas stove.

Candied Yams.—Slice boiled sweet potatoes into a baking pan; sprinkle each layer with sugar, cinnamon and bits of butter; add a few cloves and a half cup of hot water; brown in the oven. Sugar may be omitted and a tablespoon of white syrup added to the hot water. This rich dish usually accompanies the Sunday chicken in the South. Bananas, cooked in the same way, are served in the tropics with chicken.

FAMILY FRUIT CAKE.

Two cups seeded raisins, 1 tablespoon lard, 1 cupful water, 1 cupful sugar, 1 teaspoon each of cinnamon, cloves, nutmeg and soda, a pinch of salt, 2 cupfuls of flour, ½ teaspoon baking powder. Mix all the ingredients except the flour and baking powder and boil together in a double boiler for three minutes. When cold, add the flour and baking powder and bake in a slow oven three-quarters of an hour to an hour.

HARD TO KEEP.

The tramp came to the back door and unfolded a long tale of woe. His wife and six little children had, it appeared, fallen victims to a Gotha bomb, and the shock had so unnerved him, etc.

The woman of the house heard him patiently, but she fixed him all the time with a cold, searching eye.

"My man," she said, when at last she could get an inning, "are you telling me the truth? I have a very good memory for faces, and, if I am not mistaken, you called here some years ago and told me you had lost your wife and six children in the sinking of the Titanic."

"Yes, marm, that was me," agreed the tramp unblushingly. "I'm the most unfortunate man ever born. Never could keep a family anyhow."—Unidentified.

SPARKLETS.

Despite the exhortations of her teacher, small Mary persistently lagged during the march in the kindergarten one morning.

At last the teacher called Mary to her side and said: "Mary, dear, can't you keep up with the music and the little boy in front of you?"

"Yes," answered Mary, with a beaming and obliging smile, "I can, but my new shoes can't."—New York Times.

A small boy said, "Mamma, how fat Amelia has grown!" "Yes," said his mother; "but don't say 'fat,' dear; say 'stout.'" At dinner the next day the child was asked if he would have some lean meat. "No, thank you," said he, "I'll take some stout meat."—Little Chronicle.

More Light Than 20 Oil Lamps

AT LAST—the light of lights—A beautiful lamp that lights with common matches just like oil lamp, but makes and burns its own gas from common gasoline, giving a brilliant, steady, restful, white light of 300 candle power.

Most Brilliant Light Made

Brighter than the brightest electricity. More light than 20 oil lamps. Cheapest and best light made. Costs less than one-third of a cent per hour. Safer than the safest oil lamp. The

The Good Word of the Users

It is on this sure foundation that the "Premier" business has been built—rigidly reinforced by a limitless guarantee—and accounts for the remarkable growth in three years.

This has been made possible by the simplicity of the burner, its quick response to the natural action which produces the gas and the cheapness of its fuel—common coal oil.

In asking for circular "B" and drawing of complete installation, be careful to mention size and style of stove, that we may advise you correctly.

Burner Prepaid Anywhere—$5.00.

Complete Installation for Ordinary Sized Stove, $9.85

Premier Burner Co., 246 So. Spring Street, LOS ANGELES, - CAL.

Portable-economical

Perfection Oil Heater is easily carried—up stairs or down, from this room to that—anywhere heat is needed.

Lights at the touch of a match—gives instant heat. No smoke or odor.

Steady, comfortable warmth for many hours on one filling with Pearl Oil, the ever-obtainable fuel.

Cuts fuel bills, for less furnace heat and fewer grate and coal-stove fires are required. Oil consumed only when heat is needed—no waste.

Market Comment

Butter Substitutes Forced to Front!

The heavy movement of creamery butter from Pacific Coast points to the East, where the same grade of butter rules from 7 to 8c higher, has directed the attention of consumers to view more favorably the use of substitutes, where the difference in price on a 2-pound square amounts to 50c or more. The prevailing high prices for the original article, however, appear to be strongly in accord with basic market conditions. Creameries have increasing difficulty in obtaining milk to meet their demands, as dairy cattle herds have been depleted and the milk condensaries are formidable competitors for the raw product. Europe is said to be absorbing large quantities of our butter supply, and army and navy requirements are also heavy. The storage situation at the last report, November 15, showed national holdings of 70,000,000 pounds, as compared with 82,000,000 pounds at the same time last year. In the southwestern section, of which San Francisco is a part, the storage houses contain 2,440,048 pounds, as compared with 2,082,799 last year. However, a large quantity of the stored stock here is owned by the Government and affects the market conditions only indirectly. The following comparison of prices (December 3 quotations) shows the disparity in Western and Eastern quotations:

WHOLESALE BUTTER PRICES.

	San Francisco	New York	Philadelphia
94 score	61c	...	...
93 score	61c	69c	69c

Wheat Prices Remain Unchanged.

It is the opinion of the Food Administration that the Government price for the 1919 crop of wheat, guaranteed under the Lever Act, does not become ineffective as a result of the conclusion of peace, as the Lever Act provides that "all rights or liabilities under this act arising before its termination shall continue and may be enforced in the same manner as if the act had not terminated." This price is fixed at $2.26 a bushel, Chicago basis, or $2.20 San Francisco and Los Angeles delivery. Basing the estimate on sacks of 100 pounds each, the price is $3.81 2-3 for No. 1 hard white in sacks, $3.63 1-3 for No. 3 Club and Sonora.

Bean Market Steady.

The U. S. Bureau of Markets, in its summary of Tuesday's bean market, says: "California small whites held steady at $8.50@9.00, sacked, per cwt., f. o. b. Los Angeles, and moved slowly at a general even range of $10.50@11.50 in important consuming markets. Michigan choice, hand-picked pea beans were unchanged at Grand Rapids at $9.10@9.25, sacked, and ranged steady at $9.35@10.25 in Eastern markets. Shipments were moderate." The same authority, in its weekly review under date December 4, reports California white stock in consuming markets as bringing $14 to $16. The bean market, as a whole, is fairly steady.

The Busy Bee Stands Pat.

Honey prices have been the highest ever known, made so by war conditions, according to beemen. At the session of the Central Valley Honey Producers' Co-operative Exchange, held in Modesto this week, the belief was expressed that the price of the commodity should be sustained through the coming year, and to this end the War Trade Board at Washington has been asked to lift the ban against the export of honey so that California may re-establish its markets abroad once more.

Olive Growers Happy.

Tulare county olive growers are reported to be getting record prices for their 1918 crop. Manzanillas and Missions are running from $135 to $190 per ton, orchard run, while large Manzanillas are selling as high as $300 per ton, and orchard run Sevillanos at $450 per ton.

THE MARKET REPORTS

Where commodities are consigned on a commission basis, the only price obtainable is the San Francisco price, from which customary charges are deducted to ascertain actual price paid to producer. Lines of commodities sold on exchanges, as butter, eggs, cheese, grain, etc., are priced according to exchange figures, which are not the prices paid to grower. From these figures must be deducted the legal percentages permitted to be taken by wholesalers before remitting balance of sale price to shippers. Schedules of discounts governing these transactions may be obtained from the offices of the Food Administration or of various exchanges.

SAN FRANCISCO

San Francisco, December 4, 1918.

WHEAT.

Per bushel—

No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 3	2.09
Recleaned for seed, per ctl.—	
California Bluestem	$4.15@4.25
Early Baart	4.15@4.25

BARLEY.

Barley continues to be held firm, and sales were made at a slightly higher price this week than last.

Choice feed, per ctl	$2.15@2.25

OATS.

Oats are steady, with a somewhat firmer tone for red feed. Red for seed are lower on lack of demand.

Red feed, per ctl	$2.40@2.50
Red for seed	2.65@2.90
Black for seed	2.80@3.00
Recleaned Red or Black for seed	3.35@3.50

CORN.

Corn continues heavy, although some sales for choice white Egyptian are reported at $3. These sales were far less than carload quantities.

Egyptian, choice	$2.75@3.00
Milo	2.70@2.75

HAY.

Receipts of hay for the past week were 844 tons, compared with 731 the preceding week. Trade in general is quiet and receipts are ample to take care of all demands. Damaged hay, which is still arriving, has been moving fairly well, though with concessions in prices. While recent rains have been of benefit to stockmen, anxiety is still felt over cold weather prospects. Great quantities of baled hay have been damaged and are being fed out immediately to stock. This will have an influence on the market later. The present market may be regarded as easier, with prices a shade lower.

Wheat, No. 1	$25.00@27.00
do, No. 2	19.00@23.00
Choice tame oat	24.00@26.50
Wild oat	19.00@21.00
Barley	19.00@21.00
Alfalfa	17.00@21.00
Stock	17.00@20.00
Barley straw	.50@ .80

FEEDSTUFFS.

The market for feedstuffs is dull and unchanged. There is practically no export trade in either feedstuffs or hay, but it is predicted that if the Shipping Board releases much shipping on this Coast there will undoubtedly be an active export at once. This release is looked for within the next few weeks at the farthest.

New alfalfa meal, per ton	$35.00@36.00
Coconut cake or meal	Nominal
Cracked corn	$86.00@88.00
Oilcake	77.00@78.00
Rolled barley	45.00@47.00
Rolled oats	55.00@57.00
Fish meal, per 100 lbs	4.00@ 5.00

POTATOES, ONIONS, ETC.

Both potatoes and onions are weak at unchanged quotations. Tomatoes are of very poor quality and sell for almost anything, as retailers do not care to buy the class of goods offered. String beans are scarce and quoted at a higher range. Eggplant is also of inferior quality and sold at lower levels.

String beans	12@17c
Lima beans	8@9c
Carrots, per sack	85c@$1.00
Rhubarb, San Jose, per box	$1.00@1.25
Pumpkins	75@90c
Cucumbers, hothouse, box of 30	$2.50@3.00
Eggplant, per box	1.00@1.25
Livingston	None
Lettuce, per crate	$1.50@2.00
Celery, bunch	20@25c
do, crate	$3.00
Tomatoes, per crate—	
Bay	75c@$1.00
Potatoes—	
Garnet, Chile, on street	None
Fancy whites	$1.75@2.00
Choice	1.40@1.65
Sweets, per sack	2.75@3.00
Onions—	
River Reds	None
Yellows	90c@$1.00
Australian Browns	90c@$1.00
Fancy	$1.15@1.30
Garlic, new	20@25c
Green corn, Alameda, per sack	Nominal
Okra, per box	None

BEANS.

The Government has now filled all its immediate requirements and no demand for shipment outside the State has arisen. Consequently the bean market is quiet, with lower quotations on cranberry and small whites.

Bayos, per ctl	$7.25@7.50
Blackeyes, new crop	5.50@5.75
Cranberry beans	8.25@8.50
Limas (south, recleaned), new crop	$10.50
Pinks	$6.75@7.00
Mexican Reds	$6.75@7.00
Tepary beans	5.00@5.50
Garbanzos	8.00@8.75
Large whites, new crop	8.20@8.30
Small whites, new crop	9.25@9.40

POULTRY.

The poultry market is suffering from the usual after-the-holiday reaction. The demand is easy and receipts are fully large enough to take care of it. Little local stuff came in during the week, while four cars arrived from the East. Turkeys are lower, but otherwise last week's quotations stand. It is reported that the Eastern market was somewhat overstocked with turkeys during the late holiday season and that it is likely that more turkeys will be shipped to this market from the East at Christmas time.

Turkeys, live, young spring, lb	35@36c
do, old	35c
do, dressed, old	45c
Broilers, 1½ to 2 lbs	39@42c
do, 1¼ lbs	43c
do, ¾ to 1¼ lbs	45c
Fryers	35c
Hens, extra, per lb., colored	33c
do, Leghorn	33c
Smooth young roosters, per lb. (3 lbs. and over)	33c
Old roosters, colored, per lb	24c
Geese, young, per lb	28@30c
do, old, per lb	28c
Squabs, per lb	55@60c
Ducks	30@32c
do, old	27@30c
Belgian hares	22@23c
Jack rabbits	$3.25@3.75

BUTTER.

The butter market continues strong and the price was advanced one cent at the weekly call on Monday. There are some shipments East. One reason for the present price is found in the comparatively small receipts. With the exception of September and October of the present year, this November's receipts were the smallest in over two years.

	Thu.	Fri.	Sat.	Mon.	Tu	Wed.
Extra	62	62	63	63	63	
Prime first	59	59	59	Nom.	..	..
Firsts	58	58	58	Nom.	..	..

EGGS.

Eggs continue strong, with a marked advance in the price of pullets. Like butter, the receipts of eggs during November were considerably below the record of a year ago. Last month's receipts were only 25,752 cases, which is less than any month during the past two years.

	Thu.	Fri.	Sat.	Mon.	Tu	Wed.
Extra	81	82	81½	82½	82	
Extra 1sts	Nominal				80	80
Firsts	Nominal					
Extra pullets	68	76	72½	76	76	

CHEESE.

Cheese is stronger and higher. During November of this year only 615,400 pounds were received, which is less than two-thirds the receipts of the similar period of a year ago. With the single exception of December of last, this year's receipts for November were the smallest in two years. It is fair to assume that shortage in receipts is a strong element in the high prices.

California Cheddar, flats, fancy	32c
Fancy California flats, per lb	34½c
First California flats, per lb	Nominal
California Y. A. fancy	Nominal
Oregon triplets, fancy	37c
Oregon Y. A. fancy	Nominal
Monterey cheese	24@27c

FRESH FRUITS.

There is little fresh fruit on the local market, with the exception of apples, which are unchanged and sell from $1 to $2 for the California varieties, according to size, and from $2 to $3.75 for the Northwest varieties on the same basis. The berry season is over, although a few drawers are expected to come in from time to time. There were a few grapes on the market, selling from $1.50 to $2.25 per crate.

Peaches, 4-box crate	None
Figs, black, per box	None
do, double layer	None
do, Single Row Whites	None
Strawberries, per drawer	None
Blackberries, per chest	None
Raspberries, per drawer	None
Plums	None
Cantaloupes, flats	None
do, ponies	None
do, standard	None
Watermelons, per lb	None
Pears, Bartlett, per box	$2.00@3.00
Winter pears	1.00@1.50
Persimmons	

CITRUS FRUIT.

Citrus fruit is quoted at a lower level all along the line, although there are no more grapefruit at $2. Best navels are now selling at $6 and inferior grades down to $3.

Oranges, navels	$3.00@6.00
Mandarins	1.75@2.00
Lemons, fancy	5.00@6.00
do, choice	4.50@5.00
do, standard	3.50@4.00
California limes	1.50
Grapefruit, new	2.25@3.00

HONEY.

Honey, which two weeks ago brought the beemen as high as 22c, cannot get even a bid of 15c from the local buyers for carload lots. Some few cases may be bought at 16c by the dealers, but these deals are merely to fill in an order. San Francisco dealers predict that the honey association will not be able to weather the storm of lower prices. Even if the embargo on shipments is lifted, it is said the beemen cannot get much relief, as European dealers will not pay the prices demanded.

DRIED FRUITS.

With the exception of apples, the dried fruit market is firm, with no change in prices. For apples there is little demand and the buyers are not offering more than 12c.

RICE.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop, at mill	7.00

LOS ANGELES

Los Angeles, December 3, 1918.

BUTTER.

Receipts were good for the week, 319,265 pounds against 228,000 pounds the same week last year. However, while the fresh receipts were good, the very light stocks in store and higher markets East and in San Francisco encouraged buying and the market held steady and firm throughout the week. There was withdrawn from cold storage during the week 17,918 pounds against 31,862 pounds the same week last year. The cold storage holdings now are only 118,091 pounds and much of this sweet butter, leaving the market pretty nearly bare of storage goods, hence the holding up of prices, which are 18c higher than a year ago.

We quote:

California extra creamery	60c
do, prime first	58c
do, first	57c

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon
Extra	60	60	60	60	60	60
1917—						
Extra	42	42	42	42	42	42

EGGS.

The market the past week was less snappy, notwithstanding light receipts of fresh ranch eggs, which for the week were 308 cases by rail against 447 cases the same week last year. As the arrivals by truck continue about four times as large as the receipts by rail, the supply for the week was 1840 cases against 2235 cases the same week last year. To meet this shortage in fresh eggs there was withdrawn from cold storage during the week 6922 cases, against 5403 cases the same week last year. The cold storage holdings now are down to 26,132 cases against 17,878 cases this time last year. Extras advanced for the week 2c, case count 7c and pullets 5c. Extras are now 23c higher than this time last year and case count and pullets 21c higher.

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon

Pullets	48	48	49	47	46	46

VEGETABLES.

Offerings of green stuff light and all good fresh stuff in fair demand. Potatoes were in better supply slow sale and a little lower. That is Idahos. Rivers unchanged and fancy stock in fair demand. Receipts of onions light and white Globe higher and in good demand. Australian Brown firm and also selling very well. Cabbage dull and lower. Celery scarce and higher. Sweet potatoes still draggy. Market over-supplied. Cauliflower steady but slow sale. String beans and lima beans getting scarce and the market for them is steady and demand fair. Bell peppers coming in less freely and selling a little better.

We quote from growers:

Bell peppers, per lb	6@6½c
Chile peppers, per lb	4@6c
String beans, per lb	7@8c
Lima beans	6@7c
Potatoes, northern, per cwt	$2.00@2.25
do, Idaho Russets, per cwt	1.90@2.00
Sweet potatoes, per cwt	2.00@2.25
Garlic, per lb	20c
Onions—	
Australian Brown, per cwt	$1.50@1.60
White Globe, per cwt	3.25@3.50
Cabbage, per 100 lbs	75c@ 90
Celery, crate	4.00@4.50
Tomatoes, No. 1, lug	80c@
do, No. 2, lug	25@35c
Cauliflower, standard crate	$1.50@1.75

POULTRY.

The Thanksgiving market was a good one. Up to Thursday everything sold well and brought full quotations. Since then, however, the market has been very quiet. Prices, however, remain steady. The following prices were agreed upon last Friday, November 29, and hold good until the coming Friday:

Broilers, 1@1½ lbs	37c
Broilers, 1½@1¾ lbs	41c
Fryers, 2@3 lbs	35c
Roosters (soft bone), 3 lbs. and up	30c
Stags and old roosters, per lb	20c
Hens	28@32c
Tom turkeys	31@34c
Ducks	22@28c
Geese	28c

FRUITS

Appls now dominate the market. They make more than seventy-five per cent of the offerings and are meeting with a good demand. A few Japanese persimmons and guavas are coming in. Demand fair.

We quote from growers:

Apples—	
King Davids, 4-tier	$2.75@3.00
Black Twigs, 4-tier	2.75
Baldwins, 4-tier	2.00@2.25
Red Pearmains, 4-tier	1.75
White Pearmains, 4-tier	2.00
Rhode Island Greenings, 4-tier	1.50
Yellow Newtown Pippins, 4-tier	$1.75@2.00
Bellefleur, 4-tier	$1.75@1.85
do, 3½-tier	1.75@1.90
Gravenstein, 4-tier	2.00
Japanese persimmons, per lb	4@5c
Guavas, per crate of 30 baskets	$1.50@1.75

BEANS.

We quote from growers:

Limas, per cwt	$10.00

Large white, per cwt............$8.00@9.00
Small white, per cwt. 8.00
Pink, per cwt. 6.50
Tepary, per cwt. 4.50
Blackeyes, per cwt. 5.00

WALNUTS.

There is no change in this market from a week ago. Very few are to be had from first hands and they from independent growers and are bringing quotations. A good many culls are coming in and they are selling at 14@15c a pound. The Association is still shipping out two to three cars a day on contract.

We quote f. o. b. California points:

	1918	1917
Fancy budded	33c	24c
Standard budded	32c	21c
No. 1 soft shell............	31c	20c
No. 2 soft shell............	28c	18½c

HAY.

The market the past week was dull at last week's advance. Not much in and very little wanted. The dairy people took a little alfalfa, but that was all that was moving.

We quote f. o. b. Los Angeles:

Barley hay, per ton...........$24.00@25.00
Oat hay, per ton.............. 26.00@28.00
Alfalfa, northern, per ton..... 21.00@22.00
Alfalfa, local, per ton......... 22.00@24.00
Straw, per ton .... 9.00@10.00

COTTON.

The market the past week was an extremely nervous one. It being the closing week in November and the opening week in December and Thanksgiving holiday breaking the trading week, all seemed to have worked against the market. The mills were holding back on account of a dull market for their product and there was no great amount of foreign buying. The result was, prices worked lower from the start. By Saturday December in New York had worked down to 26.30c and closed at 26.70c, and January closed at 25.35c. In New Orleans December closed at 25.73c and January at 24.75c. Monday opened the current week in New York with fair buying but a bearish feeling and a sharp break after a higher opening. December closed at 25.75c and January at 24.75c. In New Orleans December closed at 25.00c and January at 24.00c.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, December 3, 1918.

Storage Emperors that have been offered for sale during the past week, in the Eastern markets, have not met with ready demand. Most of the stock opened up weak and little interest was displayed by the trade. All markets continued to pay the limit for sound, good keeping Emperors. The supply has about become exhausted, as the last of the shipments are in transit.

The late pear market shows unusual activity, and as the stock is arriving in good condition, markets ruled higher than the week previous, which up to date have been the highest of the season.

Averages for the week.

New York—Pears: Winter Nellis, $3.98; Glout Morceau, $4.40; E. Buerre, $3.40. Grapes: Cornichon, $1.90; Emperor, lugs, $2.50; kegs, $4.46; drums, $3.42; crates, $2.79; Malagas, crates, $2.60; lugs, $1.75.

Chicago—Grapes: Emperor, $2.38; Cornichon, crates, $2.57; lugs, $1.50.

Boston Grapes: Emperor, crates, $3.00; drums, $2.95; lugs, $2.66; Cornichons, $2.75; Tokays, $1.77; Glout Morceau, $3.42.

Shipments from November 22nd to 30th, inclusive: 14 pears, 3 grapes. Total shipments to date, 1918, 28,993 cars. Total shipments to date, 1917, 24,539 cars.

Special Citrus Market Report

Los Angeles, December 2, 1918.

Oranges are beginning to move more freely, the bulk of the shipments at present originating in Central California. With better weather the volume of shipments from all points is expected to rapidly increase. A wide spread of prices has developed, fruit of medium size and good color bringing around $5.50 f. o. b., while the larger sizes, which are plentiful, are bringing as low as $2.50. The Southern California orchards are still contributing light shipments only, and the range of prices is almost the same as for the Northern fruit.

The lemon glut which has depressed prices in the East for the past few weeks, and sympathetically on the Coast, is clearing up. California shipments have fallen off in volume, and advices are that there are no foreign lemons in stock and none expected.

Shipments to date are as follows: Central California, 760 carloads; Southern California, 40 carloads; Northern California, 36 carloads.

Special Livestock Market Report

San Francisco, December 4, 1918.

CATTLE—The slight depression occasioned by the strong preference for poultry Thanksgiving week has passed and a renewed demand for good beef is felt. Prime cattle still continue scarce and some packers have had to go beyond the State for their supplies of the right kind. One shipment from Ogden, Utah, is already here, consisting of seven cars of steers and four cars of cows. Small shipments are also being made from Klamath Falls, Ore.

Grass Steers—
No. 1, weighing 1000@1200 lbs..12¾@13c
do, weighing 1200@1400 lbs....12@12¼c
do, second quality..............11@11½c
do, thin ....9½@10c

Cows and heifers—
No. 1 ....9@9½c
do, second quality...............8@8½c
do, common to thin..............6@6½c

Bulls and stags—
Good ....6@6½c
Fair ....5½@6½c
Thin ....4½@5½c

Calves—
Lightweight 11½c
Medium ....10½@10¾c

SHEEP—The sheep market is strong. Better pasturage has put mutton stock in better condition, and the limited market demand is more easily supplied.

Lambs—
Yearling ....12@12½c
Milk ....14@14½c

Sheep—
Wethers ....11½@12c
Ewes ....9@9¼c

HOGS—Hogs are coming in in plentiful supply, and are of excellent quality and desirable weight. Packers here and in the East are adhering to the hog price agreement and the demand seems to be limited only by the ability of packers to handle supplies.

Hard, grain-fed, 100@150....................16c
do, do, 150@300.......................16½c
do, do, 300@400.......................15¾c

EASTERN MARKET.

HOGS—Receipts, 51,000 head; market, firm, mostly 5c to 10c above Monday's average. Butchers, $17.60@17.85; light, $17.00@17.70; packing, $16.85@17.50; throwouts, $16.25@16.75; pigs, good to choice, $14.00@14.50.

CATTLE—Receipts, 21,000 head; native Western steers, 25c higher; prime natives, $20.25, a new record; cows and heifers, strong to 25c higher; bulls, steady; calves closing 25c to 50c higher; stockers and feeders, steady to strong. Beef cattle, good, choice and prime, $15.60@20.25; common and medium, $9.75@$15.60; butcher stock, cows and heifers, $6.75@14.25; canners and cutters, $5.85@6.75; stockers and feeders, good, choice and fancy, $10.25@13.25; inferior, common and medium, $7.00@10.25; veal, calves, good and choice, $17.50@18.00; Western range beef steers, $14.40@18.00; cows and heifers, $8.35@13.00.

SHEEP—Receipts, 25,000 head; market strong to 25c higher. Lambs, choice and prime, $15.15@15.35; medium and good, $14.25@15.15; culls, $9.50@12.50.

Los Angeles, December 3, 1918.

CATTLE—The offerings of choice fed steers continue light and under scarcity the market is steady and firm. Plenty of thin and medium cattle, both cows and steers, are to be had and the market for them is dull and weak.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers........ 8.00@ 9.00
Good cows and heifers.......... 7.00@ 7.50
Canners, per cwt................ 5.50@ 6.00
Calves, per cwt................. 8.50@10.00

HOGS—While the run of hogs to market the past week was hardly so good as the week before, the supply was fair and the quality of offerings very good. Killers were all in the market and wanted supplies and lightweights brought more money.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 275@300 lbs..$14.00@15.00
Mixed, 225@275 lbs............ 15.00@15.50
Light, 175@220 lbs............. 15.50@16.50

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent

SHEEP—The market the past week was much the same as the week before. Killers still have to reach out to get what they want, California, Nevada and Idaho all being drawn on for supplies. Prices steady and choice lots firm.

Per cwt. f. o. b. Los Angeles—
Prime wethers ....$9.00@10.00
Prime ewes .... 8.50@ 9.50
Yearlings .... 9.50@10.50
Lambs ....15.00@16.00

Portland, Ore., December 3, 1918.

CATTLE—Lower; receipts, 140. Steers, prime, $11.50@12.00; good to choice, $10.50@11.50; medium to good, $9.50@10.50; fair to medium, $8.00@9.00; common to fair, $5.50@7.50. Take the Time to Read

"I don't have any time to read nowadays. You see labor is so scarce and I have to work so hard that I'm all in when I get through at night, so I go right to bed."

That's the excuse some farmers give for not keeping up on their reading, but can they really afford to deny themselves this help? Let's see. A cow tester had 28 members in his association, 14 of whom read farm papers. The net profit per cow in the herds of the latter was $33.40. In the herds whose owners did not read farm papers it was only $21.46—a difference of $11.94. Figuring on a herd of 30 cows, this would make a difference of $358.20 per year. Pretty good returns on an investment of $1 per year and just a few minutes' time each day.

It works out the same along all lines of farming, and it may safely be said that the man who won't read is too shortsighted to succeed. No man is too busy to study the methods by which others have made progress; in fact, the most successful men are the ones who are doing this very thing.

Read every page of this issue and see how many plans can be adapted to your needs. Then figure how much you can make or save by putting the suggestions into practice.

Suppose we charged a dollar for this one issue instead of a full year. Wouldn't it be about 100 per cent too low? Think it over after you've digested every page.

WANTED
50,000 HEAD DRESSED TURKEYS
47 CENTS PER POUND
Dressed Turkeys

W. C. PRICE & CO. PHONE KEARNY 1599. 244-246 CLAY ST., SAN FRANCISCO.

We have just sold DRESSED TURKEYS for several of our shippers at the highest price Turkeys ever sold for in the State of California, namely, 47 cents per pound. If you have any large, fat, young or old TURKEYS, we would advise you to dress them nicely and ship them to us by express, or express them alive to us IMMEDIATELY. We shall require the above number of TURKEYS to supply our trade with between now and Christmas, so commence now, and get your TURKEYS and CHICKENS in the best condition possible, and ship them to the old reliable firm

W. C. PRICE & CO.

Use Wells Fargo & Co. tags. Don't fail to mark our name on each tag.

HONEY, GRAIN, BROOM CORN, GREEN DRIED FRUIT, AND GENERAL PRODUCE COMMISSION MERCHANTS.

Established over forty years in San Francisco.

CONSIGNMENTS AND CORRESPONDENCE SOLICITED. Highest market prices and immediate cash returns guaranteed. Produce handled on consignment or bought out right for spot cash. Send us samples of any produce you have for sale stating quantity and price. Any parties making us shipments of Dressed or Live TURKEYS or Wool are at liberty to draw on us as an advance upon their shipments 25c per pound and we will remit the balance of their money immediately after receiving your shipment.

We make a specialty of handling wool on consignment. Would advise you to ship us all you have on hand immediately.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD
send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Schmeiser Manufacturing Co.

12 Mechanic Street DAVIS, CAL.

Manufacturers of

Sure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

K-W High Tension Magnetos are Protected Against Powder Fine Dust-Oil and Water

IN many localities tractor manufacturers find it necessary to equip their tractors with "periscope" air intakes which reach up above the cloud of fine dust. But the Magneto must be mounted on the engine and give satisfactory service under these same conditions. This is one feature that has made the K-W Magnetos the standard on tractor work.

These tractor manufacturers don't worry about dust getting into a K-W Magneto. They know its working parts are protected against even the finest Alkaline dust, and oil and water can't reach its internal parts and give trouble.

The protection of all working parts is only *one* feature of K-W Magnetos. K-W users get quick and easy starting without troublesome batteries or coils; more power out of the same fuel, and continuous, reliable, no-trouble ignition.

If you are not using K-W Ignition now, write us and let us show you how a K-W Magneto will cut your fuel bills and free you from ignition troubles, regardless of the weather or working conditions.

Insist that your new tractor be K-W equipped. Forty tractor manufacturers pay more for K-W Magnetos because of K-W superiority. Write for list of K-W equipped tractors.

THE K-W IGNITION Co.

Special 6 H. P. Tractor for Orchards and Vineyards

—Send for Free Book About It

Hundreds of growers have saved thousands of dollars through the careful purchase of this small tractor especially designed to do special *orchard and vineyard work*. You can do the same.

Send the coupon below for the "TrackPULL Book" which explains these special needs in detail and tells how the Improved 1919 Model Bean TrackPULL Tractor meets them.

Don't buy any tractor built for *general use on farms*, no matter how well known the maker is, until you are sure it meets *your* special *orchard* or *vineyard* needs.

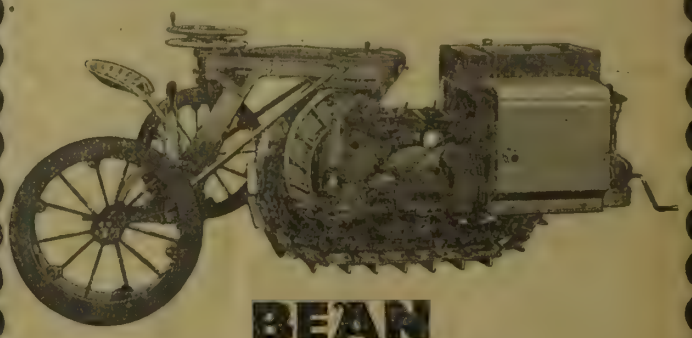
The Bean TrackPULL is built by men who have studied these needs for 34 years and have built machines to meet them.

These Vital Requirements

Your small tractor should turn all the way around inside a ten-foot circle with the tools deep in the soil with full power, the same as on the straight-away.

It should pull easily and steer easily no matter how far *off center* you may hitch the tools. It should "gee," "haw" and turn just like a team, but with more accuracy and efficiency than a team.

These are things that the Bean TrackPULL Tractor does. And 12-year-old boys handle it with perfect ease. Let your boys handle a machine like this and they'll be glad to stay on the place.



BEAN TrackPULL Tractor

Mail Coupon Now

Cut out and mail the coupon below and learn all about this special tractor. The book we send describes the patented single track feature which is responsible for the Bean's unusual action.

This patent does away with pivoting and turning which over strains one side of a tractor. It permits *full power* on all turns and straight and easy driving when the tools are hitched far *off center*.

When men have spent 34 years studying orchard and vineyard machinery needs, they can build the best tractor for such needs. Don't buy any tractor until you know in detail the kind of tractor these men have made.

Send the coupon now before you forget it, and get this *free book* by next mail.

Special Bean TrackPULL Improvements for 1919 made in Motor, Track Rollers, Drive Sprocket, Bearings and Rear Wheels. They add great reliability to the other features of the Bean

Bean Spray Pump Co., 246 W. Julian St., San Jose, Cal.

Hay Eaters Increased Faster Than Hay

"Hey" there, Pacific Rural Press! What's the hay market? What are the prospects for moving the present crop? What are prospects for the next crops?

[Written for Pacific Rural Press by R. E. Hodges.]

FOR THE nation as a whole, a greatly increased hay eating population has a greatly decreased amount of hay to eat. As the hay crops of the previous two or three years were eaten up clean, with practically no carryover, it seems apparent that the increased amount of livestock will eat all of the hay crop and a good bit of substitutes besides. By the so-called "law" of supply and demand, the high prices hay producers have been enjoying were justified and are likely to continue, especially on alfalfa, with no great variation. For the Southwestern States, Arizona, Nevada, and California, whose livestock must furnish the market for practically all of their own hay, the hay crop of 1918 is much more greatly decreased than the hay eaters, and there is strong evidence that an increase of alfalfa hay eaters is already on the boom ready to compete for the reduced crop. The market here was practically bare when the new crop came on, so there is no carryover to weaken the market; and shipping conditions are such that if the entire country were not in a similar condition we could still scarcely hope to bring in hay from other States or countries.

From the detailed facts as stated below, it would seem reasonable to conclude that hay prices need not go down. It seems safe to believe that a demand will develop for the entire production at present or higher prices.

Increasing interest in dairy cattle in alfalfa producing districts may increasingly reduce the expense of baling and transporting bulky hay, but this fall rains have shown a need of better stacks than are common.

Livestock and Hay of United States.

Horses, mules, dairy cattle and beef cattle on the farms of the United States have all increased steadily in number since 1914 and are all greater at the end of 1918 than the average during the five years 1910-1914, as reported recently by the United States Secretary of Agriculture. For the actual number we refer to our livestock columns of current dates.

The total crop of all kinds of hay in the United States was much less in 1918 than in 1917 or 1916. For 1918 it was about 86,254,000 tons. This was as much less than the 1917 crop as the entire production of California, Oregon, Nevada, and Arizona.

But while hay is fairly "fluid" in normal times, and has been shipped by boat and by rail to the Atlantic seaboard, and even to Europe and the Philippines, the past year's shortage of cars and boats has taught us not to expect to base our own market prices to any great extent on the possibility of either importing or exporting hay from the Southwestern States to maintain an equilibrium. Average exports of hay from the United States during the past five years have been less than 100,000 tons, according to reports of the U. S. Department of Commerce. Imports have not quite balanced the exports. One hundred thousand tons would not affect market prices on 86,000,000 tons anyway. Our exports have a good chance of increasing largely when our greatly increased merchant marine gets over its big job of carrying human food. The California Alfalfa Growers' Association is rightly expecting to work up a big export business in alfalfa meal in the future; but can we hope for shipping conditions to change soon enough to move our present hay crop?

Depend On Our Own Hay Eaters.

It looks to the writer as if the Southwestern States would have to depend on our own hay eaters to furnish the market for practically all of our crop. Therefore, we can study our situation safely and principally from the local standpoint. This will have to be done first by looking at conditions up to January 1, 1918, for which we have the local figures, and then consider the changes that have taken place in 1918.

The 1917 hay crop of these three States combined was 6,336,000 tons, 6 per cent greater than in 1916. Now note that hay eaters increased more rapidly than the hay. For all three States combined, the milk cows on January 1, 1918, totaled 712,000, following a steady and rather rapid increase during the past four years. Other cattle totaled 3,255,000 following the same sort of an increase. Horses in the three States totaled 678,000. This was eight thousand more than the year previous, which was the low mark following a steady decrease during the three years preceding. Mules totaled 78,000, which was less than during the previous three years. Cattle on January 1, 1918, represented an increase of more than 8 per cent. Draft stock increased six-tenths of 1 per cent over the year previous, but was far less than January 1, 1916, and still less than in 1915, indicating that draft stock has a general tendency to decline.

The 1918 Season.

For a survey of 1918 up to date we do not have figures for Arizona and Nevada, but we feel that California conditions will fairly represent

EDITORIALS

JOURNALISTIC REFORM.

EVERYTHING is being reformed nowadays and it is quite in the spirit of the times for readers to give publishers their ideas of possible and desirable improvement in the journals they pay their money for. As President Wilson is on the ocean and cannot conveniently arraign us before any of his "war boards" for treasonable shifting our eyes from the dawning glories of his league of nations, we can safely take a couple of winks at the work we are trying to do to make our farming constituency more contented and efficient in the industry which they are pursuing under conditions which involve greater risks and difficulties than American farmers were ever before called upon to face and overcome. Our desire in this publication is to encourage them by spiritual tonics to more resolute carrying of their burdens and at the same time to show them how they can lessen risks and lighten burdens by pursuing better policies and possessing themselves of better agencies and materials, in the pursuit of profitable production. It is unquestionably in this way that farming must be improved to secure for farmers the social, financial and economic standing to which they are entitled and which, for the benefit of all other people as well as for themselves, it is necessary for them to occupy. It is to such attainment that we desire to contribute to the extent of our ability and opportunity.

UNDER A BARRAGE.

DURING the last few weeks we have been under a heavy shower of comment upon the contents of this journal because the publisher in sending out requests for renewal of subscriptions inserted this suggestion:

On the back of this blank we welcome your criticisms and suggestions; also requests for special articles that will be helpful to you.

It was a very fortunate idea to arrange this referendum to readers and there has been a very frank and free response. Most of the shells which have fallen have been filled with honey, which plastered down our artistically flowing locks and filled our soul with conceit, but of such it is needless to speak, for once in awhile there has come one laden with dynamite which has blown off the honey and the hair with it and has purged our soul of all pride. Such a one is this:

Although possibly not qualified to criticise, I think that some of your articles are too much on the rambling order. This is especially true of the editorials: too much "glorious sunshine" and "beautiful showers"! Bring them more directly to the point. The farmers of today are not a bunch of children!—A. B. C., Marysville.

Concerning the rambling length of the editorials, we must say that we are not to blame. The publisher got the crazy idea some time ago that readers liked them and so he reduced the size of the type so he could give nearly twice as much for the money—which is an ideal publisher's ambition. There would be a page full of editorials any way, according to ancient models of a respectable journal's make-up, and those who liked editorials would get more of them and those who did not like them had only the one page to skip—just as they always have done since Pharaoh made Joseph food administrator and started the Crocodile to get the Nile farmers to grow more wheat to win the war. And so in the current recrudescence of Egyptian policy the publisher has been pleased, those who hate editorials have not been hurt and only the editor has suffered, as he ought to suffer for being one. If A. B. C. had been brought up on Long Primer and found himself in his old age required to stay away from the movies to write the full of a page of eight-point, we have an idea he would ramble some and might even call upon sunshine and showers to cover him!

THE GLORIES OF OPTIMISM.

FOR FEAR we should ramble more outrageously than we usually do, we dare not let ourselves go in defense of optimism, which our critic evidently arraigns in his reference to sunshine and showers. Optimism is what makes life worth living. Optimism in the soul is a foretaste of heaven. Optimism in daily life is the only sure defense against discouragement and defeat in whatever undertaking is entered upon. Optimism is the best weapon with which to deliver sharp strokes at injustice and wrong and to defend that which is fair and right. It is optimism which thrusts sharp points between the joints of the armor of Beelzebub. In all these ways optimism is indispensable in editorial writing, which is the interpretation of current fact and thought into terms of immediate and concrete significance to whatever constituency is addressed. Optimism is the staff of life, with which the editorial writer steps forth valiantly upon the dreary wilderness of eight-point type, confident that "beautiful showers" will transfix diamonds upon all the points and "glorious sunshine" will illumine his pathway with their coruscations. And if it were possible to fill the page under an eclipse of optimism, who could endure the reading of it?

On the other hand, our critic arraigns us for writing as if for children. He pays us a grand tribute of praise which we sincerely wish we could deserve. We try to write as if for children, for they are the world's optimists; but we cannot accept praise for attainment which we do not reach. We can only aim at such approximation thereto as is within our grasp, but we do sincerely rejoice in that measure of optimism which makes our writing offensive and unsatisfactory to the "cock-sure," the "know-it-all" and the "know-too-much-already," who cannot learn by suggestion and indirection and who refuse all challenges to think for themselves—because they are no longer children! If we could successfully write for children, we surely would let all irredeemable supermen go to their disgraceful deaths unvexed by word of ours. For all proper men and women are children and remain useful to the world because some light of childhood's optimism is still agleam in their souls. Youth is the birth of optimism and optimism is youth. Remember what Bulwer said:

Every street has two sides, the shady side and the sunny. When two men shake hands and part, mark which of the two takes the sunny side: he will be the younger man of the two!

THE RAMBLING OF IT.

BUT THOUGH we defend our optimism and though we choose to try to burn problems into the thought of readers with a sunglass and to wash away the ashes of fallacies with showers, even though this process requires more space even in eight-point type than sententious and dogmatic comment would require, an entirely different philosophy underlies our requirement of statements of adequate length from our associate writers who deal with what are called the practical affairs of agriculture. To our notion a satisfactory announcement of an agricultural fact is one which sets forth details enough to enable the reader to discern the relation of the fact to his own conditions or desires or to appreciate that it has none. A satisfactory description of a process or method must go farther still. It must not only show the relations which the fact embodies, it must proceed with details enough to enable the reader to compare the method or process with his own, if he is working in the same line, and to apply it to his own operations if it seems to appeal to his judgment as in some respects a better way to pursue enterprise or production. Now, if a man reads only for pastime or for somnolence, such careful descriptions of method and serious discussion of results may naturally interrupt the flow of his thoughtless running over of words, or it may irritate him into vexation which will banish repose. We do not try to cater to a reader who resorts to the printed word for pastime or for sleep. For such a reader the Farmers' Almanac of fifty years ago has never been improved upon and we shall never see its like again. We aim to print things which will keep a man awake by laying before him facts of California farming which are significant, impressive and progressive and will carry their own exhortation to live better, work better and die richer than he otherwise would. This is the purpose which our associate writers have constantly in mind when they take up the discussion of subjects in the particular lines of which they have special knowledge and understanding. They constantly endeavor to set forth not only things which are true and of good report but to teach the reader how to do the things by setting forth method and measurement so that even the wayfaring man, if he is not a fool, need not err therein. Our judgment is that their articles, even when the nature of the facts and details of method require some length in discussion, are well planned, systematically pursued and definite in arrival at results which practical men need to know and desire to pursue toward fuller success in the operations in which they are engaged. It rests wholly with the reader to skim such articles if he only desires general facts about lines which he is not definitely pursuing, or to resolutely dig into them to turn the latest special knowledge to helpfulness in his daily work. It is therefore not our design to furnish the reader a weekly scrap-book of yellow farming, but to constitute our journal an encyclopedia of California agricultural practice from which the purposeful reader can safely enter the pathways of successful experience at advanced points and not be obliged to start at the beginning and disprove for himself all the original notions which are always watching a chance to exalt the conceit and depress the purse of every beginner who is fool enough to think that knowledge was born with him and is destined to nestle in his coffin.

WHAT THE READER CAN DO TO HELP.

THE BEST THING the reader can do to make this journal better is to keep on criticising it. We shall put up something of a defense now and then, but that is simply to try out things and give other readers a chance to see a fight. Now that the great war is over, we must do something to keep up our fighting spirit or the anarchists will walk over us. Optimism is the logical enemy of Bolshevikism. When the publisher gives you a chance to kick, lay hold upon it and kick with both feet. If our present brand of optimism cannot stand the impact, we will order some other kind. And another thing to do for improvement is to take hold with us in the editing. Slam as much as you like and then send along some fact or method or any kind of a notion of yours which will make the paper better. We do not need crankism, nor visionism, nor "good things," social or economic. We can hatch out ourselves more things on those lines than the paper ought to carry. Our notion is that it will make the paper better to have more advice and information on farming policies and practices from those who have demonstrated them by their own experience. It is our wish to set forth less of the academic and bureaucratic aspects of farming and more of wisdom from men and women who are actually doing the things about which we ask them to write and which make them glad or sad by the results attained. This journal has a constituency of something like thirty thousand families which are made prosperous or otherwise by the kind of farming they are doing. It is a serious matter to enter that number of families in the capacity of industrial doctor and furnish information upon which possibly a hundred thousand lives are more or less influenced and directed. This journal has been actuated for nearly half a century with an earnest desire to guide aright in efforts for profitable production, which constitute our special scope and opportunity. We need correction of all statements which may mislead, eluci-

dation of all that may be obscure, contribution of every fact or method which may be truer or better than those we record. We would like to have a thousand editors scattered throughout the State who would feel a certain personal responsibility in keeping this journal true in its convictions, correct in its statements, helpful in its advice and acceptable in its forms of utterance. A thousand editors can only be had by co-operation with subscribers, and to this source we make appeal. Can we not, even at some little inconvenience to themselves, have a thousand editorial subscribers who will help us keep this journal right in its leadership and worthy of California?

ANOTHER FARM LABOR CONFERENCE.

WE HAVE received courteous invitation to attend a "Second Farm Labor Conference" to be held under the auspices of the State Council of Defense and the U. S. Department of Agriculture in the Ferry Building in San Francisco on December 18 and 19—beginning presumably at 10 a. m. on the first day, for no hour of assembling is stated. We have perhaps been in error in previous comments on these conferences in assuming that they were intended to be conferences of farmers on farm labor and therefore protesting that as farmers were outvoted by non-farmers there seemed to be little reason for farmers to pay attention to them. They are not intended to be farmers' meetings and therefore our objections to the voting was misplaced. The announcement of the meeting for next week is explicit on that point, as follows:

Since farm labor problems are not the exclusive concern of farmers but co-ordinate with the interests of the general public, and further, since in attempting to obtain remedies a test of possible opposition is valuable, and still further, since there are enough organizations operating solely for farmers' interests, therefore the committee considers a wise course to be the one resulting in representation of all interests—the farmers, workers, agencies supplying farm labor, and the general public. Voting on resolutions and motions will be confined to accredited representatives.

It is not stated what sort of organizations are entitled to accredit representatives, except as it may be implied from by the foregoing. On that basis it is hard to see how anyone claiming to be accredited by the "general public" could be prevented from voting. To this there can probably be no reasonable objection, as the conference does not claim to represent anybody in particular, and we presume we may cordially invite all our readers to be present.

The meeting is sponsored by a good executive committee, viz.: Frank T. Swett, J. P. Dargetz and R. L. Adams, all of whom are well known to our readers. The meetings are not definitely programmed. The first day is expected to be chiefly given to reception of reports on labor requirements and estimates of prospective labor supply and the second day to debating whatever resolutions are submitted by those who attend. The main purpose of the second conference will apparently be to pass upon proposed action by the incoming Legislature. It will be a good chance to get wise on what is in the wind in the way of labor regulation and even though there are "enough organizations operating solely for farmers' interests" it would be very wise to have as full representation of farmers as possible, even if it be only for the purpose of seeing what they will probably be up against this winter.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

No Jokes on Morning Glory.

To the Editor: Your reply, "Morning Glory from a Tenant's Eye," in your issue of November 30, is facetious but not very instructive. Morning glory is no joke—that is, in this county. Suppose one has a quarter of an acre of the pest on an otherwise "clean" ranch, what method would you advise to eradicate it, even though it were necessary to lose the use of the patch for a number of years? Would this not be better than trying ineffective remedies and taking chances of having the weed distributed over a larger territory? In other words, what do you consider the best and cheapest means of absolute eradication, entailing the shortest period of loss of use of the land?—A. S. C., Ventura county.

We do not like to explain our facetiæ, for it either reflects on the perspicacity thereof or it causes us to lose a dollar from an indignant subscriber. Still an editor has sometimes to take desperate chances. We made no joke on morning glory. What excited us was the fact that last summer, when there was a chance to get in a good fall's work on morning glory, either with a weed cutter or plant poison, we gave full particulars of the way to do it either way. Why, then, after the plant has shot its seeds and fortified its roots for the campaign of 1919 and gone into its subterranean winter quarters, wherever frosts are sharp, should we be asked to attack it? The joke seemed to us to be on the man who does his farming that way, and it has always been almost a standing joke among land owners that no matter how clear the lease might be about keeping morning glory down, most tenants become glory-blind after the leases are signed!

It is not now a good time to kill morning glory, not only because the plant is dormant in most places and most resistant of plant poison, but because the poisonous substances you may apply are most likely to be carried by water movement in the soil and to kill whatever plant or tree they reach. Next spring and summer, when treatment will be most effective and least dangerous (perhaps, although weed killers, which are not vapors, remain dangerous to other plants for a long time), we will return to the subject and describe how morning glory can be kept down without killing the land. As for easy, practicable and permanent eradication of the plant, even with killing the land, we doubt the existence of it.

Oranges or Eggs, or Both?

To the Editor: I have an orange grove of which one acre is very hilly and hard to irrigate and I cannot get water enough into the ground for the trees to do well, as it slopes both ways. I now have a cover-crop on it. I am thinking of plowing it about February and putting in alfalfa, furrowing it out the same as for the cover-crop. Must alfalfa seed be worked in before furrowing out? The soil is heavy and I make double checks to each tree. Can I cut the alfalfa green and let it lie to act as a mulch and give it lots of water and then disk it well in the spring. Do you think the trees would do better? Of course, I could neither cultivate nor plow it. I want to turn the place into a chicken ranch, as I am very successful with hens. I can make one dollar and better on each hen per year with good care. What do you think about it?—Subscriber, La Verne, Los Angeles county.

In putting in alfalfa, get the land all fixed up to distribute the water and work the surface down fine before seeding. Do not "work the seed into the soil": it is too small a seed. It should be covered with only a light raking or brushing. Test your grades with water to see if it moves as you desire, then rake lightly and sow the seed all over the surface.

As your orange trees on the crest are not doing well and not likely to do well, under the conditions you describe, you do not risk anything by going in for the hens, which you are reasonably sure about. Whether the orange trees will do better or worse than they do now when they have to take up a fight with the alfalfa, you will have to determine by experience. They may do much better when they grow under a good mulch and with the contributions which the hens will make, than they can on the sun-baked clay of the crest which is now putting them on the blink. We do not count on your getting much alfalfa, but there may be plenty for hen pasture and for the mulch. Neither do we expect you will get very big orange trees, but they may serve a good purpose as parasols for the hens. We like your proposition. You ought to get shekels from the hens and a war cross from your neighbors for making a pretty green hilltop for the admiring tourist.

An Edible Nightshade.

To the Editor: Please tell me the name of the sample of berries I am sending you and whether they are poisonous. They are growing quite profusely in the garden among the grapes and dewberries. We used to make fine pies of them in northwest Iowa and they called them "nightshade" there. What is the difference in appearance of these and the "deadly nightshade"?—A. H., Modesto.

Deadly nightshade (Atropa belladonna) is a much stouter plant, with large leaves, having more the aspect of a tobacco plant but not so large in leaf and stature. Your plant is small-leaved, slender and vine-like in its growth. What you have is Solanum nigrum, or one of the varieties of it, of which there are several. Its common name is "garden huckleberry." In parts of the country where fruit is shy much use is made of berries, as your Iowa recollection indicates. Mr. Burbank gave some attention to the plant years ago and one of his varieties was widely distributed as "wonder berry." We never had much taste for "nightshade," deadly or otherwise, and in California, where so much better pie timber is abundant, we should count it as a weed—but that perhaps is a matter of taste.

Want a Good Position?

Are you free to travel? Have you an automobile? Are you convinced that the Rural Press is the best paper of its kind on the Coast and that it should be in every farm home?

If so, we have a good position to offer you in our circulation department. Pleasant work, attending to our renewals and securing new subscribers.

Straight salary; permanent work, with advancement. Lack of experience no barrier. If you are a live wire, are willing to learn and want to make more money, let us tell you how to do it. Our offer is a liberal one.

Running Away from Bermuda.

To the Editor: I have a ten-acre Muscat vineyard two years old. Bermuda has got very bad on two acres. I want to get rid of the Bermuda. Can I transplant the vines from the Bermuda to other parts of vineyard? If so, would it set them back one year?—J. L., Raisin City.

Yes: for a year at least because any fruit that appears next year should be cut off for the sake of better establishment of the transplants, which will require very good treatment to catch up with the others by 1920. You will also have to be very careful indeed or you will transplant the Bermuda also. If root pieces an inch long go over, you will soon have Bermuda all over the place. It is possible to come through all right with what you propose, but we would rather fight the Bermuda where it is among the vines or burn the vines and let alfalfa fight the Bermuda. Policies are involved over which there may be much reasonable disagreement in judgment.

Apples Needing More Time.

To the Editor: I have several apple trees—of fine, healthy growth, but they are almost barren of fruit. They are of the Pearmain and Newtown Pippin variety. For two years past little if any blossom and about a half dozen apples on each tree. Fruit seems perfect and the trees in the healthiest condition. Trees are about five or six years old, coming into bearing two years ago.—F. W. M., Pozo.

Your trees are only about old enough to begin bearing. Their indulgence two years ago was just for your encouragement and to demonstrate to you that the nurseryman had furnished you trees true to name. As you have taken good care of them and induced them to make lots of wood growth, they are probably waiting to give you plenty of fruit later. Bearing at three years old is frequent with apricots and peaches, but apples are to be expected to be slower about it.

Pruning Persimmons.

To the Editor: I have three acres of persimmons in good bearing. The trees seem to grow too tall in the center. Should they be cut back?—C. R., McFarland.

Yes. The persimmon is not usually a strong grower after it begins to fruit heavily, but it needs to be kept down to reasonable upward extension and side branches should not be allowed to run out too far to carry the fruit. It is easy to keep a persimmon to a shapely, serviceable form and whatever cutting is needed can be done at any time after the leaves fall—probably at other times also, as the necessity appears—without apprehension of injury to the tree.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., December 10, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	2.86	10.46	11.98	60	36
Red Blur	1.34	14.06	6.90	60	30
Sacramento	1.40	7.17	4.62	60	34
San Francisco	2.28	10.58	5.15	60	44
San Jose	.76	9.61	3.91	68	30
Fresno	1.36	3.75	2.44	72	34
San Luis Obispo	1.58	7.05	4.10	76	42
Los Angeles	1.46	3.96	2.88	78	46
San Diego	.92	3.51	1.69	72	50

Dean Hunt Brings Lessons from the Front

Written for Pacific Rural Press

Dean Thomas F. Hunt, who has just returned to the University of California from France and Great Britain, where he has been with the Agricultural Mission appointed by Secretary Houston, met the staff of the College of Agriculture for the first time since his return on Tuesday evening, December 3, in Hilgard Hall, at the University of California. There was a very large impromptu gathering of instructors and their wives, and a most enthusiastic "welcome home" was extended to the popular agricultural executive of the University. Accepting a pressing invitation to tell them of his recent experiences, Dean Hunt spoke informally of things of the widest interest, of which we prepare an outline for readers of the Pacific Rural Press.

ON THE 13th day of October I stood at Hatten Chatel, which until a few days before had been the chief lookout for the German army in the St. Mehiel sector for four years, and watched, or more properly listened, to the Americans and Germans pounding each other with their big guns. On the 11th day of November I stood on Broadway and watched the roof go off New York and listened to the roar of a peace celebration which resounded around the world.

Do you wonder that, after viewing the spectacle of the war, more particularly the results of the war on the British, French and American fronts, that this sudden transformation leaves me a bit dazed?

One day, after our party had been examining a mine crater, 150 feet across, 80 to 90 feet deep (it was only one of a string of such craters extending along what in 1916 was the German front, a line that had been taken and retaken by the contending armies three times), a British officer said quite simply: "This is sacred ground to us. Most of our friends were killed here." He had also been there, a fact of which he made no mention. This whole battlefront is sacred ground to every right-minded man, whether he was there or not. To talk about it and especially our part in it, of which we have the right to be proud, seems at this short distance from the event, like sacrilege. It is like putting away mourning before the funeral is over.

Recognizing the heroism, the sacrifices, and the great power of resistance displayed by our allies through four long weary, wasting years, and never forgetting theirs was the major part, we may give silent thanks that we occupied so honorable position in the final victory.

A DATE PROPOSED FOR "VICTORY DAY."

Several dates have been proposed as the day for an annual celebration. I venture to suggest that the most significant date of all the memorable days of this war was July 18, 1918, when at Chateau Thierry, after three days in which hell itself was unleashed, the tide was turned. The attitude of mind of every man, woman and child in France changed on that day. The French nation felt it had been delivered. Without letting up in the slightest degree their military activities, they began to resume their former life. It was not so much any change in outward action as it was in mental attitude. They did not reason it. They did not give voice to it. But by some divine gift they silently sensed it. The future of the world had at last been saved from the domination of a nation whose chief tenet is that to show consideration for your fellowman is a sign of weakness.

We now celebrate July 4th. France celebrates July 14th. Hereafter we should combine to celebrate July 18th, that final date when the combined armies started the Hun back to a place whence he shall never hereafter be a menace to the world.

We are not after vengeance. But we do intend that our children, and our children's children, shall not be made to suffer the cruelties and barbarities that have been practiced during the past four years.

DUTIES THAT FOLLOW VICTORY.

My chief reason for being gratified with this recent experience is that it has given me a fresh body of knowledge with which I may hope to aid you carry on this enterprise that has been committed to our care. Under any circumstances, the opportunity to study the farming methods and the agricultural policies of two great nations like Great Britain and France would be the opportunity of a lifetime. But to do so virtually as guests of these nations at a time when the food supply was almost the most significant factor in determining the future history of the world was a privilege that one may be pardoned if he speaks of it with some emotion.

PROBLEMS OF THE FUTURE.

As I have indicated, however, I am at the moment most concerned about the future; about our own future—that future which you have been so loyally and effectively promoting. Ours is an institution with a background. A most worthy background it is. Let us be thankful that our future problems are not without difficulties. If they were easy, they would not be worthy of our effort.

You have problems of research. You have problems of instruction. You have problems of leadership in promoting those State, national and even international agricultural policies which will safeguard both the welfare of the farm home and the needs of mankind. There has never been a time when these two factors have been so interdependent or so world-wide in their significance.

As you will remember, just prior to the declaration of war, you had put in motion the machinery through which you proposed to re-examine the methods of dealing with our several activities. It is not my purpose on this informal occasion to enter into any discussion of these problems, but rather to express the hope that with the new inspiration which has come to all of us, we may return to the study of our basic responsibilities with new energy and fresh enlightenment.

AGRICULTURAL NEEDS OF THE ALLIES.

It is the general consensus of opinion among French authorities that they will need in 1920, and perhaps for one or two years thereafter, to import wheat, frozen meat, wool, farm machinery and commercial fertilizers in greater quantity than before the war. Various authorities discussed the following seven staples as probably needed by Great Britain in 1920 in greater quantity than in pre-war times—namely, wheat, meat, sugar, coffee, feeding stuffs, wool and cotton. All observers insist upon wheat as the cheapest and most concentrated import food.

Perhaps the most immediate steps to be taken in provisioning the people of Europe, is to provide suitable shipping space for frozen and chilled beef. The stocks of wheat in Europe are ample for the immediate needs of the allies. Now that the war is over, there should be no difficulty in replenishing these stocks from North and South America and Australia in ample time to meet all needs. The distribution of meat and meat products, which has became a world-wide problem, is one of fundamental and lasting importance to the American farmer.

DEAN THOMAS F. HUNT.
Dean of the College of Agriculture and Director of the California Experiment Station, University of California.

WEATHER CHIEF FACTOR IN FARMING.

The weather is the greatest single factor in the food supply of the world. Sufficient attention has not been paid to this factor. No one would maintain that the conditions were favorable throughout the world for the production of wheat in 1915 from the standpoint of labor. And yet there was gathered the greatest harvest that has ever been obtained. This result was secured notwithstanding Australia had one of the most disastrous seasons in her history. North America produced in 1917 at least 550,000,000 bushels less wheat than in 1915. Although without any doubt just as extensive effort was made to produce it. In other words, weather conditions caused a drop in production equal to over one-eighth of the total world's supply of wheat.

No one can determine with any degree of accuracy, how many years it will take to reach the normal balance of food supply, because no one knows what the weather is going to be. Two unusually abundant crops of wheat in succession might fill the granaries of the world. Three lean seasons may continue the food shortage for five years. The greatest dangers to be anticipated, however, are:

I. Difficulties of transportation and trade, and

2. Inability of individuals through disturbed conditions to employ their time to economic advantage. The former may cause local shortage of food. The latter an inability to purchase it. Among our allies there is a real shortage of sugar and of fruit, the former for well-known reasons, the latter on account of a disastrous fruit season. One season may be sufficient to bring the supply of fruit back to normal, but only a very unusual set of circumstances can bring the supply of sugar up to normal within the next two years. Restrictions in the use of other articles of food in the allied countries at the close of the war were not due so much to a shortage in the supply as to a lack of transportation or to a fear of future shortage.

SAVE FOR THE SAKE OF THE CHILDREN.

Every one should continue to economize in all reasonable channels. It is the way to pay for this victorious war promptly without undue distress. It is the way to make the victory doubly victorious. Otherwise Germany may yet win an economic victory. Economy in clothing, housing and certain forms of recreation are more important than economy in food consumption because it is not possible to save to the same extent upon the latter. It does not matter much what a person past middle age eats, so long as he does not eat too much, but it does matter what a child eats. Children should have abundant nourishment, and that of the proper character.

As never before, governments have come to undertsand that the strength of a nation depends upon the health and the education of its people. Brick and mortar no longer fortify a nation. The mind and spirit of a physically sound people are the factors that win whether in war or in peace. It is now becoming clearly recognized that the maintainance of the health and education of its people are most important functions of government. Without health, without education, an individual is helpless. Disease and ignorance are a menace to society. They form the keynote of Lloyd George's after-the-war domestic policy as outlined in his great Manchester speech. Certainly one of the most fundamentally important speeches made by a prominent public man during this war. If I seem to have emphasized this point unduly, it is because of the observations of the past three months to which more concrete allusion would not be proper.

(Concluded on page 655.)

Who is Farming the Farmers?

"Woman Farmer" relieves her mind for the Pacific Rural Press

QUOTING from an article in the current number of a certain magazine which seems to be a mouthpiece of the Food Administration, "He" (the farmer) "is free to grow food or not as he pleases, to sell where he pleases, and for as much as he can get anyone to pay. Obviously there is no use to try to fix retail prices if prices at the farm are to remain uncontrolled."

A WOMAN'S CONVICTION FROM EXPERIENCE

After having been a farmer for almost twenty years, I sincerely believe that the farmer is deliberately manipulated and exploited. He is allowed to have a fat year just about often enough to keep him in the business. The "fat years" are widely advertised, but do you hear anything of the many, many lean years? The farmer is a good, patient loser and has the saving grace of hopefulness.

HOW ABOUT RICE?

Is it not true that the price of rice is controlled this year, and that the grower of rice in this country is allowed 4½ cents a pound for his year's work, and each middleman, from the cleaner to the retailer, is allowed two cents a pound until the price to the consumer is from twelve to fourteen cents a pound? Is it true that one of these middlemen can buy and sell that rice from the warehouse by letter, telephone or telegraph, without the expense of handling the rice at all, and, protected by the Food Administration, receive one-half as much for his effort as the farmer receives for his year's work and great cash outlay?

AND THEN BEANS.

Beans were subject to some control last year and none this year, and those of us who raised beans know how it worked out. There were 300,000 sacks of 100 pounds each, or 30,000,000 pounds of beans allowed to come into this country from Japan, duty free, before the American farmer's bean crop was ready to harvest. Was the price to the consumer lowered and if so to what extent? Prices to growers of cotton were not controlled, but certainly no foreign cotton was allowed, duty free, to compete with local cotton. Had it been, it would have been interesting to note whether the price to the consumer was less.

In order to even up on an all too scant crop of fruit this year, and partly to comply with the urgent request of the Food Administration to "raise food stuffs" beans were grown between the fruit trees on a farm in which I have an interest, resulting in a harvest of several tons. My neighbors raised several hundred tons. As I write this, on November 15th, the American farmer cannot get an offer of one cent a pound for his beans, and has the choice of either giving them away or going to the expense of providing storage and insurance. If he chooses to store them, a wail ascends to high heaven, "just look at the grasping farmer, holding his beans for high prices!" And what about protecting the Japanese shipper in preference to the American farmer? Was that done to "spank" the farmer because the Food Administration was barred from regulating the price of his produce? Last year the price of beans was controlled somewhat, and the farmer was able to sell his beans immediately for a fair price, but only such beans as the government happened to want. Those farmers who had a variety of bean that the government did not happen to want received nothing for their beans and were obliged to store. The commission men will tell you now that the reason they are not in the market for beans is because the farmer is still holding his beans from last year for higher prices! All the farmer wants is a return of the cost of raising his crops, plus a fair profit. In some districts which were favorable to the growing of the variety of beans desired by the government, the growers had in a large acreage and made a good profit. This was trumpeted far and wide, said trumpeting having an object.

COST OF GROWING A CROP.

The price to the consumer has been the same, practically, before and since the influx of foreign-grown beans. If prices were gauged by what the farmer receives for his beans, dear consumer, (granting that the middleman must be taken care of) you should now be buying your beans for about five cents a pound, allowing nothing for the farmer and about a cent a pound for the several middlemen. Farmers were asked to grow barley in order to release wheat to our Allies. Can he sell his barley now for enough to cover expenses? He cannot!

Unless you have been a farmer you know nothing of the labor and anxiety attending the production of a crop of even the lowly bean. The decision of what to plant is left to the farmer, and it is momentous for it means success or failure for the whole year. Then the selection of seed, usually at double or treble the price he receives for the same product; the cost of labor attending the preparation of the soil, sowing, irrigating, cultivating, long hours of hard labor in the heat, cost of harvesting threshing hauling cleaning, and if expected to give away their year's work as this year there must be added the cost of storage and insurance, and in many cases interest on money invested. Incidentally the farmer pays $75 and up a month for regular farm hands now as against $40 per month five years ago and receives less work for the money. All other expenses are in proportion.

THE FARMER'S UPS AND DOWNS.

When entire crops are destroyed by storm or drought is the consumer's first thought of the farmer who has lost his entire year's work? Rather it is "there will be a shortage this year and I suppose the prices will be higher."

After an exceptionally good year the farmer may build a new house with modern conveniences, or buy an automobile, or send his children to college. Immediately propaganda will be started to the effect that the farmer is getting rich too fast and something must be done to that farmer forthwith to make prices lower to the consumer. Things are done to the farmer all right, but not to the benefit of the consumer. Don't you know that the farmer is like everyone else, in that he has his dream of some day owning what, to him, is the most desirable thing in the world? Sometimes it is cherished through many years of the hardest kind of labor to culminate in a nice new house with modern conveniences, such, dear city people, as you use every day without thought, at a small rental.

WHAT OF THE FUTURE?

It would be an interesting education if every consumer would secure authoritative information as to what the farmer is paid for food products and compare that price with the retail price. And now there is talk of putting our returned soldiers on farms! God grant that they be spared the humiliation of being first exploited and then condemned!

The prospect of our next legislature acceding to the demands of union labor and putting a super-tax on the untilled land with the object of compelling the farmer to till the soil for the employment of labor at a high price, ought to arouse the fighting blood of every farmer. What is to be gained by tilling more soil if the crops from soil now under cultivation cannot be sold at a small profit?

Anent these food commissions, etc., scattered over the country for the benefit of the consumer. The farmer should by all means be in the majority on such commissions, but the fact is that politicians are in the majority, both men and women, with labor well represented, and an occasional farmer. The services of many bright men and women farmers are available but they are not asked to serve. Is it through fear that the farmer may receive adequate returns to the detriment of those who are now preying on him?

Almond Growing in the Paso Robles District

Written for Pacific Rural Press by John J. Fox

THE district around Paso Robles bids fair to become one of the important almond growing centers of the State. There are now nearly 7,000 acres set to almonds in this vicinity, nearly 1,000 acres of which are beginning to bear nuts. The district at present comprises Templeton, Paso Robles and San Miguel. We recently visited Tom Henry, ex-horticultural inspector, who resigned from the commission to take over the management of the White Sox Ranch near San Miguel, belonging to Chas A. Comisky & Co. He has set out 224 acres of almonds, one-half of which are Nonpareils and the other half Ne plus Ultra and Drake's Seedlings in equal numbers. He says the Ne plus Ultra blooms from three to four days earlier than the Nonpareil, while Drake's are three to five days later. The rows are interplanted so that cross pollenization may have the best chance, with rows set across the prevailing wind.

ALMOND ROOT BEST FOR THIS SECTION.

Mr. Henry says that all his trees are on almond root as it has been found that the peach root does not stand the chalk-rock soil so well. He gave dates of blooming from his record of 1916, which were as follows: Nonpareil blooms from February 17-27; I. X. L., from February 14-25; Ne plus Ultra, from February 13-23; Drake's Seedling from February 20 to March 5, and Texas Prolific from February 25 to March 10.

The white Sox ranch, about six miles east of San Miguel is a new one for almonds but situated in what Mr. Henry says is a safe location. We asked him about the Ne plus gumming and he told us he had made a very careful study of the matter in the Paso Robles district and although this variety is a little shy compared with the others, the only gumming he has noticed has been where there has been a clay sub-soil or poor drainage. Where the soil is well drained, no gumming is apparent.

He said that in the bearing section, almonds were yielding 1,500 pounds of nuts to the acre at eight years old. We saw samples of the fruit which was well-filled and of good flavor. The Mission Almond Orchard Company has 250 acres of almonds east of San Miguel.

ORCHARDS WEST OF PASO ROBLES.

Wm. H. Goodale took us over his 15-acre orchard, one and a half miles west of Paso Robles, at 1700 feet altitude. This orchard is only one year old and is in Peach Root and is made up of Nonpareils, I. X. L., and Ne Plus Ultra.

The young trees have made a good start and Mr. Goodale told us that peach root seems to make a better start than almond, but after the trees are established the almond root is believed to be the better of the two. G. N. Talbot has a fine 500-acre orchard some 12 miles west of Paso Robles, four and five years old, and P. S. Brown has 450 acres. Paderewski, the famous pianist, has 200 acres in almonds, three years old besides pears and walnuts.

THE EL POMAR DISTRICT.

This lies about four and a half miles southwest of Templeton and has 2000 acres set out and some of it coming into bearing. Mr. Nehrhood took us around this district and the trees show excellent growth and condition. The Bowers tract has 594 acres set to almonds, four years old, that was as good as any unirrigated orchard we have seen. In some sections we noticed that prunes had been set up to a certain line and this has been done, Mr. Nehrhood told us, after careful surveys had been taken of temperatures and air drainage, so that prunes had been set out where there was any likely danger to almonds. This is a business-like way of proceeding, as it is calculated to prevent disappointment in the future or the necessity of working the trees over to prunes as has had to be done in sections where temperatures have not been mapped. Both prunes and almonds showed good growth and careful attention in pruning and cultivation. The trees are headed low and are symmetrical and even. The Nonpareil is the principal variety grown here with some Drake's Seedlings and Texas Prolific as pollinizers.

The prunes we saw in the draws had, some of them, made five to six feet of growth in their third and fourth year. The foliage was still a good color (the first week of November).

A PROMISING OUTLOOK.

When the immense area now planted all comes into bearing, the nuts turned out from the Paso Robles section will be a factor in the market. As in all other almond sections there are some orchards planted that are in unsuitable locations and sooner or later these will have to be worked over or dragged out. But after having been over both roads as far west of Paso Robles as Adelaide, and southwest, through the El Pomar district, we can say we have seen some very promising young almond orchards and that, generally speaking, great care has been exercised as to their location and management.

Growers here are interested with regard to keeping up the fertility of their soils as in other sections and will have their own problems to work out in the handling of cover-crops when the rainfall averages about 17 inches. They will begin by sowing cover-crops (after the natural weed seed has run out), and will practise early plowing to conserve their moisture—say March first. On this adobe chalk-rock soil nothing is to be gained by too frequent cultivation. From the condition of the best orchards, present methods seem to answer well. When the missing links in the State Highway have been coupled up, this pretty section will become better known.

Grape Shipments Heavy—Modern Marketing Methods

Written for Pacific Rural Press by John J. Fox

Grape shipments to the Eastern markets from our California vineyards exceeded in tonnage those of all the other green fruits combined, as appeared in a special panel of our issue of November 23. In our search for the reason for this, we called on George H. Cutter, president of the California Fruit Exchange, and learned from him not only an explanation of the increased demand but the manner in which the prices had been stabilized, even in the face of increased transportation charges and difficulties due to congestion of traffic caused by troop and army supply movements this year.

TWO EXPLANATIONS.

We noted that grape shipments had risen from 9,721 cars in 1916 to 13,111 cars in 1917 and 16,238 cars (with still some to go) in 1918 and that prices had been satisfactory to growers. Two explanations were forthcoming. The most important one was, that new markets had been established in a way we will explain later. The second reason is that many wine-users in the East to avoid the inconvenience that wartime prohibition may bring about, have been buying grapes in quantities sufficient to make their own wine for family use. To many foreigners in this country, a glass of claret constitutes a part of their daily ration and for this reason more wine grapes have been shipped to Eastern points than ever before. Alicantes and Zinfandels have been in good demand and they have been shipped in lugs, unpacked and in some instances uncovered, though New York regulations demand a cover to the package.

As showing the purpose of buyers, many wine grapes, particularly Missions, have sold at a higher price per lug box than eating grapes—75 cents, unpacked. Fifteen years ago $15.50 a ton was the highest price obtainable. As noted in a recent edition of the Pacific Rural Press, not only grapes, but many other fruits were sent forward in lugs unpacked, owing to the shortage of labor. The unpacked grapes have "taken on" in the East and this new departure will be developed to the advantage of producer, packer and consumer.

SAVE IN COST OF PACKING.

For the cost of interior containers will be saved as well as the cost of packing and the condition of the grapes on arrival at their destination is a vast improvement on the crate-method because they can be packed as they are picked in the vineyard. This saves one handling. It permits the packing of more fruit to the box and with less loss, thus obviating unnecessary expense to grower and packer. And it comes to the consumer at a lower price and more perfect condition. Another big advantage that is most important is, that the fruit can be started on its way to market twenty-four hours earlier.

We then asked Mr. Cutter to enlighten us on standardization of fresh fruits and the development and care of markets. He said that fifteen years ago it had been common for shippers to get "red ink" returns due to (a) uneven or otherwise imperfect fruit, (b) rushing fruit on to flooded markets—and, (c) length of time consumed in transit of shipments. Uneveness of quality and pack served to take money away from the shipper. Poor portions of the pack, where large and small fruit was included in one package, were not wanted. This reduced the price in the whole package, while the shipper had to pay freight on the whole. Fruit was packed too green and there was not the confidence in the pack. It formerly took from fourteen to twenty-seven days to get the fruit to market and sometimes five consecutive days shipments might arrive at that market all the same day. As there was no standard, green, ripe, large and small fruit spoiled the equanimity of the market—spoiled it for the whole.

REASONS FOR IMPROVED CONDITIONS.

Since five years ago conditions have improved throughout the whole industry. Standard packs have been either adopted or improved. Markets that formerly took from fourteen to twenty-seven days to reach Chicago and New York are now only ten to twelve days away.

The improvements added by this means are, that fruit can be better matured and sugared before it is packed. The markets can be gauged so that daily supplies can be supplied them without glutting; icing stations can be reached regularly in transit, thus causing less wastage. Standardization of fruits resulted in a better pack and an increased return to the grower. Every box of standard packed fruit can be counted on to bring 100 per cent on quality and condition. The standard pack creates confidence in the buyer and is one means of

EXTENDING OUR MARKETS.

Mr. Cutter said that it used to be hard to sell white grapes on the Eastern markets, even our delicious white Malagas. They were put on the auction markets and pushed. The consuming public had to be educated in their demand and the quality was finally established by a standardization of sugar content and quality.

Shipment of sour grapes early in order to catch the opening markets is obviated by standardization and the industry is thus protected. The demand for Tokays was also created by education and is now natural and increasing. The California Fruit Exchange now serves no less than 260 markets with fresh fruit, which is carefully distributed where the demand is most insistent.

If a glut of any one of these is imminent shipments are quickly diverted to points in need. Which means a nation-wide vigilance in the interests of the fruit growing industry to produce the best results, with a minimum of cost and wastage.

AN INSTANCE OF EDUCATIONAL METHODS.

About five years ago, table grapes slipped down during the season to about eighty cents. To avoid dumping them onto an unwilling and surfeited market they were rehandled by the Exchange at points of destination and shipped by express in small quantities to many points hitherto unreached. As a result, a profit was made for the producer after all the added expense had been deducted and permanent new markets were created which are served and being built up today. Mr. Cutter said that the time taken in transporting fruit to market may be reduced in the future to from eight to ten days, in which case fruit can be packed even more mature and well sugared than it is today. This will be to the betterment of the markets, the satisfaction of consumers and give added returns to the grower by reason of increased weight of the crops.

OTHER FRUITS.

We incidentally asked about plums which are now being shipped in lugs as we mentioned in a recent issue. With the slant-sided crate it has been practically impossible to put up a really standard pack and apparently this pack has been adhered to from a conservative dislike to changing hoary customs. We did not ask Mr. Cutter about the container, but he said:

"Every fruit shipped should have value." (It is hard to see how, under the law, a uniform pack can be put up in the container now used.)

He also stated that low grade plums (varieties) sometimes pay the grower better than high grades, because of the quantity produced. With regard to winter pears and a further production of them he was non-committal, as it is not definitely known how far the demands of such a market might reach.

THE MARKETS.

On the large markets like New York, Chicago and other cities where there are plenty of buyers, the fruit may be sold at auction and command the best price the market is willing to pay. This cannot be done in small centers where only a few buyers are present and the fruit here is disposed of through the ordinary channels of trade. Smaller markets are well served in a way that was formerly difficult. Supposing two men on a market can do with a half carload a day, it is not uncommon for them to buy a carload together and divide, thus reducing the cost on both sides and permitting fruit to be sold at less cost and less trouble to both buyer and shipper.

The science of marketing perishable fruit has reached a high status in the last ten years. Standardization of quality and size has been one of the great factors in attaining demand and business acumen and vigilance in watching, developing and supplying markets intelligently has been another factor. Standardization has given confidence to the buyer, while growing co-operative methods have led to more close relations between the producer and the seller which is reciprocal.

The grower takes, in consequence, more pride in the quality of what he produces and the manner in which it is handled. These new relations have not only benefitted the growers' bank accounts—they have also raised his standing and placed every phase of the fruit-growing industry on a higher footing. And the closer the producer keeps in touch with the great institutions that market his wares for him, the more firmly will mutual confidence become established. The great distributing system of our perishable products as it exists today must strike every thinking man as a marvel of efficiency and collective judgment. And it is the endeavor of all connected with the industry to keep California very prominently at the top of the tree in the production and distribution of fruit.

PRUNING PLUMS FOR FRUIT.

To the Editor: What is the proper method of pruning Japanese plums, particularly Wicksons, after the fourth year? Trees were headed low and have been cut back each year. The pruning has been done during the winter season. We also have Climax and Santa Rosa plums. Last year five acres of Wicksons bloomed full, but set a very small crop of fruit. Will placing bees in orchard at time of blooming make any difference in setting of fruit?—C. A. C., Los Angeles.

[Without seeing the trees, we judge from your letter that wood growth has been forced by winter pruning until now. If you have not removed it, there should be plenty of fruit wood in the trees now. Let the trees go this year if you want to bring them into bearing, only thinning out where leaders are too thick, or cutting out undesirable or crossing branches. If the tree becomes top-heavy after the fruit sets, top them back a little in June. If young trees are in very vigorous growing condition at this age, it is not uncommon for them to throw off most of bloom, instead of setting fruit and bending their energies to the production of wood. Omitting the shortening for one year will help to overcome this, as you have the Climax and Santa Rosa for cross pollenation. Bees are good aids to pollenation, as has been demonstrated by many experiments, past and recent.]

The Government has made no further releases on prunes since the release, some time ago, of the 50 to 90 sizes.

The War Is Won

But the consumer of Food
Must Still Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.
While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.
Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR

FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

CHANGE OF ORANGE TEST SUGGESTED.

An endeavor is being made to frame a measure to present to the state legislative body this coming session to amend the 8-to-1 standard already adopted, which has been found insufficient to guard against the evils of a strong market when the fruit, while coming within the requirements of the 8-to-1 test, is still immature in that it does not contain the quantity of sugar and acid found in mature fruit.

It has been found that early in the season fruit which may be very green will meet the 8-to-1 standard and later fall below the ratio, when the acid commences to come into the orange in normal quantities, then it will be several days or possibly a week before the same lot of oranges will test again, but when they do it will be with a higher specific gravity, denoting more sugar and acid, thus more food value, and the orange is now found very palatable, further during this transformation in the inside of the orange the outside is undergoing a very rapid change in color from the dark green to a yellow, which all tends to show a ripened condition.

The early low content fruit when reaching the eastern market is judged by its merits from a consumptive standpoint, this being low, likewise the returns from its sale is low and still more regrettable the fact that it injures the market for California oranges, which have been held till mature by careful growers and shippers.

DECIDUOUS FRUIT EXPERIMENT STATION.

Following a conference of deciduous fruit men and packers at San Jose, an announcement was made that an appropriation would be asked of the next Legislature for the purpose of conducting deciduous fruit experimental work. The following men were among those present at the conference: State Senator Herbert C. Jones, W. C. Bailey of San Jose, L. Woodard of Campbell, George W. Pierce, president of the Almond Growers' Association; Sheridan W. Baker of Santa Rosa, H. C. Dunlap of the Prune and Apricot Growers' Association, Albert Haentze of Evergreen and H. C. Keesling of San Jose. Conferences with the Regents of the University of California will precede any action through the Legislature. Farmers' organizations have been seeking the establishment of such a station for this important work for some time and it is confidently anticipated that the authorities of the State University will work in harmony with the orchardists in presenting their claims to the Legislature and in deciding on a policy for the experimental work.

THREE NEW HORTICULTURAL BOOKS.

The MacMillan Company of 66 Fifth avenue, New York, has just published several new books of interest to many of our readers. One of these is entitled "Manual of Vegetable Garden Insects," by C. R. Crosby and M. D. Leonard of Cornell University, which makes a handsome volume of nearly 400 pages, is well illustrated and sells for $2.50 per copy. This book covers thoroughly garden insects and their remedy. The second book is a "Manual of Tree Diseases," by W. H. Rankin, Ph. D. of Cornell University. This work describes diseases and gives the remedies covering the root, trunk, bark and leaves of trees. It is a book of nearly 400 pages and sells for $2.50. The third book is by H. P. Gould of the U. S. Department of Agriculture, and is called "Peach Growing." It is a thorough treatise of the peach and every grower should have it in his library. Price, $2.00. Send to the publishers as noted above.

California dried apples have declined one cent this week, owing to the demand from Texas and other Southeastern points falling off.

What Apple Standardization Has Done

[Written for Pacific Rural Press by A. N. Judd.]

Fifteen years ago the apple business in the Pajaro Valley began to show how silently an industry may come forth into prominence in but a few years, also developing the fact that our crude methods left much to be wished for in the way of efficiency in handling what so soon would be a product able to influence the markets of the world if properly placed. About that time the far-sighted grower began to realize that in order to stabilize the business and its future much important legislation was necessary, such as standardization of the container, grade, pack, quality and sizes. The mere mention of such a thing, however, marshalled all the forces of the grower, packer and buyer in opposition. I admit it was a saddening sight to see fine golden-hued Bellefleurs belonging to the three-tier class covering the ground, with only a worm hole in them or perhaps a scar from the larva of the voracious Tussock moth. And it was about this time that the O. R. & N. was giving the Oregon apple grower an emergency rate to "Missouri river points" in order to market this same class of fruit at a 65c rate, against our rate of $1.05. The codlin moth was bad, but this blow below the belt called out a protest, and through an urgent request Mr. Sproule, the head of the Southern Pacific freight department, came down and viewed without any alarm more than three hundred carloads of apples lying upon the ground in our valley orchards that an emergency rate might save. Mr. Sproule departed without even a smile. Maybe he had no smile. Now the apple is not a balanced ration for either man or beast, but just a tonic of the most palatable sort; besides it will make cider, vinegar, is good to dry, and makes splendid jelly, jam and jack, to say nothing of its adaptability as pie timber. But these by-products require special equipment as well as technical skill, and so far the only effort in that direction that was made was to shovel the decaying apples that came through the process of sorting into a tank and as they broke down the juice was led into barrels in an open trough that gave the flies the first sip, but they did not remove the flavor of decay that always lingered in that class of goods. The only cider obtainable was at home through the agency of a hand mill and press. Compare these products with the present ones from Jones Bros. & Co., whose ever-increasing capacity utterly fails to keep up with the demand. I thought their beginnings in 1906 were quite portentous, with many tanks of 100,000 gallons each, their plant covering nearly an acre of ground. Today it covers double the area and the cooperage tanks have a 1,500,000-gallon capacity. The year of their advent ushered in a "China dryer" or two; $3.50 a ton for culls brought all they wanted, leaving a large hold-over supply that found its way to the river. Yet it gave a renewed hope of relief drifting our way, as more dryers came. And as they increased competition increased also, so sharply, in fact, that in 1914 culls brought me one-fourth of a cent more a loose box than my packed apples did. Yet we paid $55 a ton for drying and packing and sold the product for less than 6c a pound. In 1918 the price for culls, with a cannery added as a competitor, forced the buyer of our fancy apples to pay double the price of four years ago, notwithstanding the fact that an embargo kept us out of foreign markets with our packed stuff. And with an increased production in the land to contend with many whole orchards were sold to the by-product factories for from 35c to 50c a loose box—from three to five times the price of 1914 and quite seven times the price paid for the same class of culls in 1906. A careful analysis of these figures and the previous conditions with the present one will suggest that Mr. Sproule was our good angel after all. Besides, the fact is uncovered that the apple grower was exploited until the by-product savior came upon the scene. What it has done for us in the apple game it did for Germany in the growing of potatoes. In 1911 she had 29 potato flour mills. In 1917 she had 121. Potato starch that is so necessary in the making of cotton goods comes from the culls. Desiccation and other modes of preservation consume all that is left, leaving nothing but the fancy for household uses. Germany, through the intelligent use of the cull potato, has placed herself far ahead of all other countries in its production. Satisfactory sales of the by-products has created a demand for a larger production, besides preventing waste by turning it into a profit. How many of our other products can be treated as profitably? Will some scientist come forward and finish this homely story by telling us how many there are available for a like treatment and thus save much that we waste or ignore altogether?

[Standardization has improved the quality of fruit shipped so that the grower can command increased prices. It has increased the number of evaporators and by-product factories. The cull apples now go to the fruit dryer or the large cider and vinegar works of Jones Bros. Even the peelings and cores from the drying establishments are sold to the vinegar works and converted into a high-grade product that is shipped all over the world. And lastly the pomace is returned to the soil. Recently cull apples have been yielding as good prices at these by-product factories as was paid for packing fruit before standardization was established and the industry placed on a business footing. There are now 72 evaporating plants and over 50 packing houses and canneries in the Watsonville district. Thirty-two dollars a ton has been paid for apples—orchard run—delivered at the canneries in lugs this year. Nothing is wasted under this system, for, as Mr. Judd says, it is saddening to see fruit lying rotting on the ground. Orchardists are taking more pains than ever before in the spraying and care of their orchards, as it is demonstrated so clearly that upon their orchard management depends very largely the health of their bank accounts.—J. J. F.]

Abolishment of the salaries of two of its three $5,000 a year commissioners is recommended by the State Water Commission in its biennial report just issued.

A MOST IMPORTANT POINT IN PRUNING

Throughout the State deciduous fruit men are busy pruning. Mention has so often been made of the necessity of covering large wounds with asphaltum to keep out the spores of wood rot, but it is timely to put in another reminder. This rot, which is a fungus, enters through dead bark areas, no matter whether they have died from sunburn, bruising, blight, sour sap, or any other reason, and that is why dead areas should be cleaned off and daubed with asphaltum.

In a recent letter from George P. Weldon, Chief Deputy of the State Commission of Horticulture, he says, "I should mention the necessity of making close cuts in order to prevent the decay of stubs, which always follows careless pruning—where cutting is not done close enough. My investigations of pruning throughout the State have convinced me that there is more need for impressing upon people the necessity of cutting branches without leaving stubs, than any other one thing in connection with the pruning business.

Losse Blenheim
Apricots

One of the finest 'cots in existence. The fruit grows to a uniformly large size—is of finest flavor and quality—and brings a big price in the market.

We offer the Genuine Losse Strain—budded from the original Losse orchard.

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

Uniformity is another word for economy and safety. When the same things happen with each pound of Giant Farm Powder, you know not only how much to use, but what results to expect and how to handle the explosive.

Giant Farm Powders are surer, safer and more economical because our tests guarantee every pound. We maintain our own completely equipped chemical division to inspect Giant Farm Powders during every process of manufacture. Absolute uniformity means absolute dependability. Like results always obtained under like conditions make western farmers prefer Giant Farm Powders.

"Giant Powder is the most satisfactory," says John Zurr, Santa Rosa, Cal. "I account for this because Giant Powder is made with the utmost care."

Caution: Be sure you get the genuine. That other explosives are often called "Giant Powder" indicates the high quality of the original. Look for the Giant trade-mark on every case.

The coupon (or a postal mentioning this paper) will bring you the big book "Better Farming." Tells how to remove stumps, prepare tree beds, and do all kinds of farm work cheaper and better. Write for it now.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

A New Pesky Weed.

Donald D. Penny, Horticultural Commissioner of Santa Cruz county, is experimenting with sprays for the purpose of getting rid of a new weed which has shown up in one section of the Beach road land. It is called "hell weed" and "Italian horse radish" (Lapidium draba) and has deep-delving underground root stocks. The plant's foliage simply covers the ground and apparently grows the year around. Mr. Penny is experimenting with sodium arsenate sprays of varying strengths and other chemicals and is tracing the action of the poisons to the root. One spraying of the strongest solution costs about $5 an acre. Unless this weed is controlled it will seriously impair the value of some of the best bean land.

A Friend in Need a Friend Indeed.

E. D. Seaton of Santa Rosa recently told us of a neighbor who, in the disastrous storm of September, could obtain no help to stack his prunes. Hearing of this, a certain carpenter and contractor living in Santa Rosa came out and worked all night helping stack that fruit. In the morning he refused to take anything for his assistance, saying he considered it was war work and his duty as a citizen to help prevent waste. It gives us pleasure to recount this instance of the undying vitality of the true American spirit, handed down from our early logging bee ancestors. This is only one of many similar neighborly aids afforded during this time of stress.

Spraying for Peach Blight.

Spraying of peach orchards with Bordeaux mixture for the control of peach blight is reported as in full swing by Fred K. Howard, Horticultural Commissioner of Kings county. We noticed the machines at work also in San Joaquin and Sacramento counties. The weather and general conditions have been favorable for this operation and practically no man is waiting to prune his trees before spraying for peach blight and shothole fungus. In Sacramento county growers are spraying right through pears as well to decrease the chances of scab next spring.

Fruit Steamers to England.

It is believed that if the direct steamship line between Bristol, England, and Pacific Coast ports is restored to its former basis, using the Panama Canal, our trade in canned goods, evaporated and fresh fruits will meet with a very satisfactory increase. Apples, both dried and fresh, and all other products of the Pacific Coast are very popular there. Last year a quantity of Oregon apples were received at Bristol and gave much satisfaction. The road is open, freedom of the seas is restored, and all we have to do is to produce the goods and open negotiations.

A Huge Output of Deciduous Fruit.

It is estimated that California's 1918 deciduous fruit crop will be valued at something like $40,000,000. The California Fruit Distributors show that, to the middle of November, 37,075 carloads of fresh fruits had been shipped from California to points outside the State, compared with 34,628 carloads for last year. Last year grape shipments totaled 13,943 carloads. This year they will run to about 16,100 carloads. Last year's deciduous fruit crop sold for upwards of $30,000,000. The increase will amount to about 25 per cent!

A Carload of Grapes for $4,600.

This is reported by W. D. Bennett of the California Fruit Exchange of Sacramento. The carload was sold at Cleveland and included 820 crates of Emperor grapes, which averaged $4.75 each, and 140 lug boxes of Malagas at $5 each. Quality and condition, in a ready market, commanded these high prices. The grapes were shipped through the California Fruit Exchange at Dinuba and Mr. Bennett believes the record is for all time to date. Four thousand six hundred dollars for a carload—it makes you gasp!

Fruit Sent by Parcels Post.

It is reported from Porterville that, owing to increases in express rates and the new postal regulations increasing the sizes of parcels which may be sent by mail, most of the Christmas shipments of oranges are expected to be sent by parcels post this year. Under the present rules a half box of oranges may be sent in either of the two first zones for 39c. There has already been a heavy shipment of Christmas gift oranges by this means to Atlantic Coast States.

Raisin Growing in the Imperial?

Several raisin growers have been looking over the Imperial Valley, surveying soils and other conditions, with a view to establishing themselves in the raisin industry there. The only land that they thought suitable for raisins after a ten days' tour of the valley is located near Seeley, among the sand hills, and they went away, it is said, favorably impressed with the prospect. Several pieces were selected as being suitable.

A Goodly Yield.

Edgar Shaw, a fruit grower on the Nevada road, near Grass Valley, picked 196 boxes of pears from 22 Winter Nelis pear trees, an averrage of about nine packed boxes to the tree—probably a record production for this section. Better results in prices have been obtained than were anticipated earlier in the season, when shipping conditions were poor. Late varieties of pears have brought from $3 to $3.50 in the Eastern markets.

Large Shipments of Grapes.

Table grape growers in the San Joaquin Valley received some 50 per cent more than average prices for their grapes this year. More Thompson Seedless, Malagas and Muscats were shipped than ever before. Emperors, packed in drums, brought good prices. Losses from rain or frost were very small for the shipping grapes and growers heaved a sigh of contentment and satisfaction at Thanksgiving.

Lower Price for Off-Color Oranges.

First-class Washington navel oranges are still selling around $6.50 a box f. o. b., which is the highest price ever reported for this season of the year. Poorly colored stock is only bringing around $2.50 per box, with little demand for even those where the sugar test is high. The Porterville crop will probably be cleaned up by December 15.

Another Way to Check Mildew.

During the big September rain, F. E. Barrett, on Dry Creek road, near Santa Rosa, had his prunes stacked. To prevent spread of mold he went around the dry yards with his power blower and blew dry sulphur through the stacked trays under pressure right after the storm and effectively checked the mold.

The war is credited with the recent rise in olives and olive products according to Howard T. Reiser of Bakersfield.

Counteracting Frost Action on Fruit

Written for Pacific Rural Press by H. C. Green

DANGER POINTS

Reference to the following table will give full information on temperature injurious to fruit when in bud, blossom, etc.:

	Bud	Blossom	Setting Fruit	Other Times
Grapes, Tangerines	31	31	31	28
Grapefruit, Lemons, Oranges, English Walnuts	31	31	31	28
Plums, Prunes	30	31	31	28
Almonds	28	30	30	28
Peaches, Apricots	29	30	30	28
Apples	29	30	30	26
Pears	28	29	29	28
Strawberries	28	28	28	30
Tomatoes, Sweet Potatoes	31	31	31	31
Irish Potatoes	30	30	31	32

These figures are the danger points. It is best to be on the safe side and start the fires a degree above the danger mark. To start the heaters too soon is expensive, but to start them too late is more expensive. Be careful and watch your registered instruments.

SINCE the horticulturist overcame the disasters occasioned by insect pests, there is probably no one cause of loss so seriously affecting crops as frost. The losses to fruit crops, both citrus and deciduous, through frost have been so large that special attention has been given to methods of protecting orchards. With citrus fruits the frosts of December, January and February are to be guarded against, the fruit being ripe and ready for shipment. With deciduous fruits the late spring frosts do the damage. Almonds, cherries, apricots, grapes, peaches, and prunes are hurt while in bud, or while the fruit is just setting, by the frosts of March and April. The damage depends, in all probability, as much upon the condition of the trees as the degree and duration of the cold. For example, a sharp frost during the first or second week of April sometimes does less damage if the trees are fairly past the blossoming period than the same frost would have caused occurring about the middle of March.

The protection of gardens, both vegetable and flower, is also important. The particular frosts affecting gardens are the frost of February, March and April, and it has been pointed out that the same general principles used to protect orchards should be followed in the protection of gardens. A clear night following 36 or 48 hours of boisterous north wind is likely to be followed by frost, particularly if the movement of the air in the given locality has been such as to cause a settling of cold, relatively dry air strata in the hollows or depressions of the land. The formation of frost is essentially

A PROBLEM IN AIR DRAINAGE,

and if by any means we can prevent streaks, pools, or basins of stagnant, cold, dry air we can largely prevent frost. Frost is the water vapor of the air deposited upon the plant at a temperature below 32 degrees F. The damage to plant life is caused by the falling temperature. The water vapor plays the part of an index only. Indeed, the action of the water vapor is preventive. Dry air at a temperature of 32 degrees F. weighs 563 grains per cubic foot. Vapor of water at 32 degrees F. weighs 2.1 grains per cubic foot at a saturation of 100 per cent. Air at a temperature of 25 degrees F. weighs 572 grains per cubic foot. Given a little time, therefore, on a still, clear night, the loss of heat by radiation from the plant surfaces and the ground will bring about a settling of the colder air to the bottom. The ground will be covered with frost, while thermometers six feet above the ground will record 34 or 35 degrees F. Vegetables and flowers, therefore, unless grown upon sloping or terraced ground, are at a decided disadvantage compared with tree fruit in the matter of frosts.

NATURE OF FROST.

It cannot be emphasized too clearly that it is the "low temperature" and "not" the solidification of the water which does the damage. If there be but little vapor in the air there will be but a light frost apparent, and yet the temperature may be so low as to cause great injury. The so-called hard, dry frost, also called black frost, does, as is well known, even more injury than heavy frosts. Water vapor at 25 degrees F. completely saturated weighs 1.6 grains per cubic foot. In the fall from 32 to 25 degrees nearly half a grain per cubic foot, if the saturation were 100 per cent, would be condensed, appearing in visible form as a frost flake. A certain amount of heat was given off in the transformation of this invisible water vapor into ice, and an exactly equal amount of heat (known as the latent of vaporization) will be in turn required to change this frost back into vapor. We give special attention to this point because it would appear theoretically that the secret of successful protection of garden truck and delicate flowers will be found in this action of water, both in settling free heat at this time when the temperature is falling, and on the other hand in using up heat and thus acting as a retard or brake when the temperature begins to rise quickly.

It is now quite generally known that as much injury results from the sudden warming up of the dormant and thoroughly chilled flower or vegetable as from the chilling itself. In the work of protecting fruits from frost it has been found very necessary to interpose some screen early in the morning between the sun's rays and the frosted fruit. With flowers and garden truck this can be much more easily accomplished than with fruit. In this respect the gardener has a decided advantage over the orchardist.

SOME WELL-ESTABLISHED CONCLUSIONS.

The following facts stand out prominently: First, that in California the greatest injury is done deciduous fruits by the late spring frosts occurring as late as the latter part of May, when fruit is well formed, frequently resulting in the loss of three-fourths of the crop in the case of the more tender fruits, as, for example, almonds and apricots.

Second, facts show conclusively that frost occurs chiefly in the low places, basins, and bottoms, or where the cold air had drained down and settled. The principle, often laid down, that frost was primarily a problem in air drainage, is conclusively upheld. Wherever the air was stagnant the injury from frost is most marked; and, conversely, wherever the air was in motion there was little damage from frost. Fruit on open benches, hillsides, and terraces escape. The streakiness of frost and the many apparent irregularities in its formation can be explained easily if we remember that there are currents and stream lines in the air, and that these currents may have rather sharply defined limits. A slow-moving current of air on a still night in an orchard that appears to be nearly level may result in an absence of frost along its path, while close by, where the air is stagnant, frost will be formed.

The third particular point is confirmation of the belief that the damage from the frost can be greatly lessened if some means were provided whereby the chilled fruit could be protected from the sudden warming at sunrise. Some rough temperature observations made in ranches at about the time of sunrise on a frosty morning have shown a rise of as much as 10 degrees in the air temperature within 30 minutes. It has also been noted in several ranches that the areas of greatest loss by frost were those where the sun's heat came suddenly upon the trees. It is believed that much fruit can be saved even when chilled or frozen if some screen is interposed between the fruit and the sun, so that the warming may be gradual.

PROVED METHODS OF FROST PREVENTION.

One by one the fruit grower's foes have been conquered. Fungus and insect pests known have been successfully combated. But not until a very few years ago was it deemed possible to overcome Jack Frost, one of the fruitman's most formidable foes. This is now changed. With wireless telegraphy and the aeroplane has come the "low" orchard heater, which annually adds millions of dollars to the fruit crop, although its use has scarce begun. In California thousands of carloads of fruit have been saved from frost during the past years by orchard heating.

HEATING ALL OUT OF DOORS.

Briefly, modern frost fighting consists of "heating all out of doors" by means of small fires in the orchard, generally from 75 to 100 per acre. It is not smudging, which has been practiced by European viticulturists. Smudging consists of producing a blanket of smoke by burning damp straw or some similar substance early in the morning, to keep the sun from thawing out the frozen buds and blossoms too rapidly, the theory being that if the frost goes out slowly there is less danger of injury. Orchard heating maintains a high temperature and this keeps away the frost entirely. Nevertheless, the smoke created by the fires is a valuable aid, as is proven by the fact that the smoke from the heated orchard will sometimes drift over an adjoining or-

Olive Trees

such as these are grown only on our foot-hill locations.—Note the good roots—for hardiness they have no equal.

We have a fine lot of Mission and Manzanillo trees, both on Picholine roots and grown from cuttings. We have had splendid success on all Olive plantings—a most important assurance to you.

Submit a list of your tree wants for special quotation. Do it right now.

We have also a complete assortment of Shipping Plums, Cherries, Prunes, Bartlett Pears, Fall Pears, Peaches, Almonds, Apricots, Walnuts, etc.

Our foot-hill grown trees are free from root diseases common to other localities. Our trees insure your future profits in fruit growing.

And remember—we will accept Liberty Bonds as full or part payment for trees. Write us today.

SILVA-BERGTHOLDT CO.
Newcastle—Cal.
"Behind each tree is our guarantee"

chard and protect the latter from frost injury.

The degree of cold which can be successfully combatted seems almost incredible. Twenty-two degrees, which is ten degrees below the freezing point, with several inches of snow on the ground and a strong wind blowing from the north and the orchard in bloom, are the conditions which obtained one night in a Colorado orchard, yet orchard heating saved the day and insured a good crop of fruit.

TWO LEADING FUELS USED.

The two leading fuels used in orchard heating are coal and oil. In California oil is used exclusively and has proved its superiority over all other fuels.

FORMS OF THE OIL HEATER.

The simplest form of the oil heater is a sheet-iron pot holding one or two gallons of oil, with a suitable cover to keep out the rain when the heater is not in use. One patented type of heater manufactured in California and used extensively throughout the West possesses a decided advantage over other makes, in being equipped with an attachment which acts as a damper, as a soot collector, and also serves to deflect the heat. Flame is heat, and if this flame is not controlled much of the heat so produced will rapidly rise and be lost.

NUMBER OF FIRES PER ACRE.

The number of fires per acre is difficult to determine, because so much depends upon conditions. The lower the temperature the greater velocity of air currents and the smaller the trees, the more fires per acre will be required. Large trees require considerably less fire around them than small ones, and the more foliage on the tree the less fire is needed. Under the most unfavorable conditions twelve one-gallon heaters would be none too many, while forty would be plenty in some cases. It is well to prepare for the worst while hoping for the best. Sometimes all the work and expense of orchard heating is thrown away because not enough heaters are used. Some recommend a large number of small heaters, only part of which need be lighted at times, the rest being held in reserve when needed. The better plan would be to equip the orchard with 75 to 100 large heaters per acre, burning a sufficient number to maintain the necessary temperature.

Horticultural Jottings

Stanislaus county reports a yield of nearly all crops up to expectations. Almond and walnuts both show an increase over last year's production.

Quite a little boom has taken place in the Watsonville market as a result of the lifting of the export embargo on apples and the buying of English houses.

Apple picking is about finished at Watsonville, this season being about a month later than last year, owing to the rains probably. The fruit is of excellent quality.

Five thousand, three hundred and thirty dollars was received by the Hillside Orange Association at Lindsey for a carload containing 462 boxes of late Valencias, which went to auction in Baltimore.

Orchard fig conferences are planned for December 10 and 11, to take place at Navelencia, Mount Olive and Clovis farm centers, in Fresno county, Professor Condit of the University of California leading the discussion at each place named.

B. F. Stine, a pruner of Acampo, has 66 old almond trees from which he gathered 1800 pounds of nuts this year. From five trees which he pointed out to us he gathered 37 boxes of almonds "tromped in." The varieties are I X L and Ne Plus Ultra.

Consul General Skinner of London, England, cabled on November 23, that, according to his information, apples may be freely imported into Great Britain upon the importers agreeing to sell at a price not exceeding six and a half cents per pound wholesale, or eighteen cents per pound retail. It is understood that freight is to be arranged at $4.01 per box.

The possibilities of bee-keeping in the National forests of Southern California are being investigated by agriculturists of the U. S. Department of Agriculture in co-operation with the Forest Service. Extension schools for commercial bee-keepers will be conducted at San Diego, Davis, Visalia and Riverside, each one of which will last six days. Three sessions daily will be held.

Charles P. Justice, manager of the State Honey Producers' Co-operative Exchange at Los Angeles, stated at the Modesto meeting that with the world market open again, the honey production in California will exceed three millions of dollars in value next year. A carload of honey now brings $12,000, the highest price ever known. The central valley exchange represents 10,000 colonies of bees.

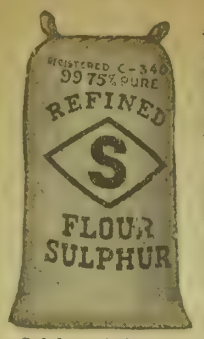
196 S. First St. San Jose, Cal.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur.

It has been proven that sulphur has increased various crops up to 350 per cent.

SAN FRANCISCO SULPHUR CO.
524 California St., San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet, price list and samples and please state for what purpose you use the sulphur, quantity needed and date of shipment preferred. Tel. Kearny 871.

The Biggest Pear Tree Order
Ever Placed

by an orchardist is one that we have just booked from Howard Reed of Marysville, for **FIFTY THOUSAND** of the new Chinese seedling, pyrus Usuriensis, which we introduced from the Orient and now offer for the first time to the pear-growers of America. By use of this new stock, blight may be eliminated from root, trunk, and main-limb crotches.

Mr. Reed is one of the leaders of the pear industry of California, and no man better appreciates the blight menace or better understands how to defeat it. This winter he will plant these trees in his great new orchard on the Yuba river, and will set Bartlett buds in the branches as soon as the trees have made heads. Built on the foundation stone of Blight-Resistance, Mr. Reed intends to make his new orchard the best and one of the biggest in the world! Our price on these seedlings is One Hundred Dollars per thousand. Ours is the only supply in the American nursery world this year—and we have only about Thirty Thousand left in No. 1 grade, diameter 3-16 of an inch and upward.

Another order of which we are also mighty proud is photographically reproduced here. It is the **HIGHEST PRICED ORDER FOR 1000 PEAR TREES EVER PLACED!**

The signature is that of E. A. Gammon, one of the most progressive and successful pear growers of California, whose orchard on the river, 14 miles below Sacramento, is productive of almost marvelous returns.

In placing his order for Bartletts, to be branch-worked on Usuriensis, the new, practically blight-proof Chinese seedling, Mr. Gammon made sure that blight would not have to be fought in root, trunk, or main-limb crotches, and thus secured the greatest degree of blight-protection possible. Mr. Gammon wrote: "My plantings would be worth $50,000.00 more than at present had I planted trees with blight-resistant root trunk, and branches.

These trees will cost Mr. Gammon $1.00 per tree—just four times the price of ordinary trees in the same quantity! The earliest date at which we can deliver branch-worked trees is 1921, and as our stock will be small his order is placed now, to insure the reservation of the trees.

ORDER SHEET

Loma Rica Nursery,
Grass Valley, California

Gentlemen: Reserve for me
Ship to me at.....
on or about Winter 1921, by.....
Freight or Express
the nursery stock specified below, which I agree to pay for on delivery, at the prices herein stated, together with the cost of packing.

Quantity	VARIETY	Size	Price	Amount
1000	Northern Bartlett			
	Root Trunk & Branches		1.00	1000
	Usuriensis			
	TOTAL	1000		$1000

It is understood that no substitution will be allowed in this order, and that this order is not subject to countermand. It is also understood that should any stock prove untrue to name Loma Rica Nursery will replace the same free of charge, and will also refund the purchase price thereof, but that no greater liability is assumed by said nursery than that herein specified.

Signed E A Gammon
Address Ford Cal
Date Nov 20/19

Although following different methods, both these men will attain the same result—**freedom from blight in root, trunk, and main-limb crotches.** This eliminates the greatest cost in blight-control work and practically places a life insurance policy on every pear tree so protected!

In districts where blight-damage is not a factor orchardists will still continue to plant pear trees on the Jap root, such trees being better than any other except on Usuriensis. We have our usual supply of such trees, with the remarkably fine root system that has made our mountain-grown nursery stock a favorite among particular planters. Our apple stock shares in this distinction, but supply this year is quite limited.

LOMA RICA NURSERY
PEAR SPECIALISTS
A. L. WISKER, Manager. GRASS VALLEY, CALIFORNIA

Hay Eaters Increased Faster Than Hay

(Continued from first page.)

all three. Our assumption is based on the facts that the combined hay crops of Arizona and Nevada for the two years 1916 and 1917 totaled about 29 per cent of the California hay crop in the same period and the number of livestock on the ranches bears a somewhat similar proportion. So we base our deductions as to what has taken place in the Southwestern States in 1918 on the conditions as we know them in California.

The total California hay crop for 1918 has been estimated before the rains at 4,147,000 tons, which is nearly 14 per cent less than in 1917 and about 10 per cent less than in 1916. There is a material reduction below these figures since the rains, as considerable quantities were piled up loosely ready for baling when the first heavy rains came. One man is said to have lost $37,000 in this way on hay he had bought to bale.

VARIOUS KINDS OF HAY.

Consideration of the total hay crop, however, does not solve the individual hay producer's problems. If he has grain hay, he knows that his principal market is in draft stock. If he has wild hay, he knows that the principal market is beef stock. If he has tame hay other than that made from grain, he wants to know about the dairy cattle situation.

Reference to statistics of the State Board of Agriculture shows that grain hay tonnage in 1916 totaled 2,056,000 tons, as against 1,838,000 tons of alfalfa hay. This situation was reversed in 1917 when grain hay totaled 1,714,000 tons and alfalfa 2,237,000 tons. Alfalfa and other tame hay comprised a trifle over half of the total in 1916 and a still greater proportion in 1917. Wild hay comprises only about 5 per cent of the total.

Now, are beef cattle likely to affect the hay market? By far the largest proportion of California cattle are fattened on grass and there promises to be plenty of that this season, so beef cattle are not likely to affect the hay market except perhaps locally in the northeastern and southeastern sections of California, in Nevada, and to a less extent in Arizona.

Are draft stock likely to affect the hay market? While they increased very slightly in the year ending January 1, 1918, on the farms, there is every reason to believe that they have decreased during 1918, as indicated by the great increase in sales of tractors and trucks to farmers. This mechanical farm power is bound to continue to displace draft stock and reduce the market for grain hay unless cattlemen take to the latter. In cities, during the war period of high feed prices, horses were disposed of in great numbers. Their work is now done by trucks and automobiles so much that horses are rarely seen as compared with two or three years ago. They are not likely to "come back" to the city streets. Even the half crop of grain hay in Livermore Valley tributary to the bay cities is moving this season at less per week than it will have to move per day from now on in order to empty the ware houses before next crop comes in.

What about alfalfa hay consumption now and future? Reference to our dairy columns will show that during 1918 the number of dairy cows in California has dropped somewhere around 40,000, representing a reduced hay-eating capacity of about 200,000 tons. But what is that to a total California crop of over four million tons! It will hardly bear the market; and, besides, a change in the dairy cattle situation is already prominently in evidence. Last spring, alfalfa and food crops, including beans, were very attractive, and cow milkers were very exacting. The combination led to many sales. Now the situation is reversed. Beans, potatoes, and grain are not moving freely; thoughts are turned to dairy cows and alfalfa, for dairy products are high and dairymen who stayed in the game most all have good bank accounts. Returning soldiers are likely to cause a return of milkers, who have been working at other businesses, resulting in a better labor situation; and the economy of having a ready market at home for the farm crops appeals to many. Thus one leading seedsman of the San Joaquin Valley reports three times as much alfalfa seed sold for fall planting in 1918 as in 1917, and farmers are planning to sow more heavily next spring. In the leading dairy county of the State we were recently told of grade dairy herds being culled out and the culls sold at $100 to $160 to less progressive but keenly interested dairymen. In Southern California grade cows are bringing as high as $300. One of the leading auctioneers of the State recently told our representative that whereas he had formerly been kept busy with dairy sales, there are scarcely any on his books for the future. Dairymen are not selling their producers, but are keen to buy or raise whatever look like they would turn hay into butterfat economically.

Dairy cattle in California totaled 597,000, January 1, 1918, following a notable steady increase ever since 1900. Other cattle totaled 1,701,000 following a steady increase since 1913. All of the signs seem to indicate a revival of this steady increase of these principal consumers of our principal hay.

CANTALOUPES AFTER ALFALFA.

Will cantaloupes grow where alfalfa has been? C. M. Stetson of Stanislaus county sold over 8000 crates from nine acres last season. He put all the manure from 25 head of stock on the alfalfa in the fall of 1916. After the rains in December, he plowed it under and grew a crop of cantaloupes in 1917. The 1918 crop was the big one. For that he plowed about 12 inches deep when it was in good condition after the February rains, and harrowed two or three times. Seed were planted in hills about four feet apart in rows seven feet apart. This required about two pounds of seed per acre to cover planting and replanting. On account of wireworms, he treated them with a solution of bluestone about the same strength as for wheat and got almost a perfect stand the first planting. The vines grew thick and knee high. Instead of giving them two or three horse cultivations as usual, he figured that the less he stirred the ground the earlier his melons would ripen. So he only hoed around each hill once and believes the melons went to market a week earlier than they would otherwise. The first melons from this field were picked July 13.

NURSERY INSPECTION.

Probably there has been more laxity in the inspection of California nurseries, or the stock as it is being dug, than in any other phase of our inspection work. The nurserymen rightly insist upon the aid of the county horticultural commissioners in detecting diseases or insect pests before their stock is shipped and rejections are made on the other end of the line. The State Commissioner of Horticulture urges every county horticultural official to give this necessary part of the work the attention that it requires. There is no easier and better place to detect troubles due to pests than in the nursery at digging time.

HELPS SOLVE FARM LABOR PROBLEMS

To produce greatly increased yields of all farm products in spite of the scarcity of labor—that is the problem squarely confronting the farmers of America, for America must feed the *world* for years to come.

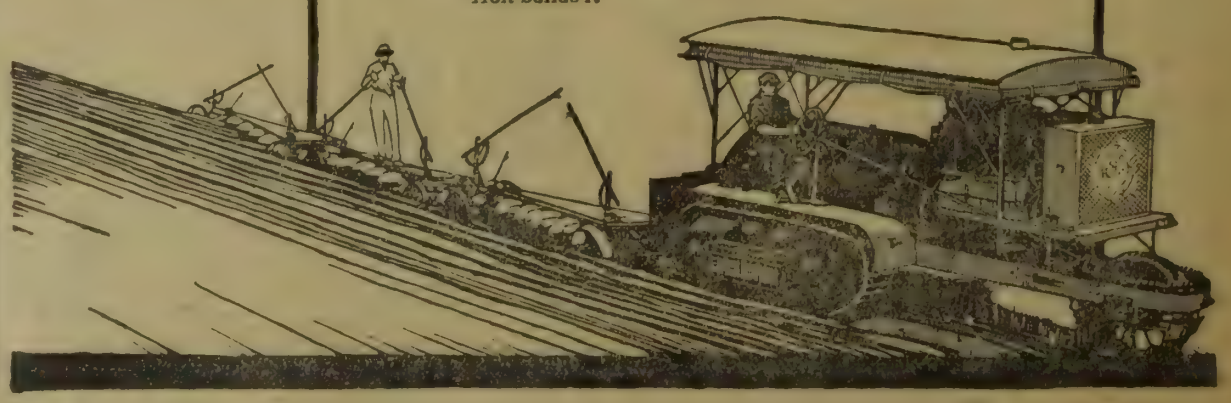
For years The Holt Manufacturing Company has been building and improving the "Caterpillar" Tractor, which now, more than ever before, is proving itself a most important factor in the saving of farm labor.

Today the wide expanses of America's fertile acres are being cultivated with the aid of thousands of "Caterpillar" Tractors. Thousands more of these tractors are hauling supplies and cannon in France.

The track principle employed in the "Caterpillar" Tractor, plus Holt manufacturing experience, Holt design and Holt high-grade materials, produces the most efficient, dependable and profitable tractor made.

Your neighbors—farmers, freighters, and contractors—are profiting by the labor saving and money saving advantages of the "Caterpillar" Tractor. You can do the same. Write for full information today.

There's but one "Caterpillar", Holt builds it



Field and Garden Suggestions

[Written for Pacific Rural Press.]

Fumigating Seeds and Grain.

Stored seeds and grain are likely to become weevily. To kill the weevils, fumigate with carbon bisulphide, which does not injure the feeding quality nor the germination, according to the ninth annual report of the Arizona Commission of Agriculture and Horticulture. It is highly explosive, like gasoline, so all lights must be kept away, and is also poisonous to breathe in considerable quantities. It is two and a half times heavier than air and will settle and fill all crevices if air is not allowed to circulate. The first step in fumigation is to make the bin practically air tight, especially the sides and bottom, or put the seed in an air-tight barrel, etc. Insects are most easily poisoned when they are most active, which is likely to be when they are most comfortably warm; and it may not pay to fumigate when temperature is under 70 degrees. Ten to twenty pounds of carbon bisulphide per 1000 cubic feet of space are needed, according to how nearly air tight the bin or receptacle has been made. [Some effect on germination of certain dried beans fumigated with carbon bisulphide in Italy has been observed, as announced by the California Commissioner of Horticulture. Cyanide of potassium killed the weevils, but did not affect germination.]

Legumes, Bacteria, and Sweet Soil.

For the most successful growth of alfalfa, beans, peas, vetches and other legumes, the proper kinds of bacteria should be abundant in the soil. When any kind of legumes are planted for the first time in a locality they are very likely to lack enough of their particular kinds of bacteria. In such cases it costs but little to inoculate the seed or the soil with pure cultures of the right kind of bacteria; and the increased yield the first year generally far more than repays the cost. But it is useless to inoculate seed to plant in sour soils. Bacteria beneficial to legumes cannot thrive in such until the acidity is neutralized by use of lime. Where the sourness is caused by long standing excess of water, the area should be drained before applying the lime. Ground limestone is effective after awhile, but hydrated lime is effective at once. Quicklime burns out the humus and kills vegetation until it becomes slacked.

Alfalfa Seed Scarce.

Fall rains greatly reduced the California crop of alfalfa seed; and war conditions greatly reduced the imports of alfalfa seed to the United States from foreign countries. Our average annual imports in the three years preceding June 30, 1914, were 7,301,712 pounds. Our average annual imports in the three years following the outbreak of hostilities dropped to 3,996,613 pounds. In the year ending June 30, 1918, we imported only 87,244 pounds. On September 18, 1918, all licenses for importation of alfalfa seed were revoked and it was announced that no licenses would hereafter be issued for importation of alfalfa seed by ocean except for such shipments as might be approved by the Seed Stocks Committee of the U. S. Department of Agriculture.

Late Planted Barley.

Forty-seven sacks of Chevalier barley per acre on 35 acres were obtained by Joe Borges of Monterey county one wet year not long since. He had intended to dry plow, but couldn't get at it until late February. The ground had been in sugar beets and made a good seedbed, though crusted by rains and weedy by February. Late in that month Mr. Borges disked the field and chiseled it about nine inches deep. He harrowed and finished seeding March 17. A half inch of rain fell that night, but the ground was somewhat rough and did not crust as it would had it been smoother. Results from late planting were far from so satisfactory last season.

Farm Labor Conference.

A farm labor conference, open to the public, will be held at the Ferry Building, San Francisco, December 18 and 19, under auspices of the State Council of Defense committee on resources and food supply, of which Federal Farm Labor Agent R. L. Adams is the secretary. Delegates are expected from about sixty organizations representing farmers, workmen, and the Government. Discussions will be held regarding the outlook for immigration, increased supplies of farm labor, reports from farmers' delegates, new State legislation, including vagrancy laws, transportation of workmen to jobs, standardization of wages, closing of saloons, importation of labor, and other questions that will be brought up by delegates.

Are You Sowing Dead Grain?

Germination tests of grain and alfalfa seed are being urged by the Fresno Farm Bureau. The system is to count out a definite number of seeds in even hundreds, put them on wet cloth or blotting paper between plates to hold the moisture, and count the sprouted seed on the third and sixth days. They ought to be kept moderately warm. Such germination tests may surprise some people. Where germination is low, a correspondingly increased amount must be sown; or, better still, feed that and sow some which germinates more and stronger.

Sugar Beet Seed Imports.

While a shortage of sugar beet seed is reported, American imports show a remarkable increase in figures compiled by the U. S. Department of Commerce. Our average annual imports for the five years ending June 30, 1914, were 11,616,300 pounds. For the next three years, including the European war, we imported 13,135,456 pounds annually. June 30, 1918, we imported 15,636,541 pounds. Adding this increase to the greatly increased home production, we see Americans raising a lot more sugar than we did before the war.

Labor Transportation Law.

A law will be discussed at the Farm Labor Conference in San Francisco, December 18-19, which proposes to make it a misdemeanor for employers to misrepresent wages to be paid, work to be performed, living and working conditions, etc., when filing applications for help at an employment agency. On the other hand, if workmen accept transportation or advances and refuse to carry out their agreements, they would be guilty of a misdemeanor, to be punished by maximum fines of $100 and 60 days' imprisonment.

Wheat Variety Yields.

Two fields of wheat adjoining each other on heavy adobe covered by a few inches of sediment in Sacramento county showed interesting yields last season. Eight hundred acres of Bluestem, most of it a perfect stand, yielded 14½ sacks per acre. Fifty acres of Early Baart with what was estimated as half a stand produced 19 sacks per acre. The Baart showed heavier stooling than any other wheat observed on that soil, the heads were large and well filled, and they matured two or three weeks earlier than the Bluestem.

Arizona Cantaloupes.

Cantaloupes averaged 203 crates per acre in the Phoenix-Glendale district of Arizona last season, as reported by the Bureau of Crop Estimates. Contracts are being signed for the 1919 crop. They indicate that the acreage will be about 1800 in this district and about 1000 in the Mesa district.

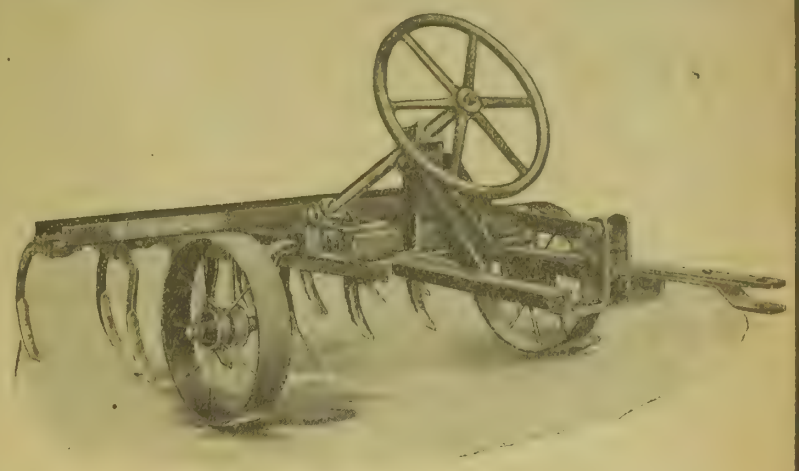
Arsenate Was Too Strong.

"Don't let anyone use as much arsenate of lead powder as 7½ pounds per 200 gallons in spraying for tent caterpillars," says H. W. Hosmer of Sonoma county, who burned the leaves of prune trees with that strength last spring. Neighbors who used 6½ pounds per 200 gallons controlled the caterpillars and did not injure the foliage noticeably.

Heavy Duty
Orchard Cultivator
No. 3

KILLEFER QUALITY

KILLEFER EFFICIENCY

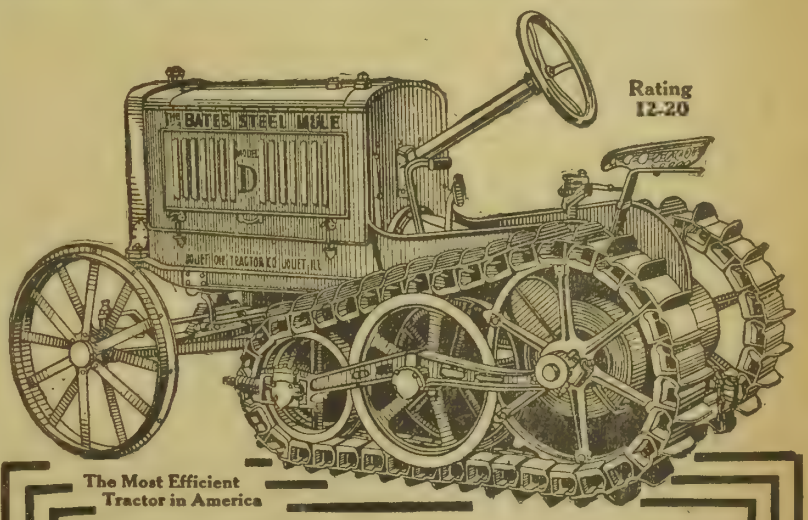


The Heavy Duty Orchard Cultivator Number 3 is built to meet the demand of the owners of the small size tractors for an extra strong cultivator that can be handled by the tractor driver. It is made on the same lines and of the same high-grade steel as our well known Monarch Cultivator, but without the levers and rear wheel, and with a hand wheel, screw lift, making it a perfect one-man, all-steel tool.

Specifications: Frame, ⅜x2½" angle iron, Standards ⅝x2" special high-grade steel, Axles 1½", Wheels 22" high, 3½" tire. Made in 5, 6, 7 and 8-foot size.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Box 156 Arcade P. O. Los Angeles, Cal.



The Most Efficient Tractor in America

Enclosed Working Parts

The unit construction of the Bates Steel Mule not only affords protection against dust but also assures permanent rigid alignment of transmission parts with the motor, regardless of any severe twistings. Working parts run in an oil bath.

This feature, with the powerful twin crawlers, heavy duty, valve-in-head kerosene motor, hardened cut-steel transmission gears, and Timken roller bearings, makes long service a certainty.

We are so proud of the Model "D" BATES STEEL MULE we want everyone to be sure and see the machine we have on exhibition here now.

The only Crawler Tractor adapted to Beet Cultivation without making changes.

Vetch-Barley Big Crop and Balanced Feed

[Written for Pacific Rural Press by R. E. Hodges.]

Four tons per acre of a balanced hay ration were raised the past season on 100 acres and followed by a heavy white bean crop by Emery Gates of Stanislaus county. Vetch furnishes the protein content and barley the carbohydrate content of this hay, which grows already mixed. Such big heads as grew on this barley are not commonly seen, and such stooling of barley is a rare advantage in growing it for hay. Being cut while in the dough, the kernels are almost as good as a regular grain ration. Vetch, growing throughout the barley, was held upright and was at its maximum value for hay, being in bloom when the barley was ready to cut. Mr. Gates chops all of his hay; and cattle, horses, and sheep all relish it to the last half of one per cent. There is no waste.

Part of the 100 acres was bottom land, part bench land, and part still higher. It is all of light loamy nature, varying in its content of sediment and sand. The year previous to the latest crop, barley and oats were grown on this same land. With better growing conditions, it yielded less than two tons per acre. On a sandy sediment area alfalfa had been tried previously, but would do nothing. This year the crop was good all over the 100 acres.

The vetch seed were carefully inoculated by Mr. Gates himself late last January, and seeded within a few hours after inoculation, being careful to get them into moist earth. Moisture by sub-irrigation or otherwise is necessary in the spring, according to Mr. Gates, or the vetch might not mature. Vetch and barley seed were mixed at the rate of 35 pounds of the former to 18 pounds of the latter; and about 53 pounds of the mixture per acre were drilled about three inches deep. The vetch would not harrow in satisfactorily if broadcasted, and inoculation would not work if the seed were long exposed to sunlight and drying. The seedbed had been nicely prepared and nothing more was done to the field until the hay was cut about June 1.

Labor-Farmer Alliance

[Written for Pacific Rural Press.]

The "California Union of Producers and Consumers," which is an alliance between the California Farmers' Union, the Pacific Co-operative League (consumers), and the California Federation of Labor, for mutual aid and support in accomplishing objectives of common interest has a definite platform which was endorsed and advocated before the recent elections. Most of the twelve planks in this platform are of direct concern in farmers' business. Two of them are more particularly in the interest of labor unions. Summaries of their planks, as taken from the report of President Fred Millard, follow:

1. Legislation to force idle land into use, by means of a graduated super-tax on all uncultivated arable land.

2. Public ownership of public utilities, including terminal grain warehouses and packing plants for meat and perhaps other products. Government retention of railways urged.

3. Government encouragement of co-operation to solve problems of equitable distribution of farm products in connection with the high cost of living.

4. Provision for citizens to vote when away from home on election day.

5. Representation of farmers and labor unions on all State boards and commissions; on any price fixing bodies, and on the University Board of Regents.

6. Prohibition injunctions which are declared to be judicial legislation, a piece of which has blocked an overwhelming majority of Stanislaus people for two years after an election which would have taken over the local telephones. This measure is, of course, primarily a labor union desire.

7. Health insurance favored.

8. County experiment stations especially for deciduous fruits and under direction of the State University.

9. Full maintainance of free public employment bureaus such as have been in operation the past season.

10. Federation of all irrigation systems under State auspices to promote their development, arrange for joint operation, and permit manufacture and sale of electric power.

11. Improvement and more effectiveness in the workmen's compensation law, safety appliances, and insurance.

12. Appointment of a representative "Reconstruction Committee," by the State to handle the problems of demobilization and reconstruction in an orderly way.

Sowing Garden Seeds

[Written for Pacific Rural Press by Samuel Haigh, San Jose.]

In sowing small seeds, where it is not advisable to use our Planet Jr. seed drill, I take a square or round pepper duster to sow lettuce, cabbage and similar small seeds that will readily pass through the holes in the cover, and generally mix the seed with a little dry arsenate of lead, as this coats the seeds and shows how they are distributed on the seedbed or drill. If the holes are not large enough, I enlarge them to suit the seeds when I use the round pepper cans. The holes in square cans having a revolving cap cannot be thus enlarged unless left open all the time, as the cap fits close and the burr caused by enlarging jams the cover.

For peas, beans and beets or other large seeds I take an ordinary fruit can and punch one or two holes in the bottom so that the beans or peas will readily pass through. For beets I punch three or four holes. I have separate cans for each variety, as these seeds vary in size.

I tie each can to a stick of suitable length so that I can stand upright and as I pass along the open drill I shake the can and the seeds drop through the holes easily and just the right distance apart.

KEEPING SWEET POTATOES.

To the Editor: I saw a piece in the Rural Press about keeping sweet potatoes. I think I have a better way, an easy way, we all use up this way. The potatoes keep well. Some people eat them as late as June, for they are good and sound. When you dig the potatoes out of the ground, pile them up and let them dry out for a week or ten days, but handle them very carefully and don't break the ends off. Get a large barrel or dry goods box and some dry sawdust. Put about two inches of sawdust in the bottom of the barrel, or box, then put in a layer of potatoes, but don't let them touch each other. Then more sawdust and more potatoes, until the barrel is full. If sawdust is not handy, take dry sand, but no dirt. Keep the barrel in a dry place. I will bet you a turnip against a carrot that they will keep. —J. Fritschi, Yuba county.

[This is a good old household way but hardly practicable for commercial crops, for which the method we described is available.—Editor.]

"THE BEAN IS THE BEST."

Winter Spraying Is Now On

And the growers who are cleaning up their trees are now the growers who are going to have the big crops—the good fruit—and the long profits at harvest-time next year. You can tell the growers who spray and those who don't by their profit balance at the end of the season.

Get a Good Sprayer

The Bean stands up to the work day in and day out—driving the material on at heavy pressure—and requiring no attention except to start and stop! Our catalog tells all about the many distinctive advantages are built into the Bean Sprayer.

Agricultural Notes

Antioch celery shipments to Eastern markets were reported on December 7 as having totaled 125 cars.

A 2000-acre tract has been secured in Fresno county for cotton alone by two former Alabama cotton growers.

Early Prolific rice, originally classified so as to bring growers $4.32, has been re-classified so it will bring $4.47.

Some rice is heating in storage after threshing, due to its high moisture content this fall. Heating rice should be repiled.

The California Rice Committee of the Food Administration hopes to have the crop all in hands of millers by March 1 at the prices already agreed upon.

Of the fifty beet-sugar factories making 130,000 tons of sugar from a million tons of beets in Poland before the war, about twenty have been either destroyed or damaged.

Homestead entries have been filed on all the areas in the National forests of California which have been decided to be chiefly valuable for agriculture. This comprises less than two per cent of the 18,000,000 acres in forests.

The new $200,000 National Rice Mills plant in West Sacramento is now operating. It can mill 4000 sacks of rice per day. Rice flour equipment also has been installed. Warehouse capacity is available for 100,000 sacks.

The Imperial Valley Pima cotton crop of about 3000 bales from 3500 acres is being ginned in the new six-stand gin recently completed at El Centro for this long-staple. In these gins, rollers replace the ordinary saws which would injure the long-staple fiber.

The report that bluestoning wheat by approved formulas had injured its germination seems to have no foundation, according to James Murphy, who has made an investigation in Fresno county. Weather conditions may be spoiling seed in certain soils before it can come up.

The large and long-pent-up wheat stores of Australia are at last let loose. The farmers of that country were harvesting the heaviest crop of wheat in its history when ocean carriers were not available owing to the war's demand for transport service. Figures compiled by the marine department of the San Francisco Chamber of Commerce show 36,000 long tons of wheat now on the high seas bound for this port. This great tonnage is being carried almost exclusively in sailing vessels.

A series of winter meetings throughout the State has been planned for the Japanese farmer, and lecturers of influence will explain to the Oriental agriculturists the condition under which his work in the Occident may be accomplished in harmony with white co-laborers. The necessity of organizing and strengthening growers' associations, farm management, sanitation, etc., will be discussed.

An injunction restraining the members and directors of the Western Cantaloupe Exchange from forming combinations in restraint of trade in violation of the Sherman Act has been issued by the Federal court. The injunction restrains the men and concerns named in it from retaining their membership in the Western Cantaloupe Exchange and specifically mentions that they are in no way to try to regulate the prices paid for cantaloupes, the acreage grown, the amount marketed, or to what extent the grower should be advanced money on his crop.

DEAN HUNT BRINGS LESSONS FROM THE FRONT.

(Concluded from page 644.)

WHAT THE SOLDIERS WILL BRING BACK.

Naturally and inevitably there has been much discussion concerning the social ideals and practices which will obtain after the the war. Some writers see social changes so world-wide as seriously to involve the political structure of our nation. Everyone knows that great political, economic and social changes have occurred in the past four years. Nobody is particularly responsible for these changes. They are a part of the progress of the human race. They are not to be stopped. They are merely to be guided.

So far as the United States is concerned, sufficient account has not been taken of the influence of that body of more than three million men who now make up the army and navy. I do not know what social philosophy the men in the trenches may have imbibed, but whatever they are I have no doubt they will form the basis of our political action for at least a generation to come. This is a factor that the thoughtless as well as the thoughtful may well consider. Each of them will influence three other persons, viz., wife, mother and father. No other nation has or ever has had throughout such a body of privates. In the very nature of the case, it is impossible. No other army has had such a well-bred, highly educated, upstanding, individually responsible body of men. They have been first the curiosity, then the wonder and finally the admiration of our allies. This is not the verdict of a naturally biased American, but the common and hearty testimony of the people of all the nations with whom they have come in contact. It is because of this fact that the war has finally been won and because of it we may trust to the future with serene confidence.

"Like Money in the Bank"

There is a book, published by the Hercules Powder Co., called "Progressive Cultivation". It tells you of all the various uses of explosives on the farm and will be sent free to any farmer who fills out and mails the coupon printed below. This book has been of invaluable service to farmers and orchardists who are anxious to get from their land a maximum of yield with a minimum of labor and expense.

HERCULES DYNAMITE

is one of the very valuable helps to the farmer in his struggle with the National problems now facing him;—the problems of labor shortage and the Country's immediate need of all food supplies.

Send for your copy of "Progressive Cultivation" today. It will tell you how to use explosives in planting your orchards and in keeping your bearing trees in good heart, in digging your ditches and draining your land,—in fact, in doing much of your heavy work at less cost and at much less labor than by the old, back-breaking methods.

We do not claim that explosives can do everything on the farm but we *know* that, judiciously used, Hercules Dynamite can be made of invaluable service to you. It will help to put cash in your bank and at the same time to produce the bumper crops that the Country needs.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

TRACTOR DEMONSTRATION PLANNED.

A mammoth tractor demonstration is to be held next spring somewhere in Central California under the auspices of the California Tractor and Implement Association. This was decided unanimously at their meeting in San Francisco, November 30. Active preparations will immediately proceed, according to Secretary G. M. Walker of the association. Professor J. B. Davidson of the University of California Department of Farm Engineering is chairman of the demonstration committee. A manager is to be selected at a salary big enough to command the best man for the purpose.

Several cities are making every effort to get this demonstration, but the choice will probably be made between Stockton, Sacramento, Modesto, San Jose and Oakland. Good transportation and hotel facilities, a small financial inducement to help cover the expenses of the demonstration, and a suitable tract of about 400 acres will be required.

FARM ENGINEERING DEPARTMENT ENDORSED.

One of the manufacturers mentioned the fact that this State, one of the foremost in use of tractors and farm-power, has been very niggardly in appropriations for instruction and investigation along these lines at University Farm. Only $13,000 is furnished for salaries and all other expenses of the University Farm Engineering Department. This includes, besides regular tractor instruction at Davis, the tractor short course at Davis, Riverside and Visalia, and such subjects as carpentry, farm buildings, forge work, rural sanitation, etc. The University of Iowa has an appropriation of $40,000 for similar work and many others have appropriations several times as large as California. The work of our University Farm Engineering Department was unanimously highly endorsed at the Tractor and Implement Association meeting, and instructions were given for its representatives to push vigorously for better financial support of this department by the regents and the legislature.

LEASED OWN RANCH—BOUGHT A TRACTOR.

Three features of tractor operation are prominent in Phil Rutherford's experience with a Lauson tractor in Stanislaus county. He says it is the only kind for his section, which has generally sandy soil. Sand can't get into the Lauson. Another feature is quick service. Mr. Rutherford telephoned for a fan belt at 3 p. m. and had it at 8 a. m. the next morning. The third feature is its steady running. He took a fancy to the machine at the Davis tractor demonstration last spring and bought one about June 1 after it had been demonstrated on his own place. When visited by the writer the last of September he had lost only one day's work on account of the engine. He had plowed a little stubble dry with three 14-inch moldboards and then started to run a 26-inch Case threshing machine with it. Three months later, he said, the tractor had worked every workable day but one and was running better than when he got it. The day's delay had been occasioned through his own fault, as he said, and would not happen again in the next thousand years. The thresher, equipped with blower and self-feeder, was run by the tractor on about two gallons of distillate per hour. The tractor moved the machine from place to place. It had threshed only grain up to the end of September, but Mr. Rutherford had some ten days of silage cutting to do and then about three months more of gyp corn and bean threshing.

Anybody can get enough work to keep a tractor busy, says Mr. Rutherford, who has rented his own place and is working the tractor entirely on contract work. The country is full of people who would rather hire a tractor to plow for them than to keep horses the year around and then perhaps not get all of their plowing done at the right time.

TRACTOR HORSEPOWER.

Pulling the same number of plows in the same soil, the horsepower exerted by a tractor is increased or decreased according to the speed at which it is run. The theoretical horsepower is the energy required to lift 33,000 pounds a foot off the ground in a minute. In practice, the horsepower of a tractor is most accurately figured by multiplying the number of pounds it pulls on the drawbar by the number of feet it travels per minute and dividing the result by 33,000. The pounds pulled are determined by inserting a dynamometer between the drawbar and the plow.

At the University Farm Tractor Short Course dynamometer tests were made on a number of tractors in 1917 and the students figured their horsepower. One machine, traveling 258 feet per minute, showed an average drawbar pull of 710 pounds. Its horsepower was 5½. (This was at the rate of 2.9 miles per hour.) The same machine in the same soil the same day developed 11 1-5 horsepower by speeding up to about 4.7 miles per hour and pulling an average of 880 pounds. The horsepower was more than doubled by pulling a 25 per cent heavier load and increasing the speed. Another tractor pulling 770 pounds at 1.9 miles per hour developed 3.9 horsepower; but on another trial it developed 6.5 horsepower running two miles per hour and pulling 1200 pounds.

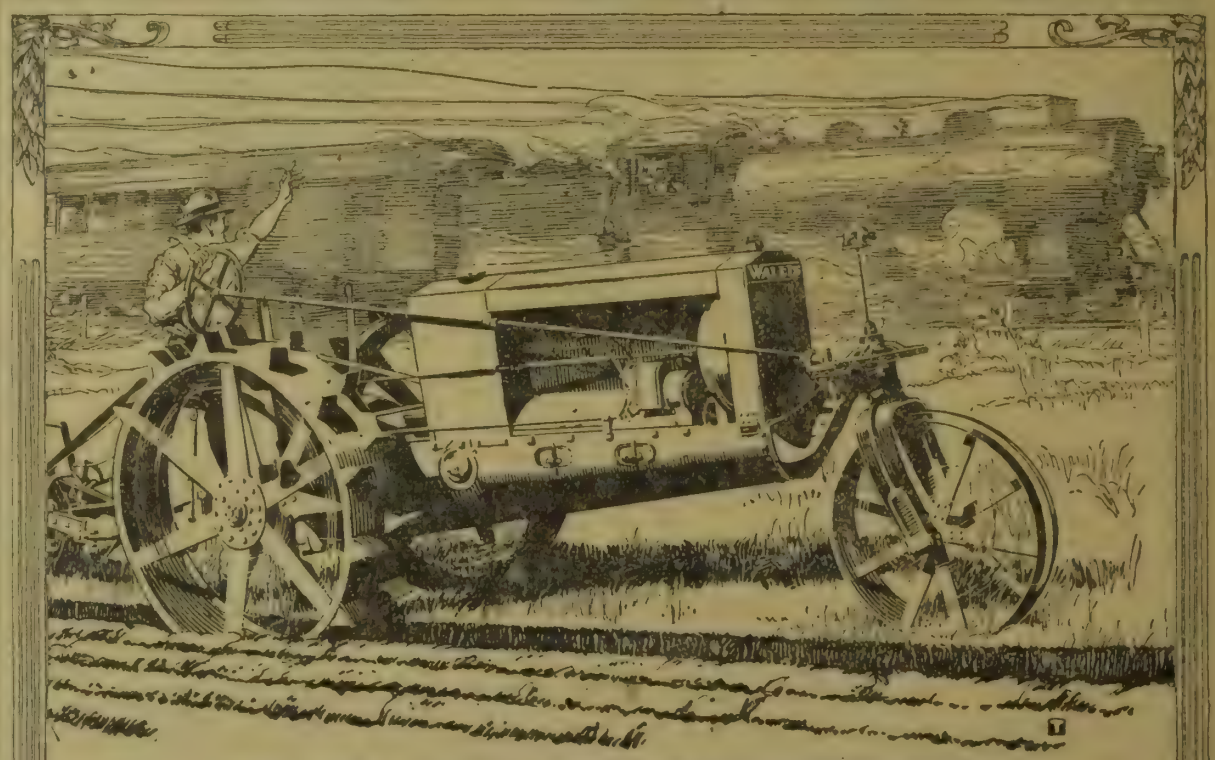
SMALL "COMBINE" TRACTOR-PULLED.

With small-sized combined harvesters now becoming popular on the smaller California grain ranches, it is important not to use so much labor as on the larger ones. M. G. Morgan of Solano county has solved the problem with entire satisfaction during the past season, using a nine-foot combine. At small cost he extended the steering post and controls of his Samson tractor, so it could be operated from the seat of the harvester. One man to fill and sew the sacks completed the crew. Mr. Morgan harvested 1000 acres at an average of 20 acres per day. He also performed all the work on his own ranch of 240 acres and states that his only expense, besides fuel and lubrication, was $3 for extras.

DRAG THE MUDDY ROADS.

With farmers using automobiles so much, there ought to be fewer rutty roads than we find in California. The way to avoid ruts is to hitch a road drag behind the machine or behind a pair of horses and go over the roads several times while they are soft but not slushy, after every considerable rain. The drag is simply a couple of timbers or logs fastened a few inches apart and hitched so the right end of the drag runs somewhat ahead of the other. This tends to make and preserve a central crown on the road, smoothes down the high places, packs the filled-in places, spreads out mud puddles to dry, and smears the mud so it dries harder and sheds future rains better.

Over 1500 Tracford tractor attachments for Ford automobiles have been sold on the Pacific Coast, according to William L. Hughson of Hughson & Merton, Inc., the Coast distributors. They have been on our market for two years.



WALLIS

America's Foremost Tractor

THE perfection of the Wallis principle in tractor construction established a new standard of tractor quality.

Wallis was the first to use a rear axle gear drive—entirely enclosed. Wallis built a powerful four-cylinder engine of latest tractor type, and drop forged, cut and hardened steel gears. Wallis enclosed all gears and moving parts in a light but durable steel armor where they run in a bath of oil. Lowest plowing cost per acre is a Wallis accomplishment. This is economy which plays an important part in the final estimate of your farm profits.

Why the Wallis principle is the accepted standard of engineering excellence and operating economy is explained and illustrated in the new Wallis catalog. A copy will be mailed upon request.

MAMMOTH TRACTOR PARADE.

A great tractor, motor truck, and tractor implement parade will start at First and Market streets in San Francisco, at 11 a. m., December 18, and proceed to the civic center, where the machines will be parked through the afternoon. At the noon hour members of the California Tractor and Implement Association, the San Francisco Ad Club, the State Automobile Association, the Tractor and Implement Dealers Association of Southern California, Rotary Club and ad clubs from all over California, are invited to a luncheon, probably at the San Francisco Commercial Club rooms. Five hundred plates will be provided. Speakers at the banquet will be Governor Stephens, Food Administrator Ralph Merritt, C. C. Moore, president of the Panama-Pacific Exposition, Governor Lynch of the Federal Reserve Bank and President Foster of the San Francisco Commercial Club. It is hoped that government artillery may make up part of the parade, in which case only forty tractors will be allowed. If the artillery does not participate, there will be no limit on the number of tractors.

CORRESPONDENCE COURSE ON TRACTORS.

A free correspondence course on tractor subjects is offered by the Avery Co., Peoria, Ill., for those who cannot attend their service schools. The correspondence course covers the following subjects: (1) Principles of a Tractor Motor; (2) Carburetor Care and Adjustment; (3) Magneto Care and Adjustment; (4) Bearings Adjustment and Lubrication; (5) Valve Grinding and Timing; (6) The Belt and Drawbar Transmission Systems; (7) Care and Operation of the Tractor.

TRACTOR PULLS FENCE POSTS.

A clever way of letting the tractor pull fence posts is urged by the International Harvester Co. Run the tractor drive wheel up to the post. Hook a chain around the post near the ground, give it a half hitch around an angle lug on the wheel and back away. It is easier than pulling teeth.

POWER NOTES.

A bill to remove many uncertainties in the water power situation and to conserve the public interests was prepared and passed by the U. S. House of Representatives, but has not been acted on by the Senate. Our readers who realize the need of public ownership of the sources of our electric power may well investigate this and report their views to our Senators.

Tractors, farm implements and machinery at the Liberty Fair occupy a tent 260 feet long and form a most economical opportunity for learning the best points about the many various machines.

A new argument in favor of increased public utility rates is that advanced by the Santa Barbara Telephone Co. The State Banking Department had denied the company a certificate stating that its bonds are legal investments for funds of savings bank and trust companies because their earnings were not sufficient. Ergo, increase the rates.

An attachment for track-type tractors to cultivate as many as 12 rows of sugar beets at once is reported from Manteca.

"Cold Weather Tips for Avery Tractor Owners" gives a tip that may solve some California engine-starting troubles. "Moisture is much more apt to form on the spark plug and short circuit it in cold weather than in warm weather."

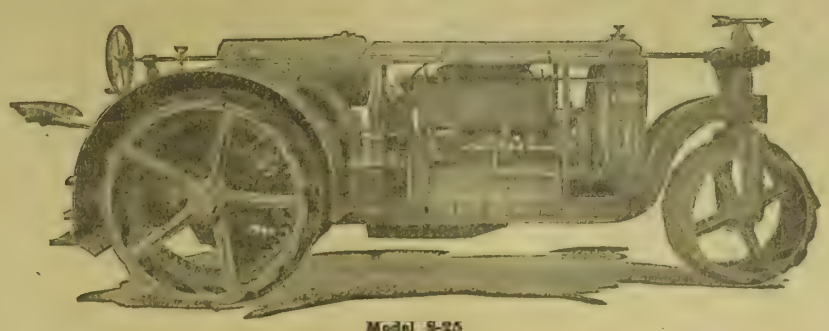
Douglas Boswell, Pacific Coast distributor for Wallis tractors, has just returned from the factory in the East. All Wallis tractors heretofore on the Coast have been of 13-25 horsepower; but Mr. Boswell has one of 50 horsepower on the way to Sacramento. It is of similar but heavier construction.

A system of developing land ready for colonists and taking a share of their crops for several years in at least partial payments for the land is that being undertaken on 15,000 acres near Chowchilla, Madera county, by the Daniel Hayes Co. They are now using five or six 75-horsepower tractors and Killefer equipment grading, leveling, and preparing the land for crops.

Samson

GMC TRACTORS SIEVE-GRIP GMC TRACTORS

Tractor



Model S-25

The durable tractor is not achieved in a day. Many features, time and experience dictate, enter into its construction.

After nearly two decades of manufacturing and field experience the GMC SAMSON SIEVE-GRIP TRACTOR is submitted as ideal durability. Many in successful operation for years, and in as effective use today, testify to its ruggedness.

The quality of the GMC SAMSON SIEVE-GRIP TRACTOR is guaranteed before built by careful selection of high-grade materials, made to specifications and over-sized to secure liberal reserve strength. Final severe tests further assure a durable product. It is built SAMSON in name and SAMSON in strength.

The GMC SAMSON SIEVE-GRIP TRACTOR performs the work of ten horses on the farm. It will do your plowing, discing, and harrowing economically and efficiently and without packing the ground. It is adapted to countless other uses on the farm for many of which horses are unsuited. It will CUT YOUR COSTS. It will INCREASE YOUR INCOME.

The durable is the efficient, economical tractor.

Our booklet, Better Farming, is yours for the asking.

Found—A Golden Opportunity in Dairying

Written for Pacific Rural Press by R. H. Whitten

For some time we have been contending that there has been a steady decrease in both the number of dairy cows and the production of dairy products in this State. Farm Advisor Scribner of Los Angeles county stated that 25 per cent of the dairy cows in his section had been slaughtered within the last year and a half, and reports from other parts of the State indicated similar reductions.

However, there were some who poo-hooed our statement. They said that only the unprofitable cows had gone to the butcher, and that by taking the feed that they had formerly consumed and using it on the remaining cows, so as to feed them more liberally, these cows would produce enough extra milk to make up the difference, so there would not be any shrinkage in the total amount of milk produced in the State.

But now we have real, honest-to-goodness figures to back up our statements. Through the courtesy of F. W. Andreason, secretary of the State Dairy Bureau, we have received an advance copy of his annual report for the twelve months ending September 30, 1918. It shows that up to the time of issuing the report for 1916 there had been a steady increase in the production of from one to eight million pounds a year, and it had about kept pace with the increase in population. But during the year ending September 30, 1917, there was a decrease of nearly a million and a half pounds, and during the twelve months ending September 30, 1918, there has been an alarming decrease of over eight million pounds. The counties producing over a million pounds are here given, all figures representing pounds of butter:

County—	1917	1918
Stanislaus	8,935,964	8,023,788
Humboldt	5,729,882	5,717,109
Imperial	6,245,187	5,154,808
Tulare	4,086,695	5,100,155
Kings	4,165,315	4,586,918
Merced	4,239,748	4,094,133
Fresno	4,072,867	3,421,964
Marin	2,458,548	2,800,521
Sonoma	3,391,101	2,780,856
San Luis Obispo	2,733,303	1,712,394
Siskiyou	945,908	1,511,999
Butte	1,172,774	1,156,731
San Joaquin	1,576,357	1,469,564
Glenn	1,291,092	1,255,009
Sacramento	1,398,385	1,082,310

The total production of butter in all counties of the State for the last three years has been as follows:

1916 ..... 70,030,171 lbs.
1917 ..... 68,373,021 lbs.
1918 ..... 60,358,595 lbs.

The production of cheese this year shows a little increase over previous years, but this is largely because in former years not all factories were required to report. The amount of cheese received in the San Francisco market during the past year was several million pounds less than that received during either of the two previous years.

PROBABLY 40,000 COWS SLAUGHTERED.

There are no available figures on the increase or decrease in the number of cows in the State, but let's consider a few facts and reports and draw our own conclusions. Probably the average cow in this State does not produce 200 pounds of butter per year, but to be liberal we'll figure on this basis, and as the decrease in butter amounted to 8,000,000 pounds, this would indicate that 40,000 cows have been slaughtered during the past year. True, a large number of the cows sent to the butchers have been the lowest producers, but in making our estimate we have considered only the shrinkage in butter, and if we included that in cheese also it would fully make up for any variations in these figures.

Furthermore, there is plenty of evidence that slaughtering has not been confined to the poorer cows. Prof. R. L. Adams of the College of Agriculture reports a large number of dairymen quitting in the counties south of San Francisco. "Since January 1," he says, "several herds have gone to the butcher from this section because their owners became weary of labor troubles and fighting the high cost of production. One man sold 120 cows to the butcher from his Newark dairy; a Centerville dairymen disposed of his entire herd of 170 to be slaughtered; a Gilroy man recently sold a herd of 70; a Watsonville man offered his entire herd of 85 Holsteins."

The reports received by the State Dairy Bureau have revealed similar conditions in other sections of the State. Their yearly report states: "Some of our inspectors have reported that many dairies have gone out of business or have greatly reduced their herds. For instance, William M. Russell reported that during one day's work in the vicinity of Conejo, Fresno county, he visited twelve places where the people had previously been dairying but had discontinued. At these places from 10 to 30 cows had been milked. The reason given for discontinuing was, first, that feed was scarce and high; second, that it was difficult to obtain milkers and difficult to keep them after they were obtained; third, because many other farm products had been very high during the last couple of years and after the land has been pastured or has been in alfalfa a number of years excellent crops of beans, potatoes, wheat and other grain can be produced on it, and as the profits from such crops were greater at this time, the labor less confining and less monotonous, many of the dairymen plowed up their pastures and alfalfa and planted crops."

Consequently, while there is never a good reason for keeping a boarder cow, and, especially when feed and labor is high, still it is evident that many good cows were slaughtered, and the loss to the State is serious, as we needed every one of them.

THE TIDE HAS TURNED.

After the rains in September, conditions changed. Feed became cheaper, butterfat prices went higher, and dairymen stopped selling their cows. And why shouldn't they? High prices for crops for human consumption cannot be expected much longer, and the only way good prices for hay and feed grains can be secured is to have the stock to consume them. There must always be a proper balance between the amount of feed produced and the amount of livestock carried, as feed values are determined ultimately by the livestock that there is to consume the feed. As it was, the decrease in cows affected this year's alfalfa market, and had it continued there would inevitably have been a surplus of hay next season and a corresponding period of low profits or loss for the farmers.

The dairymen who sold their herds paved the way to great prosperity for those who refused to sell, and who somehow managed to hold on. As the report before us states: "There have been good and bad years for the dairyman, but as an average the dairy business has proven to be the surest and most profitable branch of agriculture in this State. The man who changes from dairying to farming and back to dairying every time the market favors one industry or the other, will never do as well as the dairyman who sticks through thick and thin, because a man can never go out and buy a good herd of cows that will yield him a profit unless he has money enough to buy purebred stock. He must buy the best he can afford, cull out those which do not pay for feed and care, and then slowly improve the stock by using a purebred bull of a good dairy breed."

That is what some farmers are doing right now. They sold their cows at low prices and are now buying cows of unknown ability at much higher prices. The demand for dairy stock is good again, and when Uncle Sam's boys come home, so that milkers will become more plentiful, we shall increase our dairy production just as fast as young stock can be developed. It must be remembered, however, that the only way the number of cows can be increased—aside from importing from other States, which is not done to any large degree—is by raising the heifer calf, and it is just as necessary to impress upon dairymen the importance of saving every well-bred heifer calf as it is to urge them not to sell their cows. At the best it will hardly be possible to increase our herds fast enough so that production will keep pace with consumption.

BRIGHT FUTURE FOR DAIRYING.

We read a great deal about the foreign demand for both dairy products and breeding stock, but let's leave that out of consideration and think only of conditions as they will be after we have met all foreign demands.

As individuals we do not consume over one-fourth the amount of milk we should, and not one-half the cheese. And, instead of using the products of 560,000 dairy cows—the probable number in this State today—we should be using the products of 1,211,000 cows. We should be doing this when the public understands the food value of milk and its products, and their absolute necessity in the human diet.

A national campaign is being conducted along this line, and in another article in this issue we show you that California is not asleep at the switch. These campaigns, together with nation-wide prohibition, are going to increase the demand for milk, butter, cheese and ice cream, and the consumption per capita will be much greater than ever before.

All of these facts ought to be sufficient to satisfy every reader that the future of dairying is safe if it is conducted along proper lines. The dairy industry is not a business built upon some passing fancy or transient fashion. It is built upon the firm foundation of a human need that will surely last as long as human nature endures, and in spite of its ups and downs dairying always has been and always will be the most profitable branch of farming.

In the midst of all the uncertainties of the present time one thing remains sure, and that is the fact that there will always be a good demand for dairy products. Other farm activities crop up now and then, and for a while seem to overshadow the faithful cow, but sooner or later she emerges from under the cloud more illustrious than ever.

The cow is the foster mother of the human race, and those who have pinned their faith to her and, through thick and thin, have given her a fair chance to make good, have done well. More notes have been met, more mortgages lifted, more barns built, and more homes made comfortable and happy through her influence than through any other medium on the farm.

Will she fail now in this period of readjustment? No, she will not! And the man who boards the good ship Dairying and remains on her decks will ride safely over the billows of financial disaster that may threaten or even shipwreck some other lines of agricultural interest, and he will reach the port of Success with flying colors.

A Healthy Udder means comfort for the cow and a generous, easy milk flow. BAG BALM, the great healing ointment, will keep the udder free from sores, chaps, cuts, bruises, cracks, bunches and inflammation.

BAG BALM

IS ESPECIALLY EFFECTIVE AT THE CALVING PERIOD WHEN CAKED BAG FREQUENTLY OCCURS.

Its penetrating and softening effect is immediate. Every dairy should keep Bag Balm on hand.

Sold by druggists and feed dealers. In big tube packages. Write for free booklet, "Dairy Wrinkles."

Liberty Fair Goes "Over the Top"

[Written for Pacific Rural Press by R. H. Whitten.]

There is an old saying, "Better late than never." But as applied to the Liberty Fair, just drawing to a close at Los Angeles, it should be changed to read, "Better late than on time." For it is doubtful if the fair would have been as great a success had it been opened on the date first set for it.

It is one thing to plan an affair and have everything work out according to schedule; it is quite a different matter to have the plans changed about as often as a woman changes her mind. But the men behind the Liberty Fair never wavered for a moment in their six weeks' battle with the flu. They held the exhibitors together and they planned many new features not thought of at first. And when peace was declared they decided that the Liberty Fair should become a victory fair to celebrate in a fitting way our great conquest and to impress upon the people of California the new message of the hour—the vital necessity of increased food production to feed a starving world.

The fair fulfilled its mission, and fully justified its being held at a time when the utmost is demanded of the farmer; in fact, it would have been almost a crime if the fair had been abandoned instead of merely postponed. No branch of agricultural activity was overlooked, and there were displays which will surely prove a powerful aid in increasing the production of meats, dairy products, wool, grains and fruits.

NOT HOW MUCH, BUT HOW GOOD.

Think of it!—140 acres of intensive fair activity! Yet while the show was a big one it was not a question of how much, but how good. The fair proved a surprise, not only in the wide variety of exhibits but in their excellence.

The agricultural and horticultural buildings housed the best crops that this State has to offer. The manufacturers and liberal arts building contained over 100 different exhibits. The tractor tent was filled to overflowing, and Mr. Judah, who had charge of the exhibit, declared the collection the most interesting one ever assembled west of Chicago. He called the iron steeds "the agricultural machine guns of the future."

LIVESTOCK SHOW A HUMMER.

Between 1500 and 2000 head of livestock were on exhibition, and while the show was small as compared with the older shows of the Middle West, the quality of the animals was equal to that of any other show ever held. In the beef cattle classes, for instance, herds were brought from Canada and the United States as far east as the Mississippi, and they included many famous prize winners at the big shows of the country.

All who attended enjoyed a real treat, and the educational and inspirational value of the show cannot be overestimated. Furthermore, several of the top animals in these visiting herds were sold to California buyers and will find new homes in this State, where they will help in developing our livestock industry.

The Herefords were a grand lot, but unfortunately no local herds were shown to compare fine points with the visiting herds. Shorthorns were just as high in quality, and California exhibitors made an excellent showing against the crack visiting herds.

The swine exhibits brought together some of the best hogs ever shown on the Coast. The classes were well filled, and throughout there was a rare manifestation of quality.

The showing of dairy cattle was good, but the State at large was not well represented, as most of the herds were from Southern California. In the list of winners will be found the names of several who showed for the first time.

There was not much competition in sheep classes, and the showings of horses were light, but here again the quality was good.

The goat, poultry, pigeon and rabbit shows proved big drawing cards. The entries were large, and competition was keen.

THE PRINCIPAL AWARDS.

BEEF CATTLE.

Shorthorns.—Bull three years or over: T. T. Miller, Los Angeles, Diamond Choice.

Bull, two years and under three: Maxwell-Miller Cattle Co., Steamboat Springs, Colo., Princely Stamp; Estate of Thos B. Dibblee, Santa Barbara, Hallwood Flash; Miller, Greendale Sultan; Pacheco Cattle Co., Hollister, Pacheco Lad 92nd; Will T. Henn, Kansas City, Cumberland Goods.

Senior yearling bull: Henn all—Emmet Dale, Orange Fragrance, Golden Champion.

Junior yearling bull: Pacheco, Pacheco Marshall; Miller, Matchless Elite; Maxwell-Miller, Susan's Earl; Maxwell-Miller, Gainford Butterfly.

Senior bull calf: Dibblee, Bashan Augusta; Maxwell-Miller, Beauty's Dale; Miller, Dalmeny Count; Dibblee, King Lear.

Junior bull calf: Maxwell-Miller, Broadhood's Pride; Miller, Amethyst's Sultan; Pacheco, Pacheco Lad 145th.

Cow, three years or over: Maxwell-Miller, Eliza Broadhooks.

Cow, two years and under three: Maxwell-Miller, Clover Leaf Lovely 2nd; Pacheco, Pacheco Lass 103rd; Miller, Sultana of Linwood 2nd; Dibblee, Ormondale Beauty.

Senior yearling heifer: Miller, White Mayflower; Maxwell-Miller, Clear Spring Susan; Maxwell Miller, O. J's. White Glosster; Pacheco, Pacheco Lass 111th; Pacheco, Pacheco Lass 108th; Miller, Oakdale Claret.

Junior yearling heifer: Pacheco, Pacheco Lass 118th; Maxwell Miller, Hillshade Beauty; Dibblee, Meadow View Village Girl; Dibblee, Maplewood Surprise, Maxwell Miller, Mina Marigold.

Senior heifer calf: Maxwell-Miller, Flora Anoka; Dibblee, Princess Royal; Dibblee, Lavender Queen.

Junior heifer calf: Pacheco, Pacheco Lass 141st; Miller, Crimson Bud; Miller, Sweet Marie 2nd; Dibblee, Ruby Avon; Pacheco, Pacheco Lass 148th.

Senior champion bull: Maxwell Miller, Princely Stamp; reserve, Miller, Diamond Choice.

Junior champion bull: Dibblee, Basham Augusta; reserve, Pacheco, Pacheco Marshall.

Grand champion bull: Maxwell Miller, Princely Stamp; reserve, Dibblee, Bashan Augusta.

Senior champion female: Maxwell-Miller, Clover Leaf Lovely 2nd; also reserve on Eliza Broadhooks 2nd.

Junior champion female: Miller, White Mayflower; reserve, Pacheco, Pacheco Lass 118th.

Grand champion female: Maxwell-Miller, Clover Leaf Lovely 2nd; reserve, Miller, White Mayflower.

Aged herd: Maxwell-Miller, Miller, Dibblee, Pacheco.

Young herd: Pacheco.

Calf herd: Pacheco, Miller.

Get of sire: Pacheco, Dibblee.

Produce of dam: Miller, Maxwell-Miller.

Herefords. Bull, three years or over: Curtice Cattle Co, Calgary, Canada, Beau Perfection 48th.

Bull, two years and under three: Curtice, Beau Donald 192nd; Wm. Henn, Kansas City, Beau King 10th; Hereford Corporation, Cheyenne, Wyo., Wyoming Prince; Henn, Beau Banner 5th; Henn, Famous Fairfax.

Senior yearling bull: Henn, Disturber 11th; Curtice, Beau Donald 206th.

Junior yearling bull: Hereford Corp., Bonnie Laddie; Henn, Lamplighter 19th; Hereford Corp., Perfect Ladd 4th.

Senior bull calf: Curtice, Beau Donald 215th.

Junior bull calf: Hereford Corp., New Era 2nd; Hereford Corp., Rossman Gold Dust; Curtice, Beau Donald 222nd.

Cow, three years or over: Curtice, Belle Perfection 45th.

Cow, two years and under three: Hereford Corp., Miss Dale; Curtice, Belle Donald.

Senior yearling heifer: Curtice, Belle Donald 230th.

Junior yearling heifer: Hereford Corp., Miss Rialto 2nd and Perfect May 4th; Curtice, Belle Donald 243rd.

Senior heifer calf: Curtice, Belle Donald 254th.

Junior heifer calf: Hereford Corp., Lady Fairfax 2nd; Curtice, Belle Perfection 68th; Hereford Corp., Miss Dare 10th.

Senior champion bull: Curtice, Beau Perfection 48th; reserve, Curtice, Beau Donald 192nd.

Junior champion bull: Hereford Corp., Bonnie Laddie; reserve, Hereford Corp, New Era 2nd.

Grand champion bull: Curtice, Beau Perfection 48th; reserve, Curtice, Beau Donald 192nd.

Senior champion female: Hereford Corp., Miss Dale; reserve, Curtice, Belle Perfection 45th.

Junior champion female: Hereford Corp., Miss Rialto 2nd; reserve, Hereford Corp., Lady Fairfax 2nd.

Grand champion female: Hereford Corp., Miss Rialto; reserve, Hereford Corp., Lady Fairfax 2nd.

Aged herd: Hereford Corp., Curtice.

Young herd: Hereford Corp., Curtice.

Calf herd: Hereford Corp., Curtice.

Get of sire: Curtice.

Produce of dam: Curtice, Curtice.

Aberdeen-Angus—All awards to Congdon & Battles, Yakima, Wash.

DAIRY CATTLE.

Holsteins—Bull, three years or over: Frampton Bros. of Artesia, Burke Clyde.

Bull, two years and under three: Mrs. P. H. Jarrett of Lancaster, King Segis Pontiac.

Senior yearling bull: Burr Creamery Co. of Los Angeles, Sir Manuel Hengerveld; Jarrett, King Segis Pontiac Pietertje Jr.; Jarrett, Prince Affidgara Walker; Jarrett, Prince Delmar DeKol Walker.

Senior bull calf: Burr, Sir Manuel Kemdy Ke; Halair Bros of Riverside, Rosamaines Spofford; Halair, Rosamaines DeKol.

Cow, four years or over: L. A. County Farm, Belle Juliana DeKol; Burr, Emma Palmer Longfield.

Cow, two years and under three: G. M. Brown of Los Angeles, Hazelwood Doo Doo.

Senior yearling heifer: Brown, Hazelwood Ormsby Korndyke; Stalder Bros. of Riverside, Blanche Segis Walker.

Junior yearling heifer: Stalder, Abbekirk Pontiac.

Junior heifer calf: Stalder, all—Rosemaines Segis Ormsby, Rosamaines Cleopatra Ormsby, Rosamaines Duchess Ormsby.

Senior champion bull: Frampton, Burke Clyde.

Junior champion bull: Burr, Sir Manuel Hengerveld; reserve, Stalder, Rosamaines Pontiac Netherland.

Grand champion bull: Frampton, Burke Clyde; reserve, Burr, Sir Manuel Hengerveld.

Senior champion female: County Farm, Belle Juliana DeKol; reserve, Brown, Hazelwood Doo Doo.

Junior champion female: Brown, Hazelwood Ormsby Korndyke; reserve, Stalder, Rosemaines Segis Ormsby.

Grand champion female: County Farm, Belle Juliana DeKol.

Young herd: Stalder Bros.

Get of sire: Burr; Stalder.

Produce of dam: County Farm; Burr; Stalder.

Guernseys.—Bull, three years or over: W. H. Dupee of Santee, Imp. Itchen May King; A. B. Humphrey of Escalon, Bullion of Edgemoor.

Senior yearling bull: Humphrey, Escalon Challenger.

Senior bull calf: Dupee, Dauntless of Edgemoor.

Junior bull calf: Humphrey, Escalon Gold Brick.

Cow, four years or over: Dupee, Imp. Mildred 2nd of les Godaines; Dupee, Imp. Dewn of Sarnia.

Senior yearling heifer: Humphrey, Escalon Lady.

Junior yearling heifer: Dupee, Merry Lady of Edgemoor; Humphrey, Escalon Mary; Calla Grove Farm of Manteca, Calla Grove Itchen May.

Senior heifer calf: Dupee, Century Girl of Edgemoor; Humphrey, Escalon Evangeline; Humphrey, Escalon Bo-peep.

Junior heifer calf: Calla Grove, Calla Grove Merry May; Humphrey, Escalon Dorothy.

Senior champion bull: Dupee, Imp. Itchen May King.

Junior champion bull: Dupee, Dauntless of Edgemoor; reserve, Humphrey, Escalon Gold Brick.

Grand champion bull: Dupee, Imp. Itchen May King; reserve, Dupee, Dauntless of Edgemoor.

Senior champion female: Dupee, Imp. Mildred 2nd of les Godaines.

Junior champion female: Dupee, Century Girl of Edgemoor; reserve, Humphrey, Escalon Lady.

Grand champion female: Dupee, Imp. Mildred 2nd of les Godaines; reserve, Dupee, Century Girl of Edgemoor.

Young herd: Humphrey.

Get of sire: Dupee on Imp. Itchen May King; Humphrey on Bullion of Edgemoor.

Produce of dam: Dupee on Mary Dance of Riverside Farm; Calla Grove Farm on Calla Grove Itchen May.

Ayrshires.—All awards to E. B. McFarland, San Mateo.

Brown-Swiss.—All awards to J. Irwin Burk, Gilbert, Arizona.

Jerseys.—Awards not received; will be given next week.

SHEEP.

Shropshires.—All awards to Bishop Bros., San Ramon.

Hampshires.—All awards to Calla Grove Farm, Manteca.

SWINE.

Duroc-Jerseys.—Boar, two years and over three: C. T. Thompson, Bishop, Thompson's Pilot Defender; Conejo Ranch, Newbury Park, Councilor; Ireland Ranch, Owensmouth, Cherry Volunteer 2nd.

Senior yearling boar: Conejo, Pathfinder's Pride.

Junior yearling boar: Ireland, Ireland's Orion Defender; H. W. Hellman Estate, Los Angeles, Pioneer Defender; Ireland, Orion King of Ireland.

Senior boar pig: Donald H. Graham, Lancaster, Orion's King Gano; Conejo, Model Lad; Conejo, Latest Model; Graham, Prince Dreadnaut.

Junior boar pig: Ireland, Ireland's Cardinal Model; W. B. Hewitt, Van Nuys, Golden Cherry 7th; Hewitt, Golden Cherry 5th; Hellman, unnamed; Graham, Cherry King Del Sur.

Sow, two years or over: Conejo, Enchantress; Conejo, Critic's Lady 3rd; Thompson, Belle Crescent 2nd, Conejo, Arabella.

Senior yearling sow: Conejo all—Model Lady, Western Princess, Fairy Princess.

Junior yearling sow: Conejo, Critic Rose; Hellman, Pioneer Queen; Conejo, Sunshine Girl; Conejo, Starlight; Conejo, Golden Girl.

Senior sow pig: Conejo, Pathfinder's Golden; Graham, Little Sallie; Conejo, Model Rosebud; Graham, Windsor Queen Again; Conejo, Model's Bess.

Junior sow pig: Ireland, Cardinal's Model Queen; Graham, Big Cherry Lady; Hewitt, Golden Cherry 2nd; Hewitt, Golden Cherry 3rd.

Senior champion boar: Thompson, Thompson's Pilot Defender; reserve, Conejo, Pathfinder's Pride.

Junior champion boar: Graham, Orion's King Gano; reserve, Ireland, Ireland's Cardinal Model.

Grand champion boar: Thompson, Thompson's Pilot Defender.

Senior champion sow: Conejo, Critic's Rose; reserve, Conejo, Model Lady.

Junior champion sow: Ireland, Ireland's Maid.

Grand champion sow: Conejo, Critic's Rose; reserve, Ireland, Ireland's Maid.

Boar and three sows over one year: Conejo, first and second.

Boar and three sows under one year: Ireland, Hewitt, Thompson, Graham, Conejo.

Boar and three sows bred by exhibitor: Ireland, Hewitt, Thompson, Conejo, Graham.

Get of boar: Conejo, Conejo, Ireland, Hellman, Thompson.

Produce of sow: Ireland, Hewitt, Thompson, Hellman, Conejo.

Barrow, any age: Ireland, Graham, Graham, Graham, Conejo.

Three barrows, any age: Graham, Conejo.

Best display: Conejo.

Berkshires.—Boar, two years or over: F. L. Hall, Perris, Ames Rival 118th.

Senior yearling boar: A. B. Humphrey, Escalon, G. W. F. Leader.

Junior yearling boar: Humphrey, Grape Wild Emblem.

Senior boar pig: Hall, Rosecrest Rival Laurel 2nd; Hall, Rosecrest Rival 4th; Hall, Rosecrest Rival 3rd; Humphrey, Escalon Royal 2nd.

Junior boar pig: Humphrey, Grape Wild Chief; Humphrey, Escalon Artful.

Sow of two years or over: Hall, Nilentha Lady 17th; Humphrey, Leader's Artful Belle; Humphrey, Grand Lady Fashion; Hall, Nilentha Lady.

Senior yearling sow: Hall, Rosecrest Favorite; Hall, Rosecrest Favorite 2nd; Humphrey, Escalon Ladybird.

Junior yearling sow: Humphrey, Escalon Lassie; Hall, Rosecrest Rookwood Lady 3rd; Hall, Rosecrest Rookwood Lady 2nd.

Senior sow pig: Humphrey, Escalon Blue Belle; Hall, Rosecrest Great Hope 2nd; Humphrey, Royal Polly; Hall, Rosecrest Laurel 2nd; Hall, Rosecrest Lassie H.

Junior sow pig: All to Humphrey, Grape Wild Rose 2nd, Grape Wild Rose 3rd, Escalon Artful Belle 5th.

Senior and grand champion boar: Humphrey, Grape Wild Emblem; reserve, senior and grand champion, Humphrey, G. W. F. Leader.

Junior champion boar: Humphrey, Grape Wild Chief; reserve, Hall, Rosecrest Rival Laurel.

Senior and grand champion sow: Hall, Rosecrest Favorite; reserve, Humphrey, Escalon Lassie.

Junior champion sow: Humphrey, Grape Wild Rose 2nd; Humphrey, Blue Belle.

Boar and three sows over one year: Humphrey, Hall.

Boar and three sows under one year: Humphrey, Hall.

Boar and three sows bred by exhibitor: Humphrey, Hall, Humphrey.

Get of sire: Hall, Humphrey.

Produce of sow: Humphrey, Hall.

Barrow, any age: Three prizes to Humphrey.

Three barrows any age: Humphrey.

Hampshires. Boar, two years or over: Llano Vista Ranch, Perris, Langdon's Choice; Roy Dawson, Gardena, Oro; C. J. Gilbert, Lancaster, The Harvester Again; Conejo Ranch, Newbury Park, Conejo Chief.

Senior yearling boar: Conejo, Duke's Allen.

Junior yearling boar: F. C. Fairbanks, Redlands, Harver's Choice; L. A. Denker, Saugus, Malay's Controller; Denker, Zodiac Wonder; Conejo, Authority.

Senior boar pig: Llano Vista, Liberty; Conejo, Leading Chief; Denker, Direct Kid.

Junior boar pig: Denker, Director Jr.; Denker, Malay's Pride; Denker, Tip Top; Llano Vista, Walter G.; Conejo, Gay Allen.

Sow, two years or over: Conejo, Leading Wave 2nd; Llano Vista, Compeer's Descent; Conejo, Leading Wave 3rd; Conejo, Elmyra 2nd; Llano Vista, Direct's Model 4th.

Senior yearling sow: Conejo, Wavelet; Llano Vista, Corrine; Llano Vista, Alta; Fairbanks, Duchess; Conejo, Perfect Quality.

Junior yearling sow: Denker, Little Mesa; Conejo, Senorita; Llano Vista, Fern; Denker, Beauty, Mesa; Gilbert, Second Echo.

Senior sow pig: Denker, Dearie; Conejo, Chief's Wave; Llano Vista, Winnie; Conejo, Chief's Wave 3rd; Llano Vista, Judith.

Junior sow pig: Conejo, Allen's Idol; Denker, Wildflower; Denker, Twin Oaks; Denker, Do Do; Gilbert, Martha Allen.

Senior champion boar: Llano Vista, Langdon's Choice; reserve, Fairbanks, Harvey's Choice.

Junior champion boar: Llano Vista, Liberty.

Grand champion boar: Llano Vista, Langdon's Choice.

Senior champion sow: Denker, Dearie; reserve, Conejo, Leading Wave 2nd.

Junior champion sow: Denker, Little Mesa; reserve, Allen's Idol.

Grand champion sow: Denker, Little Mesa.

Boar and three sows over one year: Llano Vista, Conejo, Denker, Gilbert.

Boar and three sows under one year: Denker, Conejo, Llano Vista, Dawson.

Boar and three sows bred by exhibitor: Denker, Conejo, Llano Vista, Dawson, Fairbanks.

Get of boar: Conejo, Denker, Llano Vista, Gilbert, Fairbanks.

Produce of sow: Conejo, Denker, Gilbert, Fairbanks, Dawson.

Chester Whites.—All awards to F. T. Spoor, Compton.

FAT STEERS.

Steer or heifer, one and under two years: Congdon & Battles, Yakima, Wash., Black Yak; Curtice Cattle Co., Calgary, Canada, Beau Donald 212th.

Steer or heifer under one year: Hereford Corporation, Cheyenne, Wyo., Chey-

(Continued on page 663.)

Government Doings of Interest to Stockmen

[Written for Pacific Rural Press by R. H. Whitten.]

Last week we gave parts of the animal report of the Secretary of Agriculture, David F. Houston, and made a few comments on his suggestion for improvements in the livestock field. But we did not cover everything of interest to stockmen, and this week we want to comment on a few more features in the report.

INCREASING THE MEAT SUPPLY.

Campaigns for increased production have given especially fruitful results in respect to pigs and poultry, it is stated. Indications are that the increase of 15 per cent in pork production this year over 1917, asked for by the Food Administration, will be realized, at least in weight if not in number of hogs. Poultry and eggs also show a material increase and enormous quantities of the latter were preserved by householders in the season of plenty for use in time of scarcity.

Steps were taken also to encourage the growing of cattle and sheep, but results are naturally slower with these animals than with pigs and poultry.

In fighting animal diseases the department finished work that up to December, 1917, resulted in the freeing of 67,308 square miles in the Southern States from cattle fever ticks, and that up to December of this year will add 79,217 more square miles to the cleaned area.

Losses from hog cholera in the year ending March 31, 1918, amounted to only $32,000,000, as compared with $75,000,000 in 1914—a reduction of more than 50 per cent in less than five years. Thus the death rate from hog cholera has been reduced from 144 a thousand in 1897 and 118 in 1914 to 42 in 1917, the lowest in 35 years, as the result of methods of control involving farm sanitation, quarantine and the application of anti-hog cholera serum. Through treating immature pigs with serum and allowing them to be shipped out as stockers and feeders, it is believed that during the last year the nation's pork supply was increased about 40,000,000 pounds.

Efforts to eradicate tuberculosis are concentrated on driving the disease from herds of purebred cattle, with the object later of attacking the disease in swine and of driving it from circumscribed areas. An accredited list of purebred cattle herds, from which breeding stock may be secured with reasonable assurance that it is free from tuberculosis, has been established. Further progress is recorded in the eradication of parasitic and other diseases that for many years have exacted great annual tribute from livestock on American farms.

SUPERVISION AND CONDEMNATION OF MEATS.

The Federal meat inspection service covered 884 establishments in 253 cities and towns in the fiscal year 1918. The figures are in the annual report of the Secretary of Agriculture.

There were slaughtered under inspection 10,938,287 cattle, 3,323,079 calves, 8,769,498 sheep, 149,508 goats, and 35,449,247 swine—a total of 58,629,612 animals. Compared with the preceding fiscal year, these figures represent a decline of 5,000,000 in the total number of animals, but an increase of nearly 1,750,000 cattle and more than 600,000 calves. Condemnations amounted to 206,265 animals or carcasses and 528,481 parts of carcasses. The supervision of meats and products prepared and processed covered 7,905,184,924 pounds, and resulted in the condemnation of 17,543,184 pounds. There were certified for export 2,510,446,802 pounds of meat and meat-food products.

PREDATORY ANIMALS KILLED.

Destruction of predatory animals by the department's hunters in the West is estimated to have saved during the year livestock valued at $2,376,650. Co-operative State campaigns, organized to exterminate native rodents such as prairie dogs, ground squirrels, pocket gophers and jack rabbits, which annually destroy $150,000,000 worth of food and feed products, have proved to be practical and of great immediate value in increasing grain and forage production.

STOCK ON RANGES.

The number of cattle permitted to graze during the 1918 season on the national forest ranges was nearly 2,140,000 and of sheep more than 8,450,000. In two years there were placed on the forests approximately 1,000,000 additional head of livestock, representing about 25,000,000 pounds of beef, 16,000,000 pounds of mutton and 4,000,000 pounds of wool.

"The use of the national forest ranges is increasing and their productivity is rising under the system of regulation," says the report. "Never was the wisdom of Government control of these ranges more manifest than at the present time."

THE DAIRY INDUSTRY.

Continued encouragement was given to the development of the dairy industry in the Southern and Western States, to the organization and operation of cheese factories in the mountainous regions of the South, and to the building of silos as a means of providing winter feed. The food values of dairy products was brought to the attention of the consuming public and their economic use was advocated.

MARKET NEWS SERVICE.

The market news service established by the department on a relatively small scale were enlarged until at the close of the fiscal year there were approximately 90 branch offices distributing market information to all sections of the country over practically 14,000 miles of leased wires. The services cover fruits and vegetables, livestock and meats, dairy and poultry products, grain, hay and feed and seeds.

The news service on livestock and meats was extended to include additional important livestock and meat marketing centers and producing districts. New features also were added to make the service more useful to producers and the trade. The daily reports on meat-trade conditions, which formerly gave information on the demand, supplies and wholesale prices of Western dressed fresh meats in four of the most important Eastern markets, now cover also Los Angeles and San Francisco. As a supplement to the daily reports, a weekly review is published. The daily telegraphic report on livestock shipments west of the Allegheny Mountains was expanded to include all livestock loaded on railroads throughout the United States. Information regarding the "in" and "out" movement in certain feeding districts is being published. This work is valuable in indicating the potential meat supply of the country and will be developed as rapidly as available funds permit.

On June 1, 1918, the department took over the furnishing of all telegraphic market reports distributed daily from the Chicago Union Stockyards on livestock receipts and prices, including not only those regularly sent over the leased wire of the Bureau of Markets but all reports used by commercial news agencies and press associations. The substitution of a Government report for the previous unofficial service has exerted a material influence in restoring confidence in the reports of market conditions, the lack of which has been a fundamental obstacle to the economic development of the livestock industry.

DAIRY AND POULTRY PRODUCTS.

The news service on dairy and poultry products gives prices of butter, eggs and cheese, trade conditions, market receipts, storage movement, and supplies in storage and in the hands of wholesalers and jobbers. Since the fall of 1917 it has covered Washington, Boston, New York, Philadelphia, Chicago, Minneapolis and San Francisco. Data were secured each month from approximately 14,000 dairy manufacturing plants in the United States, showing the quantities produced of such products as whey, process butter, oleomargarine, cheese of different kinds, condensed and evaporated milk, various classes of powdered milk, casein and milk sugar.

LOCAL MARKET REPORTING SERVICE.

What is known as the Local Market Reporting Service covers an entirely new field and is a logical and necessary supplement to the national telegraphic news service. The first experiment was so successful that, when emergency funds became available, the work was broadened and, in co-operation with local authorities, agents were placed in 15 cities. This service consists largely of reports on local market conditions and prices based on daily observations and is conducted primarily for the benefit of growers and consumers, though it is also very useful to dealers. Consumers' figures are made public through the local newspapers and are helpful guides for the housewife. The growers' reports contain brief discussions of market features, changes and developments, and give tables showing prices received by producers for certain products and, as well, those of wholesale and commission dealers.

GRAIN, HAY AND FEED.

Bi-weekly statements on the stocks of grain, hay and feed, the supply of and demand for these commodities and the prices at which they were being bought and sold in carload lots were issued from ten leading cities, including San Francisco.

NEWS SERVICE FREE TO YOU.

This market news service is free to all farmers. The local representatives do not hunt up farmers who might be interested, but anyone who desires the reports may have his name put on the mailing list and receive them. Write to the U. S. Bureau of Markets, 315-17 Consular Building, San Francisco, or International Bank Building, Los Angeles, and tell them in what branches you are interested. They will be glad to send you the proper bulletins regularly.

DON'T SHIP LIGHTWEIGHT HOGS.

Because the producers are flooding the market with immature hogs, the Food Administration for California has issued a warning to farmers that lightweight animals should be kept on the farm. The packers are short-handed on account of the influenza epidemic and the capacity of their plants has been much reduced.

In accordance with instructions sent out from Washington, growers are urged not to ship any hogs weighing less than 150 pounds, under which weight they are regarded as immature. Loss to growers will result from a continuance of present conditions, and a waste of badly needed pork will result.

Present conditions are only temporary, as there is a serious shortage of hogs in this State as well as in the country at large.

The Placer, Nevada, and El Dorado Farm Bureaus are to co-operate in holding auction sales at Auburn. The matter of corrals and scales has been taken up with the Railroad Administration. It is planned to sell at auction cattle, hogs, sheep, goats, and poultry.

CARRUTHERS FARMS
LIVE OAK, CALIFORNIA
Shorthorns and Berkshires
Our second annual sale of Shorthorns will take place in January. Demand is very good for Berkshires, but we can supply your wants.

ORMONDALE SHORTHORNS
Are all heavy boned, and of Scotch and Scotch-topped breeding.
Suited for either the range grower or breeder.

Steers Bring World-Record Price

[Written for Pacific Rural Press.]

The highest price ever paid on an open market for beef cattle, other than show animals, was received by E. H. Lehmann, Eureka, Kan., on a carload of Hereford steers sold on the Kansas City market, November 16. The consignment arrived during the American Royal Show, and the fact that a new record had been established caused a great deal of interest among visitors at the show as well as among breeders and cattlemen at the stockyards.

The average live weight of the 15 steers, all except one of which were three-year-olds, was 1612 pounds. The total amount received by Mr. Lehmann was $6,047.50, an average of $403.16 a head. the price being 25 cents per pound.

An interesting story is told by the American Hereford Journal in connection with this sale, and it has a good moral for California ranchers who are not raising livestock.

A few years ago Mr. Lehmann was a firm believer in the idea that he was destined to become wealthy through raising wheat in Kansas. The height of his ambition at that time was to own a threshing machine, which was also believed a short and certain road to wealth. But the winds came and blew the wheat fields bare. Drouth, Hessian fly and a few other such things soon did the rest, so that at the end of the season there was little left to thresh. When this happens year after year, it begins to be very trying. Naturally, Mr. Lehmann began to look for other things.

About twenty years ago he quit the wheat and began working for cattlemen. From the moment he entered the cattle business things began to look better. And prosperity has come now in no uncertain degree. But the greatest triumph of his career in the cattle business was when he sold these Hereford steers on the open market at the new record price. News of the transaction spread rapidly throughout the stockyards district and visitors soon began flocking by the score to see these great record-breakers. The steers weighed well above 1,550 pounds and were finished to the last notch. Regardless of the big price they brought, they would have attracted attention anywhere.

They were range-bred and range-fed and had never been pampered. They had never been in a barn or a shed. Last winter they were fed on cotton cake and alfalfa hay. On April 25 they were turned on grass and fed two pounds of cake every day till June 1. From that time up to July 15 they received no more cake. But the dry weather came on then, so we started to feed cake again on July 15 and kept it up till the date of shipment, November 16. The last three weeks they were fed oats and some molasses feed.

Mr. Lehmann has a splendid ranch in the Flint Hills district of Kansas. He owns three sections and has about 10,000 acres leased. Mr. Lehmann now has more than 3000 cattle. He takes great pride in his herd of purebred Herefords, numbering from 150 to 200 head. His two herd bulls are Beau Fairfax, bought for $2,000 in the Royal sale last year, and Beau Perfect 10th.

Is there any reason why similar success cannot be achieved right in California? True, the prices paid by the packers here are not quite as high as those paid in the Middle West, but cattle can be raised much cheaper out here. And shouldn't the net profit be about as good?

California Winnings at the International

[Written for Pacific Rural Press.]

Just as we were going to press last week we slipped in a note that the University Farm Shorthorn steer, California Marvel, had won the championship at the International Livestock Show at Chicago. This, however, was not the championship for all breeds, but the senior championship for Shorthorns. Still, it is a very high honor, as the Shorthorn is one of the most popular breeds of beef cattle. And considering that California had to compete against the Middle West, this leadership among Shorthorns gives her an enviable reputation.

This winning is another proof that "blood will tell." It is also an illustration of the value of line-breeding. California Marvel is a son of Sultan Mayflower, a grandson of the famous Whitehall Sultan, and is out of the cow, Glenbrook's Marvel, herself tracing back to Whitehall Sultan. She was the dam of California Favorite, the grand champion steer at the International in 1916.

California Marvel first came in the limelight when he was made grand champion of the Pacific International Livestock Show at Portland last year. It was expected that he would meet stiff competition at the Chicago International from the junior yearling pure-bred Aberdeen-Angus, Fyvie Knight, shown by Purdue University. The highest honor went to the latter, and he was afterwards bought at auction by Wilson & Company, packers, for $3,350, which is at the rate of about $2.50 per pound—said to be the highest price ever paid for a steer. It was announced that steaks from him would be sent to France for Presidents Wilson and Poincare.

Other winnings made by the University Farm exhibit include: first senior Angus calf on U. C. Jock 3rd; second junior cross-bred calf on California Grizzly; champion grade Shropshire Wether; reserve champion pen of Poland-China barrows; first for best five steers, wethers and barrows.

A total of five firsts, six seconds and special prizes isn't such a bad record. We certainly are proud of our California stock, and of the men at the University Farm who have put the animals in condition to win — particularly Professors True, Thompson and Miller, and herdsman Alex McDonald. Long may they continue with us.

HIGH QUALITY AT INTERNATIONAL LIVESTOCK SHOW.

Never before has the International brought out as high quality as that seen in the animals exhibited at the show just ended at Chicago. Considering the labor conditions and the influenza epidemic, the entries were large, and there was keen competition in nearly all classes.

The complete list of awards is not yet available, but from those at hand the following will be of interest to our readers:

Shorthorns.—Grand champion bull, Wm. Hartnett, Waukesha, Wis., on a two-year-old, Lord Rhybon. Junior champion bull, Anoka Farms, Waukesha, Wis., on a senior bull calf, Anoka Omega.

Herefords.—Grand champion bull, O. Harris & Sons, Harris, Mo., on a two-year-old, Repeater, Jr. Junior champion bull, the same firm, on Repeater 129th.

Duroc-Jersey Hogs.—Grand champion boar, Ira Jackson, Tippecanoe, Ohio. Grand champion sow, H. W. Mumford, Ann Arbor, Mich.

Fat Cattle.—Grand champion steer, Purdue University, Lafayette, Ind., on Fyvie Knight 2nd. Champion Shorthorn, University of California, on California Marvel. Champion Aberdeen-Angus, Purdue University, on Fyvie Knight 2nd. Champion Hereford, Kansas Agricultural College, Manhattan, on Victor Hessler. Champion of grades and crossbreeds, E. P. Hall, Mechanicsburg, Ill., on Black Beauty.

Fat Swine.—Berkshires: Champion barrow, Quaker Oats Co., Chicago; champion pen, same concern. Poland-Chinas: Champion barrow, Iowa State College; champion pen, University of Missouri. Duroc-Jerseys: Champion barrow, Pennsylvania State College; champion pen, same college. Chester Whites: Champion barrow, University of Illinois; champion pen, J. K. Milner, Thorntown, Ind. Hampshires: Champion barrow, Simon Albrecht, Tiskilwa, Ill.; champion pen, University of Nebraska. Grand champion barrow of all breeds, University of Illinois, on a Chester White. Grand champion pen, University of Missouri, on Poland-Chinas.

Attention—Hereford Breeders

Wyoming Herefords

The World's Largest Herd Western Raised for Western Men

MISS RIALTO 2ND,
Never Defeated Grand Champion Wherever Shown.

Our herd won at Los Angeles Liberty Fair Every Blue Ribbon competed for, except one. Won ALL Championships on Females. Junior and Reserve Junior Championship on Males. MISS RIALTO 2ND still retaining her supremacy as Grand Championship Female, wherever shown this year.

These Great Bulls in Service

Wyoming Fairfax
New Era
Rialto
Roehampton 2nd
Gold Dust
Bonnie Lad 25th
Beau Sturgis 4th
Bonnie Lad Jr.

Over 900 Breeding Cows

representing the very choicest blood lines. Every female in our herd is descended from English importations and have been retained in our herd because of their size, bone, quality, hardiness and proven breeding worth.

"Wyoming Herefords" are maintained on our 25,000 acre ranch under the most progressive methods.

We Know Western Needs

and believe that our Herefords meet every demand of Western breeders and range men.

One, or a Carload

Because of the size of our herd we can furnish one or a carload of bulls, and an order for one receives just as careful attention as an order for a carload.

We won Grand Champion on carload of females at Denver the last two years. We have stock for sale at all times. Glad to answer questions and explain anything.

Ranch six miles east of Cheyenne, Wyoming. Twenty-five thousand acres devoted exclusively to the production of Registered Herefords. Sixteen hundred head on ranch at present time.

The Hereford Corporation of Wyoming

Wm. Cox, Herdsman Raymond S. Husted, Vice-Pres. and Gen. Mgr.
CHEYENNE, WYOMING.

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

R. C. Sturgeon of Tulare now has 25 registered Holsteins and 22 grand young heifer calves coming on. He is developing one of the finest herds in the San Joaquin Valley.

George Wendt, formerly with the Vina Ranch and lately in charge of the Longheath Farms herd of Holsteins at Mason, Nev., has accepted a position as superintendent of the Holstein herd of the Henderson Company, Sacramento.

A new California State record for Jerseys has been made by the cow Fern's Silver Ray, owned by F. H. Van Derpoel of Imperial county. She has completed a yearly record of 779.54 pounds of butterfat at eight years of age.

Tilly Alcartra has gone over the top. The world record for yearly milk production was 31,246 pounds, and on December 5 she had produced 31,300 pounds. She is now milking about 75 pounds per day and has 32 days to go to complete her year, so will smash the former record all to smithereens.

Beef Cattle.

Robert H. Hazlett at his first public sale of Herefords held at Kansas City last month made an average of $1,115 on 48 head; five bulls averaged $2,565, with a $6,100 top.

Wm. Henn of Kansas City has sold 5 Hereford bulls from his show herd at the Los Angeles Fair, all going to the Diamond Bar Ranch at Spadra. The bulls sold for an average of $1,100 each.

Congdon & Battles of Yakima, Wash., sold their first prize steer at the Liberty Fair to the Newmark Company at 22c a pound live weight. The steer weighed 1400 pounds and will be slaughtered for Christmas beef.

The first sale under the auspices of the Pacific Northwest Shorthorn Breeders' Association held in Southern Oregon was held at Roseburg, November 23, and 24 animals sold for an average of over $239 per head, with a top at $400.

Congdon & Battles of Yakima, Wash., sold from their show herd at the Liberty Fair the junior Aberdeen-Angus bull calf, Kendrick C. B. 2nd, to George Kirkwood of Los Angeles for his range cattle interests. The price was $1,000.

At the Livestock Show at Buenos Aires $42,500 American money was paid for the champion Shorthorn bull, said to be the world's record price for such an animal. Another bull sold for $20,500 and another for $20,000. The champion Hereford bull also established a record selling price for that country, bringing $25,000.

The highest average for Shorthorns made in this country since the historic New York Mills sale was reached at the recent Anoka Farms sale at Waukesha, Wis., when 48 Shorthorns, mostly calves sold for $89,550. Anoka Omega, junior champion Shorthorn bull at the International, topped the sale at $12,000. Thirteen bulls averaged $3,457 and 32 females averaged $1,275.

A world record was made in the homeland of the Hereford breed at Herefordshire when the S. C. Hayter herd was dispersed, November 7. Eighty-four head brought an average of $2,660; 33 cows with calves averaged $4,205; 4 bulls averaged $13,790. Two sales were made at world record prices, the four-year-old bull, Ringer, bringing $47,250 and a bull calf bringing $11,025.

George Watterson, proprietor of the Hereford Farms of Bishop, reports sales of registered Herefords as follows: 75 cows and heifers to C. B. Harris, Los Angeles, and S. R. Crowe, Hayward; a yearling bull to S. R. Crowe, Hayward; 20 bull calves to Tehachapi Cattle Company, Bakersfield; 2 bull calves to Thomas Williams, Bishop. Most of these animals are grand-daughters or grandsons of the bull Repeater, owned by O. Harris & Sons of Harris, Mo.

Swine and Swinemen.

Conejo Ranch, Newbury Park, has sold the Hampshire show sow, Leading Wave 2nd, for $500 to James McGill, the Indianapolis baseball magnate; also four young pigs at $400.

During the month of October the Castle View Ranch placed 47 sows, 17 bred gilts and 12 service boars, all registered Berkshires, among the ranchers of Sonoma and adjoining counties.

Mrs. Joseph Seogram Anderson, the noted horsewoman and proprietor of the Charmeran Stock Farm, Pleasanton, recently purchased a splendid young Berkshire boar from the Castle View Ranch of Santa Rosa.

Slocum & Sons of Willows have sold a large number of very fine registered Duroc-Jersey hogs to the farmers of the Durham State Land Settlement, who have decided upon Durocs as the only breed that they will raise.

Frank B. Anderson, the Berkshire breeder of Sacramento, reports sales of boars to the following: A. F. Leifer, Sacramento; H. A. Meckfessel, Arbuckle; Nahas Bros., Merced; L. N. Carpenter, Lovelock, Nev., and Rogers Ranch Co., Lovelock, Nev.

Llano Vista Ranch of Perris has sold the three-year-old Hampshire boar, Langdon's Choice, to James McGill, who also made purchases from the Conejo herd. All of the animals purchased will be cared for by L. A. Denker of Saugus for the present and later Mr. McGill expects to start a ranch of his own.

Lea Bleakmore, owner of Oak Knoll Farm at Lakeport, reports that his recent sales of Chester Whites include a fine young boar, Oak Knoll Chief, to Quigley Bros. of Richmond; also 3 gilts and 2 bred sows. The demand is heavy for gilts bred for spring farrow, and many orders are being filled.

Winsor Ranch and Peters, Lamson & Walker of Bonita have in Model Defender Lady one of the greatest Duroc-Jersey sows on the Coast. She has been grand champion at Riverside two years in succession and has had four litters during the two years, none of them less than 11 pigs; yet she will not be three years old until February. In ordinary condition she weighs 750 pounds. The owners expect to select their 1919 show herd from her litters.

Mark Bassett of Hanford is justly proud of his young herd sire, King's Gerstdale Jones, purchased several months ago from P. Hancher of Rolph, Ia. This September boar is by Hancherdale Jones 1st, for which $3,000 was refused. He has all of the size, stretch and bone of the big types, coupled with the smoothness and easy-feeding qualities of the medium types. Mr. Bassett already has several fine litters by him and he says that the pigs are the most promising of any ever farrowed on his ranch.

Allen Thompson, president of the Tulare County Duroc-Jersey Breeders' Association, writes that they are getting ready for their first consignment sale, to be held January 10, and will offer about 40 of the best bred gilts and sows in their herds, bred to some of the best boars in the State. The consignors will include Henry Cummins, Goshen; S. A. Williamson, Visalia; Joe N. Chenoweth, Visalia; C. E. Ellis, Tulare; Allen Thompson, Tulare; R. C. Sturgeon, Tulare; R. E. Clifford, Strathmore.

Livestock Miscellaneous.

Manager Joseph E. Painter of the San Francisco Livestock Show, to be held February 8 to 16, has just returned from an extended trip through the Middle West. He took in the Royal and International shows and visited many prominent breeders. The new date has found much favor with them and a large number have promised to exhibit.

The twenty-second annual convention of the American National Livestock Association will be held at Denver, January 21, and will continue for three days.

The Tehama County Stock Association has officially disbanded and abandoned its charter to reorganize as a part of the California Cattlemen's Association.

Correct Lubrication for the Ford Engine

The Ford automobile engine, illustrated here, like all *internal combustion engines*, requires an oil that holds its full lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLENE LIGHT fills these requirements perfectly. *because it is correctly refined from selected California asphalt-base crude.*

"Zerolene is the Best"

—Say leading motor car distributors, because the records of their service departments show that ZEROLENE, correctly refined from selected California asphalt-base crude, gives perfect lubrication with less wear and less carbon deposit.
Most cars are now lubricated with ZEROLENE because their owners have learned through experience that there is no better oil.
ZEROLENE is the correct oil for all types of automobile engines. It is the correct oil for your automobile. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations.

CALIFORNIA HOG BOOK

"Worth Twice The Money"

The California Hog Book, by W. S. Guilford, issued by the Rural Press nearly two years ago, is winning its way among the swine breeders of the Coast. Here is what one buyer thinks of it:

He Changed His Mind

On July 4th he wrote us that he had heard of the book and to send him a copy to his address, C. O. D., at Los Angeles. On July 11th he wrote us:

"I am in receipt of a package with charges of $2.03. If this is the book I wrote about, it is too expensive for me. I have not opened it. The package is at your disposal."

Later, on the same day, he writes:

"Wrote you this morning, offered to return Guilford's book on hogs. Began reading it, wouldn't part with it now for twice the money. Many thanks.—M. McC."

California Hog Book, Price $2.00 Postpaid

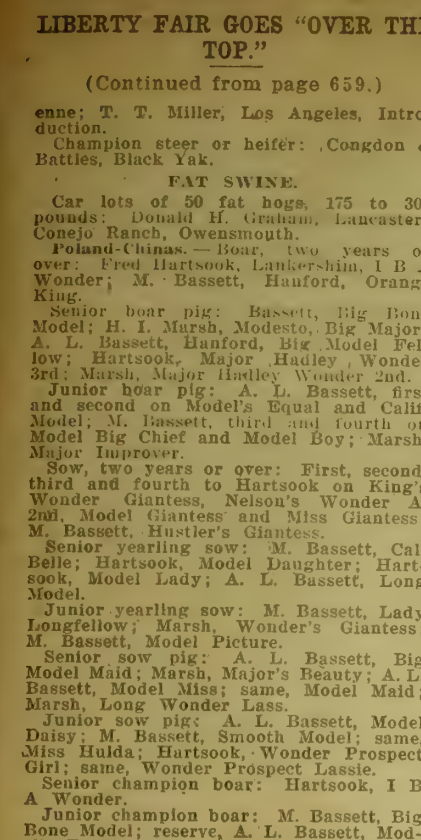
Boar and three sows bred by exhibitor: A. L. Bassett, M. Bassett, Marsh, Marsh.

Get of boar: A. L. Bassett, M. Bassett, Marsh.

Produce of sow: A. L. Bassett, M. Bassett, Marsh.

Four pigs under six months from one litter: A. L. Bassett.



Decide right now to put your dairy on a profit basis. Go after 100% health in your milk cows.

You do not need a veterinary for most of the ailments common among dairy cows. Barrenness, Retained Afterbirth, Lost Appetite, Scouring, Bunches, Abortion, etc., are nearly always a direct result of impaired organs of digestion and reproduction.

You can successfully treat and eliminate these diseases yourself with the aid of Kow-Kure. This well-known cow medicine acts directly on the affected organs and promptly restores a normal condition. Take one of your backward cows and put it to the test.

Buy Kow-Kure from your feed dealer or druggist; 60c. and $1.20 packages.

FIFTY HEAD of Angora goats for sale. Address F. W. Nason, Jamesburg, Monterey county, Cal.

Worms the Huns of Hogdom

[Written for Pacific Rural Press by R. H. Whitten.]

A kindergarten teacher was telling her pupils about the damage done by different animals, and happened to mention sparrows and worms. To draw a comparison she asked, "Now, Tommie, which are the most destructive, sparrows or worms?" "I don't know," answered Tommie, "I ain't never had sparrows."

That was a hard question for little Tommie, but an experienced hog man will quickly tell you that worms cause more trouble than all other ills to which hogs are heir. One veterinarian even goes so far as to make the statement that worms cause more losses than hog cholera. He does not mean more deaths, but because of the unthrifty condition of worm-infested hogs, the difference between what they bring when marketed and what they would bring if worm-free represents a greater amount than that represented by the losses from cholera.

Since a hog's stomach and intestines are what makes him valuable, any derangement of their functions reduces profits directly. Hogs infested with worms gain slowly, if at all. The worms sap their vitality, and the hogs use a good share of their energy in coughing instead of for growth and fattening. Furthermore, they are kept in such a weakened condition that they are more susceptible to diseases, including cholera, and as bad as worms are, of themselves, they are generally the fore-runners of disease.

It doesn't require the eye of an expert to tell that these thrifty, money-making hogs are free from worms.

HOW WORMS AFFECT HOGS.

There are a dozen different kinds of worms that infest hogs, but the ones most often found are the common round ones. They are from six to twelve inches long; seldom exceed one-fourth inch in diameter; are cylindrical, pointed at both ends, and vary in color from white to light pink. They multiply by eggs which pass out with the manure, are swallowed by other hogs on contaminated feed, and upon reaching the alimentary canal hatch out the worms. These worms are usually found in the small intestine, two or three feet from the stomach.

The round worms are not blood suckers; consequently they do not attach themselves to the inner lining of the intestine to obtain nourishment, but simply as a means of anchorage. They live by absorption of the food taken in by the animal; consequently a worm-infested hog does not even get a chance to assimilate and use its own feed, but must share it with the worms.

Considering that a worm is often a quarter of an inch in diameter, it is easy to see that the presence of a half dozen in one section of the small intestine will impede the passage, cause inflammation, and result in severe digestive disturbances. In badly infested animals the worms often work their way up the gall duct into the gall bladder, and sometimes even penetrate the liver, causing great derangement of the organs.

Also the worms throw off waste material which is toxic, and when absorbed by the hog it acts upon its nervous system. Hence it is not uncommon for the badly infested hogs to show cerebral disturbances. They have "fits" and act "crazy."

There is another worm—the thornheaded worm—which is about the same size as the common round worm and also infests the small intestine, but it fastens itself to the walls. Its head is provided with barbs pointed backward so that when the head is thrust into the wall of the intestine the worm cannot be detached without considerable force. The irritation caused by the barbed head produces a small fibrous tumor in which the head of the worm is imbedded. Sometimes a dozen or more of these worms will be found in one hog.

ALL HOGS SHOULD BE TREATED.

Few hogs are free from stomach and intestinal worms unless they have been given treatment to remove them. Young pigs usually suffer more from infestation than older ones and this has led many breeders to believe that mature hogs will not harbor worms, and hence need not be treated. But worms are found in older animals, and even though these animals do not suffer as much inconvenience as younger ones, they serve as a fertile fount to infect the young. Consequently, all hogs of all ages should be kept free from worms.

A good hog man will be on the lookout for symptoms of worms and will notice the least little sign of unthriftiness. He will associate a rough coat of hair, scurvy skin, poor returns for the feed consumed, pot belly or occasional diarrhea with probable worm infestation. And the occasional passing of a worm will cinch the diagnosis.

TRIED AND TESTED REMEDIES.

It is not a difficult matter to rid hogs of worms and many useful remedies have been recommended. The Government worm medicine consists of five grains of calomel and eight grains of santonin for every 100 pounds of live weight, given in the slop, and fed to the hogs on an empty stomach. This remedy gives good results but it has been found advantageous to add areca nut and sodium bicarbonate, and the formula of the Iowa Experiment Station is to be recommended. It is: 5 grains santonin, 3 grains calomel, 3 drams areca nut, 1 dram sodium bicarbonate for each 100 pounds of live weight. To make sure that all worms are expelled the dose should be repeated in ten days.

The capsule method of dosing hogs is coming into favor. The capsules are easily given and each hog gets his proper dosage. Santonin and calomel are generally used, and as to amounts Prof Ervard, of the Iowa station, says:

"A five grain capsule would be sufficient for a fifty pound pig and eight grains would be ample for a hundred-pound pig. We ordinarily figure eight grains of santonin plus approximately an equivalent amount of calomel for each one hundred pounds of hog up to a couple hundred pounds, although, really, we very seldom give more than fifteen grains of santonin even to heavy hogs, and usually ten grains is about as high as we would go for a two-hundred-pound hog. I would say that the dosage is entirely arbitrary and it practically all depends upon the cost. If santonin was very cheap, I would give two-hundred-pound pigs fifteen grains, whereas, if it was very high as at present, I would hold it down to about ten."

Since we got into the war the price of santonin has advanced so that its use is almost prohibitive, and in some cases it cannot be purchased at any price. A worm seed substitute, recommended by the Bureau of Animal Industry, may be used with good results. Withhold all feed and water for twenty-four hours, then give each pig from one to four ounces of castor oil, to which has been added oil of the American worm seed, as follows: Small pigs, two to three months old, 35 drops; pigs weighing 50 to 100 pounds, 50 to 100 drops; larger pigs, one teaspoonful.

One teaspoonful of turpentine per 100 pounds live weight fed in milk or slop for three consecutive meals, will kill or drive the worms out, especially if a physic of one pound Epsom salts to 1,000 pounds live weight pork, fed in slops, follows the turpentine. This will dislodge and carry out all dead undigested worms, together with those that are only sickened by the turpentine. Salts will also flush out all the eggs.

Ridding the hogs of worms is only one step in the war on these Huns of Hogdom. The next problem is to prevent re-infestation. All manure passed during the treatment should be destroyed by mixing with lime, as it will be teeming with eggs. Then a good mixture should be kept before the hogs at all times, and it can be prepared so as to prove a worm preventative, a digestion corrective and a general tonic.

A good tonic is made up as follows:

8 lbs. charcoal.
8 lbs. wood ashes.
8 lbs. air-slaked lime.
6 lbs. salt.
2 lbs. powdered sulphur.
1 lb. copperas.

Mix the lime, salt and sulphur thoroughly; then mix with the charcoal and ashes. Dissolve the copperas in two parts of hot water and sprinkle over the whole mass, mixing it thoroughly. If six pounds of bone meal is added to this mixture it will prove a good developer as well as a tonic. It is best to omit the copperas when feeding to sows in pig.

WARNING — Half-hearted effort never wins in anything. The worm is on the job all the time, and to beat this little Hun we must be just as persistent. Keep at it!

Poland-China Sows and Gilts

Bred to Purebred Duroc Boars

Am offering for sale 60 fine range raised sows from 2 to 5 years old and 100 Gilts, all gentle stock in good condition and all bred for spring farrow to purebred Duroc-Jersey boars. *Prices Reasonable.*

Sheep Industry on the Increase

[Special Information Service, U. S. Department of Agriculture.]

Sheep Increases

Sheep increased 12.6 per cent in the United States from July 1, 1917, to July 1, 1918. Estimates for 1918 show 257,921,000 pounds of wool produced, as against 245,573,000 pounds in 1917. This does not include approximately 48,000,000 pounds of pulled wool for each year.

However, while the sheep industry is gaining impetus, it is by no means keeping pace with the increase in population, and still more sheep are needed. Don't hesitate to go into sheep raising. It will put a fleece lining in your pocketbook.

There has been a gradual and logical movement in the sheep industry toward more and better flocks on the farms. The number and size of the flocks on the ranges is declining, according to the U. S. Department of Agriculture, but there is a distinct trend toward wool and mutton in sections where more intensive farming is practiced, and the farm flock is destined to play a more important part in permanent agriculture.

REASON FOR FARM TREND.

The increase in the farm States and the decrease in the range territory is due partly to the fact that range lands have increased in value and the continued homesteading has broken up the areas which were once in free range. In the farm States also the wool type of sheep has given way to the wool and mutton varieties, which has been the principal factor in bringing about an increase. The decline in the sheep industry on the Western range should not be interpreted to mean that the business in that section is going to entirely disappear, for there is every reason to believe that the range country will always continue as an important sheep producing center. Large areas in Western States will not economically lend themselves to any other grazing purposes.

Sheep which yield both wool and mutton are well adapted to more or less intensive farming. Farmers are beginning to realize that sheep of this kind fit admirably into a system of mixed farming, and with the meat and wool markets becoming more stabilized there is little need to become concerned with the yearly market fluctuations of these two products. Sheep on farms should be assured a larger place, as they can successfully share with other stock in the economical and profitable utilization of farm crops, as well as being producers of valuable clothing material for which there is no complete substitute.

MISTAKE TO RUSH IN.

One of the chief drawbacks at the present time to a more rapid development of the industry is the lack of knowledge of good flock management. There is danger in the tendency to rush into this new line of farming, which increased prices have brought about, where experience is lacking. While there is nothing difficult about managing sheep, it must be remembered that sheep breeding is essentially a long-term proposition and not a one-season crop like wheat, corn, or barley; and should be entered into with this well in mind if disappointment and failure are to be avoided.

Sheep require a small amount of high-priced grain compared with other farm animals. They utilize and thrive upon forage crops to a great extent and will make use of rough feeds about the farm which other stock will not eat. They require a small amount of labor also, which is one reason for the increase in the industry in the farming States.

The rising prices of wool and mutton since 1914 no doubt have added further impetus to sheep raising. Since the advance in price began before the war, it is fair to assume that the war is not to be given all the credit for this spirited activity and that the industry is likely to enjoy continued fair prices for a considerable time after the conclusion of peace.

Livestock Queries

Period of Heat of Ewes.

To the Editor: How often does an ewe come in heat and how long does she stay in heat?—J. A. L., Red Bluff.

[Answered by Livestock Editor.]

Ewe lambs reach puberty at about six months, but should not be bred until they are sixteen or eighteen months old. They come in heat at intervals of from fifteen to nineteen days and stay in heat from one to three days. After an ewe lambs she comes in heat in from five to six months. The average period of gestation is 147 days, although ewes have been known to lamb in 140 days and have gone as long as 156 days.

Mange in Horses.

To the Editor: I have a horse that has the mange. What causes it, and is there a cure?—Mrs. S. G. H., McFarland.

[Answered by Livestock Editor.]

Mange in horses is caused by mites that work their way into the skin. Consequently the treatment should be local. If a large area is affected, it is best to wash the animal with a 2 per cent solution of Kreso or any good coal tar dip. If the area affected is small, use an ointment made of 10 parts potassium sulphide, 2 parts potassium carbonate, 300 parts lard.

Cow Will Not Breed.

To the Editor: Can you tell me what the trouble is with my cow? She had her second calf in June. It came hind feet first and was dead. The cow seems to be perfectly well, but will not breed. Has been served four times, but does not get with calf.—M. C., Napa.

[Answered by Dr. E. J. Creely, San Francisco.]

Hind legs first is a normal presentation if the body does not come backwards. Your cow probably was torn at the neck of the womb. Sear tissue has formed and prevents the introduction of the fertilizing fluid of the male. The neck of the womb should be dilated just previous to being bred, or it may be necessary to cut open the binding tissue. This should be done by a qualified veterinarian.

Books on Goat Raising.

To the Editor: Please recommend a good book on goat raising.—F. R. B., Red Bluff.

[Answered by Livestock Editor.]

You do not state whether you want a book on milch goats or Angora goats. For the latter we recommend "Angora Goat Raising," price $1. For a general treatise we recommend "The Book of the Goat," which covers both milch and Angora goats, price $2.50. Both can be secured from the American Sheep Breeder, Union Stockyards, Chicago, Ill.

Confining Fattening Hogs.

To the Editor: Would you advise putting hogs in a small pen for the last month of their finishing off period?—J. G. H., Fresno.

[Answered by Livestock Editor.]

If the pigs have been on pasture, and are well-grown and vigorous, you will get faster gains by keeping them penned up for the last month or two. At the Iowa Experiment Station they succeeded in making 300-pound market hogs in eight months by confining them during the last sixty days.

for the safety of your hogs

Calco Hog Troughs prevent disease—they are absolutely sanitary.

Calco Hog Troughs are made of Armco rust-resisting iron—strong, durable, smooth.

With Calco Troughs every particle of feed is used, none left to sour and breed filth.

Popular sizes in Calco Troughs include:

Size	Depth.	Length.	Price
10¼-inch	5 5/16-inch	40-inch	$3.70
10¼-inch	5 5/16-inch	60-inch	4.50
14 -inch	7 3/16-inch	24-inch	4.55
14 -inch	7 3/16-inch	60-inch	6.55

Other models from 24 to 120 inches in length, from $2.95 up. Send your order today.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

TROUBLES FROM POISONOUS DIET.

While it is well known that musty, moldy, grain, leaves, or swampy ground will poison chickens, give them canker in the mouth and throat, and various other troubles, it is not generally known how the lay person can detect the trouble by the symptoms, and apply the remedy.

ASPERGILLOSIS.

The symptoms in fowls are drooping tail, watery eyes, throat swollen, and often tongue and mouth lined with yellow canker. Nearly all authorities claim that the only cure is prevention, and they are, in the main, right. Sometimes, however, a bird can be saved by prompt measures. Painting the parts with pure creolin, then dusting with powdered borax, will kill them quicker than anything else, and if the bird's strength holds out it will be saved. To keep up the strength, wet the mouth and tongue with straight tincture of iron once or twice a day and give pill made of bread and milk. If there is no improvement in three days, the case is hopeless.

LIMBERNECK.

Aspergillosis should not be confounded with limberneck; both are the result of poison in the system, but from different causes. Limberneck is usually caused by the fowl's eating rotten meat, maggots, or other animal food that has laid around rotting, such as gophers, or buried chicken carcasses they dig up. This is why it is always safer to cremate diseased poultry than it is to bury them. The diligent hens often scratch until they unearth them. Keep all such material out of reach and you will have no limbernecks, though in extremely hot weather I have had fowls that had very much the same symptoms, so nearly alike were they that no one could tell them apart. But in the latter case the birds can generally be saved.

THE UNSEASONABLE MOLT.

There seems to be a general complaint that hens and pullets are either gone into a molt or are about to do so. This is no doubt owing to a change the millers and feed men are making in the mash stuff they are selling. The only thing that can possibly be done is to feed as well as possible and get them over the molt in a short time. It may turn out to be only a partial molt anyway, but any kind is disastrous at this season of year. But these things are among the unavoidable and all the poultryman can do is grin and bear it. Plenty of green feed, bone and animal food will shorten the molt, but too much animal food, served without green feed, will provoke liver disorders and indigestion, so look well to the green feed question. Those who can turn the chickens out for a spell every day, even though it be for but a few hours, will get the hens back to work the quickest.

All changes of feed upset the hen's mechanism when she is in laying condition, and the millers and feed men ought to know this and avoid making changes in the mash without telling their customers, so that the change could be made gradual by feeding smaller quantities.

LOOKS LIKE BLACK ROT.

To the Editor: My turkeys have been very hearty birds until the last few days. Their combs and heads seem to turn blue and their appetite is not so good, and in a few days they die. We opened some and find their liver enlarged and full of white spots.—Mrs. W. W. B., Chico, Cal.

[Blue color in comb is always suggestive of internal trouble, but if the color is very dark—purplish like—it is black rot, and nothing you can do will save those that are badly affected. However, as the liver is affected there is some hopes, while if it were the lungs there would not be. Give the whole flock tincture of nux vomica, allowing ten drops to a quart of water, and keep it up, allowing no other water until there is improvement.]

RABBIT DRAGS HIND LEGS.

To the Editor: Can you tell me what to do for a rabbit that drags its hind legs?—G. S., Le Grand.

Dragging the hind legs may come from one of two causes. It may be rheumatism or kidney trouble. Get a 50c bottle of Sloan's liniment from feed dealers and rub the back and legs very gently, also give a few drops internally. If you rub too hard, you will injure the fur, so go light.

Poultry Breeders' Directory

Rate in this directory 3c. per word each issue.

WHITE LEGHORN CHICKS—hatched in January and February are money-makers if stock is good and right care given. We are equipped to fill large as well as small orders—and to your satisfaction. Write for special letter on them, also circular describing Brown and Buff Leghorns, Rhode Island Reds, White and Barred Rocks, Black Minorcas. Price and quality will both please you. Booking orders now for 1919 season. Be forehanded. The Mission Hatchery, Box 17, Campbell, Cal.

BABY CHICKS—We specialize this season on money-making White Leghorns—hatching from stock with high records that are unimpeachable. Also Brown Leghorns, Anconas, Minorcas, Rocks, Reds, Orpingtons, and White Wyandottes. Especially interesting circular with price list ready January 1st. B. W. Archibald, Soquel, Santa Cruz Co., Cal.

A Merry Xmas and Happy New Year to You and Yours

100,000 Pounds of Turkeys, Live and Dressed

Wanted for Christmas and New Year's Trade

Dear Sir:

As we predicted in our circular sent out for Thanksgiving Turkeys sold at the price we mentioned. The demand for Turkeys for CHRISTMAS is far greater than it is for Thanksgiving, and we shall need at least 100,000 pounds of TURKEYS to supply our trade with. We anticipate that high prices will prevail and we will not be surprised to see Fancy Dressed Turkeys sell at 48 to 50 cents per pound.

Commence now and fatten your Turkeys as much as possible. Ship them to us Dressed to arrive here December 21, 22, 23, and 24. If you are needing any money, when you ship your Turkeys you can draw on us for 37½ cents per pound as an advance on Choice Dressed stock, and we will make prompt cash returns as soon as the Turkeys arrive and are sold. Mark your Boxes and Coops very plainly with our cards and Wells Fargo shipping tags, placing your name and Post Office address on each tag.

We also need large quantities of Live and Dressed Chickens, Geese, Ducks, Rabbits and Hare. If you or any of your friends have any other kinds of Produce for shipment we can handle the same for you, and will give you good satisfaction with sales.

Ship us all the Grain, Dried Fruit, Beans, Potatoes, Honey, Beeswax, and Wool you have on hand. Don't hold these goods.

We would be pleased to have you drop us a line and let us know about how many head of Turkeys we may expect from you for our Xmas Holiday trade.

Yours very truly,

W. C. PRICE & CO.

GEO. H. LEE CO., Dept. 428 OMAHA, NEB.

The San Jose poultry and rabbit show, held last week, was more largely attended than of recent years.

J. A. Wilder has acquired 2300 acres of range land in the Santa Cruz Mountains and has stocked the land with 2000 Angora goats. He plans on raising them for both wool and meat and to eventually carry 10,000 goats.

HATCHING GOSLINGS IN WINTER.

Ducks and geese are commencing to lay, and breeders are getting anxious to secure early hatches. Now, in hatching ducks, they are so well known and their care is so nearly on a par with chicks that most people can raise them successfully. But with geese it is different, and yet the goose is so near akin to the duck that everybody ought to be familiar with their care. The goose takes thirty days to hatch and if set under hens the nest should be made on the ground in a sheltered spot, or in a box with moist earth filled in and a sprinkling of litter over. When the goslings hatch they should be kept warm until the hen has finished her task, then give her her brood, but confine her so that she cannot ramble around with the little fellows. Give them some straw to help out on the nest, as they love to snuggle under something. Feed and water the hen before giving her the goslings, but do not feed the goslings until about the third day, then feed just what moist mash they will eat up in a few minutes, and always set out a dish of water with the chill taken off for them to drink when they eat. Water at other times is not needed in cool weather. Have the dish covered so that all they can get in is their bill. Cold water and wet grass mean death to young goslings. Don't ever forget that warmth and a dry bed are necessary to their welfare and the more comfortable you make them the faster they grow and the cheaper the meat you will raise.

THE HEN'S WAR WORK RECORD.

When the story of the war is written, there should be a page reserved for the achievements of the American hen in the fateful year that is drawing to a close.

Toasts will be drunk to the American eagle—the praises of our heroes will be sung and everything from posters down to corn that helped win the war will be given just credit. At such a time the great American hen should not be forgotten.

The annual report of Secretary Houston of the Department of Agriculture shows what the hens did in the war year. "They had a fearful responsibility put upon them and did nobly." There were few slacker hens in 1918.

The hens set up a production record that wipes all earlier marks off the slate. There were 1,971,000,000 dozens of eggs laid during the year, which, reduced to figures that are understandable, shows that the hen produced every day between five and six eggs for every man, woman and child in the country.

The egg crop was 147,000,000 dozens larger than in 1914 and 226,000,000 dozens larger than the average for the five-year period prior to the war.

Where is the fellow who said the poultry industry of the United States was heading for the sewer?

POULTRY NOTES.

Los Angeles is to hold three poultry shows this season. One is now in progress in connection with the Liberty Fair, while the Los Angeles Poultry Association will hold its twenty-first event from December 17 to 22, and the Poultry Breeders' Association of Southern California will hold its exhibition from January 8 to 14.

Judge Wood of Amador county, while sitting in the Alameda county Superior Court last week, rendered a decision in the case of the California Poultry Producers, Inc., vs. J. R. Bell for the defendant. Judge Wood said that the contracts made between the Poultry Producers, Inc., and the individual poultry raisers could not possibly be enforced, due to the fact that they were contrary to existing laws, because of the injustice and hardship worked upon the producers, the inability of the producers to sometimes perform some of the provisions and the absence of provisions in the contracts making them fair and just to all of the parties involved.

THE HOME CIRCLE

WHEN I WAS FOUR.

When I was four—or thereabouts,
And wore a pinnie made of blue,
My mother hardly ever knew
My whereabouts.

I mind me showing her a sore
And see e'en now her brows upbent
In counterfeit astonishment,
When I was four.

Her working bag, all bound with gimp,
Held hooks and buttons for my play;
And when I mussed it up she'd gently say
"The little imp!"

I often turned it on the floor,
And lost the thimble, tape or thread,
And she, if grannie scolded, softly said
"He's only four."

And when I cried aloud because I fell,
'Twas mother always ran, she'd never miss
But take me in her arms and give a kiss
"To make it well."

Alone it was my mother, only she,
Who really understood my griefs and passion,
Who in her dear, sympathetic fashion
Gentled me.

—Ian Todd.

SKIPJACK.

Joseph opened his eyes and stared bewildered at the white cloth tent roof over his head. Where was he, and what smelled so sweet right under his head?

Then his eyes shone happily. Why, of course!—camping out—camping out at last, for the first time in his little seven years—and hadn't he always known just how it would be, because mother used to go camping with her mother and father every summer, beginning at two, and here he was seven!—and hadn't she told him just how sweet the fir bough bed would smell under his head when he went to sleep? But though he had tried and tried to pretend it all, he never could begin to pretend so sweet a smell as this.

The night before, he and mother had cut the boughs themselves, with his own new camp hatchet, and had piled up a high, springy bed. With some thick blankets over it, no one ever had had so comfy a bed; and he had tumbled into his fragrant nest, and that was all he knew till just now, when he opened his eyes and saw the tent roof instead of his own ceiling, and smelled the sweet fir boughs.

He looked across the tent. Mother and daddy had gone; and was it a fire he heard crackling outside, and daddy whistling? That must be bacon he smelled!

Out he fled, in a fever of impatience, just as the corner of the tent flap was lifted up and mother peeped cautiously in. He was about to shout good-morning, when she put her finger on her lip, and, crossing quickly to him, drew him to the tent door, whispering:

"Keep quiet, and see that cunning, cunning chipmunk out there on the log where we put our wash basin and pail of water last night. He doesn't know what to make of that shiny tin basin, does he? See how he whisks his tail, and tries to find out what is on his log—and yet he doesn't dare touch it."

"Oh, mother, isn't he funny? See him now! He sat right up and folded his hands on his stomach, and chattered to himself about it!" chuckled Joseph, gleefully, under his breath.

That was Joseph's first glimpse of Skipjack, as he promptly named his little chipmunk friend.

"We'll be very friendly and quiet with him," advised mother, "and perhaps he may grow friendly with us."

So in a few days, when the camp provisions needed replenishing, and daddy had to tramp to the nearest little mountain town to get more, Joseph begged, "You won't forget plenty of peanuts for Skipjack, will you, daddy?"

Daddy promised, and brought such a big bag that even Joseph was satisfied.

"Let's put two or three out on the wash basin log, and then he'll be pleased and come again, and we'll watch for him and give him some more every time and see if we can't get him tame."

Sure enough, Skipjack, who seemed overwhelmed with curiosity in regard to the wash basin and soap dishes that now decorated his own favorite log, soon appeared—and—could it be a peanut?

He cocked his little shiny black eye at it, whisked his tail very fast, sat on his little hind legs and looked again, finally seized one peanut, stuffed it in his cheek, gave a flying leap to the ground, another flying leap up the trunk of the nearest pine tree, raced to the topmost branches, in spirals round the trunk, down again, in the same excitement, and finally scampered off and popped down into one of his many convenient holes.

Joseph and mother and daddy, watching, but concealed behind some bushes, were convulsed with merriment. After that, Joseph kept the old wash basin log spread as a tempting feast, till frisky little Skipjack lost all fear of the basins, pails and soap boxes and scampered over them all, and didn't mind even if they clattered a little. At first, the least clatter was enough to send him tearing off the log and up the highest tree.

One day daddy brought a fresh supply from town, and Joseph, finding an empty lard pail with a cover, put the peanuts in that, and banged the cover on tight.

"Now they are safe, even if he gets very friendly," he remarked, "and I'll put the pail in my corner of the tent."

Next morning, when he went to get some nuts, being reminded by Skipjack, who sat out in the sunshine on the wash basin log, chattering impatiently, he found the cover off and the pail empty.

"Why, mother, did you or daddy take Skipjack's peanuts?" called Joseph.

No, they had neither one seen them. But who could have taken every single peanut, and right in the tent, too? There wasn't anybody who could possibly have opened the pail except mother or daddy or himself. Then his eyes opened very wide and he gasped:

"Mother! Daddy! You don't suppose Skipjack took them himself, do you? He has little hands, you know—but he couldn't, could he; and he wouldn't dare walk right over me when I was asleep, to get them, would he?"

Daddy gave a low, ruminative whistle. "The scamp! I wonder if he did! But if he has made off with a whole pailful of peanuts he certainly has no business to sit up on that log now and claim to be starving! Listen to his chattering!—as if he had been starved a month! I'll tell you, Joseph, I'm going into Edgewood again today, and I'll bring another supply of rations for Mr. Skipjack, and we'll spy on him!"

Joseph was all impatience till daddy came back. He had his lard pail ready, and he and daddy put a few peanuts in it and set it out on the log, and then, with mother, hid themselves, to watch, and kept very, very still.

Presently Skipjack frisked up on the log, his nose so close to the bark, smelling for peanuts, that he almost bumped into the pail; and Joseph, in hiding, clapped his hand over his mouth to keep from laughing out loud.

In his astonishment Skipjack sat up very straight and whisked his tail very fast, then hopped off the log, then hopped up again, apparently looked very hard in all directions to make sure no one would detect him, and then set industrious to work to open the pail.

The cover was on tight, and the pail was tall, but Skipjack was persevering. Using his little front paws like hands, and pushing with his little black nose, he had the cover almost off, when off rolled the pail with a great clatter to the ground.

Such an unexpected interruption sent poor Skipjack chattering to the top of his pine tree, and Joseph threw himself flat on the ground and pressed both hands hard on his mouth. But presently Skipjack was back, very indignant, and more than ever bent on getting that cover off—and yes—bang!—there it went, and Skipjack had the pail on its side, stuffed a peanut into each cheek, took a third one between his teeth and scampered gaily for his hole.

"Well!" said daddy. "I wouldn't have believed it!"

"Oh, daddy, isn't he the smartest, cunningest Skipjack!" Joseph shouted with long pent-up laughter.

"I'll take a hand in this game now, too," said daddy, "and we'll see how much the little scamp does know."

He took the pail, put a few nuts inside, put the cover on tight as before, then stood the pail bottom side up, on the log, and once more they all went into hiding.

Soon Skipjack reappeared, always wary, but intent on finding his peanuts. He spied the pail at once, and immediately set to work. But where was the part that came off? He chattered very wrathfully; then in a sudden flash he seemed to solve the problem. The pail was pushed over, cover off, and peanuts carried off as before.

food

is mightier than pen and sword

It is the foundation of health and human energy. It produces the stamina and the strength to do things. On the field of battle—as well as on the tables where peace and plenty reign—chocolate has proved itself a 100% food.

To insure supreme quality chocolate you must *insist* upon Ghirardelli's. It comes *only* in cans *—for your protection.*

At the store where you do your trading—in ½ lb., 1 lb. and 3 lb. cans.

OPPORTUNITY

They do me wrong who say I come no more
When once I knock and fail to find you in;
For every day I stand outside your door
And bid you wake and rise to fight and win.
Wail not for precious chances passed away!
Weep not for golden ages on the wane!
Each night I burn the records of the day;
At sunrise every soul is born again.

Laugh like a boy at splendors that have sped;
To vanished joys be blind and deaf and dumb;
My judgments seal the dead past with its dead,
But never bind a moment yet to come.
Though deep in mire, wring not your hands and weep;
I lend an arm to all who say: "I can!"
No shamefac'd outcast ever sank so deep
But yet might rise and be again a man.

Dost thou behold thy lost youth all aghast?
Dost reel from righteous retribution's blow?
Then turn from blotted archives of the past
And find the future's pages white as snow!
Art thou a mourner? Rouse thee from thy spell;
Art thou a sinner? Sins may be forgiven!
Each morning gives thee wings to flee from hell;
Each night a star to guide thy feet to Heaven.

—Walter Malone of Mississippi.

"I'm his friend now," laughed daddy, "and he can have all the peanuts he wants this summer!"

"But he doesn't eat them, does he?" asked Joseph. "He can't eat all he carries off."

"No, he has various storehouses—the holes you see him pop down—and he eats some and puts away the rest for winter. He'll have a very comfortable time next winter, won't he?"

"But what does he do when people don't come and camp near him and give him peanuts?"

"Oh, there are pine-nuts, you know, and hazelnuts, but he seems to prefer peanuts, doesn't he? Or maybe he is lazy and thinks it's easier to have peanuts handed out to him, all ready to store, than it is to skirmish all through the woods after his own winter supplies."

All that summer Joseph and mother and daddy grew more and more intimate with bright, furry little Skipjack, and he apparently trusted them more and more daily, till at the end of the summer he considered himself one of the family, and would dart up on Joseph's shoulder, or into his pocket after peanuts—but only if Joseph would keep still. He never learned quite to trust any sudden movement.

When it came time to pack up to go home, poor little Joseph was almost in tears, but not quite, because, you see, he was "seven—going on eight."

"Never mind, dear," comforted mother; "we all know he has plenty of peanuts for all winter—more than a dozen Skipjacks could possibly eat—and he will sleep in his holes, and wake up and eat the peanuts you gave him, and next winter you can think about him all curled up snug and warm underground, with lots and lots of peanuts around him, all ready to eat whenever he wakes up. We have all had such a good time here that you know we are coming back next summer, and we'll bring a flour sack of peanuts with us, and put some out on the wash basin log just the first minute we get back; and I'm sure little Skipjack will whisk right out of one of his holes to see us, and after he has sat up on his little hind legs and folded his hands over his little fat, furry tummy, and looked at us very hard, to make sure it is really we, his own old friends, you'll find he will soon be just as friendly as ever. Surely, Joseph, you wouldn't want to take him with you! Think how very, very unhappy he would be in a tiny cage, when he has been used to scampering up great trees, and over logs, and down holes. I hope you'll never, never want to cage any happy, wild thing, dear," she added wistfully.

"No, mother, I couldn't bear to make him unhappy; and if we are coming back sure pop next summer, why, it's all right." Joseph looked almost happy again.

"Sure pop," laughed back mother, with a hug, "aren't we, daddy? Next summer we'll bring a camera and take Mr. Skipjack's picture; and maybe we'll find something else to make friends with, too."

"What?" Joseph was all interest.

"I don't know," mused mother, "but you know how Farmer Griffin's chickens have been disappearing all summer, and yet nobody has seen the thief, though they find plenty of his footprints, and we might get on friendly enough terms with that old coyote, at least to see him."—Rose Brooks.

NEW ENGLAND APPLE BROWN BREAD.

Here is a recipe for the best ever apple brown bread: Two cups corn meal, 1 cup rye, 1 cup wheat or graham flour, 1 cup molasses, 1½ cups warm water (part sour milk is better), 3 apples chopped fine or some think apple sauce, 1 cup raisins, salt and a spoonful of soda. Put into a greased and floured pail or baking powder tins with tight cover. Steam four hours, remove cover and dry in oven a few minutes. The amount of wetting cannot be told exactly; it should be a batter about like gingerbread. This brown bread, served with baked beans, is all one can desire.

PUMPKIN RECIPES.

Pumpkin Croquettes.—Mix 2 cupfuls of stewed and drained pumpkin with 2 tablespoons of butter, salt, pepper and paprika to taste, and ½ cupful of crumbs. Heat, stir well together and when cool form into croquettes; brush over with beaten egg, roll in bread crumbs. Fry in hot fat, drain and serve with a tomato sauce.

Pumpkin Souffle.—Add to 2 cupfuls of hot stewed pumpkin, which has been pressed through a sieve, 1 tablespoon of butter, the yolks of three eggs well beaten, 1 tablespoon sugar, 1½ cups of rich milk, salt, pepper, paprika to taste, then fold in the beaten whites of the eggs. Pour into a buttered baking dish and bake until firm. Serve at once.

Market Comment

Duration of Wheat Price Guarantees.

Judging from a considerable number of inquiries regarding purchase of the 1918 and 1919 wheat crops, in view of prospects for early peace, the following statement is issued by the U. S. Food Administration: The President's proclamation of February 21, 1918, fixing guaranteed prices for the 1918 wheat crop, applies to wheat "harvested in the United States during the year 1918 and offered for sale before the first day of June, 1919, to such agent or employee of the United States, or other person as may be hereafter designated," at the principal primary markets specified. The Food Administration Grain Corporation was designated, June 21, 1918, to purchase the 1918 wheat crop and will therefore continue to exercise that duty and obligation, even though peace should be signed prior to June 1, 1919. The Food Control Act provides that termination of the act shall not affect any obligation accrued or accruing during its existence, and the purchase of the 1918 wheat crop is such an obligation. The President's proclamation of September 2, 1918, establishing guaranteed prices for the 1919 wheat crop, applies to wheat harvested in the United States during 1919 and offered for sale before June 1, 1920. As in the case of the 1918 crop, the wheat must be offered for sale "to such agent or employee of the United States, or other person as may be hereafter designated," at any one of the principal primary markets. Up to the present date, however, the agency by which the 1919 wheat crop is to be purchased has not been designated. Thus, although the guarantee for the 1919 wheat crop will continue until June 1, 1920, there is no present assurance it will be purchased or handled by the Food Administration Grain Corporation.

Government's Bean Purchases.

Recent bean purchases by the United States Grain Corporation, amounting to about 60,000,000 pounds, included 25,000,000 pounds of Colorado and New Mexico Pintos at 7c f. o. b., 15,000,000 pounds Michigan white beans at 9@9¼c, 5,000,000 pounds California pink beans at 7c, 10,000,000 pounds California small white beans at 8¾@9c. These purchases and some earlier in the season are expected to cover the army and export requirements for the next 90 days.

From Orchard to Market.

A Lindsay orange grower has just handed the Rural Press the following statement of present cost in getting oranges from the orchard to the consuming market:

Picking (lug box) 10c
Hauling to packing house (per box) .. 7c
Packing (packed box) 62c
Freight to New York $1.12

In estimating total cost it must be borne in mind that the lug boxes furnish fruit for only 66 per cent of the packed boxes.

Poultry Shipping Embargo Removed

The American Railway Express Company has rescinded the order placing an embargo on the shipping of standard-bred poultry for breeding purposes. This is good news to the poultry breeders of America, as all shipments will be carried by all express companies without delay.

January Hog Prices.

It was decided by representatives of the United States Food Administration, the committee of packers sharing in foreign allotment orders, representatives of the agricultural advisory committee and special representatives for the swine producers that the prices of hogs for January shall be continued on the same basis as in November and December.

New Low Price for Horses.

The U. S. Agricultural Department states that farm horses are now cheaper than they have been for ten years. Prices paid this year, it says, average $127.98. In 1910 the high-water mark was reached at $145.22, and prices have fluctuated between the two figures since then.

THE MARKET REPORTS

Where commodities are consigned on a commission basis, the only price obtainable is the San Francisco price, from which customary charges are deducted to ascertain actual price paid to producer. Lines of commodities sold on exchanges, as butter, eggs, cheese, grain, etc., are priced according to exchange figures, which are not the prices paid to grower. From these figures must be deducted the legal percentages permitted to be taken by wholesalers before remitting balance of sale price to shippers. Schedules of discounts governing these transactions may be obtained from the offices of the Food Administration or of various exchanges.

SAN FRANCISCO

San Francisco, December 11, 1918.

WHEAT.

Per bushel—

BARLEY.

Prospect of shipments to Europe and possibly to China, if the local brewers decide to build in that country, gives additional strength to the barley market, although there are no quotations on shipping and brewing descriptions.
Choice feed, per ctl .... $2.20@2.25

OATS.

Oats are firm in sympathy with the stronger barley market. It is reported that the local grain exchange plans to renew "calls" of all the grains after the first of the year. This report adds to the firmness of the grains.
Red feed, per ctl .... $2.50@2.60
Red for seed .... 2.65@2.90
Black for seed .... 2.80@3.00
Recleaned Red or Black for seed 3.35@3.50

CORN.

There are no changes in the corn situation and the quotations given below are regarded as nominal.
Egyptian, choice .... $2.75@3.00
Milo .... 2.70@2.75

HAY.

Receipts of hay for the past week were 561 tons, compared with 841 the previous week. Shortage of cars, of which there has been considerable complaint during the week, is doubtless the main cause for the decrease in shipments. At some stations, however, there were plenty of cars, but shipments were refused as weather conditions threatened to damage the hay while en route. Most of the arrivals have been alfalfa, some in fair condition and some in very bad condition.
Wheat, No. 1 .... $25.00@27.00
do, No. 2 .... 19.00@23.00
Choice tame oat .... 24.00@26.50

Okra, per box .... None

BEANS.

Nothing occurred this week to stir the bean market to activity. Quotations on cranberry and pinks were lowered slightly in an effort to move some of the stock, but the new prices found almost no demand. Other descriptions are unchanged.
Bayos, per ctl .... $7.25@7.50
Blackeyes, new crop .... 5.50@5.75
Cranberry beans .... 8.00@8.25
Limas (south, recleaned), new crop $10.50
Pinks .... $6.65@6.75
Mexican Reds .... $6.75@7.00
Tepary beans .... 5.00@5.50
Garbanzos .... 8.00@8.75
Large whites, new crop .... 8.20@8.30
Small whites, new crop .... 9.25@9.40

POULTRY.

The market is well supplied with Eastern stock and there is no prospect of any advance in hens and roosters, as excess shipments to arrive during the next week from the East will take care of the increased demand expected during Christmas week. Those having poultry and turkeys should ship the week previous to Christmas, as that is the time when retailers are most anxious to buy. It is anticipated that there will be a good shipment of dressed Southern turkeys at Christmas time and that this shipment will tend to equalize prices at that time. Christmas turkeys are expected to be a few cents lower than at Thanksgiving time.
Turkeys, live, young spring, lb .... 36@38c
do, old .... 35@36c
do, dressed 45c
Broilers, 1½ to 2 lbs .... 39@42c

Belgian hares .... 23@24c
Jack rabbits .... $3.25@3.75

BUTTER.

The price, 63 cents, was not changed this week, notwithstanding the demand and the fact that the milk canners are still paying excess prices for milk, and thus diverting much cream which otherwise would go to the dairies.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	63	63	63	63	63	63
Prime first	59	59	59	Nom.	..	..
Firsts	58	58	58	Nom.	..	..

EGGS.

Eggs were steadier this week than for some time past, extras closing at the same price as last week, with extra firsts and pullets higher. The general opinion is that eggs have now about reached the end of their "skyrocketing." Although they may go a cent or two higher on some calls, and may not go much lower before the end of the year, the approach of the new laying season and the large number of eggs in storage, which must be consumed in little more than a month, are elements of weakness which are expected to show in quotations in the near future. The same conditions prevail in the Eastern markets and unless an unexpected demand arises in New York the storage eggs in Chicago are expected soon to become the dominating feature of the egg market.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	82½	82½	81	82	82½	82
Extra 1sts	80	81	81	81	81	81
Firsts			Nominal			
Extra pullets	76½	77½	77½	77	78	78½

CHEESE.

The high cost of milk is the main reason given for an unusually small output of cheese, and this is naturally followed by higher prices. The makers of Cheddar have practically withdrawn that product from the market.
California Cheddar, flats, fancy .. Nominal
Fancy California flats, per lb 35½c
Oregon triplets, fancy 38c
Monterey cheese .... 25@28c

FRESH FRUITS.

Apples continue in good demand at unchanged quotations. Pears and persimmons have also had good sale this week, and the few grapes on the market found ready buyers.
California apples .... $1.00@2.00
Northwest apples .... 2.00@3.75
Winter pears .... $2.00@3.00
Persimmons .... 1.00@1.50

CITRUS FRUIT.

The best price for oranges this week was $5, and excellent navels are selling as low as $3. Lemons also are selling at a lower figure than last week, fancy lemons not bringing more than $5 as the top price. Grapefruit is unchanged.
Oranges, navels .... $3.00@5.00
Mandarins .... 1.75@2.00
Tangerines .... 2.50@3.00
Lemons, fancy .... 4.50@5.00

do, standard .... 3.50@4.00
California limes 1.50
Grapefruit, new .... 2.25@3.00

HONEY.

Honey continues weak, with practically no demand. One lot of extra fancy clear water white honey was shipped by a grower to the city with a request that it be sold to the trade at 20c, less commission. If this honey can be jobbed so as to retail at 25c, its high quality will probably sell it. However, buyers at present are not anxious to handle on commission.

DRIED FRUITS.

There were no changes in the situation or prices of dried fruits this week.

RICE.

Paddy rice, 1918 crop $4.32
Clear No. 1, 1918 crop, at mill 7.00

LOS ANGELES

Los Angeles, December 10, 1918.

BUTTER.

Continued light receipts and the consumptive demand holding up caused buyers to bid prices up Monday. With light production here on the Coast, the home trade taking all that is being made and Eastern markets complaining of light receipts and light cold storage stocks, caused an advance there of ½c and this had a sympathetic influence upon the market here. Receipts here for the week were only 223,798 pounds, against 254,800 pounds the same week last year. This showing caused buyers to bid extras up 1c on Monday and there was more trading than for some time. The market situation is strong.

We quote:

EGGS.

A firm market was had the past week. Receipts of fresh ranch eggs by rail for the week were 2080 cases; the same week last year 2780 cases. As the supply of fresh eggs coming in continues short of the demand, the cold storage stocks had to be drawn on pretty freely to help out. Eastern markets are the highest for many years and that had a sympathetic influence upon the market here. Fresh eggs in New York Monday sold at 95c. The Government report the first of the month made the cold storage stocks of the country 1,000,000 cases short of this time last year. Hence this unusual price. Bullish influences surround the market.

Celery, crate .... 4.00@4.50
Tomatoes, No. 1, lug .... 1.20@1.30
do, No. 2, lug .... .30@ .40
Cauliflower, standard crate .... 1.50@1.75
Hubbard squash, per cwt $1.00
Banana squash, per cwt 1.00
Pumpkins, per cwt .... .75

POULTRY.

Not much coming in the past week and not much wanted. What arrived met with a fair demand at old prices. Turkeys were in most request and may be called firm. The following prices were agreed upon last Friday, December 7, and hold good until the coming Friday:
Broilers, 1@1¼ lbs 37c
Broilers, 1½@1¾ lbs 41c
Fryers, 2@3 lbs 33c
Roasters (soft bone), 3 lbs. and up 30c
Stags and old roosters, per lb 20c
Hens .... 28@32c
Tom turkeys .... 31@34c
Ducks .... 22@28c
Geese 28c

FRUITS.

Apples continue to attract most attention and are meeting with a good demand. Prices are firm. Fancy stock brought a little more money. Guavas and Japanese persimmons in light supply and market for them showed a little more strength. Not many coming in.

We quote from growers:
Apples—
King Davids, 4-tier .... $2.75@3.00
Black Twigs, 4-tier 3.00
Baldwins, 4-tier 2.25
Red Pearmains, 4-tier 1.75
White Pearmains, 4-tier 2.00
Yellow Newtown Pippins, 4-tier .... $1.75@2.00
Bellefleur, 4½-tier .... 1.60@1.75
do, 3½-tier .... 1.75@1.90
Bellefleur, 4½-tier .... 1.60@1.85
Jonathans, Northwestern pack 3.00@3.25
Winesap, loose, per lb .... 5½@6c
Japanese persimmons, per lb .... 4@6c
Guavas, per crate of 30 baskets .. $1.75@1.85

BEANS.

There was no life to this market the past week. There was little demand for any kind and dealers don't look for any improvement in the market until after the Christmas holidays.

We quote from growers—
Limas, per cwt $10.00
Large white, per cwt .... $8.00@9.00
Small white, per cwt 8.00
Pink, per cwt 6.50
Tepary, per cwt 4.50
Blackeyes, per cwt 4.00

WALNUTS.

The season is fast drawing to a close. Few are to be had from first hands and those from independent growers are mostly culls. Prices remain unchanged. The association is still sending out a few on contract, about one car a day.

We quote f. o. b. California points:

	1918	1917
Fancy budded	33c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

HAY.

There were fair receipts the past week, but mostly low grades, which were hard to move. Choice was scarce and in good demand at steady prices. The dairy people were the best buyers, mainly of alfalfa. Horse hay still much neglected.

Barley hay, per ton	$24.00@25.00
Oat hay, per ton	26.00@28.00
Alfalfa, northern, per ton	21.00@22.00
Alfalfa, local, per ton	22.00@24.00
Straw, per ton	9.00@10.00

COTTON.

A bullish ginning report caused shorts to cover outstanding short contracts and there was more disposition to support the market than for several weeks. The current week opened Monday in New York with a firmer feeling, caused by the announcement that the Committee on Cotton Distribution had prohibited short selling. But the early advance caused many to realize, and by the close the early advance had been about all lost and the close was much the same as on Saturday. In New York December closed at 27.75c and January at 26.55c. In New Orleans December closed at 27.30c and January at 26.20c.

Is This Your Experience, Too?

"I hope you will never make a reduction in price which would cause a lowering of your standard," writes Mr. Harry E. Watson of Modesto, in renewing his subscription. "I would rather pay you $3 for one year and keep the present high standard than to have it forced to the level of many of the so-called farm papers.

"The value of a farm paper to us is the extent to which we can depend on its reports. The daily press is of little value, but the effort you are putting forth is appreciated even in places you never heard of.

"The widespread effort of farmers to organize for their common good, with its wonderful effect in every direction, makes a paper like the Rural Press, that is willing to help without being subsidized, of inestimable value to those who are really trying to progress. Our Government found much difficulty in contending with German propaganda, even when unlimited authority was given to put it down. But we poor farmers have to fight the propaganda of the various combinations with only such help as comes our way from willing workers, and we are always sure of finding the Rural Press back of us."

Yes, good friend Watson, you can always depend upon the Rural Press to stand solidly back of the farmers, championing their interests, fighting their battles and helping them solve their problems. And you can rest assured that our standard will never be lowered. No matter what the subscription price may be, the Rural Press will always be a quality paper through and through.

HORTICULTURAL JOTTINGS.

(Continued from page 651.)

Count Francis Forzano expects to harvest a 250-ton crop of olives from 112 acres this year, which only produced fifty tons last year. This place is five miles east of Roseville.

Apple values are well maintained throughout the various marketing points, strong prices ruling. Quality creates demand and an equable clean pack creates confidence, provided it is standardized.

The large orange groves of the Whitney Estate at Rocklin and Penryn are now sending out about a carload of oranges a day and the groves in the vicinity of Lincoln are also shipping out fruit.

B. G. Rooke of Lindsay reports the sale of a carload of Navel oranges to the T. H. Peppers Company of Kansas city for $3,722. The car contained 860 boxes of oranges and were grown on the Phil Baer tract.

Orchard and vineyard men of Sutter county at a recent meeting decided to fix the labor scale to be paid during the coming season at 30 cents per hour. It is hoped that by mutual agreement the price can be maintained.

"C" grade raisins are turning out much better than was expected and the grower may expect something better than the 3¼ cent price formerly named, according to F. A. Seymour of the California Associated Raisin Company.

George A. Lamiman, who has been horticultural commissioner of Shasta county for the last eight years, has resigned. He will still be identified with active orchard work however, and promises his co-operation whenever called upon.

Mrs. E. A. Tremeureux, who has a show orchard of sixty acres of cherries, apricots, plums and peaches on Dry creek, six miles west of Roseville, is installing an irrigation plant to furnish water for the orchard from a 300-foot well.

A mass meeting of wine-grape growers is to be held in the assembly hall of the Phelan building in San Francisco, on Saturday afternoon, December 14, when a number of problems vital to the viticultural industry will be discussed.

Olives from the orchards in the neighborhood of Auburn are being bought up by an Eastern firm and shipped to Corning, Tehama county, for processing. The price paid is $150 per ton f. o. b. Auburn, in lugs furnished by the company.

Some damage has been suffered in the olives of Oroville, Butte county, from two frosty nights though a large proportion of the fruit has already been harvested. However, all the fruit can be used in the Greek olive and oil plants.

Horticultural Commissioner Kellogg of Santa Barbara county, says that 90 per cent of the walnuts grown in California are descended from the Santa Barbara soft shell type, which originated from an accidental cross between the hard shell and the paper-shell imported from France and introduced into this State by the Mission fathers 134 years ago.

Special Citrus Market Report

Los Angeles, December 9, 1918.

The orange market, for several reasons, has been draggy and fluctuating for the past few weeks, and one of the factors contributing to this untoward situation has been the overeagerness of some growers to crowd the market with fruit either immature or immature in appearance. The bad effect of these undesirable shipments has been to lower the general average of prices obtained. However, on the whole, the market is on a firm basis and there is no cause for discouragement. Central California still leads in the shipments, with 1327 cars to date. Southern California is still backward, with a record of only 208 cars, as against 1856 for the corresponding term last year. On Central California shipments there is a wide spread of prices, owing to the preponderance for undesirably large sizes, the prices ranging from $2 to $5.50 f. o. b.; Southern California, $4.50 to $5. Florida oranges appear not to be entirely satisfying to the Eastern trade and are quoted at $3 to $4.45 for the best down to $1.70 for wasty stock.

Lemons are in good supply and of good quality, but are lower in sympathy with oranges. They range from $2 to $4.50 a box in the East and from $2.50 to $5 on the Coast.

Special Livestock Market Report

San Francisco, December 11, 1918.

CATTLE—There is little change in the local cattle market from last week, except that it has recovered from the customary stagnancy of Thanksgiving season. There is spirited rivalry for the few lots of fat steers of about 950 pounds up that are offered. Thirteen dollars per cwt., however, is about the top figure in this market.

Grass Steers—	
No. 1, weighing 1000@1200 lbs.	12¾@13c
do, weighing 1200@1400 lbs.	12@12¼c
do, second quality	11@11½c
do, thin	9½@10c
Cows and heifers—	
No. 1	9@9½c
do, second quality	8@8½c
do, common to thin	6@6½c
Bulls and stags—	
Good	6@6½c
Fair	5½@6¼c
Thin	4½@5½c
Calves—	
Lightweight	11½c
Medium	10½@10¾c

SHEEP—The sheep market is easy, as the equation between the light demand and the light supply is easily maintained. Good prices rule, and there is no indication of a decline.

Lambs—	
Yearling	12@12½c
Milk	14@14½c
Sheep—	
Wethers	11½@12c
Ewes	9@9¼c

HOGS—Hogs continue to arrive in plentiful supply and in good average condition. The Western Meat Co. was out of the market for a few days, but is buying as usual again, the labor situation having much improved. Indeed, Tuesday of this week scored a record kill, 1226 head going under the block. Prices unchanged.

Hard, grain-fed, 100@150	16c
do, do, 150@300	16½c
do, do, 300@400	15¾c

Los Angeles, December 10, 1918.

CATTLE—The tone of the market the past week was a little firmer, though prices show no quotable change. There continues a scarcity of choice fed steers. Owners of thin cattle are a little more independent since the rains and the market for them may be said to be firmer.

Per cwt. f. o. b. Los Angeles—	
Beef steers, 1000 to 1100 lbs.	$9.00@12.00
Prime cows and heifers	8.00@ 9.00
Good cows and heifers	7.00@ 7.50
Canners, per cwt.	5.50@ 6.00
Calves, per cwt.	8.50@10.00

HOGS—A steady and rather firm market was had the past week. The offerings were only fair; quality good. This, with firm markets East, encouraged buying and the market was fairly active at last week's prices.

Heavy, averaging 275@350 lbs—	$14.00@15.00
Mixed, 225@275 lbs.	15.00@16.00
Light, 175@225 lbs.	16.00@16.50

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—The market the past week was much the same as the week before. Not many really fat sheep and lambs are to be had. What were offered found ready sale at last week's prices.

Per cwt. f. o. b. Los Angeles—	
Prime wethers	$9.00@10.00
Prime ewes	8.50@ 9.50
Yearlings	9.50@10.50
Lambs	15.00@16.00

Portland, December 10, 1918.

CATTLE—Strong; receipts, 148. Steers, prime, $11.50@12.00; good to choice, $10.50 11.50; medium to good, $9.50@10.50; fair to medium, $8.00@9.00; common to fair, $5.50@7.50; cows and heifers, choice, $7.75 @8.00; medium to good, $6.00@7.00; fair to medium, $5.00@6.00; canners, $3.00@4.00; bulls, $5.00@7.00; calves, $9.00@12.00; stockers and feeders, $6.00@9.00.

BEET SEED—Golden Tankard for sale—35c in small lots; 10 lbs. or more, 30c. C. E. Leek, Hopland, Cal.

BARGAINS in Bartlett pear. Address L. J. Eachus, Lakeport, Lake county, Cal., Oak Mound Nursery.

PAYNE WALNUT GRAFTING WOOD—Order now. W. H. Ward, Morgan Hill, Cal.

WANTED.

WANTED—Position as dairy foreman; familiar with efficient and modern methods, productive feeding, testing milk and sanitation. Box 1290, Pacific Rural Press.

25,000 Head Dressed Turkeys

To Supply Our Christmas Trade

In San Francisco and surrounding towns there are fully one million people that we have to help to supply with

TURKEYS for CHRISTMAS

We sold dressed turkeys during Thanksgiving week as high as 48 cents per pound and we hope to sell all the fancy stock we receive for Christmas at the same price.

Ship your turkeys and chickens by express to us if you want immediate cash returns and full weights and the highest possible market prices.

Take Wells Fargo & Co.'s tags and write our name upon them. Don't fail to mark and consign your shipments direct to the old reliable firm of the

Poultrymen's Union

General Commission Merchants

Established 1890 — 209-211 Clay St., San Francisco, Cal.

Our motto is: "We strive to please our shippers."

Still Better Tillage Tools

Deering — McCormick

HAVE you seen the **New Third Lever** on a **Deering** or **McCormick** Three-Lever Disk Harrow? It is a depth regulator. With it you raise and lower the inner ends of the disk gangs to meet *all* field conditions. You do this quickly and easily without in any degree destroying the rigidity of the gangs, for which International Harvester disks have always been famous.

Have you seen the **New and Exclusive Attachment of the Tandem?** This is another feature we are proud of. The connecting braces tie to both leading gangs, extending from the tandem in such a way that the gangs *must* cut the ridges left by the leading gangs. In turning corners, the sliding connecting braces allow natural flexibility and following of the tandem without crowding sidewise.

International Harvester disk harrows have done top-notch good work for many years. They have built-in weight boxes, adjustable forecarriage, 4-wear wood bushings, tall hard oilers, etc., etc. This year they are simply unbeatable.

When you want seed beds that are right, be sure your tools —disk harrows, peg and spring-tooth harrows, cultivators, etc. —are **Deering** or **McCormick**. Write us.

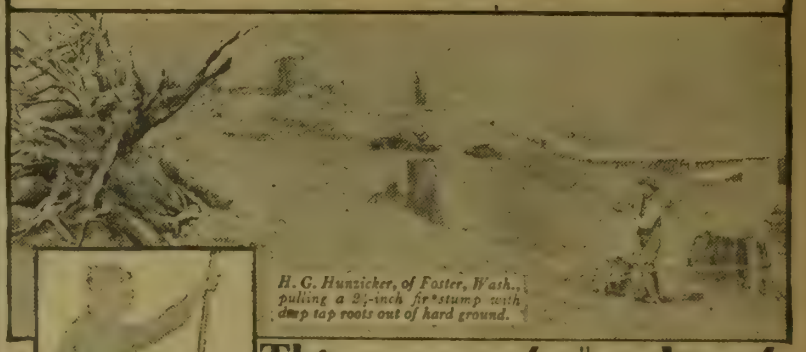
Big Money In Stump Land



H. G. Hunzicker, of Foster, Wash., pulling a 2½-inch fir stump with deep tap roots out of hard ground.

This man made $35 Land Worth $200 an acre Pulling Big stumps *by* hand

CLEAR your stump land cheaply—no digging, no expense for teams or powder. Your own right arm on the lever of the "K" Stump Puller can rip out any stump that can be pulled with the best inch steel cable. I guarantee it. I refer you to U. S. Government officials. I give highest banking references.

HAND POWER

K Stump Puller

Showing easy lever operation

Weight, without cable, 171 pounds

One man with a "K" can outpull 16 horses. Works by leverage—same principle as a jack. 100 lbs. pull on the lever gives a 48-ton pull on the stump. Made of best steel—guaranteed against breakage. Has two speeds—60 ft per minute for hauling in cable or for small stumps—slow speed for heavy pulls. Works equally well on hillsides or marshes where horses cannot go.

Write me today for special offer and free booklet on Land Clearing.

Raise the Calves and Prevent a Crisis

Written for Pacific Rural Press by R. H. Whitten

THE OLD ENGLISH PROVERB, "If you would enjoy the fruit, pluck not the blossom," applies to dairying as well as to horticultural pursuits. Changed to a more fitting expression, it would read, "If you would enjoy the fruits of dairying, kill not the heifer calf."

For some time we have been giving facts and figures to show that production in the dairy industry is not keeping pace with consumption, but the really alarming feature of the situation is the way heifer calves have been slaughtered. Government records show that in 1917 the number slaughtered was 26½ per cent greater than in 1916, and fewer calves were saved this year than last. These figures are for the entire United States, but it is safe to say that up to the time the rains came in September the percentage of calves slaughtered in California was fully as great as, or perhaps even greater than, that for the country at large.

Furthermore, probably 40,000 dairy cows have been sent to the butcher on account of high prices of feed, labor and beef, and these will have to be replaced in order to meet the normally increasing demand for dairy products. But how can it be done if the heifer calves are not saved? The dairy industry is one that cannot be suddenly increased, because it requires two years to raise a heifer to producing age and five years to bring her to a maximum production. There is nothing on earth that will make cows in 1920 and 1921 out of the calves that are killed this year. If the calves are not raised now, there will not be enough cows later on, and as we have fewer foundation cows in the State now than normally, it will take us all the longer to rebuild the dairy industry.

There can be no question that in the next few years we are not going to be able to raise dairy cattle fast enough to supply the demand, and to prevent a big shortage we should save every promising heifer calf. As one authority puts it, "No dairyman who kills a heifer calf has looked very far into the future. His best income is going to be derived from growing heifers that he can either use in two years from now or turn off for cash."

From now on a dairyman will be able to breed better cows than he can buy. Before the September rains came good producers were being sold, but since then the farmers have been holding onto all profitable cows and nearly all now being offered for sale are boarders or culls.

Be Particular About the Sire.

The common advice is to keep the heifers from heavy producing cows only, but evidently the ones giving such advice are not "up" on the principles of transmission in breeding. It has been proved that a heifer calf inherits the qualities of her sire's dam more than those of any other ancestor, and the qualities of all the ancestors on the sire's side more than of those on the dam's side. Consequently, the surest way to get high producing heifers is not to merely keep the calves from the best cows, but to have a purebred bull backed by a long line of heavy producing ancestry, and then keep all of his heifer calves that have strong constitutional vigor and good dairy type. I would greatly prefer a heifer calf out of just a fairly good cow, but by a well-bred bull, than one out of a top-notch cow but sired by only an ordinary bull. This statement may bring forth a lot of opposition, but in a later article I shall give you the results of extensive experiments to prove that while a bull calf should have a great mother, it is better for a heifer calf to have a great sire.

But there are a great many factors besides breeding that have an influence upon the value of a heifer as a producer. Looks, form, type and dairy quality are bred into her. Size, capacity and ability to produce large quantities of milk are also determined partly by breeding, but they may be influenced and augmented by proper care and judicious feeding.

With the present prices for grain, and the high prices paid for milk and dairy products, the tendency is to slight the calves, but this is not wise, and if it is necessary to cut down on feed bills it is better to do it by keeping fewer calves and feeding each one well. One heifer well grown will make more profit for her owner than two ordinary ones.

Any calf worth raising at all is worth raising well. Capacity — the ability to consume large quantities of feed and convert them into milk—is one of the essentials of a good dairy cow, and in order to develop this characteristic the calf must be kept growing from the very beginning. Careful attention during the first few months often means the difference between a sickly, undersized animal and a large, well-developed one when it enters the herd as a milking cow. A stunted calf will never recover from the handicap. If it has been improperly reared it will not make a profitable cow. "As the twig is bent, so the tree inclines."

Care of the New-Born Calf.

As soon as the calf is dropped its mother will, under normal conditions, lick it dry. If she is unable to do this, the calf should be rubbed with burlap or straw. This not only dries the coat but also tends to stimulate the circulation, which is often weak. The calf should not be left wet for any length of time if the weather is cold, as this often results in pneumonia and death. Be sure to pro-

(Continued on page 691.)

Healthy, well-bred calves like those in the upper pictures soon develop into high-producing, profitable cows like those in the lower picture. Prevent a cow shortage by saving every promising heifer calf.

EDITORIALS

OUR GREATEST CHRISTMAS GIFT.

AMERICA will sing her Christmas carols this year amid the ruins of effete European monarchies. Ever since the Revolution our historians, poets and orators have heralded the crumblings of thrones and the uprising of governments by and for the people unstratified by castes and classes and the world-spread of civilization unfolding equal opportunity for all to pursue life, liberty and happiness, according to their several endowments of speed, capacity and energy, to whatever achievements they might attain without encroachments upon the opportunities of their fellowmen. For nearly a century and a half our declaration of such principles has sounded in the ears of the world, and for five generations mankind has been watching to see if these principles could really be the foundation upon which a great and enduring nation could be builded. Long ago the world credited Americans with wonderful attainments, but they conceded to us no higher attribute than sagacity in seeing and seizing great natural resources and acuteness and enterprise in trading upon their development. The world doubted if we had a national soul. The European imperialists scorned us as possessing no soul for kultur, which aimed at world-dominion. The European proletariat believed that, in spite of our professions, we had no soul for the rights of common men—that our only thought of a poor man was to get his last dollar. Both potentate and proletariat found confirmation of their judgments of us in our national policy dictated by inappreciation of the menace to our boasted principles which the outrage of 1914 really involved. They were hardly more blind to the existence of the American soul than we ourselves were deaf to its outcry that the time had come to discharge its duty for mankind! It becomes the American to thank God most earnestly and penitently at the coming Christmas that the United States saw clearly in the year 1917 the lesson of the year and sprang to its stroke for world-salvation and thus brought victory to those who had fought almost to hopelessness to shield us from perdition while we slumbered and slept. It is a matter for profound thanksgiving that we were not permitted to awaken too late. It is surely not for us to boast of what we have done: let us rather give thanks that we did not fail to do anything. This is our greatest Christmas gift!

THE PRESIDENT'S CHRISTMAS DINNER.

ALL THE wirelesses and the cables have been busy for several days with accounts of the welcome accorded to President Wilson by the people of France and representatives of other nations assembled in Paris to express their satisfaction over his coming in his own person as representative of the American people who have given him the highest honors they have to bestow and who rejoice in the quality and devotion of his leadership. The spirit and methods of the allies' greetings to America have been most profoundly satisfactory and President Wilson has accepted them with proper national pride and individual humility. His presence in Europe at the peace-making gives American participation a dramatic concreteness, definitude and significance which could hardly have been attained in any other way, for humanity's deepest feelings are still reached by seeing and shouting, and we find our own emotions stirred by the fact that Europe sees and shouts for our representative. The effect will be wholesome in many ways.

But the greatest thing thus far about President Wilson's presence in Europe is that which is rumored as possible as we write on Tuesday. It is that our chief magistrate will turn away from princes and premiers, marshals and generals, on Christmas Day, and will dine with the rank and file of American soldiery, unattended and informally. We hope this will be found practicable, for it will be the most significant American thing that can be demonstrated in the eyes of those who are trying to learn democracy. For the relation of Americans to those whom we choose to serve us in the highest stations which we ourselves create is not betokened by genuflection nor by other act of formal worship, but by outspoken cordiality manifested on the plane of equality between man and man in the giving and receiving of honor and good will. Therefore, we hope that President Wilson will partake of Christmas cheer in as large a company of the citizen soldiery of the United States as can be conveniently assembled. And we wish that not alone that he and they can enjoy their cheer together in good American cordiality

and equality, for they are sure to do that if they get together at all, but because such an event transpiring in their midst will give European people a more concrete and realizable idea of the American equality of conduct and converse than they could possibly get in any other way and will demonstrate to them that the true American way is not by "divine right" of overlordship nor by the devil's right of Bolshevism, but by mutual honor and cordial support to those of themselves whom they themselves select to maintain good order and personal liberty for those who respect the laws which they themselves constitutionally enact and to which they require obedience.

WILL IT BE AT COBLENZ?

IT IS thought that the President may have to go to the Rhine to dine with the American soldiery actually at their appointed tasks and that at Coblenz such a notable event may transpire. Here, then, at Coblenz it may most appropriately be, for here the Rhine ceases its tortuous journey through mountains crowned with castles of ancient Teutonic regime and, taking the waters of the Moselle, speeds across the flat country toward the borders of Holland far away. It is at Coblenz that there arises a colossal equestrian statue of the first emperor of united Germany, whom Bismarck by cruel design of treachery and war installed as ruler over an unwilling people, of whose conquest the statue is a monument and a menace against possible insubordination. It is a foolish thing to erect monuments to commemorate acts of injustice, for they cannot stand. In due time righteousness prevails and such monuments are dishonored if not cast down. Thus it must be with the great bronze horseman of Coblenz. He was a better man perhaps than his tricky ministers made him and better than his offspring, but the world hates the treacherous diplomacy by which the German empire was thrown together and the German states are themselves repudiating the unholy birth of their alliance. There are other monuments of autocracy in the Rhine region which are now sadly anachronistic: German eagles screaming defiance at the French whose land had been sequestered but fortunately not conquered, and a lot more junk set up by autocratic artificers to commemorate victories of cruelty and aggression—things which made us shudder as we beheld them, even before their full significance was revealed by the abomination of 1914. In such an environment perhaps President Wilson will eat his Christmas dinner with the American doughboys, who have already earned the world's homage as heroic veterans. In no place perhaps could the President and the common soldiers of the United States so well measure their equal height and depth against each other as they sing and shout together their joy to remember the new birth of God in man which can make all men free.

CALIFORNIA'S OUTLOOK GOOD.

CALIFORNIA approaches the Christmas season with much joy in the things which make all Americans ready for a Merry Christmas and a Happy New Year. None will forget those who have given their lives that such joy may endure in the world. To them most profound honor and gratitude flow unbidden from all patriotic hearts. None will forget those who have been called humanly to mourn. To them most profound sympathy and all the satisfaction which can come from consciousness of sacrifice for the good of mankind. But it is right for the State to rejoice in the public good which has been saved and perpetuated for coming generations. It is right, also, for us who still linger and have strength to put forth honorable effort to rejoice that our beloved commonwealth is vouchsafed the outlook of a good year in 1919. The rainy season seems to be taking its course toward fullness of production. Restrictions upon industry born of war needs are melting away. Problems involving doubts and difficulties remain, but they always meet productive effort and must be faced with resolution to take reasonable risks, which farming people have been born and bred to do ever since Adam lifted his mattock valiantly against a thistle. All authorities agree that there is no danger of too much good food and that the value of it will as a rule be good also. That is about all the assurance the farmer ever had or can have in his undertakings. It is up to each farmer to arrive at the best judgment he can of what his land can best do and what the market will pay best for, of things within his conditions and adaptations. It is time now that such judgment should be earnestly sought and freely exercised. Framing programs of production may have been a war need, but there is no excuse for further governmental indulgence in it. What farming needs is more facts and less advice. The American farmer, left to the exercise of his own judgment of facts, can see farther around a crop than any of the patriotic people who seem to feel called upon to minister to farming without knowledge of it. If California farmers are thrown back now upon their own judgment and freed from schedules the outcome will be safer and saner. Fortunately California is a land of wide diversity of products and of wide adaptations, and if these are used in accordance with the diversity of facts and foresights of individual producers there will be a better fit to current needs than a whole bureau-full of programs can ordain. No man nor set of men should undertake to program products without being equipped to contract for them. As the latter is impossible, the former should be abandoned. As we believe this will be done, we feel much satisfaction in the concensus of the prophets that produce values will be good because we also believe that producers, left to themselves to calculate what they can profitably undertake in view of excessive cost of labor and supplies required, will come nearer to having something left for themselves at the end of a crop than they can have by following hortatory programs. Our confidence in the outlook lies

not only in the prospect of a year of good natural conditions but in the fact that farmers will follow their own judgments in turning such conditions to economic account.

* * *

CALIFORNIA COMMUNITY COUNCILS?

WE HAVE received the following communication, to which we desire to give careful attention and courteous treatment:

Peace has brought both problems and opportunities. To meet fully the situation the State Council of Defense, acting on the suggestion of President Wilson and the Council of National Defense and through the County Divisions, is preparing to organize in every section of the State a community council. These councils will be formed not only with the idea of service during the readjustment period, but also with the intention that they will live and function to the betterment of their respective communities during the time of prosperity now apparently assured.

These community councils will be thoroughly democratic; their membership will be extended to every man, woman and child, and they will be organized along the broadest possible lines. They will include all the advantages of community centers and farm bureaus, giving the fullest opportunity for community expression and initiative.

Among the immediate problems that will fall to these community councils will be local assistance in bringing about normal demobolization of soldiers, sailors and war workers to the end that they may most wisely be reabsorbed into peacetime pursuits.

If the foregoing appeal was simply to secure community co-operation in finding jobs for returning soldiers and sailors, we would be enthusiastically in favor of it and would exhort all local churches, women's clubs, farm bureaus, and all other farmers' organizations to co-operate in such an effort and to show gratitude to all returning heroes by assuring them a comfortable livelihood through work acceptable to them. This is a thing which all patriotic people should try to do, and they can surely do it better by community co-operation. As to "normal demobilization" and the rest of it, it looks to us too much like a recrudescence of the old trouble we had with those who were advocating "infiltration" of the veterans and keeping them marking time in the mud at Government expense so that wages of those who valiantly staid at home should not be endangered or reduced by competition. The whole idea is so abhorrent to us that we cannot speak respectfully of it. As we have said before, there may be danger of unemployment in cities and those who function in cities in various ways should be alert to avert it. That is a thing which we do not understand and of which we have nothing to say. But we do know and do not hesitate to say that to undertake to keep rural youth away from their homes and the work which is suffering through their absence is an impertinent and outrageously wrong interference with the rights of our veterans and of their parents and their waiting employers on farms and in village industries. We are solemnly and fixedly against organization for any such purpose.

As for the whole whip of which this "reabsorbing" purpose is the "cracker," we dislike and fear it. Why should we have an inspired "community council" in every neighborhood to infiltrate certain notions about "reconstruction" or to inculcate particular doctrines "during the time of prosperity"? If the Government is really encouraging such a thing, it should stop immediately. As a group of individuals with ideas of the value of which it is confident, it is perfectly proper and commendable, for all opposing groups can do the same, but to do such a thing as a Government is un-American. We have admired the way in which the Councils of Defense have kept the people right in their attitude toward the war and we are ready to admire what they think it wise to do to safeguard the results of the war against passivist propaganda by educating the people in the essentials of patriotism and the best interests of all mankind, but to attempt to create by inspiration community councils to displace existing voluntary associations and to be connected up with state and national fountains of political or economic ideas and theories, does not look good to us.

Permanent Paying Positions

Do you want to settle down in a permanent position that will assure you a steady income during the "reconstruction" period that is following the war?

If so, we have something good to offer you in our subscription department. Pleasant work, attending to our renewals and securing new subscribers.

Straight salary, with advancement. No experience necessary, but you must have an automobile. Write for particulars and tell us a little about yourself. Don't let this opportunity pass by.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Has It in for "Grain Farmers"!

To the Editor: In your issue of November 30 "P. B." of Merced wants to know if there is any demand for milo and feterita, and then howls about the middleman. I am running a small dairy and raising hogs. I want to say that the grain farmers as a rule encourage the middleman. I buy nearly all the grain I use and this summer I went to a barley grower and offered him 10c a hundred more than the market price for what barley I wanted, and I would haul it from the ranch. He said: "I will not sell a few tons; it has all got to go together." Another barley grower said: "Yes, you can have it at $2.50." The middleman was selling for $2.20. I would like to buy your correspondent's grain if he will deal reasonably.—P. E. M., Atwater.

We have had other letters from Merced county neighbors who would like to bid for P. B.'s grain. The lesson clearly is that there is a local trade possible between those who have produce to sell and those who are now buying it from local merchants. The lack of such direct trade encourages the local middlemen, as our correspondent claims. But a grower of produce has unquestionable right to say whether he will sell all he has or none of it except at a set price, and a buyer has also the same kind of a right to buy from a local dealer instead of a grower, if he can do better that way and all have the right to cuss each other in a parliamentary way, of course. Still there is undoubtedly a chance for direct trade which should not be overlooked. We have frequently described the advantage of signboards at the farm gates, stating what the farm has for sale. In this way saleable surpluses can often be profitably disposed of. The Farm Bureaus also make announcements which promote local sales. Such sales are often disliked because of indefinite collections. The local dealer gets an advantage by cash payments usually. Still the direct trading is worth encouraging.

Woolly Aphis Treatments.

To the Editor: Can you give the treatment of woolly aphis on the roots of apple trees? I have a young orchard of Gravensteins, not yet bearing, and I find a beginning of infestation of woolly aphis on some of the trees at the crown of the roots. I am informed that a farmer in the vicinity is pulling up his Gravensteins on account of infestation of the roots of the trees by woolly aphis.—W. T., Healdsburg.

Unless the trees are rendered unthrifty by some other cause or condition, they can carry woolly aphis without destroying their profitability and we would never pull up good trees because of this pest. It is exceedingly rare to find an apple orchard free from them. On the roots they can be held in check by drawing away the loose soil and applying wood ashes (from one to five gallons, according to the size of the tree) around the root crown, or by covering in tobacco stems, or by pouring in tobacco extract (1 pound of 40 per cent to 200 gallons of water) so that it will reach the aphis on the larger roots. The ashes or tobacco stems should be used at the beginning of the rainy season to leach out their contents during the winter. The liquid treatment can be applied at any time.

But in ordinary cases of infestation, if the aphis is faithfully killed as it appears on the branches, the root treatment seems negligible. In the spring, when the insects are most active, all colonies of them should be touched with a brush wet with gasoline—not drenched with gasoline, for that might kill the bark in spots: a wet touch is all that a colony needs. If they are too abundant for the colony-touch method, the trees should be thoroughly sprayed with: Nicotine sulphate, 40 per cent, 1 pound; Cresol soap, 1 gallon; water, 200 gallons. It is quite necessary to clean the tree in this way, not only to increase the thrift of it but to be sure of clean fruit. When spraying for codlin month, add one pound of tobacco extract to each 200 gallons of arsenical spray to get the aphis also.

Prune on Peach.

To the Editor: I have six-year-old Muir peach trees which I wish to change to prunes. Would it work well to bud prunes onto the peaches? What time of the year should it be done?—T. H., Healdsburg.

Peaches can be grafted over this winter by putting side-grafts into the main limbs above the forks. This is better than to split the stock, for the peach bark shrinks back and does not heal readily. It is necessary to wax well and watch to keep well waxed. As a safety device, allow the best placed suckers some distance below the grafts to grow out this pring so that you can bud into them later if the grafts do not take. Better than grafting is budding over, which you inquire about. Cut back the branches to a foot or so above the forks when the bloom buds are beginning to swell and when dry dope over the cuts. Allow suckers to grow, select those which are strongest and best placed and put a bud in near the base of each one which you select to use. Do this as soon as you can get plump buds by pinching the tips of new shoots on the prune (probably in June) and when the buds are seen to have taken shorten the shoot above at first and later cut it back to the prune bud when it starts out a few inches.

An Abnormal Orange.

To the Editor: I have an orange tree that bears oranges that have the appearance of a navel and have seeds in it, with red stripes through the meat. What is the name of this orange tree? What causes the stripes?—L. U. H., Biggs.

It is no particular kind of an orange and it has no name and is not worth any, for it has no value except as a curiosity. In old times we used to talk of such freaks as crosses of the navel and the Malta Blood, but more recently the cross pollenation idea has been abandoned because it has been demonstrated that the navel orange has endowment of variability of its own which enables it to put up any number of freaks or abnormalities without the excitement of hybridization. Particular causes for them have not been demonstrated. The thing to do with such a tree, when it ceases to be interesting as a curiosity, is to bud it over with the best type of navel or other good orange of which buds can be obtained.

Topping Olive Trees.

To the Editor: I have several old olive trees that are so tall that it's next to impossible to get the olives from the tops of them, and I don't know whether it would injure the trees if I cut out the tops.—W. M., Oakdale.

You can lower your olive trees by removing the top branches without injury to the trees. It is desirable to cut to a side branch and not leave a stub up in the air to make a lot of brush. If your top-gallants have a crop on now, cut them when the fruit is right and pick from the fallen branches. Heavy pruning can perhaps be best done after the fruit ripens and later, until the time of starting the new growth in the spring. When growth starts after heavy pruning, thin out the shoots so as not to get too much brush. You can do this thinning whenever you have time, for the olive will take the knife almost any time without resentment.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., December 17, 1918:

Stations—	Rainfall Data: Past Week	Rainfall Data: Seasonal To Date	Rainfall Data: Normal To Date	Temperature Data: Max'm	Temperature Data: Min'm
Eureka	.26	10.60	13.52	62	36
Red Bluff	.01	14.07	7.92	62	34
Sacramento	...	7.17	5.30	52	34
San Francisco	.15	10.64	5.98	62	43
San Jose	.04	9.65	4.46	58	30
Fresno	...	3.75	2.74	56	34
San Luis Obispo	.10	7.15	4.59	68	38
Los Angeles	...	3.96	3.50	74	46
San Diego	.01	3.52	2.11	68	48

THE SNOWFALL.

Emigrant Gap—Five inches of snow on the ground. Nine inches preceding week.
Sierraville—Four inches.
McCloud—Snow in patches.
Huntington Lake—Fifteen inches on the ground. Five inches the preceding week.
Cascada—None. None the preceding week.
Yosemite—Trace. One inch the preceding week.
Summit—Fifteen inches on the ground. Thirty-four inches last week.

Fruit Trees Killed by Oak-Root Decay

Written for Pacific Rural Press by John J. Fox

"The fairies are with us again," said the Tiny Tot walking with her father in the peach orchard last week. "See their little cluster of houses all newly shingled," pointing at some tan-colored toad-stools at the foot of a peach tree with tiny brown scales on top of them. "And they have white-washed the ceilings too," she continued, stooping down to look under the edge of the tallest and bending it over.

"Bless their little hearts, so they have," responded her father, rejoicing in the wonderful romance of infancy, yet groaning inwardly as he recognized in the cluster of toad-stools a manifestation of the Oak-root fungus—one of the most widespread and injurious fungi found in the Pacific Coast region—at once a delight to the exuberant imagination of the child; a fascination to the student and

A THING OF DREAD TO THE ORCHARDIST

This fungus which infects various kinds of roots and wood lying in the soil, attacks the roots of living trees and shrubs causing their death. Professor William T. Horne, assistant plant pathologist at the University of California, told the writer several years ago that probably more orchard trees were destroyed each year from the ravages of oak-root fungus than from any other one cause. The professor, who has been studying and investigating this subject for years, and who has already written largely on this subject, came to Napa some years ago at the writer's invitation to demonstrate what was then the latest experiment for its control, which experiment will be described later on. I shall quote largely from a recent circular of his in this article.

SYMPTOMS AS SHOWN ON TREES.

"Affected trees and shrubs usually show a certain amount of distress before they suddenly collapse and die during dry weather. Sometimes a tree dies suddenly, without previous symptoms, sometimes it lingers along—but finally succumbs. From the behavior of such trees it would not be possible to distinguish between this trouble and certain others, such as gopher injury, root sour sap, etc."

"In orchards the fungus usually develops from a center, spreading outward from tree to tree, year after year, so that in time extensive areas become killed out. Trees replanted within the affected area ordinarily die within a few years. Affected trees, when examined at the root show characteristic symptoms." Cut into the bark of the root and inside is a white fan shaped substance lying flat where the inner bark overlays the sap wood, though the outside bark looks perfectly sound. These white thread masses are called "mycelium" in all kinds of fungus. Well, in addition to this white matter on the inner bark (and it is this white matter that is the sinner that eats up the inner bark) Professor Horne says, "in many of the affected trees the margin of the invaded bark gums copiously. The odor of this decayed bark is not sour but has a sharp, rather agreeable mushroom smell. This white mycelium (on the inside bark) is an invariable sign of the disease." Where a tree is killed by some other agent white mycelium may be found on the outside of the roots of some different kind of fungus, harmless to living trees.

BEWARE THE RHIZOMORPH.

Generally on the outside of the affected trees are found "purplish-brown, cord like bodies growing out from the rotted wood. They resemble rootlets but are smooth and shiny and branch in a different manner." These are called rhizomorphs. A rhizomorph is really a bundle of fungus threads, the outer layer of which has become hardened into a shell. When the tip of one of these comes in contact with a live root of any but immune trees, the threads penetrate the bark and spread out underneath in a fan-shape and quickly cause death. The toad-stools that grow up from the fungus-infested wood are not found in California except in the period from October to February, but apparently there is no danger from the spores attacking living plants.

SUSCEPTIBLE TREES AND RESISTANT.

"Nearly all trees and shrubs may be attacked, though annual or short-lived crops are not usually seriously injured. Also plants with fine, slender roots are not much affected owing to the habit of the fungus developing in roots of some thickness. A few trees have seemed to be highly resistant and some practically immune. French pear is apparently immune while the trees are growing healthily. Black walnut and figs are considered highly resistant. Apples are certainly more resistant than stone fruits."

CONTROL.

Sometimes a tree will go off yellow with small undersized leaves on one side of the tree only, to be followed by death generally the following year. With regard to a tree just attacked Professor Horne says:

"Affected plants may be saved if the soil is removed from the roots and the diseased parts removed—treating the wounds as in other cases of tree surgery with some disinfectant such as creosote, Bordeaux paste or corrosive sublimate (1-1000) followed with asphalt. Usually the disease is not discovered till it is too late to save the tree."

The trained eye of the orchardist is always arrested—especially in a highly productive and well-kept orchard—by any peculiarity of the foliage or growth. He sees a tree looking off-color and of meager growth and says: "Hello, I've got a sick tree here—let's see what is the matter with it." So he takes his shovel and goes to see what is the matter. First he looks for mites perhaps and soon sees that the condition is not due to them or to scales, or any disease of the bark or leaves. Therefore it is due to prianition because the roots are not performing their function. Short of moisture? Can't be—look at the rest of the trees. Gophers? He digs well down and perceives no injury. He chops through the bark of a root with his spade—good, smooth, healthy-looking, innocent bark, perhaps, and there (like a thief under the bed) is the robber—the white mycelium of the oak-root fungus whose Latin name is Armillaria mellea, and generally speaking the damage has by this time gone too far to be stopped.

PREVENTING THE SPREAD OF FUNGUS.

May be accomplished by various means. To dig out two rows of trees surrounding the infected area, though reported successful in a number of cases, is too great a sacrifice as Prof. Horne points out. By digging a ditch 4 feet deep is probably practicable he says, especially where shallow-rooted trees like citrus are involved and in any case may be well worth trying. All the diseased roots within the infected area must be surrounded by the ditch which would have to be re-opened probably every two years or it would settle back sufficiently for the roots to cross and come in contact with diseased material. Various other barrier experiments are still under observation and no recommendation can yet be made positively concerning the use of barriers.

EXPERIMENTS WITH CARBON BISULPHIDE.

The use of carbon bisulphide has been recommended for killing the fungus in the soil, though the precise method of procedure has not been definitely established. Several years ago Professor Horne carried out an experiment of isolating an infected area in the prune orchard of E. C. Spear of St. Helena, putting down a row of holes in damp (but not wet) soil with a crowbar, 18 inches deep and 18 inches apart, and pouring about two ounces of bisulphide of carbon in the hole, which was afterwards sealed by being tramped in with the heel. Two more trees, of which we were doubtful and were left outside the barrier, afterwards went. The same thing happened in the R. S. Pearse orchard. Two trees that looked healthy but were on the line were left outside the barrier and afterward became infected and died—one of them—though not till this year.

RESISTANT TREES BEST IN INFECTED SPOTS.

Professor Horne considers planting of immune or resistant trees to be the best course of procedure on infected spots, unless it can be used for alfalfa or surface crops and vegetables. He will be busy in a further study of this malignant and insidious fungus this season. It is a matter that it is highly important every orchardist should make himself familiar with and take active steps to keep from spreading. Farmers in doubt can get definite diagnosis from those whose business it is to know.

The many vacant patches in prune, apricot and peach orchards testify to the gravity of the subject—perhaps most of them due to this disease. So many men have said: "Oh, yes; an old oak tree used to grow there and my prunes died out so I use it for vegetables—it grows dandy truck."

How Many Trays for Drying Prunes?

The past season, even before the rains, had been so poor for curing prunes that most growers found themselves getting short of trays. In talking to a prominent prune grower lately he volunteered the following opinion: "I used to think that one thousand trays to one hundred tons of green fruit were sufficient. From now on I mean to be prepared with fifteen hundred trays to every one hundred tons of green prunes."

We were glad to hear this voluntary expression of opinion and hope it is shared by others. Plenty of trays obviates the necessity of overcrowding your fruit if a dry year, takes away the necessity of doubling up your trays before the prunes are ready, and, last but not least, it permits of the trays being stacked during a heat wave—an operation that is especially necessary to produce Imperials of quality.

CALIFORNIA FIG CULTURE.

The best publication on the science and practices involved in fig growing in this State has just been published by the U. S. Department of Agriculture as its bulletin 732, entitled, "Smyrna Fig Culture." The author is G. P. Rixford of this city, whose name is familiar to our readers.

Mr. Rixford has the right to produce the best monograph on this subject because it was he (as the manager of the bulletin of forty years ago), who made the first large importations of fig cuttings from Smyrna, in 1880 and 1881. Ever since that date he has been in a general way, a prophet of figs, and during the last decade he has made himself master of the intricacies of it, as a fig specialist, under direction of Dr. W. T. Swingle, who has done a few big things with figs himself.

Mr. Rixford elucidates the science and practice of caprification most clearly and he treats also the handling of figs from the planting of the tree to the finished product of world-commerce. Every planter of Smyrna figs should get the well-illustrated pamphlet of 40 pages by sending ten cents to the Supt. of Documents, Government Printing Office, Washington, D. C., citing the number and title as given above.

The War Is Won

But the consumer of Food
Must Still Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.
While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.
Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR

FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

The Walnut Worm and Its Control

[Written for Pacific Rural Press.]

Some three years ago, C. W. Beers, Horticultural Commissioner of Santa Barbara, spoke of the depredations of what appeared to be an attack on walnuts by codling moth and arrangements were suggested for an investigation by qualified entomologists for the ensuing spring which was apparently never carried out. This year enough damage to nuts took place in certain areas to make those interested sit up and take notice, and growers in these sections have enlisted the aid of State and Federal officers to keep watch of the life history of the insect in order to effect its control as it has been spreading. Quarantine measures have been instituted against infested districts for this purpose. Growers in non-infested districts have been warned not to allow into their sections any trays, boxes, sacks, nuts or any containers from infested districts.

22 PER CENT OF NUTS AFFECTED.

We went round with Eugene Kellogg, Horticultural Commissioner of Santa Barbara county, who said that some orchards had as high as 22 per cent of nuts affected.

The moth, which is responsible for these little worms, is exactly like the little codling moth and the larvae are similar in appearance. We gathered some from beneath a piece of sacking that Mr. Kellogg had tied around one tree as a trap. They get into rough cracks in the bark and even seem to cut a little hollow for themselves and then spin themselves in.

The control measures in Santa Barbara are, trapping under sacks and destroying the worm, steaming or fumigation of all sacks before grower gets them, scrubbing of trays and boxes with kerosene or other oils. Spraying to take place here will be experimental and will consist of kaolin and dry lead arsenate dusted on the trees about the first of June at the rate of five to ten pounds to the tree, according to size.

The Walnut Growers Association of Santa Barbara owns nine Niagara dusting machines, each of which can dust-spray ten acres a day at a cost of $1.50 an acre. In addition six other machines are owned in the county. Mr. Kellogg is taking every step possible to attain results and will follow his experiments closely. His quarantine measures are very complete.

CONTROL MEASURES BEING STUDIED.

We also called on Earl Morris, Horticultural Commissioner of Orange county, who is working with Professor Ralph E Smith, of the University of California. Control measures here are similar to those set forth above (except the dusting). Spraying next year will be experimental and the life history of the insect will follow through. Mr. Morris is of the opinion that the codling moth worm of the apple and the walnut worm do not infest both trees. He has known of the walnut worm in Orange county for nine years but says it must now be controlled. It is certainly being attacked in a business-like manner. Boards of supervisors of various counties have appropriated sums of money to aid in the fight and are giving their horticultural commissioners all the support possible. For which they are to be commended.

Testimony on Standarization of Apples

The following letter was received in October by the chief apple inspector of the State Commission of Horticulture, and it was gratuitous:

"We enclose herewith a check for $4.23 for inspection charge on last week's shipments from our packing house. We are pleased to say that this is one of our bills which we take pleasure in paying, inasmuch as we consider that we get more than value received, even though the price were to be doubled.

"As the season goes on we are able to realize more and more the advantages and benefits resulting directly from the state apple inspection service as being carried out under the provisions of the California Standard Apple Act of 1917.

"Last year was the first year that a compulsory law of this kind has ever been in effect in this state as far as apples are concerned and we noted that the pack of apples in general sent out of the Watsonville District was the best pack of apples ever put up here. This information we get not only from our own observation but from remarks made to us in conversation with and by letter from various members from the fruit and produce trade scattered through out the country. This year being the second year under the standardization law should clinch these ideas in the minds of the buyers and put the California apple pack in general on the map, comparing favorably to packs put up in other states where rigid inspection is in effect.

"The benefits of this law as we see them are for every one concerned who in any way handles an inspected shipment of apples. The packer is protected against his competitor in that both of us put up the same grade and quality of fruit and in this way preventing a great deal of unfair competition which used to occur where every packer was the judge of his own pack, and unscrupulous packers would put up poor quality of goods and sell at a lower figure thereby than the packer who endeavored to place on the market an honest pack and to build up his brands.

"The standard apple act is also a protection to the buyer and the broker because each is assured by the inspection service that any shipment bought by him properly marked and branded must conform to the grades established. The community as a whole benefits by this act for the reason that the repuation for California apples is again gaining its former place in the larger markets of the country and it was not so very long ago that many of the buyers in these markets would not consider purchase of California apples.

"In conclusion we wish to say that we hope this inspection work will continue with as good results as we have been getting to date from its application and will say further that we would not care to see apples put up in the hit or miss way which they formerly were, even if the cost of inspection service to us were more than double.

ROPGERS BROS.

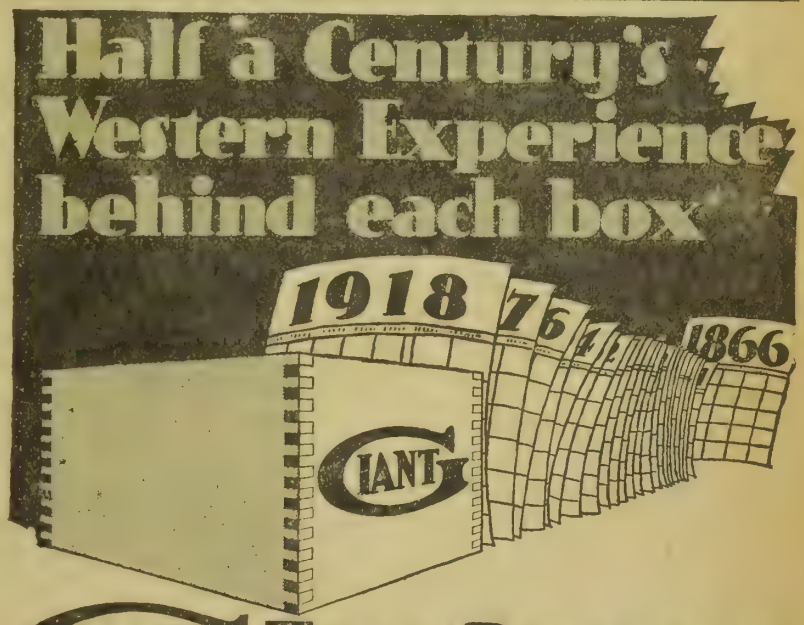
(Signed) "Carrol J. Rogers."

Another prominent packer says the Act is not sufficiently comprehensive.

DOES CYANIDE DAMAGE FRUIT TREES?

Killing scale insects by placing cyanide of potassium under the bark of fruit trees has been stated to cause the death of the tree. Accordingly Metcalf (Science XLVII, No. 1214, 1918) conducted experiments along these lines on scale infested apple and pear trees. In each of six trees, half-inch holes were bored, filled with chemically-pure potassium cyanide, and then plugged. Four of the trees apparently were followed by a dying condition, but during the summer began to recover. All of the six trees became free of scale and have continued healthy and vigorous for the past three years. The effectiveness of the cyanid treatment utilized as an insecticide in this manner, however, remains doubtful, as during the season the scale disappeared from adjoining trees which, while infested, were untreated.

Co-operation of small gardeners in Gila county, Arizona, enabled them to operate a community canning kitchen and a co-operative sales depot which are reported to have saved several thousand dollars' worth of their surplus.



GIANT FARM POWDERS
STUMPING — AGRICULTURAL

For more than 50 years Giant Powders have cut the cost of western blasting. In all this time they have been constantly improved and adapted to western conditions by a western company. Naturally they make western land clearing easier, faster and cheaper.

Giant Farm Powders—Giant and Eureka Stumping—go further than ordinary dynamites. Farmers and orchardists find that they can do more and better work at less cost with Giant Powders. Hundreds write us that Giant brands "save money"—"give better results"—"have wider breaking power"—"shoot the roots"—and "are always uniform in strength and action."

Caution: Be sure you get the genuine Giant Powders, the product of the manufacturers who originated the name. Look for the Giant trade-mark. It is your only sure protection against imitations.

Send coupon (or postal mentioning this paper) for the big free book "Better Farming." It tells you scores of money-saving ways of doing farm jobs. Write for this gold mine of information today.

Name_____ _____ Address_____

To Guard Against the Unripe Orange

[Written for Pacific Rural Press.]

Thanks to the courtesy of Fred C. Brosius, Horticultural Commissioner of Sacramento county, we recently visited some of the orange packing establishments there in company with his deputy, C. A. Wilkin, on December 3d. We found growers generally trying to co-operate in sending in fruit fit to pack immediately. We appreciate this the more, realizing their desire to participate in the holiday trade. Also the difficulty in the field is that an orange may appear perfectly colored on the side facing the picker and yet be green on the hidden side.

At the receiving sheds of the Fairoaks Fruit Company we noticed a shipment of oranges that had just been brought in from the orchards that appeared almost perfect. Only a small stack in one corner had been culled out of the whole day's run. W. W. Hinsey, manager of this company, pronounced himself as strongly in favor of strict adherence to the color test as interpreted by the State Horticultural Commission. He explained that not many cars had been shipped because of the company's attitude in this matter and was upheld by Professor Elmore Chase, who was present. If there is any question of this interpretation by reason of closeness to standard, the grower is granted the benefit of the doubt. We took back some oranges from here that tested 9-1.

At the Folsom packing sheds we noticed again a careful grading of the pack under the supervision of the Horticultural Inspector and consider the law as it stands is well administered. Yet the feeling is widespread that the present tests will have to be revised and it will be interesting to see how all districts can be satisfied.

WHY IS FRUIT STANDARDIZED?

Fruit is standardized in order that the highest degree of commercial excellence may be attained. Horticulture is the paramount industry of California. It leads the world in the production, diversity, quality and handling of all classes of fruit, we believe. When our standard is once determined, every grower, packer and inspector is expected to co-operate to hew to the line "for the good of the order." Evaders of the law are ubiquitous. They are in every land and in every class of humanity. When a law renders injustice and hardship on the majority of those engaged in a business important to mankind, it should be modified in due form and not in contempt. The standardization of oranges was for the purpose of placing that fruit on the consuming market in its most attractive, toothsome and digestible form. The 8-1 sugar test seems to be satisfactory (except at Fairoaks and Orangeville), where the color test is satisfactory, so far as the color is concerned. But the method of producing that color is not universally satisfactory to the industry.

A GREEN ORANGE IS NOT RIPE.

No matter if it does test 8, 10, or 12-1, a green orange is not ripe. But it can be made to appear ripe by the gas method of coloring, and it thus passes both tests at the expense of its delicacy of flavor—a wineman might say its "bouquet."

What is the reason of this great desire to rush things along so? The answer is: the great difference in various orange sections in the periods of ripening, even in the earlier ripening sections in Tulare and the upper Sacramento counties. Yet they all want to get the holiday markets here. And the desire is a perfectly natural one. No grower wants a brother grower to have an advantage over him by privilege, yet such a thing is possible unless artificial means are "taboo" and inspection is uniform—which it is not at present.

PROPER TEST FOR MATURITY NOT YET DETERMINED.

The consequence is that the proper test for maturity has not yet arrived and will have to come up again for discussion and determination, and to that end information is now being gathered by the State Commission of Horticulture in all the different orange sections of the State. Also what the growers think about it. The rigid enforcement of the 8-1 test would about put Fairoaks out of commission, according to Dr. Buffum and Mr. Hinsey, while the fact that the sale of immature oranges on the Eastern markets cut the sale price on such fruit from $2 and upwards a box shows what ill-judged shipments may do to the citrus industry. There would be a repetition of what early shipments of green, unripe fruit did to the table-grape industry. As one man said, "They were reg'lar bellyachers and put the market on the bum." In mid-November we saw oranges half green in color that were said to test 10-1 and 12-1 and others in the North, mature, well-colored and flavored, that were fit for market, which would not test over 7-1 we were told. As an example of what properly matured fruit is capable of, we would like to cite the first carload of oranges shipped this season by Sam Mack of Fairoaks from his 20-acre orchard. They sold at $8 a box, were naturally and evenly colored on the tree and tested 9-1. This item was given us by Mr. Hinsey. Fruit that will bring such a price when green fruit was reported sold at $3 looks to the writer like a distinct boost to the industry from the consumer's end—the only place a permanent boost can come from. The writer is also glad he will have no voice in deciding the above grave question.

Orchard Conditions in Napa County

[By W. D. Butler, Horticultural Commissioner, Napa County.]

To the Editor: I would answer your questions as follows: The pruning of young trees is progressing fine and in a few weeks will be completed. The educational work carried on in the past and the present is showing results and the growers are becoming keen on the shaping of the tree in the first year. Also some of this interest is due to the fact that our oldest orchards have reached that age when the wood rotting fungus is showing its effect in the trees that have had large limbs removed in the years of their maturity. Such evidence plainly proves that one of the most limiting factors of the tree's life is the rot fungus. We have trees in this valley that are a half century old and still healthy because they have escaped wounds. The three and four limb tree, established in the first two years of growth has become standard with us.

Spraying has not been progressing as we would like to see it. If the present favorable weather continues the growers will be soon getting busy with dormant clean-up. As you know the Brown Apricot and San Jose scales and moss are our worst pests requiring this type of treatment. However, this year we expect to clean up a lot of Red Spider eggs.

The cover crop business has dropped off in this county in the last few seasons as the results were poor. If irrigation water were available the situation would be changed in that respect. To conserve the moisture the crop must be plowed under just as it is beginning to grow good. If we could find a leguminous plant that would make a large growth through the winter months it would be a blessing to the growers who have old orchards, as the continuous clean culture methods have allowed the soil to be burnt out of humus and consequently even a scant growth of wild stuff is hard to get. Our newly planted orchards in what was grain land needs no cover-crop as the wild growth is now two feet high and if we have a warm winter no one knows what it will be by spring.

SPRAY FOR BROWN APRICOT SCALE.

To the Editor: Will you kindly tell me the best spray for Brown Apricot scale, and the best time to use it? I am a novice in the fruit business and a recent subscriber to the Rural Press.—U. S. G., Mountain View.

Use crude oil emulsion or a miscible oil, winter strength. Right now is the best time to spray for this scale to get maximum results.—Editor.

Maximum Yield
Big Profits

the result of reading our new illustrated catalog and planters' guide.

Fruit growers, whether experienced or not, will profit greatly by reading our new catalog.

It contains practical articles on preparation of soil—selection of proper varieties—pruning—shaping—irrigation, and many other items of particular interest to the planter.

Write to us and let us know your local conditions—what varieties you have in mind—whether citrus, deciduous, or ornamental trees, roses or vines.

Many years of experience will enable us to give you helpful suggestions.

Our new catalog, just off the press, will aid you materially in making your planting more successful.

In The Fruit Business

Rain and Raisins.

Instead of 200,000 tons of raisins as was estimated, the actual crop harvested will not amount to more than 160,000 tons, according to Wylie M. Giffen, president of the Associated Raisin Company, which shows the rain damage to have been about twenty per cent in all, the largest raisin crop ever produced. When the rain came two years ago and reduced the crop 25 per cent only about 20 per cent of the crop had been sold and the price was raised on the unsold raisins one cent a pound. This year about 70 per cent of the crop had been sold when the rains came and when the association applied to the U. S. Food Administration to raise the price on the unsold portion, the request was denied on the ground that the price had been agreed on and it would be unfair to the other fruit industries to allow the increase.

Stained Almonds Corrected.

Most of the almonds damaged in the early September rains have had the stains removed by means of a new process discovered by the California Almond Exchange. This will result in there being comparatively little loss in stained fruit sent in by members. After weeks of experiment, chemists found the process which bleached the almonds and satisfied the State that no harmful ingredients were used. The Exchange has already advanced 14 to 15 cents on the best varieties of rain-stained nuts. The advances range 75 per cent of what was allowed on perfect nuts.

Fig Institute Impending.

Professor J. I. Condit, of the University of California, will conduct an Institute at the Chamber of Commerce, Hanford (Kings county) on December 19. At 10 a. m. he will lecture on the subject of Fig Culture and at 2 p. m. an automobile trip to various fig orchards will be made where Professor Condit will demonstrate pruning, disease control, etc. The meetings will be held under the auspices of the Farm Bureau.

Pruning for Large Prunes.

To the Editor: Much has been said about pruning the prune tree. My observation is that pruning to thin out the trees so they will not be very brushy and to cut back all along fruit laterals one-half, thus growing the fruit closer to the main limbs, will insure larger and better prunes than any other method; and it is the large fruit that brings the high prices. I have seen this tried out.—W. S. K., Acampo.

Fresh Olive Shipment.

Peter Bayer of Oakdale is shipping green olives (untreated) to New York by express. They will be pickled there. New York buyers claim that olives hold their flavor better if shipped green, so this experiment will be watched with interest. Mr. Bayer received $1,200 for the olives from three acres.

Fair Salvage.

Sheridan W. Baker of Santa Rosa would have had 65 tons of prunes (40-50) on his Healdsburg ranch if it had not been for the rain. His fruit was stacked and he saved altogether 31 tons of No. 1 fruit and about four tons of No. 2. The rain took the rest.

Spray for Peach Blight Now.

Deciduous trees have been holding their foliage much later than usual this year and November spraying has been delayed. Spraying for peach blight and shothole fungus should be put off no longer. Do it now.

Lectures on Fig Production.

Lectures on fig production have been planned by Farm Adviser N. P. Searles at his farm center meetings. Prof. J. J. Condit of the University of California, who is an authority on fig production, will deliver the addresses and will discuss methods of pruning, cultivation, pollenization and other matters of importance.

TREES

—with roots such as these

are grown only on our foothill soil and location. Hardy-of selected parentage-well-grown-absolutely reliable-and free from root-knot and diseases common to other localities.

We know we can meet your requirements. Our stock of trees is complete. Submit today a list of your wants for special quotations. Remember, behind each tree is our guarantee.

Those who wait will be disappointed. Write now—right now!

THE BASIS FOR ORCHARD PERFECTION — THE CROW TREES

MR. PLANTER:

The coming season promises to be the most favorable in many years for orchard planting. With such a season and

FIRST CLASS TREES

a successful start for a profitable orchard is assured. WE GUARANTEE OUR STOCK—BETTER CANNOT BE HAD ANYWHERE AT ANY PRICE.

OUR SPECIALTIES:

FRENCH PRUNES on all roots, grown from carefully selected bearing trees, unsurpassed for size and quantity of fruit.

PEAK'S CLING PEACH, in great demand by canners; ripens between Tuscan and Phillips and is fully equal to those old stand-bys in quality and productiveness.

KNOBEL APRICOT, an improved Blenheim; larger fruit and a heavier, more dependable bearer.

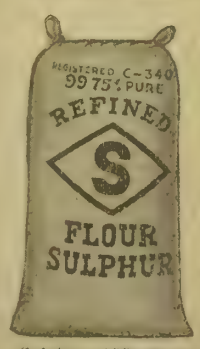
JAPANESE PERSIMMONS "Made in America." These home-grown trees live as readily as other fruit trees and are true to name; of the imported trees the few which live are usually untrue.

A FULL LINE

of all that is best in Fruit, Nut and Ornamental Trees, Vines and Plants; and our prices are very low as compared with other commodities. Write for our Price List; free.

CROW'S NURSERIES, = GILROY, CAL.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur.

It has been proven that sulphur has increased various crops up to 350 per cent.

SAN FRANCISCO SULPHUR CO.
524 California St., San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet, price list and samples and please state for what purpose you use the sulphur, quantity needed and date of shipment preferred. Tel. Kearny 871.

Hopeful Signs for the Barley Market

Written for Pacific Rural Press by R. E. Hodges

To the Editor: Can you dig up and publish the barley situation of the United States and the possible world market? What is the approximate total yield of California and of the other barley States?—A. T. G., Chico.

Much barley is being held in the warehouses all over California with no one offering what is considered the cost of production, plus a reasonable profit. But while the possibilities were dark during the war, some encouragement has followed signing of the armistice. This is chiefly because transportation is being released and new barley-using countries are being opened up as possible markets where there was no hope of selling while the war continued.

WORLD BARLEY CROPS.

The world's average crop of barley for the ten years ending 1915-1916 was 31,204,270,000 pounds, according to statistics of the "International Institute of Agriculture." During that period, the Northern hemisphere produced over 99 per cent of the world's barley crop. The average annual production for Germany, Austria, Hungary, Belgium, Bulgaria, Roumania, and Russia for five years preceding the war was 18,535,500,000 pounds or about 57 per cent of the world production in the same period. Russia alone averaged 10,986,200,000 pounds, while Germany and Austria-Hungary together averaged 6,625,400,000 pounds per year. We have a statement from a leading barley exporter of San Francisco that before the European war, Germany furnished malt not only to the countries of Europe surrounding her, but also, since the Spanish-American war, to South American and Oriental countries. She has not done this in any large way since the war started, and we leave the reader to judge whether the other countries, mentioned have kept up to their average production since the war started.

Since it is well known that barley represented gold nuggets a year ago, and since the impression is that nearly all of the countries which produce most barley outside of America, are destitute for food, we can assume that there is but little carry-over in the world from the 1917 crop, and that the war-stricken countries have not raised much in 1918.

WORLD BARLEY CROP SMALL IN 1918.

The estimated 1918 crop of the other important barley countries of the world, by the more or less accurate estimates of the Institute, totals 14,648,593,600 pounds, a seven per cent increase over their average for five years, but far from enough to counter-balance the reduced crops of the conquered nations. The world's 1918 barley production, so far as it can be learned, is only 45 or 50 per cent of the ten year average, and U. S. produced about 36 per cent of this, by the Institute figures, as published in their June, 1918, crop report. As a matter of fact, our own U. S. Secretary of Agriculture in his report for November, 1918, gives this country credit for 11,352,240,000 pounds, twice as much as the Institute figured.

WHAT OF BARLEY CONSUMPTION?

At any rate, if the consuming capacity and desire in Europe should equal what it was before the war, there is a tremendous world shortage of barley. Probably the normal consumption for the years ahead will show a decrease below that of the years before the war, though the wets assure us that Europeans still want their booze.

A considerable amount of barley is normally used in Europe, especially in the Scandinavian countries for human food and for stock feed. We may count on this demand to continue if barley can be sold there much cheaper than wheat, which may be doubtful in view of the great stocks of wheat carried over in wheat countries from the present and previous years, and in view of the world's short crop of barley.

AMERICAN BARLEY CROPS.

Our California barley may be stored and it may be shipped to world markets. What proportion is actually shipped out of the State in normal times is discussed below, along with the markets which are just beginning to open up. Just now we will consider the American crop. Reduced to bushels, in order to compare California figures with those of eastern States, we have the table given below for the principal producing states as given by the U. S. Department of Agriculture.

BARLEY CROP IN BUSHELS AS ESTIMATED OCTOBER 1.

State—	1918	1917	Condition— 1918	Ten-year Aver
Wis.	24,780,000	19,200,000	95	86
Minn.	45,136,000	37,800,000	91	83
Ia.	11,340,000	10,500,000	92	88
N. Dak.	36,486,000	22,512,000	87	80
S. Dak.	33,000,000	26,520,000	92	83
Cal.	34,060,000	39,150,000	88	92
U. S.	236,505,000	208,975,000	89.8	87.2

It will be noticed that while the growing conditions in eastern States were fine, the biggest acreage California ever planted produced a crop considerably less than that of 1917. The crop of this state is 14.4 of the total in U. S.; owing to poor growing conditions, the bushels which should weigh 48 pounds will not average much above 42 pounds.

The recent government buying started with the standard of 48 pounds, but it was soon found that the orders could not be filled even with 45-pound barley without a great deal of screening which was done. Forty-five-pound barley can be used for brewing, but forty-pound barley will not be accepted for this purpose if any better is available. But brewing is stopped in U. S.; although some malting for export is permitted by recent regulations.

MARKETS FOR CALIFORNIA CROP.

Now, considering available markets for California barley, we have indicated in previous issues that we believe the demand for brewing in U. S. will continue to decrease annually. The demand for horse and mule feed also seems likely to decrease annually. The demand for hog and cattle feed has a good chance to increase. The demand for human food is not likely to amount to anything. The demand for malt to be shipped abroad may increase for a time as indicated in our paneled paragraph.

IMPORTANCE OF EXPORTS.

Our barley exports have not included a large percentage of the crops in past years until 1917; but they included the best part. From tables prepared by the E. Clemens Horst Company of San Francisco, June 20, 1917, we find that for a period of seventeen years, 1900-1916, California produced an average of 505,000 tons of commercial barley. Of this, we consumed in the State, an average of 320,000 tons or over 63 per cent of the total. Our average exports from San Francisco to Europe were 125,000 tons or less than twenty-five per cent of the crop.

THE BARLEY market in California and the Eastern States has been picking up since the armistice was signed. Though brewing in the United States has been stopped, and though all exports of barley are still going through the Food Administration Grain Corporation, the embargo has been lifted on our exports of malt to North and South American countries and islands and to the Orient. The United States had this trade previous to the Spanish American war, but at that time Germany captured it from us. Since then, both China and Japan have become great beer drinkers, particularly Japan. A great number of breweries were erected and operated by Japanese under the direction invariably of German brewmasters with Japanese understudies. When Japan entered the war the Germans were fired and Japanese conducted their own breweries. Though the Japanese barley crop for the five years 1912 to 1916 has averaged 2,166,296,500 pounds according to the International Institute of Agriculture, she has still imported large quantities of malt from Germany. Since the European war started, this trade has been captured by Americans who intend to keep it. Germany before the war also supplied all Europe with malt, according to a leading exporter of San Francisco, and this market will now look to United States. Already maltsters are said to have resumed operations in readiness for removal of export restrictions. While this will probably help the market for 1918 barley, it cannot help that for the crops to be sold after the national prohibition amendment goes into effect.

California Cauliflower Review

[Written for Pacific Rural Press.]

Early cauliflower shipments have been moving for over a month from southern California to Eastern markets and heavy shipments of the main crop are commencing. The crop is, estimated nearly the same as last year, though the acreage of cauliflower and brocolli in Los Angeles and San Mateo counties has decreased from the record of 6400 last year to 4600 this year, as estimated by Assistant Truck Crop Specialist R. G. Risser of the United States Bureau of Crop Estimates. Our fall rains have improved the quality greatly over last year. Early stock usually matures in weather too warm and sunny to make the large white solid heads desired, and it comes onto Eastern markets just as the New York crop is being finished. Heaviest shipments from Southern California go in December and January normally. The heaviest from central California go in February and March. Straight carloads of cauliflower are shipped through the winter, but a considerable portion goes in mixed cars with other vegetables throughout the season, which normally ends in May, when warm weather opens and discolors too many heads before they are ready to ship.

Decreased acreage this year is due to unfortunate results with the last crop. The largest acreage ever planted yielded only an estimated average of 173 crates per acre in Los Angeles county, as against 210 crates for the previous season. In San Mateo county last season's yield was estimated at 150 crates per acre, as against 230 the year before. In Los Angeles county less than an inch of rain had fallen up to February 1, as against the normal of about 11 inches. Drying winds added to the damage and aphis heaped insult on injury. When rains did come, they waterlogged some poorly drained districts. Size of heads was smaller than the year before, as indicated by the average of 15 required to fill a crate, as against 13 in 1916-17. Crops intended to mature early came ready for shipment along with the later crops and added to the freight congestion. The Government recommended 520 crates per car, as against 500 normally carried, and the extra amount interfered with ventilation. Delays en route added to the trouble and much of this foodstuff was wasted, while a great deal more brought low prices.

CROP Production

Is controlled by the kind and quantity of plant food furnished the tree or plant.

It is not enough to merely fertilize. It is important that the tree be fed material giving maximum results under California conditions

These materials are furnished in

Farms for Veterans of Land and Sea

[Written for Pacific Rural Press.]

They are veterans because they have nobly done all their country required of them, no matter what their ages may be! It is one of the tokens of this rapid phase of world-development that all citizens of reasonable toll of years may have veterans for sons and grandsons—and may have daughters also veterans for even they may be enrolled in the naval yeomanry of their country. It is a grand new endowment of America to have veterans just stepping out strongly into manhood and womanhood and not only veterans who are tottering on the brink of the grave. Who can estimate the value to the country to start them right?

The proposition to offer returning veterans, who desire to go to farming for themselves, ready made farms, has been several times endorsed by the Pacific Rural Press. The question is can it be worked out to the advantage of the veterans and of the country, and that question cannot be definitely answered off hand. Congress will deal with it this winter and it should be discussed by all farmers and farmers' organizations. The latest phases of the scheme are those presented by the Secretaries of the Interior and of Labor in their annual reports, of which we are receiving advanced outlines. They will serve as a basis for the farmers' discussions which we have suggested.

SECRETARY LANE'S VIEWS.

"As an immediate programme," said the Secretary, "we should first offer an opportunity upon our present irrigation projects for all who wish work at clearing and leveling the land not now cultivated but for which water is available, or to which water can be brought under the present irrigation system, and that such tracts shall be developed under an appropriate land-settlement plan. This we can do at once and meet whatever labor problem may be immediate.

"As a second step I would urge an appropriation for one or more of the largest irrigation schemes for which surveys are in an advanced state. Concurrently it would seem to me wise to undertake the draining of the most promising projects—Government-owned land preferred, but, if privately owned, the land to be bought at an appraisement made by the Farm Loan Board.

"There is an alternative method of dealing with private lands which already has the approval of Congress, being incorporated in the reclamation act. Under this a private owner agrees to sell his land to whoever gets the water right at an appraised price as a condition precedent to our undertaking the construction of irrigation work. Under such a plan there would be no difficulty whatever in securing control of any-sized bodies of cut-over or swamp lands that might be desired; the Government would not buy the land, but the owner would look to the new settler for the price, and take it on such terms as the Government itself would exact for its own expenditure upon the land."

THREE PROJECTS AT FIRST.

Let us assume three projects, he suggests—one an irrigation scheme, another a drainage project, a third the development of a body of cut-over lands. The one would need to have great dams constructed to impound and divert waters, a hydro-electric plant, miles of canal and tunnel, perhaps, thousands of acres to be cleared and leveled, fenced and broken. This would mean years of work at good wages, work in the open under housing conditions that would seem palatial to the soldier of the trench, and at the end a piece of land on which would be erected a house and barn, a farm home in a group of farm homes. For this he must pay. But already he had received wages out of which he can have saved the necessary first installment on his place of 10 to 15 per cent. The balance with interest he can pay in forty yearly installments, or earlier if he can.

Mr. Lane estimates that more than one-third, probably nearer one-half, of the American troops in Europe came from farms, and probably would wish to return to the agricultural work.

SECRETARY WILSON'S VIEWS.

Colonization by returned soldiers and sailors of large tracts of land under the direction and with the aid of the Federal Government is recommended, as a solution of many of the labor problems arising from demobilization, by Secretary of Labor Wilson in his annual report, made public today. The Government should, in the opinion of Mr. Wilson, establish and equip individual farms, which would be linked into community groups.

Agricultural areas should be purchased by the Federal Government and added to the public domain to provide land for the carrying out of the proposed colonization program for returned members of the military forces, the report asserts. It is proposed that administration of the program be directed by a board consisting of the heads of the Agriculture, Interior and Labor Departments.

Legislation needed to carry out the plan, Secretary Wilson believes, should include these provisions:

The possibility of commercialized speculation must be eliminated.

Colonists must be given access, not only to land, but to farms; not to the bare soil, but to fully equipped agricultural plants ready to operate.

Plenty of Nitrate in Chile

The amount of Nitrate in the Chilean Deposits is

720,000,000 Tons

At present rate of world's consumption, deposits will last for

300 Years

Shipping conditions are improving. American farmers should learn the FACTS. Write for information.

Growers Want Experiment Stations

[Written for Pacific Rural Press by Margaret Honeywell.]

A meeting was held of representative fruit growers of Northern California with the Regents of the University of California last Tuesday afternoon in San Francisco to submit the outlined plan for deciduous experiment stations under University supervision. Among those present were Benjamin Ide Wheeler, A. W. Foster, and Robert Sproul of the Regents, and Dean Hunt, William T. Horn and H. C. Howard of the College of Agriculture, State Horticultural Commissioner Hecke, Frank T. Swett of Martinez, G. W. Pierce of Davis, Henry Wheatley of Napa, H. C. Dunlap, James T. Brooks, Horace G. Keesling of San Jose, H. A. Clark of Saratoga, L. Woodward of Campbell, Elwyn D. Seaton and Sheridan Baker of Santa Rosa, and Mrs. H. C. De Nyse of Riverside.

H. C. Dunlap asked Mr. Woodward to present the new plan as drawn up under changed war conditions. The scheme as submitted is to have various sub-stations under varying soils and conditions, to have special committees of practical fruit growers familiar with local conditions around these stations as advisors, and to use the Farm Bureaus as a means of disseminating the information. Small areas would be purchased by the State, thus assuring the permanence of the experiments. For this work the fruit men asked for $150,000. The old plan as submitted in June called for a central experiment station, which Frank T. Swett, who spoke for the pear and grape associations, pointed out would not have the practical advantage of trying out the actual experiment where the fruit later would be grown. He endorsed the plan heartily, as he said that the pear blight was the pear man's greatest difficulty, and by such a series of experiments with resistant stock the actual location of pear land could be found. Of benefit to the grape men the advantages of the laboratory would be felt, because the big problem now was marketing; and, as no cheap satisfactory means of making grape syrup had been found this experimental work would prove invaluable. Mrs. H. E. De Nyse of Riverside enthusiastically approved the plan, and spoke of the advantages of standardization which stations over the State could help establish.

Sheridan Baker told of the value of the late pruning demonstrations in Sonoma county and the interest aroused in the farmers to better their conditions. He approved the plan in behalf of the prune and apricot growers of that county.

G. W. Pierce of the Almond Growers' Association spoke of the need of increased production and better quality of fruit and nuts to meet the competition that would result with the Mediterranean areas competing again. He cited an interesting illustration of high cost of labor in Spain—a correspondent of the Almond Association wrote that wages were high this year, 70c a day for men and 40c for women. This sort of labor competition, he argued, had to be met in California by intelligently supervised experimental work.

Mr. Wheatley also spoke in favor of the new plan. Horace G. Keesling laid emphasis on the importance of the fruit industry in California and the necessity of money for these sub-stations.

H. A. Clark said that the question of the 25-year-old prune tree was the urgent one in Santa Clara county and that something had to be done about it. He said that there had been "guessing enough" and "time enough lost" for actual experimentation to be necessary. James T. Brooks of the San Jose Chamber of Commerce urged that "the University be taken to the people, just as the banks were."

State Horticultural Commissioner Hecke gave the figures of the value of the various deciduous crops, and stated that any industry bringing as much money into the State deserved State recognition and aid. He pointed out that the County Horticultural Commissioners now acted as policemen, as they had not the time for research or teaching, but that this work would be done by these sub-stations with increased efficiency under the College of Agriculture.

President Wheeler stated that the Regents felt the necessity of the work and assured the passing of a $50,000 request. The fruit men talked for the necessity of more money for separate stations, but Dean Hunt explained that the College of Agriculture was asking for $40,000 only for citrus work, and this $50,000 for deciduous use in excess of the last budget, despite the necessity for increased expenses in other lines. The citrus experiment station will have a total of $184,000, if this $40,000 increase is allowed, but it was pointed out that the citrus industry had organized earlier.

A. W. Foster backed the $50,000 plan, as he felt that the Legislature would be one of retrenchment, and he favored asking for what he was sure could be secured.

The meeting closed with the recommendation of Dean Hunt that a committee of three fruit growers be appointed to confer with Dr. Whitten, head of the pomological department of the Agricultural College.

UNIVERSAL BRAND

ORCHARD SPRAY

For dormant season spraying you want a good, general clean-up spray; a spray that will serve not alone as an insecticide—but will tone up and stimulate your fruit trees. For instance—

Crude Oil Emulsion

You can depend on this to control the scale insects. It penetrates the cracks in the bark and *kills the eggs*. So—what chance is there for Red Spiders, Aphids and their creepy brothers to do much damage?

Order your Universal Spray now—don't take any chances.

Among the other sprays we manufacture or distribute are:

Dormant Soluble Oil
Bordeaux Mixture
"Triumph" for Citrus Trees
Lime Sulphur Solution
Arsenate of Lead
Miscible Oil No. 1 for Olives
Miscible Oil No. 2 for Thrips

Whenever you have any questions to ask—write our Service Department, in charge of Paul R. Jones, Entomologist. This expert advice costs you nothing.

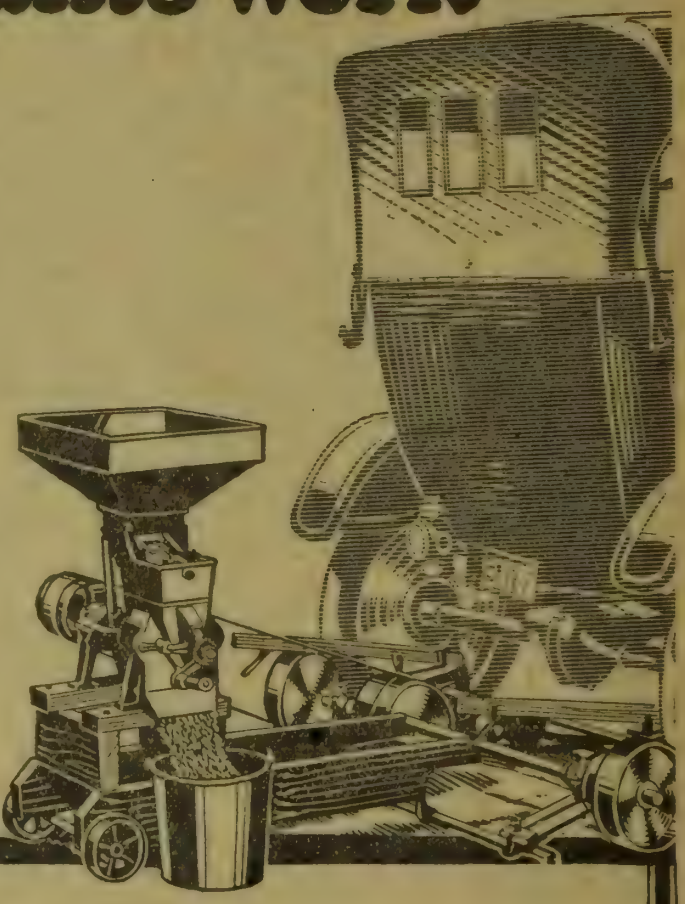
A SPRAY *for* Every Purpose

Farm Hand Wants Work



PUT your automobile to work grinding feed, sawing wood, pumping, hoisting hay, running milker, separator, concrete mixer, and any other belted implement on your farm.

Thousands of enthusiastic farmers are turning their cars into sure profit-makers in these days of farm labor scarcity.

LAY Porta Power

LAY Porta Power is an implement which can be instantly connected with the rear tires, delivering at the belt 5 to 8 H. P. The engine has power to spare, and the tire wear is negligible. It adds more than $300 to the value of your car, and, because it takes the engine to the job, instead of the job to the engine, it gives you much more value than a stationary engine costing $150 to $300 more.

Your farm can produce many dollars more if you use LAY Porta Power. Many farmers make it pay for itself in one season. Built to last a life-time.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Honey Sorghum Results.

Several yields of thirty tons of honey sorghum per acre are reported by Farm Advisor A. A. Jungerman of Stanislaus county, where enough seed was introduced last year to plant 500 acres in various localities. Sorghum was made in six farm bureau centers and more than six made silage. As much as 200 gallons of sorghum per acre were made, and it proved a fine substitute for sugar, even in cake making. A custom mill is expected to be put up at Hughson and the acreage will be increased. Honey sorghum requires 135 days to mature, and therefore cannot be advocated as a second crop. For silage it cannot be advocated in place of corn except where smut has been so bad that corn will probably not fill many ears. It does best, according to Mr. Jungerman, on heavier soils, with plenty of moisture. The heaviest yield was on sub-irrigated land planted in May and matured in October. Lack of irrigation on some fields held back the growth, but it shot up after the September rains.

Winter-Forcing Asparagus.

Winter-forcing of asparagus is possible where temperatures can be kept between 55 and 80 degrees according to the U. S. Department of Agriculture. Bed the crowns in soft earth about an inch under the surface, and keep it moist but well drained. A temperature of 55 to 60 degrees makes the best shoots; higher temperatures make them grow faster and softer. For the first ten days after bedding, keep the temperature between 45 and 50 degrees if possible. Cutting begins six weeks after bedding, and continues until the roots are exhausted. Keep a supply of roots dormant to bed for succession. White shoots are obtained by excluding light.

Scaling Profits on Beet Sugar.

California beet sugar manufacturers expect less profit this year than last on their output, notwithstanding that the Food Administration has fixed a higher price for sugar. The price has been advanced to 9c a pound, seaport refinery basis. This is higher by 1.55c than last year, but the higher prices paid for beets, labor and materials are expected to more than offset the advance in gross price. However, it is believed there is still a liberal margin left for fair profits to operators.

New Corn Worm.

About 300 square miles in Massachusetts have become infested by the "European cornstalk borer," a new pest in this country. It is a worm that works in the growing stalks of corn, grain sorghums, etc. Anybody who has observed such a pest should at once notify the State Horticultural Commissioner at Sacramento, as the most practicable control seems to be the winter burning of infested stalks, stubble, and dry vegetation. Prompt reports may avoid spreading the pest to all parts of the State.

State Law Against Vagrancy.

A State law that "will compel any idle and physically able man in the State to accept employment tendered him at a reasonable wage with reasonable living and working conditions, with a penalty of hard labor to be furnished by city and county governing boards without compensation other than subsistence" was favored by resolution of the Farm Labor Conference recently held at the State Council of Defense offices; and the executive committee is now drafting such a bill to be presented to the legislature.

Nevada Hay.

Alfalfa hay was selling at Fernley, Nevada for $20 in the stack before the rains, according to J. C. Loomis of the Bomberger Seed Co. Crops in Mason Valley had been contracted at $16 to $18. Since the rains, prices sagged on account of green feed. About the same conditions prevailed in the northeastern counties of California. The crops in these districts are mostly fed to cattle and sheep without baling.

Weather-Proofing for Out-buildings.

A mixture of equal parts kerosene and crude oil to spray onto fences and walls or to brush onto roofs and flat surfaces fills pores in the wood, excludes moisture and decay, and gives a soft brown color. The kerosene is used for greater penetration than crude oil alone would have.

Agricultural Notes

The Wheatland rice industry is growing rapidly in importance.

C. R. Graff of Orange county has recently sold 177 sacks of blackeye beans at 6½c.

The first rainfall in thirteen months was recorded December 7 in Imperial Valley, when about 0.2 inch fell.

A general meeting of central California cotton growers will be held about the middle of January in Fresno.

Livingston (Merced county) farmers are discussing the feasibility of building and operating a bean cannery there.

Plans for increased sugar beet acreage in Orange county are reported due to increased contract prices offered.

An 800-acre ranch for the raising of vegetables to can has been leased in Yolo county by the California Packing Corporation.

Kern county's new cotton gin at Bakersfield has begun operations. It is expected that 1000 bales of cotton will be harvested this season.

With a total value of $12,272,412,000 the nation's principal farm crops were more than in any year in the history of American agriculture.

Cotton experiment fields at Planada and Dos Palos, Merced county, are being picked. Too much fall rain seems to have prevented the bolls from opening satisfactorily.

Some Fresno cotton growers came near plowing good cotton under. The fairly mature bolls will yet open, even though the leaves have fallen, if dry weather comes.

Acreage of winter wheat up to December 16 was estimated at 49,027,000 by the Department of Agriculture. This is 15.9 per cent greater than was sown in the fall of 1917.

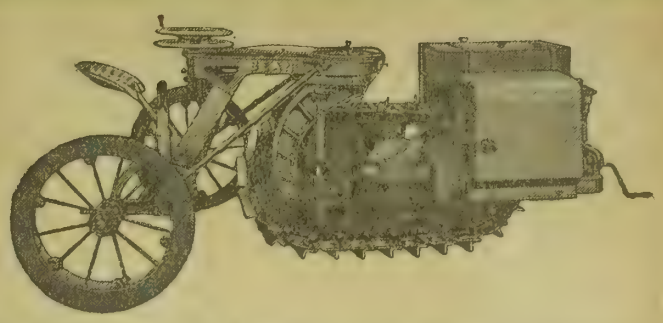
A large area of the famous Sutter Basin, between Marcuse and Vernon, along the Feather river, will be under cultivation soon. The work of clearing the land brush is under way.

It is claimed that there were about 5000 acres devoted to broom corn in California this year, most of the acreage being in Southern California and in Kings and Tulare counties.

The secretary of the American Forestry Association has sailed for Paris, where he will confer with French Government officials with a view to proffering aid in reforesting devastated areas of France.

California has 16,000,000 acres of public land outside the 18,000,000 acres in forest reserves, according to the U. S. Land Office. Much of this public land is fertile but dry and distant from transportation.

Fairbanks, Alaska, is not always below zero. Production in this region the past season is reported by Chairman W. C. Edes of the Alaska Engineering Commission as: Oat and wheat hay, 350 tons; seed oats, 10 tons; seed wheat, 30 tons; potatoes, 450 tons; cabbage, 35 tons; carrots, turnips and rutabagas, 80 tons; tomatoes, cucumbers and other hothouse vegetables, 25 tons.



34 Years' Orchard Experience in Special 6 H. P. Tractor

—Send for Free TrackPULL Book

A COMPLETELY convincing book, sent free, explains why men who own orchards or vineyards need the special 6 H.P. Bean TrackPULL Tractor.

This highly improved 1919 Model special tractor is the product of men who have specialized for 34 years in the building of orchard machinery. It is the result of all their experience, so it meets orchardists' and vineyardists' needs as no other tractor built for *general* work could ever be expected to do.

Don't make the mistake of buying a tractor that won't do *your kind of work.* The Bean TrackPULL is made for it. Don't purchase any other machine until you know just what this patented tractor saves.

Features Due to Patents

The Bean TrackPULL will right-about-face inside a ten-foot circle with tools deep in the ground. It pulls all the way around the turns just as strong as on the straight-away. No pivoting. No overstraining one side. Makes no difference how far off center you hitch.

This feature is due to the *front drive* principle—to the Bean's *patented single track.*

You steer with the track, just as you "steer with a team," "gee-ing," or "haw-ing" this way or that as you choose. Twelve-year-old boys can handle this machine with ease. Such machines keep boys satisfied on the farm.

BEAN

TrackPULL Tractor

Write Us Now

Send for the free book that tells all about the Bean, describing each feature and pointing out clearly just what each means *to you.*

Get the small tractor that will serve you best—a tractor built by a firm that has made a specialized study of orchard and vineyard needs for 34 years. You can depend on this kind of tractor. No other kind is designed especially for orchard and vineyard work.

Send the coupon for the free book. Do it now while you're thinking of it.

Special Improved features of the 1919 Model TrackPULL are found in Motor, Track Rollers, Drive Sprocket, Bearings and Rear Wheels. They provide extra reliability.

Robbing Peter to Give Water to Paul

[Written for Pacific Rural Press by Mrs. Sarah C. Ames.]

As one of your readers whose earliest remembrance of printed matter is of the Rural Press, and who weekly looks to your editorials for the best all-round view of the agriculturalists problems, I am going to ask you to print the following and get the perspective of one in my position:

WATER IS THE KEY TO CALIFORNIA PRODUCTION.

If America is to supply the necessities of life, to not only her own people, but to the war devastated countries of Europe, it is necessary to know and then to change some conditions not now generally known. While nearly every food, clothing, medicine, building, heating lighting and power product, needed by the human family can be produced from the lands of California and the waters thereof we have not been producing many of these things for ourselves. Land and climate we have in great variety. Water we have in this State in abundance if it were only made available.

Is this subject of production, and the things necessary for increased production of any concern to the people of the cities? If war prices and war pestilence teach us anything they teach us that all must be fed and cared for, for the epidemic growing in hunger, poverty and exhaustion is no respector of persons. It has taken the strong, powerful, influential and delicately nurtured as well as the less fortunate.

WHY DISTRIBUTION IS NOT EQUITABLE.

The people who shape legislation and rule, live in the cities, and the producers of land products from their isolated position, can do little but choose between the men and measures put up by those who by more convenient opportunities can get together to do so.

Production has for ages been left to the people out on the land and up to this world war no one ever went hungry for lack of enough being produced, but many often did for lack of a system of distribution. Conditions, brought about through ignorance and indifference of those in control of public affairs have gradually forced more and more producers away from the land, till at the commencement of the war we were producing just a "pattern" and we were told that we must save to send food to Europe.

CAMOUFLAGING THE REAL CONDITIONS.

Again we are told to save food since the need is greater than during the war. This advice to save food seems not only "penny wise and pound foolish," but pernicious when compared to the lack of attention paid to means for increased production, and the ignorance and injustice that is lessening the production and destroying the stocks necessary for dairy, poultry and meat products.

The writer was present when Mr. Ralph P. Merritt figuratively lulled an audience to sleep over an active volcano, with much the same statement as used by Prof. Frank Adams in a communication in Saturday's Pacific Rural Press of December 7, entitled "Officials Did Not Take Rice Water."

Mr. Adams shows that officials did not take water away from growing rice, but, their activities increased the allotment to the rice by withdrawing water from other crops. His last sentence reads: "This withdrawal was acquiesced in very patriotically by nearly every user and in the long run very little substantial damage was done to anybody."

A LOCAL VIEW OF SUCH WITHDRAWAL.

In view of this practice of "withdrawing" the use of water from crops needing it and entitled to its use, being a common practice for the last twenty years, in one locality mentioned by Mr. Adams, the facts as given in the home town paper, in a three and one-half column article entitled "Alfalfa Men Come Last," and the State officials' comments, should be called to public attention, the true state of affairs be made known and the remedy applied.

The local paper said: "It was a regular 'Monkey and Parrot' exhibition which Professor Veihmeyer was regaled with, but the Food Administration man declared that 'it was a typical irrigation district row,' and seemed to enjoy the encounter as much as anyone."

That looks like adding an "insult to injury," when you know that the discrimination was against old alfalfa fields and old trees; nearly all these old alfalfa fields and orchards involve, or did involve a family home; also a small dairy herd. Nearly all of these old alfalfa fields and orchards involve many year's work and double the cost of new lands for one year crops. Many of the owners, pioneers in irrigation, paid the first cost as water rights and then a water rental yearly, whether their water was "withdrawn" or not. The Federal Government still requires the water user to put up, or sign up to pay the full cost of making the water available before going onto any of its projects, as at Fallon, Nevada, on May 2, this year. The ruling for farm sites in Truckee-Carson irrigation project drawing at Fallon, Nevada, May 2, 1918, was that water right applications must be in the hands of the project manager of the U. S. Reclamation Service between April 27 and May 2, 1918.

TWO THINGS ESSENTIAL.

California lands, for many crops, are like a dead body. Water makes life and increase for such lands. Many who had encumbered their lands to develop water and continuously used it for twenty years or more are told that their water rights are not worth the paper they are written on, "mere scraps of paper."

The people of California, as citizens of a democracy, have asked for two things, first for the federal government's credit to aid in developing its water resources for the benefit of all its citizens; second, to adjudicate or quiet title to water now in use.

HOME-MADE ALMOND HULLER.

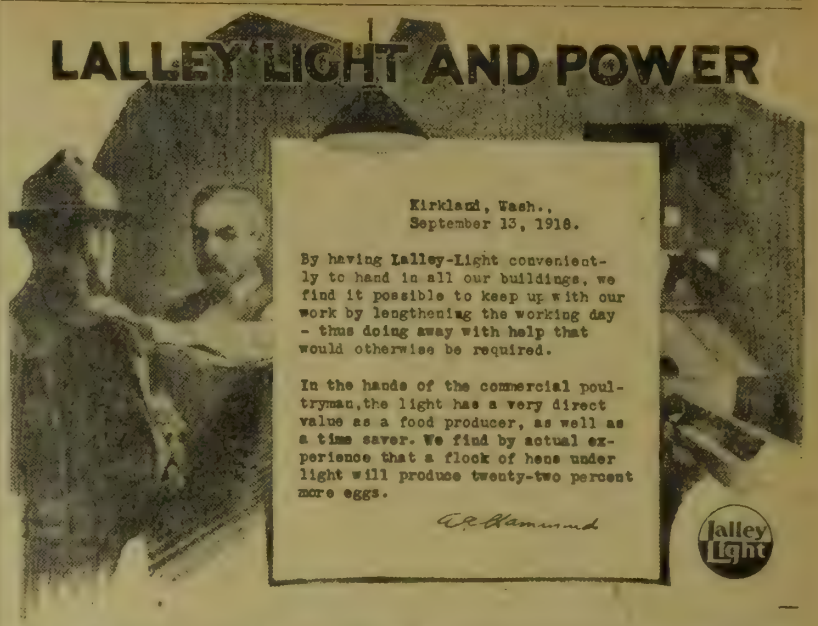
To the Editor: I find the arrangement I will describe very helpful in hulling and shelling a few almonds which are known as stick-tights.

The almond huller consists of a rough board table about 3x2 feet, made out of 1x12 redwood or pine. For hulling I make a small square rubber 8 or 10 inches square with a button 1x1½ nailed on one side as a handhold. By using a combined rotary, back and forth motion bearing down on the huller I can separate the hulls much faster than by hand. The hulls must be separated occasionally or the board will ride on them too much. To shell the almonds I use the same device only bear down more lightly. Where one has only fifteen or twenty trees it does not pay to invest in a machine to do this work. Of course shelling them is only necessary when the almonds are badly discolored as they were this year. Then it pays big to shell them, as the shelled almonds are worth 48 cents per pound to the candy-makers.—Samuel Haigh, San Jose.

MECHANICAL COTTON PICKER.

Vacuum suction through three to five long rubber tubes, each operated by a man, has been doing fast cotton picking on the Dodge Rice and Land Company's ranch in Butte county. It is claimed that five men can pick as much this way as 60 could by hand. Dirt and sticks are separated from the cotton in the machine. If it proves a commercial success, a tremendous step has been taken in cotton growing. T. R. Gabel of Los Angeles is the inventor.

The rice mill at Gridley seems unable to handle all rice offered, though its capacity was increased this season.



Helping To Make Up The Farm's Man-Power

War has taught thousands of farmers that Lalley-Light is a labor-saving necessity of utmost value; and that after the war the need for it will be even greater.

The world looked to American farmers to feed it while it battled; and must look to us for food for a long time to come.

Inexhaustible Lalley electric light and power are taking the place of those who have not yet returned — saving the work of farm hands — saving women's work—lengthening days that are all too short, and helping men do more.

Lalley-Light actually pays for itself in the first year or so—as shown by eight years of everyday farm experience.

Right now is the best time to see the nearest Lalley-Light dealer; or write us today for literature.

Lalley Electro-Lighting Corporation, 775 Belleview Avenue DETROIT, Michigan

LALLEY-LIGHT

THE ELECTRIC LIGHT AND POWER FOR EVERY FARM

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

12 Mechanic Street DAVIS, CAL.

Manufacturers of

4ure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

Motor and Engine do Not Work Together

To the Editor: I use a two-horsepower motor to run a milking machine, but the power is frequently off in winter, so I intend to get a gas engine. I also intend to get a feed cutter and a circular saw. These would require five horsepower. Can I hitch a three-horsepower engine onto the line shaft with the motor and work both together on the saw, or will I have to get a five-horsepower engine?—C. F., Soledad.

A gas engine will not work on a line shaft together with a motor, chiefly because the speed of the engine varies from moment to moment while the motor speed is practically constant. You would have the engine pulling back on the motor periodically, not only reducing your available total power but also endangering the motor by the overload when the engine slacks up and by the repeated shocks due to the periodically varying load. A five-horsepower engine will operate the milking machine with no practical waste of power for the short periods when electricity is off and your only extra expense will be interest on the extra investment in a five-horsepower engine over what a three-horsepower would cost. Probably a less preferable way would be to turn your motor in for a five-horsepower motor and buy a two-horsepower gas engine to use on the milking machine when power is off. This would use a trifle more electricity on the milker and would involve greater investment, but might pay if you should need enough electricity every month to make your bills over four dollars per month. We have asked L. S. Ready of the State Railroad Commission whether the interruptions to your electric service could be remedied. Your line runs from Santa Clara county up to King city and, being so far from the source of electricity, is likely to be down occasionally through bad winter weather. The company will have a hearing before the Railroad Commission in January with reference to an increase in rates, installation of better service, and greater speed in repairing the lines, but Mr. Ready believes that for a milking machine interruptions are too likely to occur to depend absolutely on electricity in your section.

CANADA'S POTATO SURPLUS REACHES RECORD FIGURES.

Canada's 1918 potato crop, according to press reports, is as follows: A revised estimate of the Canadian potato crop from figures in possession of the Canada Food Board shows an exportable surplus in six provinces of 28,433,000 bushels over all requirements for domestic use and seeding. Alberta, Saskatchewan, and Ontario have no surplus. Early frosts and prolonged drought reduced the yield below normal in those provinces. On the contrary, Quebec, New Brunswick, and Manitoba show a remarkable surplus of 24,500,000 bushels. The balance of 3,933,000 bushels is in Prince Edward Island, Nova Scotia, and British Columbia.

The estimated total production for the Dominion in 1918 is put at 105,579,700 bushels, as compared with 79,892,000 for last year.

Roots also proved a record crop, with turnips leading at 120,767,900 bushels.

WHEAT AND FLOUR EXPORTS.

Exports of wheat for the nine months ending September, 1918, were 48,687,256 bushels as compared with 91,412,812 bushels in the corresponding period of 1917, and 113,312,453 in 1916 upto October. Of the 1918 shipments more than half were exported in September. Now while wheat exports have been dropping heavily, wheat flour exports have increased from 11,470,472 barrels in the first nine months of 1916 and 8,891,721 barrels in the same period of 1917 to 17,802,438 barrels up to October 1 in 1918. In September, 1918, however, only 333,148 barrels of flour were shipped as against 1,015,293 in September, 1917. The Food Administration is aiming since the 1918 crop movement started, to send as much of it as possible to Europe in the form of wheat in order to add to European mill feed supplies and encourage rebuilding up their livestock industry.

MOTOR TRUCKS IN FORESTS.

Army motor trucks are likely to be assigned to the Forest Service for transportation of men and supplies to forest fires, according to Acting District Forester R. Headley of San Francisco. Much loss of property, forest trees, and Federal funds could have been avoided heretofore by use of motor vehicles. A complete estimate of the number that can be used to advantage has recently been made by the Forest Service to the U. S. Motor Transport Corps.

POWER-SIMPLICITY-ECONOMY

WATERLOO BOY

ORIGINAL KEROSENE TRACTOR

Dependable Power that does not fail when your farm work has been delayed and you must take advantage of favorable weather and ground conditions.

Simple Power which the inexperienced hired man can utilize to full day capacity, at any drawbar or belt job on the farm.

Reserve Power that's available in emergencies—for variable soil conditions or upgrade work.

Economical Power that insures low operating cost—works all day under full load on 18 gallons or less of cheap kerosene.

Built to Standard Quality

Waterloo Boy fully sustains the quality-fame attained by Waterloo Boy power machines in 25 years' manufacturing success. Backed by a plain guarantee from a responsible manufacturer. Two-speed motor supplies ample reserve power for tillage operations, and belt power for all farm needs, including threshing. All working parts of the Waterloo Boy are easily accessible.

Our illustrated catalog contains convincing proof of Waterloo Boy success. Sent free—write for it today.

The Engine Selected by over 150,000 Farmers

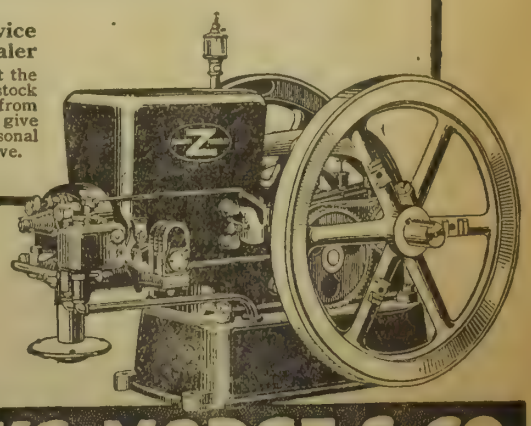
RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.



The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors and other mechanical farm power are invited to make this department an exchange of their experiences and troubles

TRACTORS WILL LEVEL BATTLE-FIELDS.

We have read of the giant tanks that crashed their irresistible way across the battlefields, destroying all that came in their way. We have learned, too, that these fighting tanks were suggested by the great American "Caterpillar" farm tractors used by the allies for hauling their big guns. Those guns contributed their share to the destruction, hurling high explosive shells without number, destroying cities, towns and villages, blotting out bridges and roads and tearing up fields. In many places you can go for miles and scarce find a spot large enough to stand upon that has not been churned up by an explosive.

Those who have visited French farm lands report that the fields that once yielded abundant crops seem blasted beyond all hope of recovery. The pock-marks of the small shells are everywhere, and at frequent intervals are huge craters, yards across and many feet deep, where the larger shells have exploded. At some points entire farms have disappeared, for here the troops sank their mines, which, when fired, engulfed whole companies and entirely changed the contour of the land. The fertile top soil is gone, buried beneath the upturned sterile clay and sand. Back and forth across all this devastation run endless mazes of trenches, man deep, with earthen ramparts before them, cutting up the fields until plowing or cultivating seems an utter impossibility.

Such is the condition in which returning French and Belgian farmers will find their once fertile acres. It will be a disheartening sight, for with the old horse and scraper method of leveling it would mean years of work before the land would again be fit for cultivation.

Here is where the "Caterpillar" farm tractor will drop its war charge, the heavy gun, and go to work for those simple peasant folk. Hitched to a big land leveler, it will cut off the earthen ramparts, fill the trenches, craters and shell-holes, nad leave the surface level.

The whole affair is similar to the land-leveling operations pursued by the United States Reclamation Service, where great stretches of virgin country have had to be leveled accurately so that irrigation would be feasible. On the Truckee-Carson project United States engineers decided to attack the task with tractors. They used two Holt "Caterpillar" tractors, pulling two Holt land levelers. The outfits worked 16 hours per day and results were so satisfactory and costs so low that three more outfits were ordered. Plowing and leveling cost $32.75 per acre, including overhead.

The land leveler is a machine operating in fashion similar to the road scraper. When drawn by a 75-horsepower "Caterpillar" tractor, the Holt leveler is fitted with an eight-foot blade, which can carry seven cubic yards of dirt. The operator lays the dirt wherever he wishes. He is also able to make instant variations in the blade's bite.

Tractor land leveler filling shell holes and trenches.

FRESNO WANTS BIG TRACTOR DEMONSTRATION.

To the Editor: The Central California Tractor and Implement Association of Fresno has extended an invitation to the California Tractor and Implement Association to hold its big spring tractor and implement demonstration near the city of Fresno.

Fresno is the geographical center of California, the third largest center of population and the center of California's largest agricultural district. The association feels, therefore, that the interests of your organization could best be served and the largest possible number of farmers reached by selecting Fresno county for the coming meet.

The following brief facts will substantiate this claim: Within easy access of Fresno by rail or highway lives a population of 19,498 farmers, distributed throughout the following counties, as shown by the 1910 Government census, plus a conservative estimated increase of 25 per cent. However, the 1910 figures have been taken as a basis for comparison:

Fresno county	6,245 farmers
Kings county	1,837 farmers
Tulare county	4,021 farmers
Kern county	1,047 farmers
Madera county	573 farmers
Merced county	1,856 farmers
Total	15,599 plus 25% or 19,498

The following named agricultural organizations are interested in this demonstration and will use their best influence to encourage large attendance of their members: California Associated Raisin Company, 8700 members; California Peach Growers, Inc., 5000 members; Valley Fruit Growers' Association, 3300 members. Unorganized farmers in the grain growing, orange, table grape, fig and other industries may be relied upon and can be reached through various local Chambers of Commerce.

A suitable piece of ground of 500 acres or more can be secured adjacent to the city of Fresno, with good plowing conditions, during the latter part of April or the first of May, and accessible by highway or interurban.

The fullest co-operation from the Central California Tractor and Im-

What Keeps the Tractor on the Job?

You can't get full service from your tractor, unless all the fuel is ignited instantaneously. The one sure way to get the full power that comes from this complete ignition is to have

BOSCH Magneto Ignition

WITH BOSCH IMPULSE STARTER

The rip-roaring Bosch sparks drive into the firing chamber with such penetrating power that all the fuel is completely ignited.

Besides this powerful spark, Bosch has the rugged, sturdy stanchness that stands up under the hardest use. It will see you through any job, however tough, and do it year in and year out.

With the big, strong, simple Bosch Impulse Starter, now in general use, you also will be sure of quick, easy starting.

Bosch costs more than ordinary ignition systems. Yet it is standard equipment on many fine tractors, because the manufacturers know it is the best. They want to be sure of giving real service, even at higher cost to themselves.

Whatever the make of your tractor, it can have a Bosch Magneto. The maker will install Bosch if you ask for it when you order, and the tractor you already have can have a Bosch fitted by any Bosch Service Station.

Be sure to specify: "Bosch Magneto Ignition" on your order.

POWER FOR PUMPING.

To the Editor: I have three wells close together which I intend to connect at the pump in a pit about 20 feet down. The water can be pumped down to about 18 feet below the bottom of the pit. I will discharge about 5 feet above ground. How much power will be required for a 4-inch centrifugal pump? How much for a 5-inch pump? Are the figures you quote supplied by engine dealers or pump dealers? The one wants us to use extra power, the other tells us to use less.—H. F. B., Santa Margarita.

Figure about 0.22 h. p per foot of lift for the four-inch pump lifting 400 gallons per minute 45 feet, or about 0.34 h. p. per foot lift for the five-inch pump throwing 700 gallons per minute. For the smaller pump get a 10 h. p. engine or motor. For the larger one, get a 16-h. p engine. It won't cost so much to run an engine with a trifle over-capacity as one so small it would have to be overloaded and strained. You may also encounter a dry year, or neighbors may pump your water away from you. If your lift should become much greater, you would hate to buy a new engine as you would if skimping on power in one you buy now.

Engineers have worked out tables of power required for various volumes and lifts of centrifugal pumps. Both engine and pump dealers use the same tables; but in making the recommendations, the one may add a margin of reserve power while the other may try to minimize the cost of power.

TRACTOR DISPLAY AND AD. CLUB LUNCHEON.

Two notable forces combined on Wednesday of this week to give San Franciscans a better idea of how current agricultural progress is being attained. The California Tractor and Implement Association conducted a street parade which attracted wide attention and the San Francisco Advertising Club gave a luncheon to several hundred wide-awake business men, manufacturers and men prominent in public affairs. The lesson of the twin event is that modern agricultural progress is mainly due to tractors and their trailing implements and to advertising which makes the public aware of what can be done with up-to-date farming appliances. This lesson was well enforced both by tractors and luncheon orators in full operation, and all participating were interested and edified. In the tractor parade we noticed the following tractors: Avery, Samson Sieve-Grip, International Harvester Co., Fageol, Yuba, Wallis, Holt's Caterpillars, J. I. Case Machine Co., Lauson, and Moline. It is a good thing to bring city and country interests together, as the affair surely did.

OVERHAULING COST OF TRACTOR.

Good service has been given by the Yuba 18-30 tractor which has done the work three years on a 300-acre ranch in Los Angeles county for W. R. Hudson. It has just been overhauled at a cost of $400, the machinist work having been done by himself. As this tractor is now priced at $2,900 f. o. b., factory, the overhauling after three years is very reasonable. The entire life of a tractor decently used in California is averaged at not more than five or six years, so Mr. Hudson is getting service much better than the average.

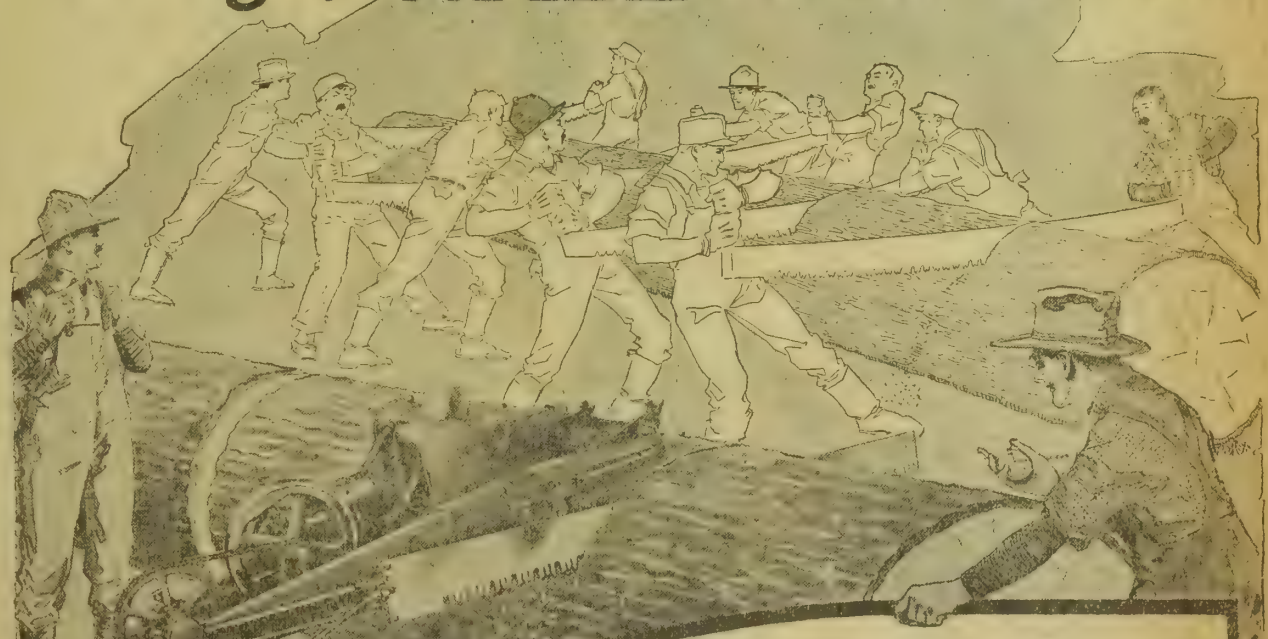
The Mighty WADE Outsaws 10 Men!



A money-maker and hard work saver for land clearers and wood-cutting contractors. One man can move it from cut to cut. Simple and reliable. Hundreds in use all over the United States—in the woods of the Pacific Northwest, California, Minnesota, Arkansas, New York. When not in use for wood cutting the 4-H.-P. motor will run feed mills, feed cutters, pumps, etc.

Read What These Owners of WADE DRAG SAWS Say:

"One afternoon my brother-in-law and I took my WADE into the woods and sawed three hard maple trees into 16-inch blocks, the trees averaging about two and one-half feet at the stump. He expected it would take me from eight to ten hours to do the job, but it was all done in three hours.—F. W. Hiller, Vernon, N. Y.

I cut thirteen and one-half ricks of cottonwood in six hours.—J. W. Stratton, Atkins, Ark.

One gallon of gasoline will cut six to ten cords of wood; it depends on the kind of timber you cut.—W. D. Thomas, Bull Run, Or.

My WADE saw paid for itself six times over.—F. W. Taylor, Swisshome, Or.

I am making $250 a month with my WADE.—F. A. Storts, Orville, Cal.

Thirty-six inches in diameter, yellow birch, is the largest I have cut and I cut down to six inches.—P. L. Cole, West Duluth, Minn.

I cut down to eight inches in diameter.—F. T. Swank, Park Falls, Wis.

America must burn more wood for fuel. One Wade will do 10 men's work at one-tenth the cost. Write for free book, "How Dan Ross Cuts 40 Cords a Day." Full details and special price.

A 53 YEAR REPUTATION BACKS THE WADE

Horticultural Jottings

It is reported that olives around Oroville are running heavily to large sizes.

Cold nights and warm days have helped color up oranges in the Fairoaks section.

The Hemet-San Jacinto Olive Growers' Association has packed 12 carloads of olives.

Yakima Valley, Washington, reports this year's crop of Winesap apples the best ever produced.

It has been estimated recently that the raisins saved this year will bring the crop up to 170,000 tons.

Horticultural Commissioner Earle Mills of Butte county says the pear blight infection around Paradise is well under control.

H. J. Ryan has been appointed horticultural commissioner of Los Angeles county to fill the vacancy caused by the death of William Wood.

Fred G. Stokes of Lake county reports that there will be heavy plantings of pears and prunes in that section this year. Several thousand A1 Bartlett pear trees on Japanese roots are being shipped out.

Many California fruit trees are to be used in replanting the ruined orchards of France, according to plans being formed by the Los Angeles branch of the committee for devastated France.

A 200-acre mulberry plantation has been started in Butte county with a view to the establishment there of a silk manufacturing industry. The Seriterre Company of Oroville is the promoter.

The annual fig institute for Fresno county will be held January 3 and 4. Present fig prices are very good. The growers seem generally disposed to let the market take care of itself until war conditions pass.

Apple growers of the Northwest are expecting that the embargo against shipping apples to Europe will soon be removed. England expects to import apples and control the price at which they will be sold.

The biggest order for trees ever known to be given from Yuba county was given by Howard Reed, well-known orchardist, who bought 50,000 pear striplings for 500 acres of land which he will plant this year.

Members of the California Grape Protection Association, at a meeting in this city last Saturday, representative of the grape-growing counties of the State, subscribed $1,500 to meet the initial expense of the coming campaign.

The Sunlit Fruit Co. cannery at Atwater closed its packing department after a most successful season's pack, which totaled for the season 60,000 cases of peaches and 30,000 cases of sweet potatoes. This is an increase of 15,000 cases over last year's pack.

George A. Lamiman, for years Horticultural Commissioner of Shasta county, has been engaged by Silva-Bergtholdt Co. of Newcastle as their expert horticulturist. This company operates 1100 acres of orchard properties, which will give Mr. Lamiman plenty of congenial work to do.

The Legislature is to be asked to make an appropriation of $48,000 for the establishment of a nursery for the propagation of the stock for the planting of shade trees along California's State highways, to protect the concrete roads from the extremes of summer heat and to afford comfort and eye relief to travelers.

The Fresno orange crop is turning out very satisfactorily, according to Horticultural Commissioner F. P. Roullard. The shipments will be larger than last year. Where growers had expected a 30 per cent crop, the oranges are generally turning out about 45 per cent. The quality of the fruit is excellent, both in color and ripening.

Fred Feuelberger, Horticultural Commissioner of Alameda county, was elected president of the County Horticultural Commissioners of the

When Our Trees Are Planted Righ

Plant Fruit T

IF you have not already ob
Fruit Tree Catalogue, sen
your orchard more intelli
possession than you could o

Our explanation of varieties, our practical inf
and vineyards, compiled by men fully experienc

Here is a sample of the concise way our catalogue deals with various fruits:

Peaches

California leads all other States in the production of peaches, in fact it is the leading horticultural product of the State.

Both the Clingstone and Freestone peaches have been bringing handsome returns to the growers and the heavy demand for foreign shipments as well as for home consumption makes peach growing one of the most profitable industries.

The California Peach Growers' Association represents 6000 growers. It is incorporated for $1,000,000, and now controls 85 per cent or more of the tonnage sold on the market. Since this Association has been formed, grades have been standardized and prices have been obtained which have been remunerative to the grower and gives an impetus to the planting of new acreage.

The trees do best on well-drained, sandy loam and white ash soils. If planted on heavy soils, care must be taken to have it well drained. The so-called "hard-pan lands," if properly blasted, allowing the roots to extend into the deep, free soil below, produces fruit of the finest quality and the trees are very prolific. Such land is usually rough and requires leveling before planting.

When the trees are set, cut them back to 18 inches from the top of the ground and shorten in all branches, if any, to two buds.

The first winter after planting cut away all branches up to 12 inches from the ground and leave from three to five branches to form the head of the tree and prune these back to 12 inches. These branches should be distributed on the trunk of the tree to prevent crowding and development of forks. Forked trees, when loaded with fruit, are liable to slip down and ruin or entirely kill them.

The second winter thin out the small lateral branches, leaving not more than two or three on each of the framework branches, and cut these back about one-half. This system can be followed each year, but thinning of lateral branches must be resorted to in order to prevent smothering the inside of the tree.

As a rule, peaches are set from 20 to 24 feet apart. On light soils set the trees 20 feet apart, but on heavier soils 22 to 24 feet is preferable.

Peaches are divided into two classes, viz.: Freestones and Clingstones. Some of the very early varieties of the freestones cling slightly to the pit, which, however, is not an objectionable feature. The freestone varieties are used for canning, drying and shipping, while the clingstones are principally used for canning and shipping. The freestones best suited for canning are Foster, Elberta, Lovell and Salway; those for drying are Elberta, Muir and Lovell.

The MUIR PEACH

Is Unexcelled for Peeling and Drying Purposes

MUIR—The Muir is the King or Queen, as it might be called, of all the freestone peaches for drying purposes in California. It was originated on the place of John Muir, near Silverville, California, but was first propagated by Mr. G. W. Thissell of Winters, California. It is very large in size and a perfect freestone, having a clear yellow flesh, which certainly presents a most beautiful appearance when properly dried.

In addition to its attractive appearance, it contains more sugar qualities than any other peach, which allows it to dry exceedingly heavy, making it a very profitable variety to the producer. We feel that this peach is so widely known and favored among California planters that it is needless for us to mention all of its good qualities.

We believe that everyone who contemplates planting a peach orchard for drying purposes should certainly not overlook the Muir. The California Peach Growers' Association have demonstrated that this variety is the only one that can be "Process Peeled" successfully. Time of ripening, latter part of July.

Drying of Peaches

In drying peaches great care should be exercised so as to obtain a clean, well-colored and desirable product, which always tends to make it more saleable.

Fruit should never be picked, for drying, until well ripened, at which time it contains its largest quantity of sugar, dries very rapidly, weighs heavy, and makes a large percentage of fancy fruit. In picking up fruit which has dropped voluntarily, sunburnt and green, shriveled fruit should never be taken, as it only tends to lessen the value of the good product and reduces the profits.

In cutting fruit one should be careful to see that a complete circle of the fruit, with the knife, is made, otherwise it is partly torn and when dried presents a very poor appearance.

In placing the fruit on trays, which are used for sulphuring and drying, it should all be placed face up; the tray having cleats of sufficient height to admit the largest peaches without touching other trays when stacked. These trays should not be allowed to stand longer than is absolutely necessary before entering the sulphur house. When this is allowed a crust forms on the fruit and proper sulphuring is very difficult. * * *

State at a meeting in Sacramento last week. Fred P. Roullard of Fresno was elected vice-president and Fred C. Brosius of Sacramento was elected secretary.

The packing of the Lindsay orange crop is over. The total crop from Lindsay will be about 1000 cars, about half the normal. It is about 50 per cent more than the summer estimate after the June crop. The total shipment from Tulare county is approximately 2300 cars, about double the shipment of last year. The returns will not be near anticipation and will net about $3 per box.

As a result of fruit market investigations conducted in New Zealand by the U. S. Bureau of Markets, cooperating with the American Consul-General at Auckland, grapes from the United States will now be received into that country, which previously allowed imports from Australia only. This affords a new market for our Malagas, Emperors and other table varieties.

Nurserymen state that the demand for apricot trees is not up to normal, caused probably by slow market this year for the dried fruit. As the Government will soon take its hands off the dried fruit industries, the apricot situation will soon come gack to normal, so that it would seem that now was a good time to plant apricots while good stock is obtainable.

C. H. Barker, Grass Valley pear grower and shipper, reports having received as high as $3.50 per box for late pears shipped to the Eastern markets. The close of the Bartlett season was also very satisfactory, the prices ranging as high as $4 per box. Despite unfavorable conditions existing in mid-summer, the season was better than the average for fruit growers here, in the opinion of Barker.

A new non-profit co-operative project has been launched in the Liberty Groves Operating Corporation, San Bernardino, which proposes to do the farming for growers on the same principle that the exchanges and associations market the fruit. The grower will have his orange-orchard cultivated, irrigated, fumigated, pruned and the fruit harvested and packed. Grower (loquitur). This is the life!

A local paper says the fruit season of 1918, so far as it affected Nevada county, was one of many difficulties, and comparatively few of the growers realized the profits of former years. Some showed a balance on the wrong side of the ledger when the final returns were in. Particularly was this true of some of the smaller and less experienced shippers, whose principal shipments reached the Eastern auction markets at a time when prices were so low that there was nothing left above the shipping expense.

Word from the Fresno district says that the fogs have been seriously delaying the drying of the raisins. About 15,000 to 20,000 tons of raisins are still on the trays and in half boxes. Some of these may be lost, but a cold, frosty spell would soon cure thousands of tons. The damp weather has held the growers back. The raisins are practically all in the stack. Wylie M. Giffen, president of the California Associated Raisin Company, is using the dryer on practically his entire crop, and is drying some of his neighbors' crops.

J. N. French of the rodent division of the State Commission of Horticulture gave his first demonstration in killing gophers and squirrels in the Watsonville district last week. By the use of French's probe a man with a couple of hours' experience can locate and drop poison into from three hundred to five hundred runways a day. A feature of French's work is the poison used. Sweet potatoes are cut in cubes big enough to prevent the gopher from putting them in his pouches. He is therefore forced to eat the bait on the spot or else abandon it, and most gophers will take a few nibbles before abandoning a piece of sweet potato, no matter how full they are.

For Butter or For Worse

Startling Facts Regarding the Increasing Use of Butter Substitutes. An Association Being Revived to Fight the Oleomargarine Interests.

Dairymen of California, do you realize the alarming extent to which oleomargarine and other substitutes for butter are being used? You were happy when the price of butterfat went up, but do you know that there is just as much danger when it goes exceptionally high as there is when it is not high enough? If the price goes beyond what the consumers have been led to believe represents the worth of butter they will discontinue its use and buy substitutes.

That's just what they have been doing. The annual report of the State Dairy Bureau, just issued, gives alarming figures regarding the increasing use of oleomargarine as indicated by the number of licenses issued. The record is given in the accompanying table:

OLEOMARGARINE LICENSES ISSUED

	Retail	Bakery and Restaurant	Wholesale.
July 1, 1916, to June 30, 1917.....	836	371	8
July 1, 1917, to June 30, 1918.....2,758		575	20
July 1, 1918, to Dec. 1, 1918.....2,738		434	25

Notice that the last row of figures in the table is for only five months. When the complete records for this year are available it will be found that more permits were issued during the last six months than during the entire preceding twelve months. Also notice that during those twelve months nearly three times as many licenses were issued as during the previous twelve months.

THE PUBLIC MUST BE EDUCATED.

To be sure, the situation is disappointing; it is even serious. But it does not mean that dairying is doomed. It simply means that the public must be familiarized with the difference between butter and its substitutes—must be educated to the real food value of butter and its absolute necessity in human diet.

Dr. McCollum, of Johns Hopkins University, has discovered that dairy products alone contain a vitamine which is absolutely necessary to the proper maintainance of human life, and that persons when deprived of it become weak, torpid and prone to disease. Consequently, not only does the dairy cow produce a cheap, palatable food, but she supplies one for which there is no substitute—a food which constitutes an indispensable part of our diet, and without which we cannot develop properly.

But how many people know these facts and hundreds of others that ought to be put before them? The reason why so many people are using oleomargarine in the place of butter is that the manufacturers are constantly on the job advertising their products and keeping their brands before the public, while the dairymen, unorganized, sit back and bemoan their fate.

DAIRYMEN MUST USE THEIR OWN GOODS.

Worse than this, the dairymen are not using their own goods. An investigation carried on just a few months ago among general stores selling to dairy farmers revealed the astounding fact that these farmers themselves are as liberal users of butter substitutes as city folks. In their effort to reduce the high cost of living they are striking a killing blow right at the heart of their own industry. False economy, of course, but they are doing it just the same.

Education should begin at home, and first of all the farmers need to be informed of the real food value of their product and its necessity in their diet.

ORGANIZED EFFORT NECESSARY.

To do this, and to educate the public at large; also to have suitable laws enacted to protect the interests of the dairymen, organized effort is necessary, and we are glad to notice a movement along this line.

In 1893 the California Dairy Association was incorporated "for educational and legislative purposes," but it ceased its activities about 1902. It was recently suggested by W. B. Hopkins, manager of the Petaluma Co-operative Creamery, that a strong association of dairymen be organized, primarily for oleo legislation, and later for a campaign of advertising dairy products, in co-operation with national organizations.

OLD ASSOCIATIONS REVIVED.

Following this suggestion, the creamery directors of Marin, Sonoma and Napa counties became interested in reviving the old association and building up a large state membership in time to take action at the coming session of the state legislature.

The work was undertaken by the former secretary, Mr. Samuel E. Watson, state dairy inspector, who secured a leave of absence from the State Dairy Bureau in order to devote all of his time to the new work.

Within a few days over 300 members were secured and over $1000 raised to open up a campaign for quick action. One thousand members are assured in the three counties, and it is hoped to secure at least 5000 throughout the entire state. Early in January a meeting will be called to elect a new board of directors to conduct the affairs of the association.

It is proposed to issue a monthly bulletin in January, February and March, to give oleo and dairy statistics and keep the members informed of legislative progress on oleo and other measures of interest to dairymen.

Quarterly meetings are planned, in which dairymen of the most important districts will meet for consultation and mutual benefit. At these meetings university instructors, practical dairymen from other sections, and experts in dairy work will speak, and great good should result.

The association will be conducted for educational and legislative purposes only, and will not go into any commercial undertakings; nor should it be confused with any work of that nature now under way. It will, however, work in harmony with creamery operators, butter makers and other associations along the line of education and legislation.

The necessity for such an organization is self-evident, and it seems to us that this association is starting out along the right lines. If interested, write for fuller particulars to the secretary, Samuel E. Watson, 1254 Regent street, Alameda.

CREAMERY OPERATORS MEET AT VISALIA.

[Written for Pacific Rural Press by W. H. Schrader.]

The California Creamery Operators' Convention, postponed from last October, opened in Visalia last Thursday. An instructive program had been arranged by Secretary F. H. Daniels. A hearty welcome, including a key to the town, was extended to the visiting creamery men by various city dignitaries. President Nels Beck, in his report, emphasized the need of more revenue for the organization and Ed H. Webster later reported the plan devised to secure this, to wit: Assessing every creamery member one-tenth of a mill for every pound of butter produced. C. M. Conner, Farm Advisor for Tulare county, outlined some of the things being done in the county to further the dairy industry, especially emphasizing the importance of silo and corn ensilage both in the improvement of the dairy ration and the greater production secured by alfalfa, barley and corn rotation.

At the evening session Ed H. Webster pointed out the good effects secured by cow testing associations in the Imperial Valley. C. W. Rubel (taking the place of Prof. G. H. True on the program) outlined the advantages of co-operative bull associations, especially in communities of small dairies. Even the large dairymen could, through such co-operation, oftentimes more conveniently get the breeding desired. Geo. R. McCloud of the Sperry Flour Co. spoke in favor of a proprietary feed law for California. Prof. F. W. Woll of the University Farm agreed with most of Mr. McCloud's ideas, but thought that the various grains, etc., used in such feeds (rather than merely the percentages of carbohydrates, fats, proteins, etc.) should be indicated in the formula.

On Friday morning the operators were treated to an auto sightseeing trip, which included a visit to an orange packing house where was prepared for market another golden product for which Tulare county is nearly as famous as for butter. In the afternoon Dr. C. L. Roadhouse of the University Farm gave an interesting talk on "Business Phases of Dairy Manufactures" and I. L. Deming, also of the Farm, pointed out the necessities of standardization of creamery butter. C. F. Doane of Eureka gave an interesting talk on the cheese situation in California. He described the advantages of the equable climate in the coast counties for cheese manufacture.

In the evening S. H. Greene of the Food Commission prophesied great prosperity for the dairy industry after the war for many years. J. M. Henderson, president of the Associated Dairymen, told what that organization is doing to standardize production and stabilize prices. J. P. Murphy of Tulare questioned whether the Alfalfa Growers' Association would help the dairymen. He feared that a price of $20 per ton for alfalfa hay would tempt the dairy farmers to sell their cows and go into the business of selling hay. W. H. Roussel of San Francisco gave an interesting talk on marketing dairy products.

On Saturday N. Knudson spoke on "Neutralizers, Their Use and Effect," and N. Nyberg of Modesto gave some "New Ideas in Butter Making."

S. H. Greene outlined the benefits to be derived from a State Dairy Council and the members by unanimous vote authorized the executive committee to appropriate reasonable funds to finance the movement.

The following officers were chosen for the coming year: President, Dr. C. L. Roadhouse of University Farm; vice-president, C. E. Gray of San Francisco; executive committee, S. H. Greene of San Francisco, Ed H. Webster of El Centro, and J. R. Murphy of Fresno.

The University Farm at Davis was chosen as the place for holding the convention in 1919.

The leaders in the butter scoring contest were: Petaluma Co-operative Creamery, 95½ per cent; Danish Creamery, Visalia, 95¼ per cent; Modesto Creamery, 94¾ per cent; and Valley Creamery of Stockton, 94½ per cent.

THE MAN BEHIND THE LIBERTY FAIR.

The Liberty Fair is now past history, but we cannot lay down our pen without giving credit to C. R. Thomas for the success of the affair. The livestock feature was the drawing card, and this veteran showman is the one who made it draw.

Mr. Thomas seems to feel that the Rural Press gave him valuable backing, as is evidenced by the following, just received from him: "Your paper was one of the main factors in carrying the show to a successful termination. I thank you and your representatives most heartily, and appreciate everything you have done more than you will ever know."

FOR TWO THOUSAND YEARS the people of Holland have been developing the Holstein Friesian breed of dairy cattle. They have developed a breed that most economically turns large amounts of coarse fodder into valuable dairy products, and is valuable for beef purposes. Holstein Friesian cows excel all others in milk and butter production and return a greater profit upon the cost of their feed.

Raise the Calves and Prevent a Crisis

(Continued from first page.)

tect the calf from draughts and dampness. Clean the stall and bed it with dry straw soon after the calf is born. Many progressive dairymen wash the mouth, udder and hind quarters of the cow with a disinfectant, so that if it has any transmissible disease the risk of giving it to the calf will be reduced to the minimum.

We will assume that the cow is known to be free from tuberculosis and that the calf is to be allowed to nurse. In this case the next step is to see that the calf does nurse. A strong, healthy calf will do this of its own free will within a half hour or so after being dropped. If a weak calf does not nurse within an hour, assistance should be given, and the calf should nurse frequently during the first day.

Attention should be given to the navel cord so as to prevent infection, which leads to numerous calf ills. If the cord is long, cut it about three or four inches from the body, but don't tie it, as is often recommended. Instead, immerse the cord for about ten minutes in a cup or goblet containing a 1-1000 solution of corrosive sublimate or an equally reliable disinfectant. Then dust the cord with a desiccating or healing powder, such as equal parts of powdered alum and boric acid, repeating this occasionally until the stump dries and seals so that no filth or disease germs can enter.

WHEN TO SEPARATE CALF FROM COW.

Some authorities state that the calf should be removed from its mother at once, maintaining that it is easier to get it to drink if it has never nursed. Others claim that a calf can more easily be taught to drink after it has nursed for a few days, because it is stronger; also they say that it is more difficult to make the calf drink all the colostrum milk it needs than to let it get it from the cow.

Since the cow's milk is not used for domestic purposes for from three to five days, it seems best to leave the calf with her until her milk can be used, especially if her udder is caked or inflamed, as the frequent nursing of the calf will usually bring it to its normal condition. But the attendant should be sure to milk out the udder each day, and if the calf shows signs of scouring it should be separated from its mother at once and fed very lightly. A good dairy cow produces more milk than is necessary for her calf and, not knowing any better, the little fellow will drink more than is good for him. This overfeeding is apt to cause scours.

But whether a calf is allowed to nurse or not, it should receive the first milk from the cow—colostrum, it is called. This milk contains six times as much protein and twice the amount of ash in normal milk. It is a strong laxative, and as the stomach of a new-born calf contains a sticky yellow substance which is difficult to remove, this colostrum is necessary to loosen this material, cause it to pass off and start the digestive functions. It does more toward starting the calf on the road to a strong, healthy cow than any later feed.

The calf should continue to receive the milk from its own mother for four or five days, after which it may be given the mixed whole milk of the herd, if more convenient.

WEANING THE CALF.

The first feed from the pail is an important step in the calf's life. Keep it from the cow for about 12 hours, and then it will be quite hungry. Put about two quarts of its mother's milk, fresh and warm, into a clean pail and hold it in front of the calf. Occasionally a calf will just put its nose into the pail and drink without coaxing, but in most cases it will be necessary to wet two fingers in the milk, let the calf suck them, and by this means gradually draw its nose into the milk. Remove the fingers carefully after awhile and allow it to drink alone if it will. Often it will take its nose out and the operation will have to be repeated. The patience of Job is necessary, but usually after the second or third feeding the calf will drink alone.

The stomach of the young calf is so constructed that it requires frequent feedings in small amounts, and for the first week or two it should be fed three times a day, at regular intervals, and always with milk immediately after it is drawn, so that it will be as near the body temperature as possible. Theoretically, three or four feedings daily for some time are best, but in actual practice more than two feedings are a great inconvenience, and after the first week or two the calf will get along well enough on two feedings a day.

CHANGING TO SKIM MILK.

Fresh, whole milk should be fed until the calf is two or three weeks old, beginning with four to six quarts daily and ending with five to seven, depending upon the size of the calf. Then begin to change gradually to skim milk, having the change consume from a week to ten days, depending upon the richness of the milk. Start with six to eight quarts and increase so that when six weeks old the calf will be getting eight to ten quarts. Most dairymen wean their calves from skim milk when from four to six months old, cutting down gradually on the amount of milk, and increasing the other foods in the same proportion.

GRAIN NECESSARY TO REPLACE FAT.

When the change is made to skim milk something must be fed to take the place of the fat lost in skimming. Barley does not contain much fat, but the carbonaceous matter takes the place of it, and here in California, taking prices into consideration, probably the best mixture can be made up by using two parts of ground barley and one part coconut meal, by weight. I like to add a teaspoonful of blood meal in every feed. This is the best known bowel corrective, and when used regularly will prevent scours. Also it is fine for growth of bone and muscle.

It is desirable to induce the calf to eat hay and grain as early as possible, so that it will start the normal habit of the ruminant. It is possessed of a good set of back teeth at birth, and is able to begin grinding its food when two or three weeks old.

Do not feed grain in the milk, as the calf will gulp it down without masticating it, and this will lead to indigestion. Put a small handful of grain into the pail just as the milk disappears and the calf is busy trying to find more. It will quickly learn to eat the grain, and should receive about one-half pound daily until two months old. After that gradually increase the amount until one pound daily is being fed. It is hardly possible for a calf fed skim milk to eat too much grain, but with our rich pastures it will seldom be found profitable to feed more than the amounts indicated.

CALVES NEED ROUGHAGE.

Roughage develops capacity in the digestive organs, and a calf should be supplied with hay soon after it begins eating grain. It is best to start the calf on clean, dry hay, as green alfalfa has a laxative effect and may cause scours. When put on green alfalfa the calf should be fed other feeds first to prevent it from eating too much alfalfa.

After a few months a limited amount of silage may be added to the roughage, and beet pulp to the grain ration. Grain should be continued until the heifer is at least a year old—better to feed a small amount until it is two years old, if you want a large, well-developed heifer.

WATER AND SALT IMPORTANT.

Fresh water is an item that is often neglected, farmers reasoning that it is not necessary as long as calves are receiving milk. But this is a mistake, as from the time they are two weeks old they will drink several pounds of water daily if it is available. They should have access to clean, fresh water at all times.

Salt, another requisite often overlooked, will add to the health and vigor of calves, and is essential to their proper development. As soon as they begin to eat hay and grain, salt should be continually available.

CALF-RAISING PRECAUTIONS.

Properly fed on skim milk and suitable grains and roughage, a calf should gain from 1½ to 2 pounds per day until weaned at four or six months. But it will do this only when proper feeding is accompanied by proper care.

Absolute cleanliness is a most important factor. Clean feeding pails, troughs and stalls are safeguards against digestive troubles. Milk should be fed in pails scalded after each feeding. Discarded feed should be removed from feed boxes, and care should be taken to prevent meal from fermenting in the corners. Calves should be kept dry, and as bedding becomes wet quickly it should be changed frequently. Shade should be provided in summer, and protection from rain and raw winds in winter.

Yes, all of these things mean extra expense, but they don't mean extravagance. They pay.

COLD RAINS REDUCE MILK FLOW.

Cold, uncomfortable cows do not make economical use of feed. Their highly developed nervous systems are very susceptible to sudden changes of temperature, and more energy is consumed in maintaining the body heat of a cow exposed to cold rains than is utilized in the production of milk.

This should be borne in mind at this season of the year, and preparations should be made to shelter the cows. A little protection from cold rains and winds will prevent the reduction in milk flow which they always cause. Do not waste feed by letting your cows stand out in such weather.

A movement is on foot to organize a California Dairy Council to be affiliated with the National Dairy Council and represent our interests in the nation-wide movement which is being launched.

His Calves Are Now Coming

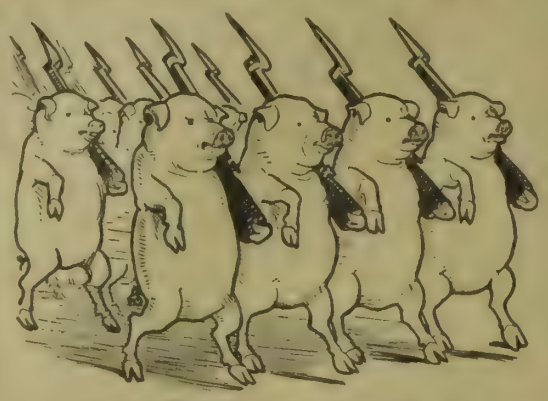
War Declared on Hog Marketing Methods

Written for Pacific Rural Press by R. H. Whitten

GREAT melting beeswax! We certainly started something when we published those articles on the hog marketing situation in our issue of November 30. Farm advisors, association officers and individual hog raisers uncorked the vials of their wrath and commenced a drive on the present unsatisfactory marketing methods by storming us with letters in which they unmuzzled their feelings in a rapid fire of 6-inch adjectives. Some roasted the packers to a fare-thee-well; others gave them credit for being almost human and expressed satisfaction with the way they were being treated.



Even the hogs themselves are so disgusted with present marketing methods that they are up in arms.

One Farm Bureau official, whose letter we shall give later, said: "Prof. Wickson's editorial and Mr. Whitten's article suggest what the hog producers hope ultimately to attain. In the meantime we must find a better way of marketing until the 'best way' is attained." But what will prove a better way? Several methods have already been tried, and it is a safe bet that in each case the originator felt sure that he had the ideal plan; yet when it was put in operation certain faults were discovered.

Later on we may want to make a few suggestions, but before doing so we would like to give, without much comment, several letters which have been received. They cover both sides of the case, and while perhaps no ideal plan has yet been outlined we are in hopes that these letters will lead to a further discussion of the problem which will result in a satisfactory solution. A dozen heads are better than one, and a hundred are better than a dozen. So we invite you all to join in this discussion.

BIFF! THE NAPA COUNTY SALE GETS HOT SHOTS.

First of all, as the letter from Farm Advisor Baade of Napa county, which started this rumpus, was aimed at the packers, we feel that we should start off with the reply which F. L. Washburn of the Western Meat Company desires to make through our columns. Here it is:

"I read with interest the article written by Mr. H. J. Baade, Farm Advisor of Napa county, regarding sale of hogs which he conducted on November 14.

"The marketing of hogs seems to be the subject of a great deal of discussion at the present time, and, in my opinion, the conclusion reached by Mr. Whitten is the clearest statement that has so far been made on this subject, viz.: that the disposal of hogs at public stockyards located in the principal market centers, San Francisco and Los Angeles, is the only logical and practical way to solve the problem, where all sales are made through the commission man or one equally qualified to sell the stock at its market value.

"The fall season of 1918 is the first where there has evidently been an earnest effort to turn off finished hogs, and I am free to say that never has the percentage of really good hogs been so high, many of the lots showing the evidence of improved breeding, especially as a result of the Bassett stock.

"The quality of the Napa hogs was good, so I was informed by Mr. W. W. Everett, who attended the sale and was much interested in its success, and who telephoned me after the first lot sold that there were none but local buyers represented. I told Mr. Everett that to show an interest in the sale he could put in a bid of $14.85 to $15 for us on all the good hogs that were for sale, but while he was phoning the hogs were hurriedly sold.

"In my opinion these hogs were sold at a little lower basis than our market, which at that time was 16½c delivered at our yards, but if the prices bid were not satisfactory it would have been an easy matter to have held the hogs over and made other disposition of them. In other words, the Farm Advisor should have in mind the delivered price then prevailing at primary markets.

"On this date our hog buyer was at Minturn, where he attended a sale and made no purchase, as we had hogs enough on hand to last through all of the following week, our supplies coming from many parts of the State and not entirely from the auction sales, and my offer to Mr. Everett was made with the idea of helping the sale instead of discouraging it.

"Our packing plant was badly disorganized all through the month of November and we were helpless to handle more hogs than we did, our feed bills on hogs that we were holding over being enormous. On Monday of this week we had over 4000 hogs on hand, some of which we will be obliged to hold over a week in our yards.

"There had been heavy declines in the Eastern market during October, but no change has been made in our offering price since November 1st, and never yet have we taken advantage of an opportunity to drop the market on a shipper who sent us his hogs in good faith that he would receive market price the day his hogs left the shipping point.

"As for Saturday being the wrong day of the week, I fail to see where this makes any difference. One day is as good as another, but it should be arranged so that auctions should not be held on same day at different points.

"Further, the shrinkage on hogs bought at auction sales is frequently excessive, sometimes running as high as 19 pounds per head on the general average.

"As I understand it, the price of 13c mentioned as being paid at the Napa sale was paid for only one hog—a very large sow—the bulk selling at from 14c to 14½. If the auctions are to be conducted on a basis of supply and demand, there is bound to be a wide difference in the prices paid when really no change has taken place at the primary markets.

"From the results of our pork business for the past ten years, I want to go on record that our work has been along pioneer lines, to induce the raising of hogs of sufficient number and good quality so that our requirements could be properly met. If we had been obliged to depend on the hog business solely, we would have dropped out long ago, and it has only been on diversified lines that our business has succeeded.

"A continuous effort on the part of producer, breeder of registered stock and packer is necessary for a proper mutual understanding of the different problems, and you can rest assured that the Western Meat Company will at all times do its part."

TROUBLE ON A NEW BATTLEFIELD.

Here endeth skirmish No. 1. The next battle takes us to Madera, where a Farm Bureau auction sale was held Monday, November 18, that at Napa being on the previous Saturday. A few days before the sale Farm Advisor E. F. Smyth learned that some of the packers did not plan on having direct representatives, and that a local buyer, Mr. Buckholz of Chowchilla, would represent several companies. So he wrote letters urging the packers to send salaried men to represent them, his reasons being:

"The local buyers have been accustomed to making money by buying hogs at the lowest price they

HARTSOOK
BIG TYPE
POLAND-CHINA HOGS

During the past two years I have been engaged in laying the foundation for high-class herds of Holstein cattle, Poland-China hogs and Toggenburg milk goats. In making my selections I have held closely to the highest standards of breed excellence. I have at no time permitted mere pedigree to influence my choice.

All who have inspected my herds have remarked on the uniformity, size and constitution noted. As to the lines of breeding represented there can be no improvement. It is with a real sense of pride that I make this initial announcement and I trust that all who are interested will visit my ranch and inspect my herds. My prices will be found very reasonable and I guarantee satisfaction.

can get them for and selling them at the highest price obtainable. The same result obtains, to a certain extent, in working on a commission. This system is not productive of satisfaction to the farmer, because in the long run he gets less for his product, is jockeyed against his neighbors and if caught in financial need is forced to market his produce at a sacrifice.

"The farmer is better satisfied because he feels that he is dealing directly with the larger companies—is therefore more apt to get the market price and is also getting closer to the ultimate consumer of his products. He is more content because he knows that by the auction sale method he is eliminating a portion of the numerous middlemen for whose service he otherwise has to pay. Those satisfactions stimulate the production of more and better pork, which the packing companies no doubt desire."

THE ENEMY EXPLAINS HIS POSITION.

As we have already brought the Western Meat Company into this controversy, we will quote from Mr. Washburn's reply to Mr. Smythe's letter:

"We want you to feel that the Western Meat Company is behind these sales, but you can readily understand that under the present conditions we cannot be as active at all the sales as we are at some. For instance, on the day at which your sale was held we had a full week's supply on hand, and you can well understand that we would not want to be feeding a large number of hogs any longer than necessary. I write this so that you will understand that a packer, such as ourselves, cannot always be in the market for all or even part of the hogs that are offered at every point.

"As far as Mr. Buckholz is concerned, he has shipped us a great many hogs, and as we have gotten almost our entire supplies from the shippers we naturally feel friendly toward them, and from what I can learn of the hog sales and the amount of overhead that they carry I believe that the hog man has been just as well off by selling to the dealers. I think also that this situation can be materially improved, for there is no reason why it should cost any more than $20 overhead to handle a car of hogs, as it certainly does not need a high-priced auctioneer, and the reduction of the overhead at the Farm Bureau sales would, I think, be one of the best methods of interesting the farmer in this method of marketing.

"The local buyers who have been shipping to us have to take their chances, and if anyone thinks that they have been making an unusual profit on their operations I believe he is very badly mistaken. The average shipper is very fortunate if he makes from $30 to $40 on a car, and in doing so he is taking all the chances of excessive shrinkage due to present poor railroad service, death, loss, etc.

"We will always be ready to give you a delivered price on your hogs, which you can hold in reserve, in case the prices that are bid at the auction are not satisfactory. The auction sales so far have been very uneven; that is, hogs have sold one day at considerably more than they were worth and on others at less, but this is something that is bound to arise in connection with a new business. We believe you are on the right track, and you can depend on the Western Meat Company to give these sales their very best support at all times, except in such cases as mentioned."

RESERVES BROUGHT INTO BATTLE.

But this letter did not satisfy Mr. Smythe, and he fired a broadside back at Mr. Washburn, extracts from which we give:

"A hog auction sale ordinarily costs not more than $50, including the auctioneer's wages. Divide this by five, the number of cars that we had at our sale, and you will see that the overhead expenses are about $10 per car. If, as you say, the buyer seldom makes more than $40, the difference here is $30 per car. Fifty cars a year times thirty dollars is $1,500, which is no small item in the pockets of the farmers of any locality. Moreover, in my estimation, the difference is double the above figures.

"You write that, as you have gotten almost your entire supply from the local buyers, you naturally feel friendly toward them. Don't you think that the producer should be your first consideration? The favoring of the middleman is never going to help the farmer. By dealing more directly with the producer you not only have a chance of giving him the benefits of price that usually fall to the middleman, but you leave a much greater opportunity of inducing him to continually work for high quality in his product.

"Whenever you want one or several cars of hogs, suppose you try the practice of informing us of your need, with the price you wish to pay. Through the Farm Bureau organization it is now possible for us to ship you within a week after notice. The hogs so shipped will be graded and stocked as for an auction sale. We are even willing to go a step further and by ear-tagging or marking the hogs hold each grower responsible for the quality of his hogs, thus guaranteeing you against loss from tuberculosis, etc., providing the difference in price warrants this extra work and care. Such a practice should result in a considerable saving and more satisfaction all around. You could then make complaints or suggestions directly to the man raising the hogs."

NEW PLAN FOR GOING OVER THE TOP.

But Mr. Smythe didn't stop after he had finished lambasting the packers. He got busy and formulated a new plan, which he expects to try out in January. It is as follows:

"Each man having hogs to market will bring them to the assembling point, where they will be graded into carload lots as at the auction sales.

"Each man will sign a statement at the scales swearing that his hogs have been without food of any kind, but clear water, for 12 hours. This will prevent the hard hogs carrying the soft. (No real man wants to live off his neighbors, and no man will take chances on the lot that would be his, if he signed a false statement.) The hogs will then be weighed and fed. The food will be provided by the Farm Bureau and pro-rated on the weight of the hogs. The hogs will be loaded and shipped in charge of a local man to the market from which we can get the highest bid, by mail or telegraph. We will simply notify the twenty or so large meat packing concerns in the State that we will have so many hogs for sale on such a date, for them to offer us a price on or before that date. The hogs will also be fed and watered on the train. Our shrinkage should be comparatively small. The returns will be pro-rated on the weights.

"To bring the system down to a still finer point, each man's hogs will be ear-tagged as soon as they are brought in and weighed. Then, if there is any condemnation, the owner of the hogs will stand it. This will enable the packing concerns to give a much better price, as they will be guaranteed against any loss.

"This method will give every man a square deal and I believe that every hog raiser will receive 2c a pound more for his hogs, the year around, than he now gets."

BATTLE WON IN NORTHERN CALIFORNIA.

Once more the scene changes. This time we take you up into Mendocino county, where a plan very similar to the one suggested by Mr Smythe has been tried out. It has given excellent satisfaction, and has put the local buyers in the obituary columns. J. G. Newman of Potter Valley describes the plan as follows:

"Our directors realized that the farmers were not receiving the prices they should have for a well-finished hog, and that often the man with the poorly finished stuff was receiving just as much as the growers selling stock in good mar-

EVERY HOG GUARANTEED TO PLEASE.

L. A. DENKER, - Saugus, Cal.

Livestock and Dairy Notes

Livestock breeders all over the State are invited to send on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

D. F. Conant of Rancho Santa Marguerita, Modesto, intends to sell all but 10 head of his well-known registered Jerseys.

While many Stanislaus dairymen sold their milking cows, it is noticed that they kept their best heifers, and soon they will be back in the game again.

The Food Administration has lifted its regulation on cream restricting the butterfat content to 20 per cent. So we can have nice, thick cream again.

A meeting of dairymen in Orange county has been called by the Farm Advisor to form a cow testing association and banish the boarders from the herds of that county.

Holsteins bought at the Tagus Ranch sale were widely scattered over the State. Many new herds will be started and many dairymen having grade stock will begin to change to purebreds.

J. J. Walters has purchased 50 acres of rich river bottom land near St. Helena, which he will seed to alfalfa. He has a few purebred Holsteins and is looking around for a few more good ones.

Four cars of California butter were recently shipped to New York. Three cars sold from 64c to 65½c—the limit allowed by the Food Administration for that class. One car scored 92 points and brought 68c and 68½c at wholesale.

A. A. Jenkins, the Tulare Jersey breeder, announces an official yearly record of 804 pounds butter made by his cow, Irene Cadora. Another cow made 603 pounds, and a heifer with first calf is expected to complete her year in January with over 600 pounds to her credit.

Tilly Alcartra, the greatest dairy cow in the world, owned by A. W. Morris & Sons, Woodland, will be one of the stellar attractions at the San Francisco Livestock Show, to be held February 8 to 16. She will complete her year on official test January 10 and is expected to make between 33,000 and 33,500 pounds.

W. J. Higdon of Tulare has recently sold registered Holstein bulls to A. E. Poston, Tulare; J. H. Harris, Tulare, and Hans Hansen, Tranquility. The latter bull was a son of Prince Riverside Walker. Mr. Poston bought at the recent Tulare sale several of the cows consigned by Mr. Higdon.

Swine and Swinemen.

R. C. Sturgeon of Tulare has sold a registered Duroc boar of Advancer breeding to McDowell & Kendall of Lemoore.

Fred Ross, the Poland-China breeder of Hanford, has sold a fine son of his noted herd boar, Rossmead Big Bob, to J. K. Macomber, Tipton.

H. C. Witherow of Live Oak made the following sales of registered Duroc-Jerseys last week: Service boar to F. E. Forderhase, Live Oak; bred gilts to R. C. Sexton, Live Oak, Manuel Foster, Live Oak, and Ed G. Skewes, Grass Valley.

The first prize carload of fat hogs, shown at the Liberty Fair by Donald Graham of Lancaster, was sold at auction to the Cudahy Packing Company for $20.50 per hundred—the highest price ever paid in California. But everybody who saw the hogs said they were worth it.

Llano Vista Ranch of Perris, breeders of the Hampshires that make "more pork at greater profit," had both the grand champion and the reserve champion boar at the Liberty Fair. They won three firsts and many other prizes.

Mark Bassett of Hanford made some great winnings at Los Angeles on the get of his great Poland-China herd boar, Model Fellow. Mr. Bassett's "advanced type" are big yet are smooth and have worlds of quality.

The swine exhibitors at the Liberty Fair were so well pleased with the treatment received from Walter T. Gatton, superintendent of the swine department, that they presented him with a sum of money as an expression of their appreciation.

Anchorage Farm, Orland, is doing a big business with come-back customers. For instance, E. H. Hale, Orland, bought a son of Star Leader last year, used him on his grade herd and got such fine results that he recently purchased eight fine registered Berkshire sows bred for spring farrow.

C. J. Gilbert of Lancaster has the great Hampshire boar, The Harvester, at the head of his herd and has added several prize winning sows, including Wavelet, first prize senior sow at Los Angeles; Mary Pickford, first prize aged sow at Sacramento, and Leading Wave 3rd, third prize aged sow at Los Angeles.

Donald Graham of Lancaster was offered $2,500 for his Liberty Fair junior and reserve grand champion boar, Orion's King Gano. It was the opinion of many that this wonderful boar should have been made grand champion. He is a typical Duroc of great stretch and good bone, has a strong back and a fine cherry red coat.

Fred Hartsook of Lankershim is justly proud of the fact that the Poland-Chinas in his herd won 50 per cent of all prizes at the State Fair, 90 per cent at Fresno, 95 per cent at Riverside, and it would require about a column to give all of his winnings at Los Angeles. His boar, I B A Wonder, was made grand champion.

W. D. Trewhitt of Hanford is determined to have the best Poland-China boars on the Coast and has purchased two new herd headers—Model Jones, by Big Jones, a son of the $6,600 Gerstdale Jones, from E. D. Frazier, Drexel, Mo., and Wonder Jones, out of a daughter of Gerstdale Jones, by the 1026-pound Big Long Wonder, from C. H. Porter, Eagle Grove, Ia.

Jack Borge of Los Banos reports heavy sales of registered Duroc-Jersey hogs. He has a large herd headed by Russell Orion Boy, a son of the Oregon champion of 1916, and mated to sows sired by the California champion of 1917. Mr. Borge will soon move to Dos Palos, where he has bought a farm and will have more room to take care of his rapidly growing business. He intends to show at the State Fair again next year.

The Farm Bureau Pig Clubs of Sutter county held their fall judging at Sutter City, Friday, December 13, at which 31 young Berkshire sows were shown. W. M. Carruthers judged the pigs from the standpoint of the breeder. Also prizes were given for the greatest gain in weight in a given time. A large crowd was in attendance and all were enthusiastic over the results. A young man by the name of Powell had the first prize pig.

Beef Cattle.

Al Knierr of Tipton is feeding 800 three- and four-year-old Durham and Hereford steers for marketing in May or earlier.

Thos. B. Dibblee Estate of Santa Barbara purchased two Shorthorn bulls at the Liberty Fair from Wm. Henn, Kansas City.

Carruthers Farms of Live Oak recently sold to Spencer Ranch Company of Cranmore, Sutter county, the year-old show Shorthorn bull, Live Oak Flash.

The Wyoming Hereford Corporation of Cheyenne, Wyo., made several sales at the Liberty Fair and booked several orders for future delivery.

We reported last week that Wm. Henn of Kansas City had sold five Hereford bulls from his show herd at the Liberty Fair to Diamond Bar Ranch, Spadra. Since then he has sold them two more bulls.

Paicines Ranch of Paicines has sold its entire herd of Shorthorns, except some young heifers, to Ed Cebrian of San Francisco. There were about 300 registered and 100 grade animals. Mr. Cebrian will put them on his coast ranch.

H. M. Barngrover of Santa Clara attended the Royal Livestock Show at Kansas City and bought at private treaty from Walter Yost, Kansas City, the yearling Hereford bull, Don Woodford, a grandson of Woodford, the noted bull owned by Col. Woodford of Kentucky. He will show this bull at San Francisco, together with an aged bull, several bull calves, three cows, two heifers and several heifer calves.

Sheep.

Many Nevada sheep herders were victims of the "flu" and many herds strayed over the hills and deserts and were lost or killed. It is estimated that the loss will reach $100,000.

Edward Bishop, prominent Shropshire breeder of San Francisco and San Ramon, died of the "flu" contracted while attending the International at Chicago. His death means a severe loss to the livestock industry of this State.

Ed Spear of St. Helena writes that on a recent trip over some of the big sheep ranges in the mountains between Anderson and Ukiah valleys he found the green feed looking exceptionally good for this time of the year.

The Imperial Valley Wool Growers' Association has petitioned the Supervisors to pass an ordinance taxing male dogs $5 and females $10. The sheep men claim that the losses from dogs are far greater than those from preying animals.

Livestock Miscellaneous.

The Voorman Company of Tyler Island, Sacramento county, received $5,000 from Miller & Lux for grazing privileges on 3000 acres of stubble field.

John Burrell of the Kings County Jack Ranch reports that the demand for jacks and jennets has been very heavy during the past year. He states that his sales on the Pacific Coast have amounted to over $50,000.

Murdo MacKenzie, former president of the American National Livestock Association, will become associated with Thomas E. Wilson, the packer, in a livestock advisory capacity to bring about a better understanding between producer and packer.

TO MAKE GOOD BUTTER.

Making good butter always pays. To tell a woman that she does not know how to make good butter is hazardous, yet it is true that a great many women do not, says W. B. Combs of the Missouri College of Agriculture. It is true that they churn their butter from cream, but in many cases the resulting product is far from desirable. They are satisfied with plain grease for the table. These same women protest when the market will not take their product at near the price of good butter. If they would take pains with their butter-making they would find a demand for their butter at full market price.

Here are a few suggestions such women probably overlook:

Use only slightly sour cream with a clean acid flavor, free from dirt and lumps of curd.

Pay strict attention to the temperature at which churning is done and use a temperature which will result in butter granules about the size of popcorn. If cream is too cold, the granules will be small and hard; if too warm, they will probably be large and soft. Take temperature with a thermometer.

Drain buttermilk well off of butter before washing, then pour in a dipper of water to rinse off the last of the buttermilk. Following this, add water for washing and give only enough washing to rid butter of buttermilk—six or eight revolutions, if a barrel churn.

Work salt into butter at the rate of three-fourths of an ounce to the pound. Work until water is expelled and butter appears waxy.

ABSORBINE
TRADE MARK REG. U.S. PAT. OFF.

Reduces Strained, Puffy Ankles, Lymphangitis, Poll Evil, Fistula, Boils, Swellings; Stops Lameness and allays pain. Heals Sores, Cuts, Bruises, Boot Chafes. It is a SAFE ANTISEPTIC AND GERMICIDE

1008 Eighth St., Main 431 Sacramento, Cal.

A MONSTER AUCTION SALE.

The present big demand for breeding stock of all kinds was conclusively shown at the monster auction sale at the Tagus Ranch last week. Dairy and beef cattle, swine and horses all were eagerly bid in at good prices.

On Tuesday 90 head of registered Holsteins were sold, bringing over $20,000. The herd sire, King Sadie Vale Rose, brought $500, and twin heifers, granddaughters of King Segis Pontiac, sold for $500 and $400 respectively. Practically all these purebred animals went into dairy herds of Tulare and neighboring counties, an indication that the dairymen of this section are building up their herds.

On Wednesday 200 purebred Duroc-Jerseys went through the auction ring like the proverbial greased pig, in less than five hours' actual selling time. They brought an average of over $50 per head for everything, including suckling pigs, runts and herd boars. Orion's Golden Colonel, the junior herd boar, brought the top price of the sale, $650, while California's Defender, junior champion at the P.-P. I. E., sold for $450. Both went to G. H. Emmons of San Francisco, who was the largest buyer. Crimson Beauty, a fine young sow, went to Harry Cope of Tulare for $500. T. J. Walker of San Fernando was a large buyer, securing some of the good ones. Several of the hog syndicates who are taking the investing public into partnership had representatives at the sale who bought lavishly.

The sale of the hogs was completed by 4 o'clock, and after that between 400 and 500 head of grade Angus and Shorthorn cows were sold in carload lots, bringing from $60 to $70 per head, although they were mostly very light and thin. A score of purebred Angus and Shorthorn bulls brought prices ranging from $100 to $360. On account of the demand manifested and the good prices received, Mr. Merritt decided to include in the sale the balance of the beef cattle on the ranch—some seven or eight hundred head—and it was arranged to extend the sale over Saturday and Sunday.

The sale of horses on Thursday was probably the most successful held on this Coast for many years. Seventeen registered stallions and seventeen registered mares, Percherons and Belgians, were sold. The top price was $2,100 for a Belgian stallion. One hundred head of graded mares, work horses and mules were also sold and brought satisfactory prices.

Friday was devoted to the sale of the ranch equipment, implements and machinery, of which there was such a quantity and variety that a good part of the 6000-acre ranch was used in its display.

The exact figures and total realized from the sale are not available at this writing, but it is estimated by C. L. Hughes, the sales manager, that receipts totaled approximately $150,000.

FIFTY HEAD of Angora goats for sale. Address F. W. Nason, Jamesburg, Monterey county, Cal.

Hog Syndicate or Hog Skin-dicate?

[Written for Pacific Rural Press.]

We read a little while ago of an automatic hog ranch where there were self-feeders, automatic waterers, automatic exercisers, self-oilers, self-cleaning feed troughs and everything so handy that a hog could almost bring himself up. About all the farmer had to do was to haul the hog to market and get his check.

But why bother having hogs on the ranch at all? Why put money into buildings and equipment, why do all the laborious work of feeding and caring for hogs, why run all the risks, when you can throw everything onto someone's else shoulders and still make even bigger profits than you could make on your own operations?

OPERATIONS OF THE HOG SYNDICATES.

Sure you can! If you don't believe it just write to some of the hog syndicates for their literature and read over their estimates—"estimates" is right. True, you have to pay a pretty big price for a grade sow—$150—but isn't it worth it to be relieved of all the bother and risk?

Think of it! The syndicate insures your sow, immunes her, breeds her, and feeds her and her offspring for a period of five years. You get one-half the offspring, which the syndicate markets for you free of charge, and at the end of five years your sow is sold and you get all she brings.

You run absolutely no risk—positively none. If the sow dies, the company replaces her. If she fails to have twelve pigs a year, she is replaced with one that does. You are not charged for any running expenses—the company pays for feed, labor and everything else out of the proceeds from its half of the offspring. In short, you furnish the sow and the company does the rest.

And those estimates of profits—oh, how alluring they are! They say that figures don't lie, but how some liars do figure! When the market price for hogs is 18½c, pork can be produced at 5½c per pound under these methods. And, conservatively of course, you should make $135 the first year on each sow purchased at $150—$607.50 in five years, plus whatever your sow brings. All you have to do is to sit back in your easy chair and, like cascarets, these hogs work for you while you sleep.

Can you beat it? As we heard it stated recently, "Pigs ain't just pigs any more; they're walking banks." But do we really want walking banks? Wouldn't stationary ones be better? Wouldn't it be sort of satisfying to know that no one was going to walk away with our hard-earned cash?

We are not telling all we know. We hope it won't be necessary, as we prefer to boost rather than knock. But theres' an old saying, "All is not gold that glitters," and we might coin a new one, "All is not hog that hollers." Or, if you like it better, "All is not profit that promises."

Look before you leap. Investigate thoroughly. Demand records of actual results, as well as estimates and promises. A successful record for say three years would be a good one to base your decision on. How many of these concerns can show such a record?

Look before you leap, and like as not you won't leap.

War Declared on Hog Marketing Methods

(Continued from page 693.)

ketable condition. In order to do away with this unfairness and to encourage the marketing of a better article, and also at a better price, the directors rolled up their sleeves and went into the fray.

"The marketing had all been done by local buyers, or middlemen. Sometimes there was competition among them, but more often it was 'take my price or keep your hogs.' These middlemen operated on a minimum margin of 2c. That is, for hard, grain-fed hogs, weighed at Ukiah, 2c under the prevailing market in San Francisco was paid, and, mind you, that was the minimum; the maximum often ran several cents above that.

"A livestock marketing committee was appointed, consisting of Farm Advisor C. S. Myszka and two directors. They considered the auction sale, but decided upon another method, which I shall try to explain. Let me say at the start that it was the co-operation of the Western Meat Company that made our method possible. This company agreed to keep every consignor's hogs separate, from the scales to the hook. In order to distinguish the hogs we used a tailor's scissors and clipped off slashes of hair in different places on the body of the hogs, also taking down the ear marks, if the hogs had any. In the company's yards each consignor's hogs were graded and weighed, the amount to be received by each one figured up, and the representative who accompanied the hogs to San Francisco was given a check for the carload or more which he brought in. On his return to Ukiah the check was then deposited with a local bank, which, after expenses were deducted, checked out the individual amounts.

"In order to know what we are accomplishing, we weigh each consignment separately in Ukiah and it is on these weights that expenses are figured, making it possible for the man with the good hog and the small shrinkage to profit thereby. Up to date we have shipped six carloads and have managed to save the producers money on every shipment, one carload returning $220 over the 2c margin. On our last shipment we received a premium on 50 head, and this was returned to the producer as an inducement to grow better hogs instead of making up for the fellow who had shipped an inferior article and had received more than was coming to him.

"Several days before shipping, the Western Meat Company quote us prices and we in return notify them of the number of carloads being shipped. The Farm Bureau charges one-half of 1 per cent with which to reimburse the consignor for dead or condemned hogs and any incidental expenses which may occur. Up to date we have had no condemned hogs or any dying in transit.

"In conclusion I will give an illustration of what the Farm Bureau is saving individual producers. One man marketed 30 head of hogs at two different times. Each time, before shipping with the Farm Bureau, he had a local buyer quote him a price. Then, taking that price on Ukiah weights and deducting it from what he actually received for his hogs through the Farm Bureau shipment, he was better than $75 to the good. Not an insignificant sum in these days of high prices for feed and labor."

HELP ASKED FROM THE ALLIES.

So there! We have received many more good letters, but we have given you plenty of food for thought for one week. Now what suggestions can you make? Don't forget our invitation for further discussion. But please get right down to brass tacks, and if you want to criticise make your criticisms constructive. Then, by getting a few good suggestions from your letter, a few more from another, and so on, perhaps we'll be able to combine all of them into a plan that will prove that "better way."

GIVE COWS PLENTY OF SALT.

Cows soon drop into a state of low vitality when not given the proper amount of salt. Recent results obtained by an experiment station showed that when cows were kept away from salt for a long time there was a breakdown in the animals, and their condition was serious. When salt was again supplied their recovery was rapid.

Common barrel salt has been found the best for cows. It should be supplied in a trough or box under shelter. Keep it where the cows can have access to it at all times. Some cows require more than others.

MORE BERKSHIRES ADDED TO CASTLEVIEW HERD.

When J. Francis O'Connor purchased almost the entire Frank Brush herd of Berkshires there was one sow in particular that he was very anxious to get, this being Riverby Princess, the grand champion sow at the National Swine Show. But he was not able to get her at the time, as she had been booked for a Sacramento banker at $600. However, through a misunderstanding, the deal fell through and Mr. O'Connor stretched himself for a long price and secured this wonderful animal.

The sow won in the under-six-months class at the P. P. I. E. and for the first time in Berkshire history a junior pig was made grand champion. Mr Brush purchased her at the public sale for $865 when she was under six months of age. And that the purchase was a wise one is proved by the fact that Mr. Brush realized more than $1,000 from one litter.

But this is not the only addition that Mr. O'Connor has recently made to his herd. He purchased the entire herd, of 49 head from A. W. Foster, including the Grand Lady Mayhews, the grand champion sow at the 1916 State Fair, which Mr. Foster purchased for $500 at the sale. Mr. O'Connor will retain this sow in his herd and perhaps a few others, but the balance will be used in supplying the very heavy demand that he is having for breeding stock. Most of the sows in the Foster herd were sired by Iowana Rival's Majestic, a boar purchased at the P. P. I. E. and pronounced by A. J. Lovejoy to be one of the greatest boars ever brought to California.

California Hog Book

"The Hog Dictionary"

Following is a letter received from W. F. Sandercock, carrying a fine endorsement of the "California Hog Book." Perhaps this book would be of equal value to you.

December 13, 1918.

Pacific Rural Press:

Gentlemen: I have thoroughly enjoyed and have derived much benefit from the California Hog Book, written by Mr. W. S. Guilford. I think it is the most thorough book I have ever read and we are using it on the Natomario Ranche as a "Hog Dictionary."

SANDERCOCK LAND CO.

The California Hog Book contains 250 pages, is fully illustrated, bound in cloth, price $2 postpaid.

Oak Knoll Farm an Ideal Hog Domicile

[Written for Pacific Rural Press.]

Highlander, the $1,000 grand champion Chester White at the State Fair last fall. Owned by Lea Bleakmore, Oak Knoll Farm, Lakeport.

If you have traveled about very much you have observed that most "great sights" are less impressive than expected. But you won't be disappointed if you tour up into Lake county and visit Oak Knoll farm at Lakeport. You will find one of the best equipped ranches in California, and you will see hogs raised in de luxe style.

The thing that will impress you most will not be the size of the ranch, even though it consists of 1600 acres and has a mile and a half frontage on Clear Lake. It will be the up-to-date buildings and equipment, and the systematic methods employed. For instanee, there is a central farrowing house, 175 feet long, with cement floor, electric lights and steam heat. A feed cart runs through the alley, and the troughs are hinged so that when empty they can be tipped toward the alley and flushed into a gutter. There is a deodorizing plant, and all partitions are movable so that everything can be cleaned out when desired.

As it is necessary for help to be with the sows at farrowing time, there are cooking and sleeping quarters in the farrowing house, and it is safe to say that few farm houses have better quarters than are here provided.

There is a mammoth feeding shed, so arranged that the hogs cannot crowd one another while eating. From it the hogs may be turned into any one of several fields which surround it. In these fields clover grows bush-high and furnishes wonderful feed. In addition to this roughage the hogs—that is, the market hogs—are fed corn that is soaked in skim milk and cooked. A herd of cows is maintained to furnish the skim milk.

Mr. Lea Bleakmore, owner of this ranch, came in the limelight of the swine world when he purchased at the State Fair last September the grand champion Chester White boar, Highlander, paying $1,000 for him. The price seemed high, but a good judge of hogs can tell from the accompanying illustration that the boar has outstanding quality, and he has been doing such good work in the Oak Knoll that he will quickly pay for himself.

Mr. Bleakmore maintains a herd of 200 brood sows. He has found a heavy demand for sows and gilts bred to Highlander for spring farrow, and is already booking orders for spring pigs sired by this great boar.

Great Interest in San Francisco Show

[Written for Pacific Rural Press.]

When the California International Livestock Show opens its gates February 8 its capacity will be taxed to the utmost to accommodate the many breeders who desire to exhibit. Very few entries made for the former date have been cancelled, and in some cases additions have been made to the original entries. Also, Oregon and Washington will be better represented, as already several breeders from those States have signified their intentions to show.

Manager Joseph E. Painter, who recently returned from an extensive Eastern trip, during which he took in the Royal and International shows, reports that a wonderful interest seems to have been awakened among the Rocky Mountain and Corn Belt breeders, and that several of the most prominent ones will bring their herds out here. There is now a harmonious working agreement between the San Francisco and Denver shows, which will result in securing many of the herds that will be exhibited there—probably enough to warrant a special train.

The secretaries of the Hereford, Shorthorn and Angus breed associations have agreed to do everything in their power to further the interests of their breeds, and in some cases probably more money will be added to that already appropriated, in order to get better herds.

One of the features will be the sale of Hereford and Shorthorn cattle during the show week. It is expected that several animals of merit belonging to Eastern breeders will be entered. In addition to these individual sales there will be offered several carloads of breeding bulls for range purposes entered in competition at the show. This will afford the range cattlemen of California a splendid opportunity to purchase these animals at home at about the time they are needed for range use.

The noted Swift six-horse team of dapple grays, which have been such a wonderful attraction at the Chicago and Denver shows, will be a feature each evening and will be seen for the first time on the Pacific Coast.

While the entries will remain open until the middle of January, it is highly advisable that those expecting to exhibit make their entries at the earliest possible date, for probably before the final closing many will have to be refused on account of lack of space. The space, although seemingly large, will be taxed to its utmost, and when every stall is applied for it will not be possible to make any additional room.

DAIRY ASSOCIATION PROGRESS.

"Irresistible progress" would be a pretty good description of the condition of the "Milk Producers' Association of Central California" which has about 1800 members in eastern Stanislaus, San Joaquin, Santa Clara, Alameda, and Contra Costa counties. The Modesto Creamery, which the Association bought and started to operate May 1, 1918, is now producing 9,000 to 10,000 pounds of butter per day, according to general manager Lowell Gum. A new factory to make milk sugar, cheese, and casein is being built in Modesto and will be ready for operation about January 15. The Association controls about 90 per cent of all the whole milk that goes into the East Bay cities by means of its contracts with dealers. About 2,000 pounds of butter per day are being made at the Valley Creamery of Stockton, which the Association bought September 1, 1918. The policy, as outlined by Mr. Gum, is to pay competitive prices for cream and milk and then distribute the profits in the form of dividends to members. Dairymen join by paying 50 cents per cow at once and $2.25 per year per cow for two years.

SHEEP FOR PROFIT'S SAKE.

A good ewe will give more milk for the feed consumed than the best dairy cow.

Her milk fed to lambs will produce more income per gallon than cow's milk sold in the can or made into butter.

The lambs do their own milking; the cows have to be milked by high-priced help.

The ewe has a fleece; the cow has not.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

SOME RABBIT LORE.

We always associate the word rabbit with productiveness and prolific abundance. In the animal line the rabbit does live up to our ideas, when given proper care and feed. Many people feed rabbits so entirely wrong that the death rate of the young is enormous, simply because of wrong feeding and unsanitary conditions. Piling one hutch on top of another, several tiers high, is, according to a U. S. Bulletin, the cause of most of the contagious diseases with which rabbits are afflicted. I have had two inquiries just lately, asking if alfalfa meal was not as good as the alfalfa hay or alfalfa itself?

I am sure if those who are feeding rabbits will take time to observe the animals they will agree that I am right—dry alfalfa meal, while it contains all the nutriment of alfalfa hay, is always dusty. Now then, the rabbit must chew its food and if it chews the dry alfalfa some of the dust is going to irritate the throat and lining of the air passages, because as the rabbit gathers the food into its mouth it cannot moisten the meal fast enough to gratify its hunger unless it is fed very often, and it just gobbles it up and rolls it around to moisten it as fast as possible. If the alfalfa meal is moistened, there is not enough chewing service and it will be bolted in chunks and then the digestive tract will be irritated. Another big mistake is made by feeding dry feed for a few days and then wet feed. The digestive organs of animals are not capable of adapting themselves to sudden changes, and this changing around always makes for trouble.

Baby rabbits are delicate little creatures and need to be let alone for the first few days to the care of the mother. When a doe kills her young, the cause may often be found to be too much excitement, too many visitors inspecting the nest and handing the babies around for inspection. Unless the doe is very gentle, she resents this and kills one or more in her excitement. Still another cause of mortality among young rabbits is wet and dirty nests. If nests are not well covered, rain is likely to beat in. In such case the litter should be changed and the nest box aired and dried.

When the young get about three weeks old they will commence to nibble and from then on there should be no stint to the feed if you want them to grow. I have found out from a prominent breeder, who makes money with rabbits, that he feeds his young rabbits green feed, such as alfalfa, but he takes pains to have it free from superfluous moisture on the outside. Then he feeds sprouted oats twice a day and he says the youngsters grow like weeds. Of this I have no doubt, for I know wild rabbits always prefer the oat field. Always keep a little piece of rock salt where they can lick it. Keep quarters clean and feed regularly and the mortality of young rabbits will not be any greater than in other young animal life.

Rabbits are profitable things to have in these days and no breeder can afford to starve them, but feed so as to keep them growing.

LARGE AND SMALL BREEDS.

I noticed the Eastern poultry journals did not think very much about Edward Brown's poultry talks—too much economy in it and too much talk about the heavy breeds. Well, that is foolish of them, because we do need poultry meat just as much as we need eggs, and all the talking one man or a dozen men can do will never harm the White Leghorn. It has won its way into the hearts of men and women who want to keep poultry in big flocks, it bears confinement well and adapts itself to any and all conditions it is placed in and does its best. Which means that where lots of chickens would give up and die the White Leghorn will keep trying to make the most out of nothing. If there is anything to eat in the country, it can't be put too high for a Leghorn to reach it with clipped wings, and it can't be so hot that, once having searched and found it, Mr. Leghorn will drop it anywhere but down its gullet.

MEDIUM-SIZED BREEDS MAKE GOOD.

The work of the world is done by the army of small to medium sized men and women, and the bulk of the poultry produce is from the small to medium sized breeds. Mr. Brown could no more harm them by advocating table poultry than he could put the army of small men out of work. What the occasion calls for is enough of both kinds. Yet the farmer with land can raise the large breeds to better advantage than the man cramped for room, and the latter can keep more Leghorns in a given space than he can other breeds, so what is there to quarrel about. I talk large breeds more than small ones because I am talking to men with room to accommodate the large or medium breeds, men who can let them run while they grow bone and muscle and can then finish them off in proper style. I have seen men with fifty Leghorns buying their feed in paper sacks. The man with land would not think of doing that. Paper sack purchases mount up pretty high, but the purchaser pays out in little sums so does not miss it at the time. It's on a par with thrift stamps. If a man can raise a score or two of chickens out of his wage earnings, he is so much ahead anyway, and while some of us may be inclined to laugh I have done so myself, but felt ashamed after. Why, the spirit of thrift is always commendable and should be encouraged.

BLUE ANDALUSIANS ALWAYS CROSS-BREEDS.

To the Editor: In the Rural Press there was a question about Blue Andalusian fowls not breeding true to color, and the answer seemed a little incomplete. I think you will find the following the correct explanation: These fowls provide one of the most striking illustrations known of the famous Mendelian law of breeding, or of transmission of characteristics. Actually the Blue Andalusian is not, scientifically speaking, a pure breed, but a cross of two breeds of fowls, one black, another white. Just as lampblack mixed with white lead will make a slate color, so the cross of Black Andalusians and White Andalusians will gave a slate colored offspring. So Black Andalusians bred to Blacks will give Blacks always; White bred to White will give White, and only that, for generations untold, save as they do not come true to type; but Blue bred to Blue will carry in it never the blue as a distinct color, but only as a mixture of black and white, and for a good part of the time the offspring will come either pure white or pure black. Without going into the theory of the law, it is sufficient to say that the average colors of fowls resulting from matings between blue fowls would be one White Andalusian, as white in nature as if all his ancestors had been white; two blue fowls; and one black fowl, as black in nature as if all of his ancestors had been black.

So, in breeding Andalusians, blue fowls are always cross-breeds as far as color is concerned, no matter if all their ancestors for ten generations were blue, and their offspring will be both white, black and blue. However, black bred to white will always give blue, while blue bred to either black or white will give partly blue, partly the other color. For the explanation of this see the explanation of the Mendelian law. The facts, however, are as stated.

The red, white and roan of Shorthorn cattle run somewhat, but not altogether, similar to this, the red and white corresponding to the separate breeds, and the roan to a merging of the others.—Agricola, Exeter.

BEST TURKEY BREEDS.

To the Editor: What breed of turkeys is the largest and easiest to raise, and least liable to disease? Also, will you point out the essential differences between the Mammoth Bronze, Golden Bronze and Bourbon Reds?—S. S., San Luis Obispo, Cal.

There are, in all, eight varieties of turkeys: Bronze, Narragansett, Buff, Slate, White, Black, Bourbon Red and the Wild Turkey. The Bronze is the largest of all varieties and the Narragansett the next. Thirty years ago I had the Narragansett and I never had a sick turkey. They are particularly healthy and are prolific. They are very full breasted and are a little more compact than the Bronze. Standard weight of male is 20 to 30 pounds, for females 12 to 18 pounds. This variety is popular in the New England States, but very rare in California. Here the most popular is the Bronze, and, if properly bred and raised, they are hard to beat. If I were going into turkeys, one of these two would be my choice for commercial purposes.

HOT AIR

is great stuff coming up from the furnace, but it doesn't get you much of anywhere in the poultry business. Profitable results come from having experience, good judgment, and work. Don't let the experience cost you too much—there's where good judgment comes in. How about buying chicks? Are you influenced by big claims, deluxe adjectives, exorbitant egg yields, high prices, cheap prices? Call on your good judgment again. Remember that humbug loves a sucker. Play safe. Investigate when you can. Will you risk a card and send for our circular?

• • • • • •

We hatch White, Brown, and Buff Leghorns, R. I. Reds, Barred and White Rocks, Black Minorcas. Capacity 12,000 weekly. Quality of breeding stock and chicks will please you; as will also the price and service. You can order a score, or thousands—safe delivery guaranteed and preferred pens quoted when requested.

BREEDING COCKERELS FOR SALE.
The Mission Hatchery, Box 17, Campbell, Calif.

GIANT BRONZE TURKEYS—Gold Nugget Strain. Prove their superiority by winning Gold Special Sweepstakes for best turkeys at the following great shows: Arizona State Fair, 1916; Texas State Fair, 1917; California State Fair, 1917-1918; Los Angeles Show 1917-1918; Pacific Coast Land and Industrial Exposition Oakland 1918. An illustrated record. Large turkeys can be raised at practically the same cost as small ones. Toms for sale that will increase size and improve any flock. I am the originator of the Gold Nugget Strain. J. Will Blackman, 607 East Third St., Los Angeles, Cal.

BABY CHICKS—We specialize this season on money making White Leghorns—hatching from stock with high records that are unimpeachable. Also Brown Leghorns, Anconas, Minorcas, Rocks, Reds, Orpingtons and White Wyandottes. Especially interesting circular with prices ist ready January 1st. B. W. Archibald, Soquel, Santa Cruz Co., Cal.

PLACE ORDERS EARLY for chicks with the Madera Hatchery, Madera, Cal.

OUR 200-290 EGG Leghorns, Anconas, Reds, Rocks, Minorcas, Wyandottes, Orpingtons, Ducks, clear $5 for customers now. Breeders, pullets, chicks. Half booked for January, February, March delivery, last year's prices. Many repeat orders. 30,000 capacity hatcheries full now. J. Beeson, Pasadena, Cal.

PEERLESS WHITE WYANDOTTES—Our 200-egg strain, bred for years for show qualities and high egg production. 50 cockerels, 100 pullets for sale. Trios and mated yards. Eggs for hatching. Catalogue free. J. W. Atkinson, Box B, 130 Willard St., San Jose, Cal.

LARM'S REDS—Larm's strain, Rhode Island Reds, single and rose comb hatching eggs from 220 egg record layers. Breeding pens. Cockerels. First prize winners in leading California shows. Wm. Larm, 3915 Thirty-ninth avenue, Fruitvale, Cal.

EASTERN BRED Mammoth Bronze Turkeys. Being sure my birds will give the usual satisfaction, I guarantee them to be as I represent. If not, return at once C. O. D. R. M. Dodge, Stafford Farm, R. D. 2, Box 129, Bakersfield, Cal.

BABY CHICKS—Ready in January. Order early and get the date you want. White and Brown Leghorns, Black Minorcas, R. I. Reds, Barred Rocks. Safe delivery guaranteed. Write for circular. Stubble Poultry Ranch and Hatchery, Palo Alto, Calif.

WE ARE READY to book orders for baby chicks from seven different breeds. Stock well mated up and well cross-mated. Advance orders receive best attention. Santa Clara Valley Hatchery, Lincoln Ave., San Jose, Cal. Joseph A. Bihn, Prop.

BRONZE TURKEYS—Young toms and hens for sale; also yearling hens. Order breeding toms now and have them shipped when wanted. Eggs in season. Albert M. Hart, Clements, Cal.

BABY CHICKS—Hatched from our own stock in our own hatchery. Hens are of S. C. White Leghorn utility stock, bred for commercial laying. H. A. George, Route 2, Box 29, Petaluma.

BABY CHIX—R. I. Reds my specialty. The best pays. Bred for eggs, color, size. Hens on free range. January deliveries 17c each; 16c in 1000 lots. Denton Poultry Yards, Box 360, Campbell, Cal.

BABY CHICKS (White Leghorns) shipped on approval before remitting. No weak ones charged for. Schellville Hatchery, Schellville, Cal.

FOR SALE — $38.50 Kreisky oil-burning brooder stove. Never used. Successfully broods seventeen hundred chicks. Bargain, $25. H. W. Fitting, Livermore, Cal.

MAMMOTH BRONZE TURKEY TOMS and hens for sale. Order now before prices advance. Also Collie dogs for herding. John G. Moe, St. Helena, Cal.

BABY CHICKS—Booking orders for spring deliveries. White and Brown Leghorns, Rhode Island Reds, Barred Rocks. E. W. Ohlen, Campbell, Cal.

MAMMOTH BRONZE show and breeding toms. Big, heavy-boned, good color. Eastern blood. $10 and $15. H. G. Stevenson, Jr., Winters, Cal.

CHICKENS, DUCKS, GEESE, GUINEAS, Pea Fowl, Pigeons. Wm. A. French, 545 W. Park St., Stockton, Cal. Stamps.

FOR SALE—MAMMOTH BRONZE TURKEYS—The best in the West. Geo. A. Smith & Son, Corcoran, Cal.

WHITE LEGHORN BABY CHIX from heavy laying (Hogan-ized) stock $15 per 100. We guarantee safe arrival. The Pioneer Hatchery, 408 Sixth street, Petaluma, Cal.

EASTMAN'S BRED-TO-LAY Hogan-ized and trap-nested Barred Plymouth Rocks. January chicks. Eggs. Cockerels. Fairmead Poultry Farm, Fairmead, Cal.

MODEL POULTRY FARM—White Leghorn specialists. Our fifteenth year. Baby chix and hatching eggs for sale. Also first-class breeding cockerels. Our prices are right. W. C. Smith, Penn Corners, Cal.

BARRED PLYMOUTH ROCKS—Winners at leading shows and wonderful layers. Choice stock for sale. "Nothing better in poultry." Catalog free. Chas. H. Vedden, Box 396, Los Gatos, Cal.

BUFF ORPINGTONS, BUFF DUCKS, BOURBON RED TURKEYS—The Ferris Ranch, R. 2, B. 144D, Pomona, Cal.

WHITE WYANDOTTES—Purebred vigorous breeding cockerels and hens for sale. R. W. Stawetaki, Route B, San Jose, Cal.

FOR SALE—Golden Bronze turkeys. Big boned breeding toms of America's best strain. Eggs in season. M. M. Reiman, Planada, Cal.

THE WAR IS OVER

BUT THE FOOD SCARCITY
IS GREATER THAN EVER

What will You Plant Next Year?

You must soon decide upon your next garden and field crops, and the best guide at this time is the latest edition of

California Vegetables, in Garden and Field

BY E. J. WICKSON

The long winter evenings are with us—why not take the opportunity to study up the best way to grow and make the most out of your soil? Whether you wish to produce beans, beets, potatoes, celery, cucumbers, corn, melons, onions, tomatoes, rhubarb, squashes, turnips—or any garden or field crop—you need this book. It is a handsome volume of over 300 pages, well illustrated, bound in cloth, and will be sent to your address for $2 per copy postpaid.

Make yourself a Christmas present—you will get an enjoyable, an interesting and a practical book.

COUNTRY LANDS.

I HAVE 10,000 ACRES of good land ready for development, and am looking for a partner or associate to put in the money necessary to develop it. It is all level, deep sandy loam; average rainfall eighteen inches; two railroads across it; good climate, in California. Tract was acquired many years ago when raw and inaccessible. Now it has railroad facilities, and irrigation water is coming. Much of it is available for wheat and barley, considerable can be put in alfalfa, and all of it some time in the future will subdivide for small fruit and dairy ranches. Can be devoted advantageously to stock raising, as it commands extensive free range in adjacent hills. I have had many years experience in real estate, and picked this for my own money, but now when it calls for development, I lack the ready money for that purpose. If I can find the right kind of a partner to put in the necessary capital, I will give him a ground-floor chance. It will take $50,000 to pay off debts, and should have a fund of as much more for development. Interview and particulars to bona fide prospects. Address "Owner," Pacific Rural Press.

AN INCOME ORCHARD of 16½ acres, one mile from town, on West 1st St., Napa, with three of the best fruits grown, mixed varieties of cherries—Tartarians, Bings, Royal Ann—prunes and Bartlett pears; the land is A-1; house of 5 rooms, bath, patent toilet, with sewer to creek; large barn garage, windmill; also pumping plant run by motor; all building electrically equipped; about 1-3 down, balance on time. For full particulars address A. G. Inman, P. O. Box 35, Napa, or call No. 83 N. Main street.

FOR LEASE—SUMMER SHEEP RANGE—Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the Diamond Match Company, Grazing Dept., Chico, California.

FOR SALE OR TRADE—Fourteen acres of highly improved land in the city of Brawley. Six-room modern bungalow. Fruit trees of all kinds. Could be subdivided. Value fifteen thousand. Mrs. D. L. Boyd, Brawley, Imperial Co., Cal.

FOR SALE OR EXCHANGE—40 or 80 acres. Would trade for registered Shorthorn cattle. Address: J. S. Fry, Chowchilla, Cal.

WANT SMALL RANCH for general farming. Give price, description, location. Box 1340, Pacific Rural Press.

SEEDS AND PLANTS.

ATTENTION—In order to introduce our Sweet Spanish Onions, we will sell a few pounds of seed in small packages. The onion from this seed is mild and sweet and has no equal. Packages 30c. Seed guaranteed. Orders filled as they come in. Plant December, January, and February. Kirkpatrick-Thompson, Sweet Spanish Onion Industry of California, 667 Eighth St., Riverside, Cal.

BUDDED AVOCADOS—Fuerte, Sharpless, Lyon, Dickinson, Blakeman, Puebla, Spinks, Taft Linda, Rey, Queen, Knight, and others. A fine stock of field-grown trees, $2.50 for one. $2.00 each by the 100. 25c per tree for packing. Newbery-Sherlock, 2202 East Colorado St., Pasadena.

TO THE TRADE—Buy almond trees from an almond specialist. 100,000 almond trees on bitter almond roots, standard varieties. Car load lots solicited. Write for prices. W. T. Hohenshell, Le Grand Nurseries, Le Grand, Cal.

PLUM STOCK (P. D.)—Immune to crown gall and black knot. Tested by State Pathological Laboratory of Whittier. Unites perfectly with prune, plum, peach, almond, apricot, and nectarine. Worth investigating. Tribble Bros., Elk Grove, Cal.

HORSE BEANS FOR SALE—Medium size. Takes about 20 lbs. to the acre for plowing under for cover crop. Makes more foliage than the larger beans. Address J. C. Stahlman, Rt. 1, Box 460, San Jose.

BERRY PLANTS—Burbank Phenomenal berry, Blackberry, Loganberry, Raspberry, Strawberry, Currants, and Gooseberry. Ready now. M. J. Moniz, Berry Specialist, Sebastopol, Cal.

TREES—Bartlett Pears on Japan root. Fine trees with excellent root system. Write for prices. White Ranch Nurseries, H. J. Carse, Mgr., Peardale, Nevada Co., Cal.

A FEW SACKS Honey Sorghum seed. Greatest quantity, best quality silage ever grown—20 cents. Imperial Seed House, El Centro, Cal.

ASPARAGUS ROOTS—We have many thousand Connovers, Colossal, and Mammoth White roots. Low wholesale prices. Stanislaus Nursery Co., Modesto, Cal.

FOR SALE—Walnut grafting wood, selected Franquette, Mayette, Eureka, and Payne varieties—5c foot. Bowman, Kuhn Ranch, San Jose, Cal.

TREES, TREES, TREES.
No war prices.
Cash Nurseries, Sebastopol, Cal.

BEET SEED—Golden Tankard for sale—35c in small lots; 10 lbs. or more, 30c. C. E. Leek, Hopland, Cal.

PAYNE WALNUT GRAFTING WOOD—Order now. W. H. Ward, Morgan Hill, Cal.

AMERICANIZATION OF GERMAN SONGBIRD INDUSTRY.

As successor to the famous songbirds of Wilhelm's former land has come a college-educated bird raised in the academic atmosphere of Berkeley.

Once again has Berkeley scored in putting down the kaiser and once again has she launched a new American enterprise on the ashes of Germany's defeat.

A. H. Hasseler, native of Germany, but now a staunch American citizen, who resides in Berkeley, has the distinction of probably having the largest collection of famous German Rollers in the United States. But Hasseler refuses to have his birds associated with any reminder of "kultur" and has rechristened them "California Rollers."

NOT HYPHENATED.

"They're all American, my birds are," declared Hasseler. "More than that, too, the German Roller as raised in Germany is like a vaudeville performer compared to a grand opera star. That's what California and America have done for the birds."

Fifteen years ago Hasseler started to this country from Germany with three pairs of German Rollers owned by his father, a dealer in birds. Today he has nearly seventy, while several weeks ago he had more than 150. In the spring he expects to have between four and five hundred tiny singers.

"Thousands of Rollers have been sacrificed by Germany in the war and there are practically none left of the famous songbirds there," Hasseler declares. "America can now step in and take away from Germany an industry that has always been considered essentially German.

"Germany sent her Rollers to the front line trenches to be used in giving warning of gas attacks and thousands of the little singers gave their lives in order that soldiers might be saved, for as soon as they dropped to the ground they gave a silent signal for donning gas masks."

SENT TO AMERICA.

Heretofore, Hasseler states, more than 1,000,000 German birds came to this country every Christmas to supply the demand for the singers as Yule-tide gifts. This country, he declares, received only the inferior birds, however. "So great was the demand for them that dealers in birds found a ready market for them anywhere and they sent on only those they didn't want there," he said. "The best singers remained in Germany."

German dealers in canaries maintained regular testing rooms, according to Hasseler, similar to those used in trying phonograph records. As soon as a bird showed a shrill note he was put to one side for the American trade. The others were kept in Germany.

As evidence of what Berkeley's academic atmosphere can do for members of the bird family, Hasseler has trained his singers in following opera gems. As a rule, he declares, the birds object to anything but the classics played in the softest tones, a noisy phonograph selection bringing a bedlam of objections. One less highbrow of the canary family has chosen the "Missouri Waltz" as his favorite selection and whistles through the entire melody.

ONE-TONE SINGERS.

Hasseler is training his birds to be one-tone singers and is developing bassos, contraltos and sopranos, with still others emulating the flute, saxophone and similar soft-toned orchestral instruments. Also he has proved a second Ponce de Leon. Instead of the scant two or three years Rollers have heretofore retained the glory of their voices, Hasseler has birds who have been singing continuously for twelve years.

It took more than 200 years from the time the first Rollers were captured on Canary Islands in 1600 by German skippers to develop them into domestic birds, while Hasseler declares that perfection is far from reached in their present musical education.

TURKEYS HAVE LIVER TROUBLE.

To the Editor: A number of my turkeys are affected with liver trouble, from which some have died. The liver is about twice its natural size, is brittle and covered with yellow spots. The droppings are yellow and stringy. When sickness is first noticed the birds are thirsty and eat nothing. They have free range and are fed a little barley twice a day.—Subscriber, Paicines, Cal.

Give the whole flock a physic of either castor oil or sulphate of magnesia in a little mash at night. Next morning put 15 drops of tincture of nux vomica in every quart of water you serve, second day lower it to 10 drops to a quart of water. Keep this up until improvement sets in. Cause is improper feeding—not enough green feed—added to perhaps a little cold. If the trouble had been noticed at first, it was simply a case of indigestion.

BARGAINS in Bartlett pear. Address L. J. Eachus, Lakeport, Lake county, Cal., Oak Mound Nursery.

WALNUT TREES—Placentia and Eureka on black root. La Puenta Walnut Nurseries, Puente, Cal. Phone 103.

WANTED.

FARM MANAGER WANTS POSITION—Can convince you that I have experience in details, also executive ability in farm business and crop management. I can make your farm pay if it involves the following operations: Dairying of any type; hog raising; irrigation; land levelings; general croppings, i. e., alfalfa, all small grains, cotton, and rice. Must see your ranch and agree on policies before engagement. Box 1320, Pacific Rural Press.

WANTED—Position as superintendent or foreman on big ranch—hay or grain, fruit farm or asparagus. Understand also drying and curing and packing of fruit. Can give good references. Box 1330, Pacific Rural Press.

ALL-AROUND RANCH SUPERINTENDENT—Will be open for position January 15. Experienced handling orchards, alfalfa, and general farming. Best of references. C. E. Buck, Rt. A, Box 122, Modesto, Cal.

Make Poultry Pay

One of our subscribers was completely disgusted with poultry raising. Every morning forty of his hens would brag about what they were going to do, but at night he would find that only about eight had laid. The rest had simply lied.

So he bought a copy of our poultry book and in less than two weeks his hens had quit lying and gone to laying. They were shelling out enough extra eggs to pay for the book in less than two days.

California Poultry Practice Tells How

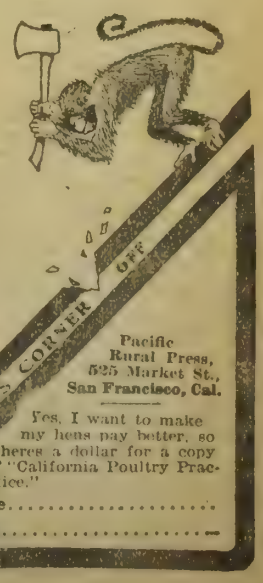
This great book will do as much for you. It was written by a Californian for Californians. The author, Mrs. Susan Swaysgood, after years of successful experience, has succeeded in showing the farmer how to make poultry raising more profitable. She knows what to tell and how to tell it. She deals out hard-headed poultry sense and still has every paragraph full of snap and sparkle.

The book deals with actual conditions—not theories—and covers every phase of the industry. It gives advice about location, buildings, equipment, choice of breeds, best way to begin, how to select stock, etc. There are valuable instructions for incubating, brooding, culling, feeding, breeding for heavy laying, showing, treating diseases, marketing products, etc. You will find everything necessary to insure your success.

Now Is the Time to Start

Never was there a better time to take up poultry raising in earnest. The nation's supply of meat animals is not keeping pace with the increase in population, and the people must turn to poultry raisers for nitrogenous foods. Eggs will be the cheapest concentrates, and table fowls the cheapest meat.

A golden market awaits all poultry products here on the coast, where we don't even produce enough to supply the local demand. As a government expert puts it: "The Pacific Coast offers a wider and more inviting field for future development in poultry raising than any other section of the United States."



Costs Only a Dollar

But play safe. Start right by getting this book and following the methods which have already proved successful. It will cost you only a dollar; you would not sell it for ten.

Send Coupon Today

THE HOME CIRCLE

The Bells on Christmas Day

I heard the bells on Christmas Day
Their old familiar carols play,
And wild and sweet
The words repeat,
Of "Peace on earth, good-will to men!"

And thought how, as the day had come,
The belfries of all Christendom
Had rolled along
The unbroken song,
Of "Peace on earth, good-will to men!"

Till ringing, singing on its way,
The world revolved from night to day,—
A voice, a chime,
A chant sublime,
Of "Peace on earth, good-will to men!"

And in despair I bowed my head;
"There is no peace on earth," I said,
"For hate is strong
And mocks the song
Of peace on earth, good-will to men!"

Then pealed the bells more loud and deep:
"God is not dead; nor doth he sleep!
The wrong shall fail,
The right prevail,
With peace on earth, good-will to men!"

—Henry Wadsworth Longfellow.

When Santa Claus Was Little

Haven't you always thought of Santa Claus as being, in his first years, a chubby, roly-poly, red-cheeked youngster? That is the way I've always pictured him. But, do you know, we were both entirely mistaken!

You look a little doubtful, and I can understand that; but let me tell you the true story, as I heard it from Mr. North Wind.

The way I happened to hear the story was this:

I was walking, one day in late December, along a stretch of country road, on my way to Greenwood Farm to buy ducks. I had two miles to go, so, to amuse myself, fell to making a few tardy plans for Christmas.

After I had arranged just what to give Betty and her brothers and sisters, and Barbara and her brothers and sisters, I thought next of Cecily. I am especially fond of Cecily, and so wanted to think very hard about her gift. In order to do this I sat down for a few minutes on an old tree stump beside the road.

Pretty soon I heard a chickadee. I whistled, and he answered. I whistled again; but this time he was suspicious, and made no reply. The third time, however, he had made up his mind to be friendly. Between the chickadee and thoughts of Cecily's present I might have been late indeed at Greenwood Farm had not some one luckily brought me to my feet.

I had just exclaimed aloud: "I know what I'll do! I'll paint her a picture of Santa Claus as a little boy—round, red cheeks, laughing face"—

"He wasn't a bit like that!" came a clear, piercing voice. At the same moment an icy blast made me spring from the stump, and step briskly forward on my way.

It was Mr. North Wind who had spoken, and he now kept me company, as he continued: "I'm glad I have a chance to put somebody right on that point. No, you may believe me or not, but Santa Claus, up to seven years old, was a very different child from your idea of him. Pale—peevish"—

"What?" I cried.

"Pale, peevish," shrilled Mr. North Wind in my startled ear, "by no means a favorite."

"You amaze me!" said I, "but when he was seven?"

"I will tell you all about it," said Mr. North Wind. "Santa Claus was an only child, and his mother was forever afraid of his catching cold, so she kept him indoors a great deal."

"Enough to ruin any child's disposition!" cried I, indignantly; for you may be sure I was going to stand by Santa Claus through thick and thin.

"True," said Mr. North Wind, "and that boy was a caution! At breakfast he wanted the thickest part of the cream. If a playmate came to see him, he shared his toys very unwillingly."

I could almost have cried to hear this.

"However," went on Mr. North Wind, "a big change came over Santa Claus, and all because of a dream, or, I might say, all because of mince pie, for mince pie made the dream. You may be sure that Santa Claus's mother seldom gave him pie for supper, least of all mince pie; but on this particular night Santa Claus went to a party at the house of a boy neighbor. He ate mince pie, nor did he refuse plum cake. Later, candy went the rounds. There followed a Dream.

"Santa Claus dreamed that he sat at the foot of a long hill, and toward him, down the hill, streamed an endless supply of cakes, candy, toys, books, and many other things. In between the cakes, toys, books, etc., wound a never-ceasing rivulet of—what do you think?—thick, yellow cream! Santa Claus tried to push off this crowding, overwhelming flow of things, but on they came. The worst of it was that at the top of the hill Santa Claus could see dozens of little boys and girls looking wistfully down upon all this profusion, many of the children reaching out their hands—all in vain—and some of the youngest ones crying bitterly.

"Now, although so petted and somewhat spoiled, Santa Claus had naturally a fine, generous heart (the whole world is ready to prove that!) and the sight of all these forlorn little boys and girls made him feel very sad, indeed. He tried his best to throw toys up to the children, but his arms and hands seemed turned to lead. Meanwhile, a loud voice came from somewhere, saying over and over, 'All for you! All for you!'

"But even the worst of nightmares come to an end, and, when Santa Claus awoke, he was much comforted to think this was but a dream."

"Then what happened?" I asked Mr. North Wind, for his voice was suddenly gentle and almost dying away. At my question he shook himself into fresh vigor.

"Santa Claus never forgot that dream. The next day was his seventh birthday, and his mother could not imagine why, with all his beautiful new presents, the boy all that morning was so quiet and thoughtful. The truth is Santa Claus was beginning to see that to share with others was the only happy way for him. It seemed suddenly mean and undesirable that he should have so much, and he was hunting about in his mind to reach the best plan for giving.

"I can't go into the whole story, as we have nearly reached your Greenwood Farm; but that was the beginning. That very day, after dinner, he got out his new scarlet sled, and asked all the boys in that neighborhood, big and little, to try it in turn. Seeing him come in at supper time in such a rosy glow, his mother decided that fresh air, after all, was best. So after that Santa Claus lived much more out of doors; and, if he grew big and strong, his generous impulses and power to love increased, too, just as steadily.

"Well, when Santa Claus became a man, he had a large fortune left to him by his Aunt Jollity (such was her curious name); and he was not long in deciding to use this vast amount of money, year by year, in making Christmas a brighter day for the children everywhere. By this time Santa Claus had grown so hardy that he preferred the coldest, snappiest kind of weather to any other. Accordingly, he built his home away at the North Pole. You have at once guessed another reason for his doing this, and you are right. The North Pole would be a fairly private place in which to keep safely his Christmas secrets. Hardly anyone dropped in of an evening. The rest you know, too — how every Christmas eve sees Santa Claus in his sleigh guiding the reindeer swiftly from door to door, and leaving all those charming gifts the children at peep of day find in their stockings."

Just then we found ourselves at Greenwood Farm, so I shook Mr. North Wind's white-mittened hand, and gave him hearty thanks for his story. As I went in to buy my ducks I could hear Mr. Wind's voice greeting Farmer Green. It sounded like this:

"Merry Christmas! Happy New-oooo-oooo-oooooooo Year!"—Caroline Stetson Allen.

CANNING OF HOMINY.

In response to requests, we reprint the following recipe for making hominy from white Indian corn:

Dissolve 2 level tablespoons of soda lye (commercial sodium hydrate) in each gallon of water in an agateware pot. Place dry white corn in this and boil hard for one hour. Place the corn in a wire basket or mosquito-netting bag and allow cold water to run through it for five or six hours. If this cannot be done, place in a large tub of water, change the water often and stir frequently for six or eight hours. This is to remove the lye.

After the lye has been removed, rub off the hulls and black-tip caps. This can be done by rubbing the kernels over a screen or colander. Separate the hulls and kernels by washing upon a coarse screen.

Fill into cans. Add a boiling hot brine of 2 tablespoons of salt per gallon of water. Cap and seal. Sterilize cans 45 minutes at 15 pounds pressure, or 1¼ hours on each of three successive days in a wash boiler. If jars are used, sterilize 1½ hours for three successive days.

HOW TO COOK TEPARIES.

[Written for Pacific Rural Press by A. C. Rapp, Tprlock.]

We have been using tepary beans at home and find when cooked right they are not inferior to any. We have employed quite a few men the last two years in caring for our crops and find that all are very well pleased with the beans. In fact, they have all eaten heartily. I will give you the recipe which we use, as follows:

Put on beans in cold water and soda and let them come to a boil and boil ten minutes and then drain. Put on clear, cold water again, let come to boil, then boil fifteen minutes. Drain and repeat with clear, cold as above twice. Then your beans are ready to be cooked, baked and seasoned to suit, as any other bean.

By putting beans through the different waters the objectionable taste is removed and your beans are as good as any.

CHRISTMAS CANDIES.

Honey Popcorn Balls. — Take 1 pint extracted honey, put it into an iron frying pan and boil until very thick; then stir in freshly popped corn and when cold mold into balls.

Popcorn Balls with Corn Syrup.—Boil together 1 cup of corn syrup and 1 tablespoon vinegar until it hardens when dropped into cold water; stir in freshly popped corn and when cool enough to handle butter the hands well and form into balls.

Honey Caramels.—One cup honey, 1 cup granulated sugar, 3 tablespoons sweet milk. Boil together until it will form a soft ball when taken in the fingers. Add 1 teaspoon vanilla; pour into a greased dish ½ to ¾ inch deep. As the mixture cools, cut in squares and wrap each square in paraffin paper. To make chocolate caramels, add 1 tablespoon melted chocolate just before taking off the fire, stirring well.

Parisian Sweets.—One pound figs, 1 pound dates, 1 pound English walnut meats. Mix together and put through the meat grinder. Work mixture on board dredged with confectioner's sugar until well blended. Roll to ¼-inch thickness and cut with sharp knife in ¾-inch squares.

Maple Sugar Candy.—One pound soft maple sugar, ¾ cup thin cream, ¼ cup boiling water, ⅔ cup English walnut meats broken up. Break sugar up and put in saucepan with cream and water. Boil until a soft ball forms in cold water; remove from fire and beat until creamy; add nuts and pour into buttered tin. When cool, cut in squares.

Stuffed Dates.—Wash and dry dates; remove stones and fill cavity with one of the following fillings, shape in original form and roll in sugar. Fillings: Peanut butter creamed with a little lemon juice; walnut or pecan meats; candied ginger; candied pineapple or fondant.

Mint Paste.—Soak 1 envelope of gelatine in a little cold water, then dissolve in 2 cups of boiling water; add 3 tablespoons strained honey, color a rich green and flavor with a few drops of oil of peppermint. Pour into oiled pans an inch deep. When cold, cut in squares and dip in powdered sugar.

Coloring for Candies.—Saffron will give a yellow tint; spinach leaves, crushed and boiled, will give green; the juice of strawberries, raspberries and blackberries will give varying shades of pink. Small tubes or bottles of coloring matter may be purchased in all colors.

Salted Almonds.—Blanch and dry the almonds; put a spoonful of oil in a small saucepan and when hot put in the almonds and brown lightly. Drain on brown paper and sprinkle with salt.

THE CHRISTMAS DINNER TABLE.

This year, when we are urged to make use of only such foods as are produced in our own State, we of California are especially fortunate, as we may have everything from soup to nuts, in a well-planned dinner, without transgressing the wish of the Food Administration.

The elaborateness or simplicity of the dinner has nothing to do with its attractiveness, for a very simple meal may be made delicious when served on spotless linen and a well-decorated table. Flowers, ferns, a large dish of fruit, or a huge pumpkin hollowed out to hold autumn leaves, huckleberry or our native redberry, makes a centerpiece that every household can arrange for.

A holly centerpiece may be arranged by making a star of the leaves and berries and placing on a large mirror. Scatter holly over the white table linen and have place cards done in holly.

A miniature cedar tree, covered with diamond dust, decorated with cranberries, cotton and strings of tinsel, makes an attractive centerpiece. The use of place cards is an addition and they may be made at home by copying some suitable design on heavy white paper and using either colored crayons or water colors to color them. Almost any child can do that kind of work and it usually makes them very happy to be permitted to be helpful in that way.

A very attractive centerpiece, especially for children, may be had by using a rather good-sized paper mache turkey, enclosing it with long sticks of striped candy laid in a fence effect.

The dinner itself helps to decorate the table—the brown fowl is in pleasing harmony with the green of parsley and lettuce and the red jelly. A baked potato may be much improved by two slashes to hold butter and a little parsley. A simple baked apple for dessert takes on a festive air when crowned with a dab of whipped cream and topped with a candied cherry. Get out the best dishes and give an extra shine to silver and glass—it is more work, to be sure, but work that is well worth while in the enjoyment of your family.

TRIMMING THE CHRISTMAS TREE

For those who want a change from the regulation ornaments many inexpensive things are offered. The small penny toys make very nice souvenirs for all the small visitors and bunches of raisins and bright-colored apples furnish something that may be eaten as well as looked at.

In using popcorn, put pins through the largest kernels and stick them on the end of the little boughs and it gives the appearance of snowflakes and is very pretty.

Candy is always acceptable and candy canes, fishes and pipes are bright and effective and a number of small baskets filled with gum drops, raisins, almonds or chocolate pennies help decorate the tree and also furnish something to give away.

After the enjoyment of the tree is over and it seems desirable to clear it away, put it in the yard, with bread crumbs in the baskets, and note the pleasure the birds get.

CHOICE OF CHRISTMAS GREENS.

People used to be more particular than they are now as to what greens they used for church decoration. The favorite plants were holly, bay, rosemary and laurel. Ivy was objectionable because it was formerly sacred to Bacchus. Cypress was sometimes used, but its funeral associations made it out of place at so festive a season as Christmas. Mistletoe was excluded because it was sacred to the Druidic religion and perhaps because it was considered too frivolous in its suggestions. The decorations should properly remain in the church till the end of January, but must be cleared away before February 2, "Candlemas Day."

CHRISTMAS CAROLS.

There is a great revival of interest in Christmas caroling in many communities. Now, when so many country people have machines, and distances are so easily covered, caroling parties in the country are quite as possible as in more thickly settled communities. To get the best results, participants should have some ability to sing and a rehearsal with someone in charge to lead is almost a necessity. Suitable songs, as "Hark, the Herald Angels Sing," "Silent Night," or "A Little Town of Bethlehem" and "Merry, Merry Christmas," should be chosen.

A good hot breakfast at some home, served after the caroling trip is over, is much enjoyed.

An old Scottish shepherd, faithful to the traditions of his clan, still wore the Highland kilt. One cold, raw day he was tending his sheep. His plaid was wrapped closely about him, but his bare legs were blue with cold. A fellow-clansman, who had been away from his native hills, came by, wearing an English overcoat. Observing the shivering shepherd, he asked, "Sandy, are ye no' cauld wi' the kilt?" "Na, na," replied the loyal Sandy, "but A'm near kilt wi' the cauld!"—New York Times.

-: AN INTERESTING SHORT STORY :-

We cannot prepare any better advertisement for

GOMBAULT'S CAUSTIC BALSAM

than the following voluntary testimonial from a man who stands very high in all business and social circles where he is known:

No. 2131 Wyoming Avenue, Washington, D. C., November 26, 1917.

The Lawrence-Williams Co.,

Dear Sirs:—I have had GOMBAULT'S CAUSTIC BALSAM constantly in my home for thirty-three years and have used it for a large number of animal and human ailments. It is by far the most effective, reliable and economical medical preparation that I have ever known. Its persistent use for chronic rheumatism, lumbago, neuritis and kindred troubles bring sure relief. For sore throat, pains in chest and acute cramps it penetrates and relieves pain. For mosquito bites, bee stings and bites of all other vermin it instantly stops all irritation. For itching between the toes and on limbs, it is an instantaneous cure. For fresh cuts, wounds and old sores, it eliminates all danger from blood poisoning and hastens a cure. A few drops of CAUSTIC BALSAM is more effective than half a bottle of any other application that I know of.

Truly yours, M. J. LAWRENCE.

GOMBAULT'S CAUSTIC BALSAM has had a steady, reliable sale in France, where it is made, for forty-five years. In the United States and Canada, with only moderate advertising, it has had an increasing sale for thirty-five years. The demand is produced strictly by its merits. Price $1.75 per bottle. Sold by druggists, or sent by Parcel Post on receipt of price. Guaranteed to give satisfaction. For further particulars and unlimited testimonials, address

LOS ANGELES CALIFORNIA

The Modern Yule Log

The spacious fireplace with its blazing log was beautiful and highly satisfactory to our ancestors, but to meet the demands of this advanced age it was necessary to devise an easy means of producing a fire of real service from an economical fuel, yet pleasing to the eye. It was this need that prompted the effort which resulted in "the simplest thing in the world"—the "Premier" burner.

A piece of paper, the turn of a valve and the result is a fire of beauty, clean, hot and economical. The entire absence of effort and the usual cleaning "after effect" makes the "Premier" an ideal Christmas present for mother. Why not make every day "Mother's Day"—one continuous Yule-tide of peace and comfort? So little is required to accomplish this. You can buy the installation complete or in part, do the installing yourself without making any changes in the stove. Let us give you details—ask for drawing and circular "B." Give number, size and style of stove. Common coal oil is the fuel, a "Premier" burner the means, and five dollars the price

The burner, guaranteed and prepaid, $5.00

To complete a one-burner installation, $4.85 additional by express, charges collect.

Two burners and complete installation about $18.00

All inquiries receive prompt attention.

Premier Burner Co., Los Angeles, Cal.

Market Comment

Immediate Wool Deliveries Urged.

The War Industries Board has released the following statement to wool growers: "The domestic wools section of the War Industries Board announces that the Government Wool Adminstration will take over for the Government only such wools of the 1918 clip not now in the hands of approved dealers in distributing centers as have been loaded on cars and billed through to an approved dealer in an approved distributing center on or prior to December 31, 1918, and then only in case the approved dealer in the approved distributing center to whom such wools may be consigned files statement and a copy of the invoice thereof within five days after receipt of invoice."

Export of Wheat Products Permitted.

Exporters, who in the past have been refused licenses to ship wheat products, will now be permitted to ship all such products except wheat flour to specified countries, according to a ruling of the War Trade Board. Purchases of wheat product commodities for the Entente Allies and the Central Powers will continue to be made by the Allied Provisions Export Commission, acting on behalf of the governments of those countries. European and other neutrals will have to place their orders for flour through the Food Administration until the next crop is in.

An Acute Garlic Shortage.

Garlic was a drug on the market last year at 6c a pound and at present that product is commanding 30c a pound, with the prospect that the supply will be entirely exhausted before the next new crop. Two reasons for the existing scarcity are assigned. One is that conditions were not favorable last summer for garlic growing, and another is the heavy buying of California garlic early in the season by Eastern wholesale produce dealers in expectation of an early shortage.

No Official Bean Prices This Year.

George A. Turner, president and manager of the California Bean Growers' Association at Stockton, says the association furnished the largest part of the beans recently purchased in California by the U. S. Food Administration. All varieties were furnished at the market prices, and this will be the practice of the Food Administration in all future purchases. No prices will be fixed by the Government this year.

Rice Price Agreement to End.

This year the price of rice was stabilized through an agreement with the United States Food Administration and the growers, and the latter are further protected by an embargo upon the importation of Oriental rices. This arrangement will terminate with the marketing of this year's crop, and sooner, should the peace treaty be signed before the crop is marketed.

Minimum Hog Prices Explained.

Hogs weighing 150 pounds are not protected by the minimum prices, but are classed as "throw-outs." Producers should remember that $17.50 is the average cost of packers' droves, and purchase may be exclusive of "throw-outs" as low as $16.50, but must be bought above the minimum in order that the average cost will not fall below $17.50.

Barley May Move Again.

The removal of war restrictions on the exportation of barley must be very gratifying to barley growers of California. Before the war this was a very important business at this port, shipments going largely to Mexico, Canada, Central America, Japan and South America. This trade will doubtless be resumed at once.

Canada's 1919 Wheat Crop.

Canada has decided not to guarantee the wheat crop for 1919. The Government feels that there might be a loss of several hundred million dollars if the crop should be guaranteed.

THE MARKET REPORTS

Where commodities are consigned on a commission basis, the only price obtainable is the San Francisco price, from which customary charges are deducted to ascertain actual price paid to producer. Lines of commodities sold on exchanges, as butter, eggs, cheese, grain, etc., are priced according to exchange figures, which are not the prices paid to grower. From these figures must be deducted the legal percentages permitted to be taken by wholesalers before remitting balance of sale price to shippers. Schedules of discounts governing these transactions may be obtained from the offices of the Food Administration or of various exchanges.

SAN FRANCISCO

San Francisco, December 18, 1918.

WHEAT.

ANNOUNCEMENT.

The following are the prices announced by the Federal Grain Corporation, which are still in effect:

Per bushel—
No. 1 hard $2.20
No. 2 .... 2.17
No. 3 .... 2.13
No. 1 soft 2.18
No. 2 .... 2.15
No. 3 .... 2.11
Club or Sonora, No. 1 .... 2.16
do, No. 2 .... 2.13
do, No. 3 .... 2.09

Recleaned for seed, per ctl.—
California Bluestem .... $4.15@4.25
Early Baart .... 4.15@4.25

BARLEY.

The grain exchange made an effort to start calls on barley this week, but no enthusiasm developed, and it is believed that no life can be instilled in any of the grains until after the holiday season. The other grains were not called. Barley is inclined to steadiness, and no change in quotation is noted.

Choice feed, per ctl .... $2.20@2.25

OATS.

Oats are dull and unchanged. There is but little demand, and that for small quantities.

Red feed, per ctl .... $2.50@2.60
Red for seed .... 2.65@2.90
Black for seed .... 2.80@3.00
Recleaned Red or Black for seed 3.35@3.50

CORN.

Corn prices are unchanged this week. Some choice California white corn was offered on the street and sold at $3.25.

Egyptian, choice .... $2.75@3.00
Milo .... 2.70@2.75

HAY.

Receipts of hay for the past week were 816 tons, compared with 844 of the previous week. Shipments were delayed by the rains of last week and these also further damaged hay, particularly in the river districts. The continued cold weather following the rain is retarding the growth of new hay to a considerable extent. Local conditions have been very unsettled since September on account of the repeated rains and considerable effort has to be made to dispose of the damaged hay arriving. Interior trade is reported dull, but as stocks of hay are getting low, some activity may be expected shortly.

Wheat, No. 1 .... $25.00@27.00
do, No. 2 .... 19.00@23.00
Choice tame oat .... 24.00@26.50
Wild oat .... 19.00@21.00
Barley .... 19.00@21.00
Alfalfa .... 17.00@21.00
Stock .... 17.00@20.00
Barley straw .... .50@ .80

FEEDSTUFFS.

The market for feedstuffs is dull to a great extent on account of the holiday season. No buyers are making purchases in excess of immediate needs, and they do not want to carry large stocks over the period of winding up the year's business. Coconut meal is again in the market and is quoted at $45 to $47. It is reported that the flour mills may again make bran, shorts and middlings, but "mill run" is the only wheat by-product at present on the market. Linseed meal is another of the feedstuffs again coming on the market. So far it is in limited quantity and sells at $77 to $78.

New alfalfa meal, per ton .... $35.00@36.00
Coconut cake or meal .... 45.00@47.00
Whole yellow corn .... 77.00@80.00
Cracked corn .... 80.00@82.00
Oilcake .... 77.00@78.00
Rolled barley .... 45.00@47.00
Rolled oats .... 55.00@57.00
Mill run .... 34.00@35.00
Linseed meal .... 77.00@78.00
Fish meal, per 100 lbs .... 4.80@ 5.00

POTATOES, ONIONS, ETC.

While potatoes are quoted somewhat higher, there is very little demand at this season. This, however, is normal at the holiday season and a stronger market seems probable in the course of a few weeks. Onions are very weak. There are no more fancy to be had and the ordinary run is selling at lower quotations. It is said that some sold at low as 50 cents. All the tomatoes in the market are now coming from the South. They are better quality than the recent receipts from this section and sell at a higher price. Celery is strong and in demand. The bulk sells from $4 to $4.50.

String beans .... 12@15c
Lima beans .... 8@9c
Carrots, per sack .... 85c@$1.00
Rhubarb, San Jose, per box .... $1.00@1.25
Pumpkins .... 75@90c
Cucumbers, hothouse, box of 30 .. $2.50@3.00
Eggplant, per lb .... 8@16c
Lettuce, per crate .... $1.50@2.00
Celery, bunch .... 20@25c
do, crate .... $3.75@5.00

Tomatoes, per crate—
Southern .... $2.50@3.00

Potatoes—
Fancy whites .... $2.00@2.15
Choice .... 1.85@1.90
Sweets, per sack .... 3.50@3.75

Onions—
Yellows .... 60@90c
Australian Browns .... 60@90c
Garlic, new .... 20@25c
Green corn, Alameda, per sack .... Nominal
Okra, per box .... None

BEANS.

Beans continue to be more or less of a drug on the general market. No demand from any quarter has developed, and while only a few descriptions are marked at a lower level, nearly all the prices quoted could doubtless be shaded if there was a prospect of a sale. There is absolutely no life in the market.

Bayos, per ctl. .... $7.25@7.50
Blackeyes, new crop .... 5.50@5.75
Cranberry beans .... 7.75@8.00
Limas (south, recleaned), new crop $10.40
Pinks .... $6.65@6.75
Mexican Reds .... $6.75@7.00
Tepary beans .... 5.00@5.50
Garbanzos .... 8.50@9.00
Large whites, new crop .... 8.20@8.30
Small whites, new crop .... 9.10@9.25

POULTRY.

The poultry market is in a normal condition as far as local shipments and prices are concerned. Shipments from the East are arriving in good quantity. This week's arrivals and scheduled arrivals before Saturday amount to 12 carloads. This will have a stabilizing effect and the general opinion is that there will be no changes in quotations until after Christmas.

Turkeys, live, young spring, lb .... 36@38c
do, old .... 35@36c
do, dressed 45c
Broilers, 1½ to 2 lbs .... 39@42c
do, 1¼ lbs 43c
do, ¾ to 1¼ lbs 45c
Fryers 35c
Hens, extra, per lb., colored 33c
do, Leghorn 33c
Smooth young roosters, per lb. (3 lbs. and over) 33c
Old roosters, colored, per lb 24c
Geese, young, per lb .... 32@35c
do, old, per lb .... 30@32c
Squabs, per lb .... 65@60c
Ducks .... 30@32c
do, old .... 27@30c
Belgian hares .... 23@24c
Jack rabbits .... $3.25@3.75

BUTTER.

Extra butter continues to advance in price, 64 cents being established as the week's price on Monday of this week. Prime firsts were again quoted this week, the price 63½ showing an advance of 4½ cents from the last quotation of ten days ago. Storage butter is becoming scarce in the local market and some inquiry has been made for the Australian butter, whose arrivals a year ago greatly relieved the market at that time.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	63	63	63	64	64	64
Prime first	..	..	..	63½	63½	63½
Firsts	58	58	58	Nom.	..	..

EGGS.

Extras and extra pullets dropped 5 cents last Friday, on the development of weakness in the Eastern market. The lower prices in New York brought about a temporary panic in the local exchange. Somewhat of a reaction came on Monday and some of the members made shipments to the Eastern market in expectation of a recovery there. The Eastern market is now much stronger and local prices for pullets are equal to the high price of last week, while extras are only a cent and a half lower.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	81½	76½	76½	77½	79½	80½
Extra 1sts	81	Nom.	..	..	..	..
Firsts	Nominal.					
Extra pullets	78	73	73½	75	78	78½

CHEESE.

The cheese market continues strong at constantly higher quotations. While the demand is not very vigorous the receipts are comparatively small and not more than the trade is willing to absorb, even at present prices.

Fancy California flats, per lb 36½c
Oregon triplets, fancy 38½c
Monterey cheese .... 26@29c

FRESH FRUITS.

The holiday demand for fruits is normal, but large enough to justify dealers in changing quotations. The commission men report a good demand for apples, but other fruits are not in especial demand.

California apples .... $1.00@2.00
Northwest apples .... 2.00@3.75
Winter pears .... $2.00@3.00
Persimmons .... 1.00@1.50

CITRUS FRUIT.

Mandarins are quoted somewhat lower, but otherwise there has been no change in the quotations of citrus fruits. The season's demand for oranges is excellent, while other citrus fruits are more or less neglected.

Oranges, navels .... $3.00@5.00
Mandarins .... 1.50@1.75
Tangerines .... 2.50@3.00
Lemons, fancy .... 4.50@5.00
do, choice .... 4.00@4.50
do, standard .... 3.50@4.00
California limes 1.50
Grapefruit, new .... 2.25@3.00

HONEY.

The honey market is unsettled, with very little demand. Buyers are unwilling to make an offer for honey at any price, owing to the small demand.

DRIED FRUITS.

Apples this week were somewhat lower and some prime fruit was bought from the packers at 11 to 11½ cents. The market was fairly active at these figures. No other change in dried fruits is reported.

RICE.

Paddy rice, 1918 crop $4.32
Clear No. 1, 1918 crop, at mill 7.00

LOS ANGELES

Los Angeles, December 17, 1918.

BUTTER.

Continued light receipts caused a firm market the past week and what arriving was taken by the consuming trade at full old prices. Receipts for the week were 243,800 pounds, against 253,700 pounds the same week last year. Monday the San Francisco market advanced 1c on extras and Chicago and New York ½c higher, causing what little extra offered on 'change Monday to sell up 1c, and more could have been sold if here. The supply of fresh butter being light and no indication of an increase in the production in the near future and very light stocks, makes the situation a firm one. There was taken into cold storage the past week 13,583 pounds, mostly sweet butter, making the holdings now in cold storage 123,623 pounds, against 152,942 pounds the same week last year.

Extra	61	61	61	61	61	62
1917—						
Extra	46	46	45	45	45	46

EGGS.

There has been a sharp decline in this market from a week ago. With the Chicago and New York markets 5c to 6c lower than last week and the approaching of the laying season, caused buyers on 'change to hold back and insist on lower prices. The receipts of fresh ranch eggs by rail for the week were only 384 cases, against 648 cases the same week last year. The truck receipts continue to run about four times as large as the arrivals by rail, making the supply for the week 1920 cases, against 3240 cases the same week last year. To meet this shortage in the supply of fresh eggs there was withdrawn from cold storage during the week 6098 cases, bringing the cold storage holdings now down to 15,861 cases; this time last year 10,301 cases. There is still over 5500 cases more eggs in cold storage than a year ago and in another week the Christmas demand will be over and with the coming of the new year a marked increase in the receipts of fresh eggs may be looked for and lower prices anticipated.

Daily quotations—

Pullets	43	43	45	45	45	50

POULTRY.

There was a fair demand the past week for what coming in and all young stuff was higher. But few coming in. Turkeys and geese in fair demand and steady. Hens also unchanged and selling fairly. Ducks scarce and higher.

The following prices were agreed upon last Friday, December 13, and hold good until the coming Friday.

Broilers, 1@1¼ lbs 40c
Broilers, 1½@1¾ lbs 45c
Fryers, 2@3 lbs .... [illegible]
Roasters (soft bone), 3 lbs. and up 30c
Stags and old roosters, per lb 20c
Hens .... 28@32c
Tom turkeys .... 31@34c
Ducks .... 22@28c
Geese 28c

VEGETABLES.

Fresh vegetables are getting scarcer and higher every week. Green peppers are in good demand. Not many coming in. Tomatoes are also higher and what few No. 1 coming in are in good demand. Sweet potatoes are dull and weak. Cabbage dull but unchanged. Cauliflower coming in more freely and lower, but demand fair. Celery in good demand and higher. Garlic scarce and sharply higher. Potatoes coming in more freely; market is draggy. Onions are hardly so firm; poor stock is dull and lower. Squashes and pumpkins coming in freely and market dull. Lima beans out of season. Peas in light supply and the best a little higher.

We quote from growers:
Peas, per lb .... 9@12c
Bell peppers, per lb .... 9@10c
Chile peppers, per lb .... 9@10c
Potatoes, northern, per cwt .... $2.00@2.25

do, No. 2, lug .... .30@ .40
Cauliflower, standard crate .... $1.20@1.40
Hubbard squash, per cwt $1.00
Banana squash, per cwt 1.00
Pumpkins, per cwt .... .75

FRUITS.

A firm market and very good demand was had the past week for apples, which continue to make up most of the offerings of deciduous fruits. A few Japanese persimmons are coming in and the market for them is steady and firm. Guavas are no more.

We quote from growers.
Apples—

do, 3½-tier .... 1.85@2.00
Bellefleur, 4½-tier .... 1.75@1.80
Jonathans, Northwestern pack 3.00@3.25
Winesap, loose, per lb .... 5½@6c
Japanese persimmons, per lb .... 4@10c

WALNUTS.

Few walnuts are now to be had from first hands and they from independent growers and of low grades. Prices for such steady and demand fair. Culls are also selling fairly and bringing 14c to 15c a pound to growers. The association's deliveries have dropped down to four or five cars a week and the season will soon be over.

	1918	1917
Fancy budded	33c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

BEANS.

The market here is still dull. Very little buying the past week, and that local. No outside demand for any kind. The trade is holding back until after the opening of the new year.

Limas, per cwt.	$10.00
Large white, per cwt.	$8.00@9.00
Small white, per cwt.	8.00
Pink, per cwt.	6.50
Tepary, per cwt.	4.00
Blackeyes, per cwt.	4.50

HAY.

The market the past week was dull and weak. More coming in and under the influence of the increased supply buyers held back and only took such lots as were needed to do them from day to day. We quote f. o. b. Los Angeles:

Barley hay, per ton	$24.00@25.00
Oat hay, per ton	26.00@28.00
Alfalfa, northern, per ton	21.00@22.00
Alfalfa, local, per ton	22.00@24.00
Straw, per ton	9.00@10.00

COTTON.

The market the past week was a fairly good one, though it was void of excitement. The week opened lower under the influence of a bearish Government report, which was made public Wednesday of last week. It made the crop this year 11,700,000 bales, against 11,302,000 bales last year. This caused more or less realizing by timid longs. But at the lower prices there was fair buying. The current week opened with a good export demand caused by lower ocean freights and fair home buying, and prices ruled higher both in New York and New Orleans. In New York December closed at 28.80c and January at 26.84c. In New Orleans December closed at 29.10c and January at 27.35c.

Special Citrus Market Report

Los Angeles, December 16, 1918.

Now that practically all the navel crop has been shipped from the Tulare district, the returns show that the crop has been larger and prices lower than had been hoped for. Instead of about 1200 carloads, as per early estimates, shipments have run over 2000 cars—2037 up to December 10. It is thought the fruit has averaged about $3 per box to growers. Attention is now directed to Southern California, which will supply the bulk of the navels for the remainder of the season. The demand for ripe, well-colored fruit is strong, and the general range of prices has been from $4.50 to $5. A few lots of fancy stock have sold for as high as $7 and some off stuff has sold as low as $2.75. Owing to favorable weather conditions, a larger orange crop is expected in Southern California than earlier estimates forecast.

Lemons are strong in all markets and range from $3.50 to $4.75 delivered. It is reported from New York that a fair-sized consignment of foreign lemons is on the way.

Shipments to date total about 3000 boxes of oranges and about 1000 boxes of lemons.

Special Livestock Market Report

San Francisco, December 18, 1918.

CATTLE—The cattle market shows indications of weakness, and it looks as though the prices at which stockmen are holding their cattle will have to be lowered, as packers claim they cannot get their money out of beef at present holding prices. Calves are scarce and held at stiffer prices.

Grass Steers—
- No. 1, weighing 1000@1200 lbs. 12¾@13c
- do, weighing 1200@1400 lbs. 12@12¼c
- do, second quality 11@11½c
- do, thin 9½@10c

Cows and heifers—
- No. 1 9@9½c
- do, second quality 8@8½c
- do, common to thin 6@6½c

Bulls and stags—
- Good 6@6½c
- Fair 5½@6½c
- Thin 4½@5½c

Calves—
- Lightweight 11½c
- Medium 10½@10¾c

SHEEP—Sheep and lambs to meet present demands are coming principally out of feed lots. Some heavy lambs are coming on the market and are bringing about 14c here with the wool on.

Lambs—
- Yearling 12@12½c
- Milk 14@14½c

Sheep—
- Wethers 11½@12c
- Ewes 9@9¼c

HOGS—While hogs are still coming in freely, they are readily absorbed by the packers, who are now well equipped to handle all that may be offered.
- Hard, grain-fed, 100@150 16c
- do, do, 150@300 16½c
- do, do, 300@400 16c

Los Angeles, December 17, 1918.

CATTLE—There is no quotable change in this market from a week ago. At the same time its tone is weak in sympathy with markets East, that just now are burdened with heavy receipts. Choice fat steers continue scarce and are in demand, while thin and medium are dull.

Per cwt. f. o. b. Los Angeles—
- Beef steers, 1000 to 1100 lbs. $9.00@12.00
- Prime cows and heifers 8.00@ 9.00
- Good cows and heifers 7.00@ 7.50
- Canners, per cwt 5.50@ 6.00
- Calves, per cwt 8.50@10.00

HOGS—Under moderate receipts and the quality of logs coming in good caused killers to take what hogs arriving at steady prices. Receipts at Chicago and Kansas City the past week were excessive and only the support given the big packers by the government in contracts based on previous high prices has prevented a heavy decline.

Per cwt. f. o. b. Los Angeles—
- Heavy, averaging 275@350 lbs $14.00@15.00
- Mixed, 225@275 lbs 15.00@16.00
- Light, 175@225 lbs 16.00@16.50

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—More liberal receipts at the Eastern markets and lower prices there caused killers here to bid lower for lambs the past week. But at the lower prices there was a fair demand for both muttons and lambs.

Per cwt. f. o. b. Los Angeles—
- Prime wethers $9.00@10.00
- Prime ewes 8.50@ 9.50
- Yearlings 9.50@10.50
- Lambs 14.00@15.00

PORTLAND LIVE STOCK.

Portland, December 17, 1918.

CATTLE—Strong; receipts, 68. Steers, prime, $11.50@12.50; good to choice, $10.00@$11.50; medium to good, $9.50@10.00; fair to medium, $8.00@8.50; common to fair, $3.50@7.50; cows and heifers, choice, $7.50@8.00; medium to good, $6.00@7.00; fair to medium, $5.00@6.00; canners, $3.00@4.00; bulls, $5.00@7.50; calves, $9.00@11.00; stockers and feeders, $6.00@9.00.

HOGS—Higher; receipts, 185; prime mixed, $16.85@17.15; medium mixed, $16.50@16.85; rough heavies, $14.75@16.00; pigs, $14.00@15.00; bulk of sales, $16.85@17.00.

SHEEP—Firm; receipts, 24; prime lambs, $12.00@13.00; fair to medium, $9.00@11.00; yearlings, $10.00@11.50; wethers, $9.00@10.00; ewes, $6.00@8.00; rough heavies, $14.60@14.75.

Chicago, December 17, 1918.

HOGS—Receipts, 50,400; market slow, generally steady; bulk of sales, $17.35@$17.60; butchers, $17.45@17.50; light, $16.55@17.45; packing, $16.60@17.40; throwouts, $15.50@16.60; pigs, good to choice, $13.75@$15.00.

CATTLE—Receipts, 25,000; good weight steers and canner stock strong; other classes opening slow; calves, 25c lower; feeders, steady. Beef cattle, good, choice and prime, $15.25@19.75; common and medium, $9.50@15.25; butcher stock cows and heifers, $7.00@14.25; canners and cutters, $6.50@7.00; stockers and feeders, good, choice and fancy, $10.25@13.50; inferior, common and medium, $7.25@10.25. Veal calves, good and choice, $15.50@16.00; western range, beef steers, $14.25@17.50; cows and heifers, $7.00@12.25.

SHEEP—Receipts, 17,000; market, opening steady; lambs, choice and prime, $14.75@15.00; medium and good, $13.50@14.75; culls, $9.50@12.00; ewes, choice and prime, $9.00@9.50; medium and good, $7.75@9.00; culls, $4.00@6.75.

Our Christmas Wishes

If all the Christmas wishes of the publisher and editors of the Rural Press to you, dear readers, were printed in this issue it would be as big as all outdoors.

So we can merely take the space to send you a lighted fagot from our heart's fire to increase your own, and to express our deepest wish, which is that the evergreen of Rural Press service may never lose its charm for you, but, on the contrary, will become more fascinating and helpful every day.

When the Christmas bells
Ring out their message true,
Remember that in our hearts
There's a loving wish for you.

United States Beet Sugar Crop, 1918

[Written for Pacific Rural Press.]

The following interesting resume of the beet sugar crop of the United States for 1918 is issued by the Bureau of Crop Estimates, December 10, 1918:

The production of beet sugar in the United States from the harvest of 1918 is estimated at 740,100 short tons. This estimate is based upon reports made before the close of the season and is subject to revision. The production in 1917 was 765,207 short tons. The area harvested in 1918 is estimated at 592,100 acres, or 72,697 acres less than in 1917. The area planted was 689,700 acres in 1918 and 806,600 acres in 1917. In 1918 there was 14 per cent of the planted acreage abandoned, and in 1917 25 per cent, which was the highest on record.

The beets worked in factories in 1918 are estimated at 5,822,600 short tons and were purchased at an average price to growers of $10.02 per ton, as compared with $7.39 in 1917.

The principal sugar-producing States, with their output for 1918, are: Colorado, 182,700 short tons; Utah, 118,000; Michigan, 117,600; California, 109.300; Ohio, 43.100; Wisconsin, 14,300; and all other States 111,000 short tons. Details concerning this report will be published in the Monthly Crop Report for December, 1918.

The acreage harvested in these States was: Colorado, 126,500; Michigan, 108,200; California, 102,400; Utah, 83,600; Ohio, 33,300; Idaho, 32,600; Wisconsin, 12,600; and all other States, 92.900 acres.

The beets worked in these States were: Colorado, 1,412,200 short tons; Utah, 1,012,900; Michigan, 873,700; California, 843,700; Idaho, 336,600; Ohio, 328.900; Wisconsin, 110,400; and all other States, 904,200 short tons.

STANISLAUS CROP ACREAGE INCREASED.

Stanislaus county's acreage of leading field crops for the harvest of 1919, as estimated for the Government by the Stanislaus County Board of Trade, are about as follows, compared with figures for crops harvested in 1917:

Crop—	Acreage 1917	Acreage 1919
Gyp corn	12,000	12,600
Oats	20,813	21,853
Barley	90,000	94,500
Rye	2,000	2,100
Rice	900	1,320
Sweet potatoes	1,300	1,300
Beans	17,000	30,000
Wheat	5,000	45,000
Total	149,013	208,673

Federal Farm Loans

Long Term *Low Rate*

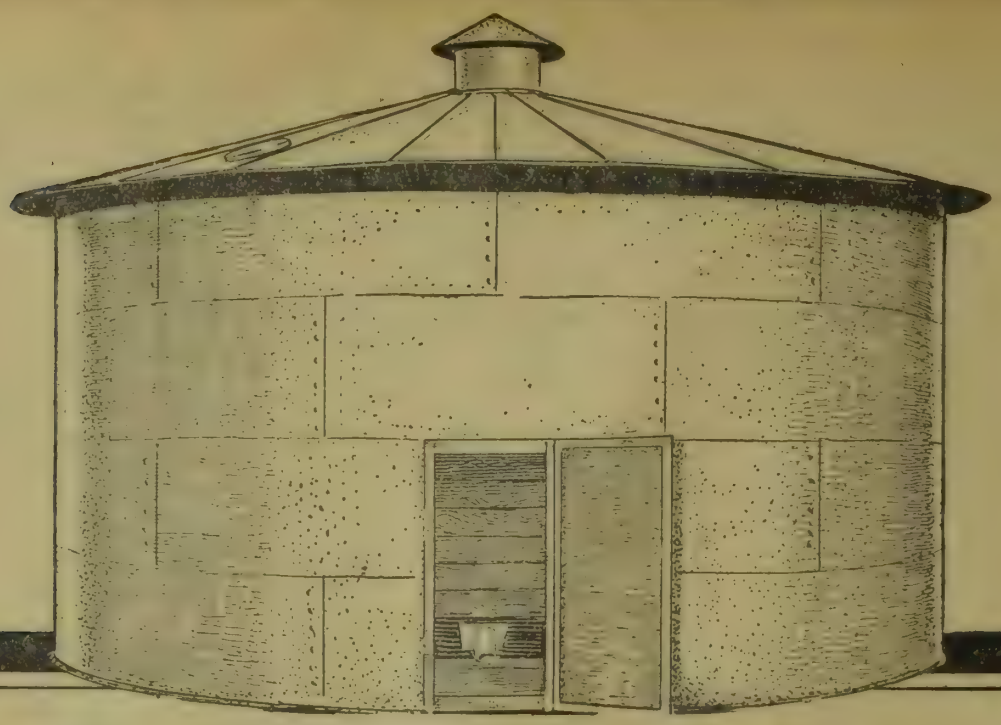
All loans made on an amortization plan whereby the borrower repays the principal gradually with each interest payment.

Over three thousand satisfied borrowers in this district. It will pay you to investigate.

For information apply to the nearest **National Farm Loan Association** or write direct to

Federal Land Bank of Berkeley

Berkeley, Cal.



Calco Metal Grain Bins may be erected quickly with unskilled labor. A hammer and a monkey wrench are all the tools needed. These fire-proof bins come in galvanized sheets, punched and shaped to fit. Galvanized stove bolts hold them in place. They are durable, rust-resisting, economic bins for grain handling. Capacities from 600 to 5400 bushels.

Save Grain

Handling grain in sacks causes waste—large waste. Experts find that 10% of all California grown grain is wasted through sack handling. One-tenth of each year's crop eliminated. One-tenth of the grower's profit—gone. One-tenth of the California crop of grain never reaches its market. Absolute waste. How? A little here and a little there.

Save Grain from Rain

Sacked grain in the fields becomes filtrated with dust—rain comes, the bottom of the sacks are spoiled—the grain often sprouts before it is shipped. How much grain did early rains cost you last year?

Save Grain from Vermin

Rats, mice, gophers,—little ways that destroy a great quantity of California's sun-drenched, golden crops. The holes rats and gophers gnawed in your sacks last year—how much did it cost you?

Save Grain from Leaking Sacks

Leaking sacks! They are ripped when thrown down, a snag, a nail, careless help—and the weak place gives way. How much did you lose this way last year?

Save on Labor

How about your labor problem? How many sack sewers, buckers and jiggers did you hire? You threshed and left the sacked grain in the field. You were trying to get the most out of your help.

Handle Grain in Bulk

Suppose you could harvest your grain *without* sacks, sewers, and jiggers. Suppose you could thresh your grain directly into a dump wagon—in bulk—and put it into a fire-proof metal bin on your own farm? You could let your *extra* help go and save those wages.

Save Sack Costs

You would save the entire cost of sacks. You would cheat the rats and gophers, the birds, the rain, fire and thieves. You would *save*—not waste.

Write for this Booklet

The Calco Metal Grain Bin is for the grain grower who watches the corners. It is rat-, mice-, gopher-, fire-, weather-, thief- and waste-proof. Write for the booklet, "Calco Grain Bins." It tells of the costs of handling grain by sacks and the saving in bulk handling. Just write your name and address on the edge of this page and mail it. It does not obligate you a particle. Do it NOW.

California Farm Products Biggest in History

Written for Pacific Rural Press by R. E. Hodges

FIELD CROPS have been produced in California during 1918 on the greatest acreage ever planted, and while the yield per acre was not in all cases up to normal, the value of the crops will, we believe, prove to be the greatest ever raised in the State, when they shall have been sold. Markets on some of the main products have been slow to open up due to the uncertainty of Government Food Administration regulations, especially since the armistice was signed. But the world shortage of food gives every promise of market improvement when market men know where they stand. The dry winter of 1917-18 following one of less than normal rainfall, was the cause of considerable reduction in yield, on both dry-farmed and irrigated lands. Costs of production jumped twenty to several hundred per cent and growers have been injured by lack of markets at corresponding prices.

Hay.

Hay has continued the chief field crop of California in acreage, yield, and farm value, though the acreage of alfalfa was considerably reduced last spring in favor of other field crops. In spite of the dry season, which normally throws much grain into hay, the crop of grain hay was much smaller than last year. Price levels of last winter and spring are not maintained, but the average farm price of hay of all sorts has been higher than in 1917, and there is reason to believe that the present crop will have moved at paying prices before next crop comes. The selling market for alfalfa hay seems to have better prospects than that for other kinds. A reason for the relatively low prices of alfalfa recently is the rain-damaged stuff that has been dumped onto the market.

Beans.

Beans stood second to hay in 1918 in estimated farm value; and the acreage and production were the greatest in our history. Serious losses in yield and extra cost of production were caused by the early fall rains. Considerable sales have been made at prices about 20 per cent less than a year ago, but most growers are holding for what looks to be a better market in the near future, when trading opens free from restrictions, provided the large Asiatic crop does not prove a greater influence than now seems probable.

CALIFORNIA FARM PRODUCTS, 1918

ORCHARD AND VINEYARD PRODUCTS.		
Deciduous Fruits	$39,639,500	
Citrus Fruits	52,133,500	
Dried Fruits (including Prunes, Raisins, Figs)	35,621,000	
Berries	6,847,500	
Olive Products	2,900,000	
Nuts	11,040,000	
Table and Wine Grapes	25,046,000	
		$173,227,000
FARM PRODUCTS.		
Barley	$37,568,800	
Beans	44,297,000	
Corn	4,788,000	
Cotton	14,500,000	
Hay	84,400,000	
Hops (estimated)	1,000,000	
Oats	7,010,000	
Potatoes	15,066,000	
Rice	13,056,000	
Rye (estimated)	400,000	
Sugar beets	8,453,874	
Wheat	16,622,100	
Vegetables (canned and fresh)	40,500,000	
		287,663,774
DAIRY PRODUCTS.		
Butter, 60,348,595 pounds	$27,199,112	
Cheese, 9,795,974 pounds	2,290,298	
Condensed and Powdered Milk, Casein, Milk Sugar	6,938,646	
Market Milk and Cream	15,500,000	
Calves produced on dairies	1,500,000	
Skim Milk and Butter Milk	1,000,000	
		54,426,056
POULTRY PRODUCTS.		
Eggs	$36,480,000	
Poultry	12,600,000	
		49,080,000
MISCELLANEOUS.		
Honey	$2,400,000	
Nursery and Florist Products	4,500,000	
		6,900,000
LIVESTOCK.		
Horses	$11,466,000	
Mules	1,897,500	
Milch Cows	21,641,250	
Other Cattle	25,064,235	
Sheep	37,642,560	
Hogs	15,340,500	
		113,052,045
Grand total		$684,348,875

Farm population of California (U. S. Census), 440,985.

Barley.

The greatest acreage of barley ever planted in the State did not yield the greatest crop, because of the dry season, and its plumpness is not up to normal. The abnormal prices which led to such a large acreage were due to abnormal conditions which did not continue, and barley is a drug on the market at what growers consider is the cost of production without any profit. Since several of the leading barley producing countries of the world probably did not produce much last season, there is hope for the marketing of the present crop. The outlook for the crop of 1919 is not clear, but Europe may call for all we will grow beyond local feeding requirements. The East is likely to retire from her plunge into barley and this will improve the chances for the California product.

Potatoes.

In tonnage produced, potatoes stand next below hay and barley. Discouraging conditions last spring caused decreased planting, and unfavorable summer weather reduced the crop prospects. Despite this and a decreased production throughout the United States, the late market has been draggy and prices to growers not far, if any, above cost of production. A large acreage of summer potatoes yielded light but sold well. Many of the older fields where quality is not the best anyway will be devoted to other crops next year. Considerable acreage in the Delta is being reclaimed to raise potatoes next year. Our potato shipments out of the State are increasing, but are still far less than our imports.

Wheat.

It is a trifle amusing and highly satisfactory this season to see the grand rush to plant wheat. Last season's planting was the largest in recent times, but high barley prices intoxicated many farmers and in their intoxication they could not see how wheat at Government prices could repay the costs of production. They said that their land would not grow wheat with any safety. This was before the dry season was assured. Now, wheat is replacing barley on much of the acreage that would have been planted to the former last fall. Some people claim they were urged by the Government last fall to grow barley, but as we remember, the Government was pleading for more wheat. At any rate, the

WHAT CROP-DRIVES FOR 1919?

WE ARE giving much space this week to crop reviews by our staff writers, who are making it their lives' work to know broadly and accurately the special lines of production which we entrust to them. They are all men of adequate experience and wide observation in California agricultural affairs and of long and intimate acquaintance with California producers and handlers of crops, whose good will and confidence they enjoy. Each of them uses these resources in the effort to set forth significant facts as to the present conditions and relations of the producing lines which he endeavors to describe and trace out. It is up to the discernment and judgment of the reader to select from their statements which facts and tendencies are significant under his own resources and conditions and therefore may become a guide in his undertakings. The writers do not undertake to function as prophets, but they do not hesitate to indicate what appeals to them as reasonable expectations on the basis of facts which they have discerned. The reader must determine for himself what ground he has for cherishing particular expectations with his own outfit of natural and economic conditions, capacity and energy. This is a proper man's job in farming: he must hold his own lines or steering-gear and must make his own crop-drive for 1919. All producers should do their best to roll up a grand surplus of staple and transportable foods in the coming year, for the outlook is apparently clear that the world will need them and will pay well for them; but what individual producers shall undertake each must decide for himself through the best judgment he can form, according to his own measure of his conditions and abilities to put up and come through. Our statements and our carefully compiled tables of statistics cover great facts of production which are significant in forming individual judgments, but we write no programs and boom no "good things." We have gone far enough in "reconstruction" to avoid the errors of the immediate past.

A YEAR OF GREAT ATTAINMENT.

WE HAVE classified the attainments and present conditions of California production in three main categories: General Agriculture, Animal Industries and Fruit Production. The first is fundamental, the second indispensable, the third intensive—the concentration of California's distinctive natural adaptations into products of highest popular estimation. These categories do not specify all the farming products of California, but nearly all others which are of commercial account will attach themselves more or less closely to one or the other of these and add to the importance of it in the reader's mind. California has a range of products which surpasses that of any other State and this fact must be assurance that measurements upon the three-fold basis indicated are really expansible without exaggeration. It is a safe estimate that the open-air industries, including forestry and mining and apart from what are recognized as factory-production, made an output of a billion dollars' value in 1918. It is true that this sum seems quite moderate and comprehensible since we have so much experience in figuring war costs and liberty loans, but it would amount, for this branch of industry alone, to an output of about $330 per capita—and when one remembers that it is that much for every Californian from grandpa to baby Ann, and a million city people also, it is surely heading somewhat high. City industries also saw great expansion during 1918 and achieved results are so gratifying that they are setting grave metropolitan bankers to jesting about the future like the grave-diggers in Hamlet. But that is out of our line.

GREAT TIMES COMING.

EVERYBODY is anticipating great development for all California things, now that the war shackles have been stricken off. The railways will return to their old business of inviting instead of avoiding travel. Uncle Sam is evidently minded to show the people that he really has unique talents as a promoter as well as a demoter and will make railway train lists and menu cards to suit the most fastidious tastes. Even ex-railway manager McAdoo himself, after having made a war-time economy record by scraping a million tons of waste oil from car wheels, has set a brilliant example of loosening up by selecting a winter residence among the sanctified millionaires of Santa Barbara. And tourist promoters say everyone is doing it and that it is much easier to interest the weary, war-profit money kings in wintering alongside the westward course of empire than to waylay them to the gulf resorts, where there is nothing to do but to count the blinks of an alligator. The 1919 crop of tourists, investors and settlers promises to be immense. By doing her duty during the war, by sending men and building ships and furnishing food with record-breaking speed, volume and variety, California has earned most desirable publicity. We are receiving more inquiry letters than ever before from abroad and from all parts of this country, asking whether the things they hear are true and production of the things they see is open to newcomers—and no doubt this is the common experience of Californians. California men and women and California productions have received the world's admiration during the war as never before, and the State will immediately begin harvesting the crop from such an honorable sowing!

COMELY CALIFORNIA!

REV. J. P. McQUAIDE of San Francisco, who is now a captain and wears the blue chevron for service in France, tells a reporter that while he was waiting in General Pershing's anteroom at Chaumont he was delighted to see upon the wall this placard:

Out here in California, where the orange turns to gold,
And nature has forgotten the art of growing cold,
There's not a day in all the year that flowers do not grow;
There's not an hour that rivers do not unfettered flow;
There's not a single moment that songsters do not sing,
And there's a constant conflict between summer and the spring.
Oh, just the joy of it were worth one's life to give,
Out here in California, where it's just a joy to live.

We are not sure that it is poetry, but we agree with Captain McQuaide that fact and sentiment are all right. And he imagines that General Pershing pasted the card himself. With this also we agree, for General Pershing was a Californian before he became a world hero, and being a Californian is a thing one never forgets to be thankful for!

CLOSE OF THE VOLUME.

THE general review effort to which we give special attention in this issue has required some slight changes in the arrangement of other more conventional matter which we hope the reader will find to his advantage. One thing is, however, thoroughly regular in this issue as the last of its volume and that is the index which occupies the last page. It has been prepared with unusual care and is the key to the contents of all issues for the half year. The volume is undoubtedly the best of the long series of which it is the ninety-sixth. It has had more work expended upon it and it has gathered tokens of appreciation and support beyond any hitherto enjoyed. We have two earnest hopes to express in connection with this fact: first that we have rendered service commensurate with favors received: second, that we shall be able to do better with the next volume.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Starting Fig Trees.

To the Editor: Should yearling fig tree cuttings be cut back when planted? If so, to what length? How should yearling rooted fig trees be treated when planted in orchard?—C. A., Guinda.

What are called "tip cuttings," or those which have a bud at the top end, are preferred to those made by cross-cutting and leaving exposed pith at the top. Tip cuttings can be made from the ends of long shoots if the wood is well matured, round and smooth, not angular and wrinkled. Short lateral shoots ending in a tip-bud are preferable and they are usually made ten or twelve inches in length and planted about two-thirds of their lengths below ground. If enough tip cuttings are hard to get, lower cuts can be used—carefully sealing the tops with asphaltum grafting wax. In cuttings of figs always cut through the joint where the wood is hardest. We would plant out yearlings about as they come from the nursery, not cutting back as with other trees, but removing shoots which start too low and forming the head about 24 to 30 inches from the ground. Very large yearlings can be cut back to about this height—waxing the cut ends carefully.

Pollination of Bartletts.

To the Editor: Please advise me through the Pacific Rural Press if it is necessary in a Bartlett pear orchard to plant also some other kind of a pear?—H. K., St. Helena.

On the basis of the experience of California pear growers for several decades during which they have successfully grown Bartletts in solid blocks, it must be answered that the introduction of other varieties to pollinate the Bartlett is not necessary. The question of whether somewhat greater crops can be had by cross-pollination is not definitely settled. Though some are planting with such expectation, others report that they cannot see any better bearing from Bartletts which stand near other varieties than from those which do not. We are always glad to receive results of observation on this point.

Seed from Hold-Over Carrots.

To the Editor: Will you please let me know if carrot seed saved from carrots left over from the year before and not transplanted make good seed. —A. A., Hollister.

If you mean whether seed you have secured that way will grow, we have no doubt that it will. If you mean to ask whether that is the way to grow good carrot seed, we answer that it is not, because it gives no chance to select the best type of roots for mothers and it does not allow you to get the land in good shape for the best performance of the roots you select to plant. In the course of time you would get back to the wild type by sowing and growing that way.

A Book on Lawn-Making.

To the Editor: Can you cite me to a text book on lawn-making in California or to any publication giving fullest details?—R. V., Sacramento.

We do not know of any monograph on this subject. The fullest details thereof, according to California practice, so far as we have observed, are presented in "California Garden Flowers," published by the Pacific Rural Press.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., December 24, 1918:

Stations—	Rainfall Data: Past Week	Rainfall Data: Seasonal To Date	Rainfall Data: Normal To Date	Temperature Data: Max'm	Temperature Data: Min'm
Eureka	1.00	11.60	15.13	56	34
Red Bluff	.38	14.45	9.03	62	34
Sacramento	.22	7.39	6.32	54	32
San Francisco	.28	11.02	7.25	58	43
San Jose	.26	9.91	5.45	58	30
Fresno	.09	3.84	3.09	64	32
San Luis Obispo	.22	7.37	5.09	62	34
Los Angeles	.02	3.98	4.39	68	46
San Diego	.62	4.14	2.64	64	42

Two Hundred Millions in Calif. Fruit Products!

Written for Pacific Rural Press by John J. Fox

TAKEN AS A WHOLE, the year 1918, which started full of promise, has been a profitable one for the growers. Some of the fruits have given exceptional results. Others with a light setting have been satisfactory. Where unusual weather conditions were responsible for a grievous loss to prune, raisin and fig growers, they were met with fortitude and a steady front. After two very dry years many trees and vines were in a very weakened condition and were at their lowest ebb when the fruit was ripening. As this report goes to press, orchard trees everywhere are in better condition than they have been for a long time and are in the fullness of vigor. The outlook therefor for 1919 is distinctly buoyant.

Cherries.

Cherries were an improvement over last year with an estimate of 72 per cent of a crop for the State as compared with about 25 per cent last year. Up to the time of the September rains cherry trees all over the State showed more or less distress after two dry years and a very low water-table. Not nearly so many cherries were face-packed as usual because of the expense, and some were shipped in lugs. On local markets good blacks went as high as 15 cents. The ready movement of cherries throughout the season was somewhat fluctuating owing to the difficulty experienced in getting car service with the usual promptness.

Apricots.

The crop was a bit shy on apricots this year through the State with 74 per cent of a crop on an increased bearing acreage of 1,250 acres in excess of last year's returns. The demand for apricots was fair, the packed fruit ruling around $1.25 a crate and going as high as $2.00. The embargo on dried fruits put a crimp in the market so far as moving stock was concerned, though the Prune and Apricot Association cleaned up the entire hold-over at prices very little below the previous year's average as we have recently explained. The average ruling price for the year was about 14½ cents on dried stock. Apricot pits sold at about $40.00 a ton. Improving conditions should lead to increased plantings where the apricot is known to thrive and where it has been tried out. Apricot trees throughout the state are in excellent condition now.

Peaches.

In many sections the crop ran light but the crop for the State totals up 73 per cent of a seven-year average. Prices of fresh fruit throughout the year were satisfactory. Perhaps $37.50 a ton on all varieties will not be far out. Tuscans were selling as high as $62.00 at the ranch and 4 cents and better on the market. The peach growers by co-operation have placed the industry on a pretty solid foundation again, which is reflected by the confidence with which men are going ahead and planting out new acreage. Many other old peach orchards are being kept going because of the goodly prices obtained. The dried stock ranging around eleven cents was almost all saved before the rain.

Berries.

Strawberries, blacks and logans yielded pretty close to a 95 per cent crop this year and the demand and prices kept up throughout the season. At the height of the season strawberries sold at $7.00 to $9.00 per chest; blackberries at $6.00 to $7.00; raspberries at $9.00 to $11.00 and loganberries at $8.00 to $10.00. There was practically no loss of fruit from rain, heat or any other weather condition. In the Sebastopol section (where 80 per cent of the berry business of Sonoma county is handled), canning stock averaged $100.00 a ton to the grower and shipping stock from $200.00 to $230.000 a ton. Lawtons averaged 20 per cent higher than last year; Mammoths 40 per cent, while logans beat them all.

Pears.

Pears are credited with 82 per cent of an average crop. The stock brought to the grower an average of $70.00 a ton.

The area in bearing pears now shows an increase over last year of 7,500 acres. Ten to 11 cents was obtained on dried pears similar to stock selling at 7 to 8 cents last year. Lake county pears went to 15 cents. The State Pear Growers' Association has lent stability and confidence to its members.

Pear trees came through this trying year in perhaps better condition than any other orchard trees. Plantings are steadily going forward—there is no boom but a steady growth. Winter and keeping varieties are being planted judiciously among the Bartletts and the demand will be carefully tried out.

Plums.

The demand for plums was steadfast throughout the season and prices were satisfactory ranging from $1.00 to $1.50 a box. Among the varieties that seemed most in demand were Formosa, Cal. Blue, Santa Rosa, Grand Duke, Wickson, Burbank, Beauty. President also seems a comer as are the Tragedy, Sugar and Standard prunes. The Satsuma is also liked. Vacaville seems to be fighting shy of late plums. The planting of young plum acreage for this season are about normal so far as we can gather.

Almonds.

This steadily growing industry has added 1,500 acres to its bearing area the past year. The crop averaged 63 per cent of normal. After two dry years many almond orchards suffered severely this year from attacks of red spider and mite, damaging to the trees and reducing the quality and size of the fruit. The September rains did comparatively little damage to the crop and were very beneficial to the trees—probably saved the life of many. Opening prices to the growers ranged from 15 cents for Drakes, 16 cents for Ne Plus Ultra, 17 cents for I X L's, while Nonpariels were quoted at 19½ cents. We are not yet able to get final prices to the growers.

There is plenty of room for this industry to expand, when our importations of almonds came to over 11,000 tons in one year.

Apples.

The State average crop of apples was 66 per cent of a seven-year average. The acreage shows a decrease, though the bearing area is increased by 4,726 acres. The fruit has been of good quality generally, standardization having improved orchard management as well as the pack. The demand may be said to have been well sustained throughout the season. Probably a dollar and a quarter per packed box would represent a pretty fair average return to the grower. Orchards were sold at $32.00 a ton at Watsonville "orchard run." At Sebastopol from $40.00 to $60.00 a ton was paid for shipping apples delivered to the packing house in lugs. This is 20 per cent improvement on last year's prices. Dried stock was quoted at 14½ cents in November, but receded to 11 cents a month later when fruit from the Southern and Eastern states was shoved on to the market. This has made it rather a disappointment to dryers and processors who bought at the advanced figures, 12½ cents on average sales.

Prunes.

In point of acreage this crop comes second (with peaches) only to oranges. Plantings are going steadily forward while the future of this great industry looks bright. The markets are being rapidly extended as the growers support their organizations to make this possible. Prices early in the season were definitely set by the Food Administration and a certain portion of the crop commandeered by the government for the use of the Army and Navy. On bases these prices ranged as follows: 31-41 at 10 cents; 42-51 at 9½ cents; 52-71 at 8½ cents; 72-101 at 8 cents; 102-121 at 4½ cents a pound; 122 and up at 4 cents, while 20-30 were on a flat rate of 15 cents a pound. Though the estimate of the year's crop only stood at 69 per cent, the new acreage coming into bearing would probably have topped this. But on September the 12th we received a visitation in the shape of excessive rains lasting from 24 to 36 hours which caught nearly half the crop on the trays and much of the remainder on the ground. This rain was so unexpected that only a small percentage of fruit had been stacked and the exposed fruit was saturated, carrying off the sugar in solution or else by fermentation. Practically all of the fruit stacked was saved while that that was fully exposed perished or was saved in such poor condition as to render it of small value. A great deal more might have been saved but for the dull, muggy weather that followed the storm. As it was, many growers only endeavored to salvage some hopeless-looking stuff as a patriotic duty. The Government messed things up for the growers, who are still suffering because of delayed action on the part of the authorities in the fulfillment of their contracts and the making of prompt returns therefor. Either that or release the fruit to the ordinary channels of trade—fish or cut bait.

Figs.

The condition of figs before the rains was quoted at 99 per cent. Throughout the State conditions of both trees and fruit was top-notch. However, the rains reduced the crop considerably in Modesto and Merced counties and took almost all in the northern valley counties. In the chief growing section of Fresno and Tulare counties not much damage was done. Extensive plantings are contemplated for the coming season.

Walnuts.

This has been a banner year for walnuts in every way—production, quality and prices to the growers. This important industry now has 47,272 acres bearing and 21,675 acres non-bearing. The Association price was 29 cents. Culls are bringing 14 to 15 cents a pound to the growers through process of manufacture. These prices range about 30 per cent higher than last year's fruit and the quality has probably never been surpassed. In two sections there was some loss occasioned by the walnut worm against which a campaign will be waged the coming year. Walnut growers have no complaint this year, for their 78 per cent of a crop as estimated has been exceeded.

Olives.

This year produced about 65 per cent of a crop for the State and a very large proportion of the crop was up to pickling standard. The rains came along at a good time for olives—invigorating the trees and plumping out the fruit.

Loss from frost was generally negligible. The producing area has increased over last year by 4,380 acres. War conditions put a temporary crimp in the marketing of ripe olives, but the growers' associations will now be able to pick right up where they left off. The demand for this article is increasing and there is good scope for its extension. The increased demand for the Greek olive was due to the impossibility of obtaining it from Europe. Trees for the coming year are in excellent condition. The average prices to growers would range from $150.00 to $175.00 a ton and picking cost about $40.00 at ton this year.

Lemons.

Lemons have had a banner year with 90 per cent of a crop and a strong demand resulting in good prices. There is a reported increase of 7,000 acres in bearing. Nothing untoward has to be chronicled against this industry for the year. They are believed to have averaged the grower from $2.50 to $3.00 a box.

Oranges.

The orange crop for the year was estimated at 85 per cent of a crop, though it is doubtful if it will reach this owing to some loss from drops and splits. The latter are being used in the making of marmalade. The great orange industry that has helped to make California famous is still steadily growing in magnitude. The bearing area exceeds the report of last year by 4878 acres. Average returns are up to expectations, generally speaking. Returns to the growers are estimated at about $3 a box. Though some off-colored fruit has returned less than half of this, yet a goodly amount has yielded far more. A readjustment of the marketing test for oranges is expected to be arrived at before another season and one, it is to be hoped, that will work out satisfactorily in all orange districts with their varying conditions and seasons.

Raisin Grapes.

The raisin industry centered at Fresno is probably the largest concentrated dried fruit undertaking in this or any other country. And, like a snowball, it is gaining in size and solidity as it rolls steadily on. Since the growers have associated themselves together—all pulling in one direction—it seems that the more raisins they produce the easier it is to find a market for them.

This year, with a heavy crop in prospect and price set by the Government, everything was practically cut and dried before harvest. And before the rains came the major portion of the seedless grapes were harvested and the rest stacked in safety except in the northern counties. Then came the rain right onto the curing Muscats, which resulted in reducing a 200,000-ton crop to an estimate of 160.000. This includes the 75 per cent loss on seedless raisins experienced in the northern Sacramento Valley, which is not a good Muscat region in competition with the Fresno section. The prices this year were fixed at 5½ cents for Muscats, 6¾ cents for Thompson Seedless, and 6½ cents for Sultanas. Quite a quantity of the rain-damaged Muscats were salvaged and are labeled C grade, these bringing 3½ cents, we understand.

Table Grapes and Wine Grapes.

This has been a really wonderful year for table grape shippers, beating all records, which this year was harvested from some 70,000 acres. The crop was strong and well set and very little damage was effected by the rains, except where foliage was very heavy or very light; but even this was small. With some 16,500 carloads of grapes shipped for the season, with an average of perhaps $60 a ton to the grower loose, the table-grape men had every reason to be satisfied with the season, as was mentioned in a special article appearing in the Pacific Rural Press of December 14. Many of the grapes shipped were sent forward unpacked and the fact that wine grapes commanded such large prices in the Eastern market explained the use for which they were intended. The grape industry is one of such magnitude and one for which our great State is so pre-eminently fitted that the writer feels that everything possible should be done to realize its benefits.

Seen From the Livestock Observatory

Written for Pacific Rural Press by R. H. Whitten

HERE WE ARE on the threshold of the new year. In the business world it is customary at this time to take inventory of stock on hand, to reckon profit and loss, to look back over the year and from the experiences gained lay plans for the new year.

And why should we not do the same in the livestock world? Successful business men take plenty of time for reflection; time to study conditions and problems; time to lay sound plans. Why should we not do likewise? Farmers, as a rule, do not think enough; they just drift with the tide. But a good business man develops foresight; he is able to reason from cause to effect, and by studying past and present conditions he can tell pretty nearly how to lay his plans for successful future operations. So let's be good business men of the livestock world and study the situation at close range.

Our review this year must necessarily be different from that of previous years, not only because conditions have been abnormal but particularly because the ending of the war has brought us face to face with an entirely new set of conditions. Consequently, in determining where we are at and what we should do, we must take into consideration the conditions existing before the war as well as during the past year; also the after-war foreign demands as well as our natural home requirements—that is, so far as they affect the situation here on the Coast.

GREAT PROSPERITY AHEAD FOR DAIRYMEN.

Dairy products will stand near the top of the list of foods needed in Europe, and while probably no California butter will be shipped abroad it is doubtful if the East can supply the foreign demand, and this means a good market in the East for California butter. Several carloads have been shipped East recently, scoring high and bringing good prices.

But can we supply this demand? No! It is doubtful if our production will even keep pace with home consumption. On the first of January there were 597,000 dairy cows in the State, and it is probable that about 40,000 were slaughtered during the year. This caused a shrinkage of 8,000,000 pounds of butter for the year, the production for 1918 being 60,358,595 pounds, as against 68,373,021 pounds for 1917.

It is estimated that if we consumed as much milk and dairy products as we should it would require 1,211,000 cows to supply the demand, which means more than double the number now in the State. It is pretty certain that the demand will steadily increase, for a national campaign is being conducted to educate people to the food value of dairy products and their absolute necessity in the human diet, and soon California organizations will be playing an important part in this campaign. This, together with prohibition, will increase the demand for milk, butter, cheese and ice cream, and the consumption per capita will be much greater than ever before.

Prices for dairy products have been higher than ever before. For example, butter at San Francisco averaged 45.07 cents for the year, as against 37.07 cents for 1917 and 32.12 cents for 1913, the last full year before the war. And while we produced 8,000,000 pounds less butter in 1918 than in 1917, prices ranged so much higher that the total value of butter for the year was $27,199,122, as against $25,345,879 for 1917. The same applies to all dairy products, the total value for 1918 being $54,428,056, as against $48,235,107 for 1917—an increase of $6,192,951.

While it cannot be expected that the high prices paid for dairy products during the year will continue permanently, still it is quite certain that they will never go back to the old level. There is talk of the Government regulating prices, but whether anything comes from this or not, the heavy demand that is bound to result from an increased population and an increased consumption per capita is bound to keep prices up to a point that will return the producer a satisfactory profit, especially now that feed is down to a reasonable price again.

However, there never will be a time when poor cows can be made to pay, and herds should be tested, culled and bred up. The future of dairying is safe if conducted along these lines.

BEEF CATTLE MEN LEARNED LESSON FROM DROUGHT.

It is impossible to get accurate down-to-date figures on the beef cattle situation. There were 1,701,000 head in the State at the beginning of the year, 1,636,000 on January 1, 1917, and 1,410,000 head on January 1, 1914. This shows a steady increase, yet not sufficient to keep pace with the increase in population. Furthermore, on account of short feed and unpromising weather conditions, liquidation was heavy early in the year, and as fewer cows than usual were bred the calf crop was short.

But as hard as the drought was on cattlemen it proved a blessing in disguise, for it taught them to prepare for dry years. They have built silos, raised silage crops, developed water and put their operations on a sound basis so that they will not be at the mercy of the weather.

Cattlemen also have learned that more money can be made from a few animals that have been bred for fast-growing, easy-fleshing qualities than from twice as many of the ordinary kind, and those who have breeding stock for sale report the demand for registered bulls greater than ever before.

The worst drawback to Great Success in the beef cattle game today seems to be the lack of adequate marketing facilities. Too big a share of the profits now goes to the local buyer. But active steps are being taken to perfect a marketing organization, and probably before the end of the year we shall see this trouble remedied.

Prices paid for steers have been high—going considerably above $13. They may drop a little, but there will be a sufficient margin between feeding costs and market prices to guarantee cattlemen a substantial profit. Packers expect that the demand will be good and prices will continue quite near the present level for many months. O. V. Battles of Congdon & Battles said at the International Livestock Show that California would become a beef cattle paradise during the next decade because of its luxuriant forage and long season of open grazing. Here's hoping.

SHEEP RAISING STILL PROFITABLE.

Conditions in the sheep industry are a little different. Because of the Government demands for wool and the exceptional prices paid, sheep values soared out of sight. On January 1, 1914, there were 2,551,000 sheep in California, valued at $3.80 per head. On January 1, 1918, there were 2,776,000, valued at $11.30. The number increased only slightly, but the value per head jumped almost

> *The Livestock industry is on the threshold of the greatest boom it has ever experienced.—John Fletcher, ex-Pres. Drovers' National Bank, Chicago.*

300 per cent. Values went still higher during the year, and we heard of grade yearlings selling for $18 and $19 as breeders. Market prices were correspondingly high, and lambs sold at $9 and $10, while before the war they were bringing about $5.

This year's prices would be ridiculous for peace times, and a big drop must be expected. The Government stopped appraising wool at the close of the war, as it has a stock of about 300,000,000 pounds on hand which is estimated to last at least fourteen months, so wool also will drop in price.

But the point we want to make is that even when normal prices are resumed there will still be good money in sheep. A flock should be kept on almost every farm to clean up the waste, and in proportion to the cost of feeding them they will prove the best money makers on the place.

HOGS STILL GOING STRONG.

The hog has been in the limelight more during the past year than any other farm animal, chiefly because of the open discussion regarding marketing conditions. Hog raisers have been emphatic in their demands for better marketing facilities, and while all of this agitation will probably lead to better methods, still at the present prices of feeds and hogs the latter can be marketed at a satisfactory profit.

The Food Administration has established a Chicago minimum of 17½ cents, and the 1-cent differential on this Coast will be maintained, thus making the Coast price 16½ cents at terminals. This is for hogs weighing over 150 pounds, and does not include stags, boars, thin sows and skips. San Francisco packers state that they expect this minimum to be maintained for many months, and they do not see any reason for a drop in hog prices for a long time.

Certainly there is no danger of an over-production. On January 1, 1914, we had 797,000 hogs in the State. In 1917 the number had increased to 994,000, but on January 1, 1918, the number had dropped back to 974,000. We have no figures to show the number now on the farms, but while the Government asked for an increase of 15 per cent we believe that hogs did not hold their own during the year. Feed was high last winter and only about 50 per cent of the usual number of sows was bred for spring litters. Probably a larger percentage was bred for fall litters, and after the big drop in barley a still larger number was bred for next spring's farrowing. Since barley went down and the fall rains came on there has been a very heavy demand for breeding stock, and especially for bred sows. The year 1919 will see many more hogs in the State, but packers say that they expect to be able to handle all that are offered, and at prices that will mean a satisfactory margin of profit to the raisers.

GOOD HORSES STILL NECESSARY.

In 1914 there were 498,000 horses in the State, valued at $100 each. On the first of this year the number had dropped to 468,000, and the price to $98. Probably there has been a still greater drop during this year, and while it may safely be said that the day of the small horse has gone, it is pretty certain that there will always be a place for the good draft horse.

It is useless to deny the value of the tractor. Under favorable conditions it may do most of the work on some ranches, but weather conditions often preclude its use, and in irrigated sections many farms are so interset by ditches as to make the tractor's use impossible. To insist that the tractor can entirely replace the horse is not justified by conditions or facts, and the well-bred, heavy draft horse will always be "sure of his job."

In 1912 there were 1957 registered stallions in the State. The 1918 report shows only 590, or about 30 per cent of the number in 1912. Probably we don't need so many as formerly, but as 20.5 per cent of those registered are classed as mongrels, cross-breds or non-standard, the number of real good registered stallions is getting dangerously low, and the tide should begin to turn.

BIG DEMAND FOR REGISTERED STOCK.

With the signing of the armistice between the Allies and Germany has come a rebound in the livestock breeding world that is astonishing even the most optimistic breeders. Top prices, average prices and group prices show a confirmation of our oft-repeated statement that after the war we would see the greatest demand for breeding stock ever known.

For some time we have been keeping our readers posted on Eastern sales and it will be remembered that records have been broken almost with the speed of a rapid-firing gun. Here in California breeders report an unprecedented demand for stock. Many are sold out and booked ahead; some are increasing their herds in order to supply the demand.

At the Liberty Fair the demand for breeding stock was phenomenal. One beef cattle breeder from Kansas City brought out 12 head of bulls and sold 10 at an average of about $1,100 each. Another beef cattle breeder booked orders for 30 bred heifers. An offer of $2,500 was refused for a yearling boar, and one firm made sales of hogs amounting to $14,500, and, to cap the climax, a Wyoming beef cattle concern booked orders for 130 heifers and five bulls.

That's the way things are going. The breeders who hung on are reaping their just reward for perseverance, and those who go into the game now will not be too late to win their share of the prosperity that is coming to every rancher who plays the game in the right way. It is no time for wild, reckless plunging, but the man who uses conservatism and sound judgment will find livestock raising the biggest profit-making proposition that looms up on the agricultural horizon today.

GOVERNMENT GIVING REAL ASSISTANCE.

He won't have to play the game so much alone as has been necessary in the past. Government and State agencies will work for him and with him. Permanent Government control of both packing houses and stockyards is being recommended by Secretary Houston. Stockyards at Los Angeles are promised at an early date, and probably San Francisco will fall in line soon.

Counties included in the California farm bureau system now cover 85 per cent of the farms of the State. Farm bureau sales are bringing farmers higher prices for their hogs, and feed is being bought at a considerable saving. Also the farm advisors are giving the farmers much valuable assistance.

Government and State have joined in fighting tuberculosis, hog cholera and other animal diseases. Losses from cholera have been reduced more than 50 per cent, and to encourage dairymen to have clean herds an accredited list is being published giving all herds that are free from tuberculosis.

A mill feed law will probably be passed at the coming session of our State Legislature, so that buyers will know what they are getting and will get what they pay for. Also, probably a law will be enacted that will put a crimp in the making and selling of oleomargarine as a substitute for butter.

During this period of readjustment many of the problems which have been vexing farmers will be solved; many of the obstacles in the way of successful livestock raising will be removed. The coming year will see great advancement along many lines. It is going to be the greatest year for livestock men in the history of the State. The signs of Great Prosperity have never before been so evident. Rainbows, rainbows everywhere.

California's Farm Production Over $1300 per Capita

Figures Complied by H. E. Pastor

CALIFORNIA CEREAL AND FIELD CROPS.

The tabulations below are compiled from the most reliable data available at this time. The figures for 1918 are the preliminary estimates only, but will be found to vary little from the finals. On a few of the commodities nothing like dependable data could be obtained, and the figures given express approximations only:

BARLEY.

Year—	Acreage	Production (bushels)	Price	Value
1914	1,402,000	42,060,000	$0.59	$24,815,000
1915	1,306,000	39,440,000	.62	24,453,000

HOW A COVER-CROP STEALS MOISTURE

Henry Wheatley, a well-known fruit-grower of Napa county, keeps his orchards in a very high state of fertility by applications of manure and by cover cropping. He has a heavy crop of green stuff to turn under practically every year, and believes in getting it plowed in early, if possible. It is not always possible, The writer saw a very heavy crop of vetch and barley of his, between the rows of a 3-acre apple and peach orchard two years old. It had been an old horse corral and the ground was rich enough to use in a propagating shed. The crop we saw last spring was the result of 40 pounds of vetch and ten pounds of barley seed to the acre, and yet as hay it would have yielded four tons to the acre. Mr. Wheatley cut one-half of this crop green and fed it out to horses, after which the ground was immediately plowed and worked down. The other half of the crop was allowed to mature (as there was too much of it to use green), and after it had been mowed and hauled off the ground was thoroughly irrigated, then plowed and worked down along in April and later irrigated.

This is one demonstration, and it seems to be a valuable one, of the fact that results do not show that irrigation can replace winter storage of moisture. At least in this class of land, which is a strong alluvial clay loam of great depth. When the writer saw the young trees with the cover crop growing amongst them last spring they were very even in size. Today, at the end of the growing season, the trees where the crop was cut green and the ground plowed early are fully four times the size of those where the crop was matured. Both on identically the same land and having the same care after May first. This is an example worth seeing and is especially valuable to those men who insist on maturing their cover crops before turning under.

We have some more cultural examples to buttress our principle of early plowing—especially where irrigation can only be light or is not practiced at all. These examples will be reserved till plow time approaches and interest is centered in the work at hand. A couple of months from now will see a pretty general scouring of plow shares amongst orchardists.

Today (Dec. 16th) we noticed a number of fruit men plowing in the neighborhood of Santa Rosa, where there was a heavy growth of mullen and mustard which was yellow with bloom. Those heavy crops will be rotted in a month if turned under now, and there is every likelihood of a second growth to be turned under in March. At any rate those tough old weeds will not have a chance to get woody and interfere with the functions of the mulch next spring. And the ground will be in better shape to absorb the rainfall.

Squirrel Eradication Saving to the State

[Written for Pacific Rural Press.]

A report has been made by the County Horticultural Commissioners through the State Commission to the Insecticide and Fungicide Laboratory at Berkeley.

We gather from this report, through the courtesy of Prof. Geo. P. Gray, in charge of the Laboratory, that approximately 625 tons of poisoned barley were distributed in the State of California during the year immediately preceding June 30th, 1918. The average cost per ton was $350.00 or 17½c per pound, an estimated total amount of $218,750.00 being expended for poisons, other materials and barley during this period.

It is generally conceded that about 1 pound (1 qt.) of poisoned barley is sufficient for 40 baits, i. e., enough to poison 40 ground squirrels, or 80,000 baits to one ton. From records of the United State Biological Survey, for years engaged in the eradication of ground squirrels on government lands, National Forests and Public Domain, of the Rodent Control Division of the State Commission of Horticulture, in charge of ground squirrel eradication on state and school lands in California, we find that approximately 1 lb. (1 qt.) of poisoned barley is sufficient to poison 5 acres. Due to the fact that these records were mostly obtained on rough range lands, an adjustment of this estimate should be made to suit conditions prevailing on private properties over which the major portion of these 625 tons were distributed, to read 1 pound (1 qt.) poisoned barley to 2½ acres. Presuming that this contention is correct, we find that on this basis 1 ton would be sufficient for the control of ground squirrels on an area of 5,000 acres. As previously mentioned, 625 tons were used in California, which at 40 baits to the pound, or 80,000 baits to the ton, would mean 50,000,000 baits, or eradication completed over 3,125,000 acres.

Again: If for the sake of argument we contend that only one bait in ten was effective, in other words, destroyed a ground squirrel, the 50,000,000 baits would have accounted for at least 5,000,000 of the pests.

According to Prof. R. L. Adams' figures, squirrels on agricultural land destroy grains and other crops to the extent of $1.50 each per year. Squirrels on pasture and range land destroy feed valued at 25c each per year, or a mean average of the two of 75c per squirrel per year.

At least 5,000,000 ground squirrels doing 75c damage annually or a total of $3,750,000 were destroyed by the use of 625 tons of poisoned barley at a total cost of $218,750.00, allowing at net saving to the State of $3,531,250.00 by Rodent Control operations during the past season.

WHY DO WE "KNOCK" TEPARIES?

A subscriber objects to the "knocks" we have been giving tepary beans. It is not our fault that consumers and dealers do not want them. We merely state the fact because it is our business to keep our readers informed. We would hate to lead anybody to plant teparies next year. We have suggested that some agency such as the Bean Growers' Association might put on an advertising campaign that would teach consumers how to cook them properly. Then if teparies were sold to consumers as "teparies" and not as "small whites," a market might be created for all that would be grown where other beans would not thrive.

"THE BEAN IS THE BEST."

Winter Spraying Is Now On

And the growers who are cleaning up their trees are now the growers who are going to have the big crops—the good fruit—and the long profits at harvest-time next year. You can tell the growers who spray and those who don't by their profit balance at the end of the season.

Get a Good Sprayer

The Bean stands up to the work day in and day out—driving the material on at heavy pressure—and requiring no attention except to start and stop! Our catalog tells all about the many distinctive advantages are built into the Bean Sprayer

SEED POTATOES

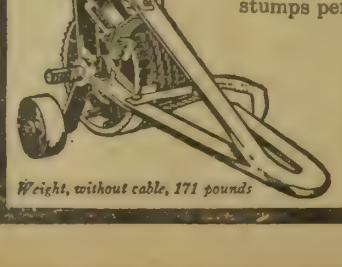
We specialize in selected SEED POTATOES: Certified White Rose, American Wonders, British Queens, Burbanks, Garnet Chilis, and other varieties. Also fancy, recleaned Alfalfa Seed. Write for prices.

WM. A. CURTIS & CO. = San Francisco, Cal.

Stop Wasting Money On Your Stump Land
Turn It Into Dollars

GRASP the OPPORTUNITY and put DOLLARS in your pocket by clearing your stump land. Stump land was never so valuable as it is TO-DAY. The "K" Stump Puller will do the work in less time and the least expense. Cost just about ½ of a horse power machine and about ¼ of the cost of dynamite. One man or woman with a "K" can out pull 16 large horses. One person single handed can pull from 50 to 150 stumps per day.

HAND POWER
K Stump Puller



Weight, without cable, 171 pounds

No stump too big for the "K"

works by leverage—same principle as a jack—one man can lift or pull 48 tons alone. Works easy as rowing a boat. Works on hillsides or marshes where horses cannot operate. Has 2 speeds and weighs 171 pounds. Made of the best steel. Absolutely guaranteed against breakage. Endorsed by U. S. Government officials. Highest bank references.

Send for my special offer and free book on Land Clearing

Horticultural Jottings

The death of County Horticultural Commissioner A. H. Taylor of Lassen is reported, on December 5th.

If this season's plantings equal those of last year, California will boast one million acres in fruit in 1919.

Imperial county is launching out in the production of grapefruit. She has 72 acres in bearing and 446 in non-bearing.

In the berry districts $36 a ton was paid for picking shipping stock this year and $28 a ton for picking canning stock.

From what we learn, this will be about the last year when paper trays will be used for drying raisins, except in an emergency.

The improvement in our system of county roads and highways will bring more cherry land within profitable reach of the markets.

H. G. Keesling has presented several pounds of the Keesling walnuts to the San Jose Chamber of Commerce to be placed on exhibition.

Miller & Gobbe's evaporating plant at Sebastopol is closed for the season. This firm packed and shipped 30 carloads of apples this year.

Imperial county seems to be launching out a bit in her grapefruit acreage. She has 72 acres bearing and 446 acres not yet bearing.

Plowing of orchards is already going forward where the weed crop is heavy. Much mustard is in bloom and this is being turned under near Santa Rosa.

The cold, snappy nights and white frosts lately have done very little damage to citrus fruit crops of Sutter county, most of the fruit being well matured.

H. C. Hauck of Kelseyville has 200 young Comice pear trees just commencing to bear. He reports a yield this first year of 60 boxes of fine, large fruit, which he sold at $3.50 a box.

The largest single order ever placed with a California nursery was that of Howard Reed, who has purchased 55,000 pear trees to be planted on his 500-acre ranch, which lies along the Yuba river, near Hammonton.

F. P. Roullard, Horticultural Commissioner of Fresno county, recently conducted a squirrel drive over a large section of his worst infested territory. A levy of 2 cents an acre was made to pay for the poison.

Sixty-two carloads of cantaloupes were shipped from Ripon the past year—a good beginning. San Joaquin county also shipped 2,706 cars of table grapes and 896 cars of wine grapes to the Eastern markets—happy New Year!

Orange Cove is packing and shipping oranges in earnest. Four boxes of oranges from this section took first prize recently at the Liberty Fair in Los Angeles. It was shown as a part of the Fresno County Chamber of Commerce exhibit.

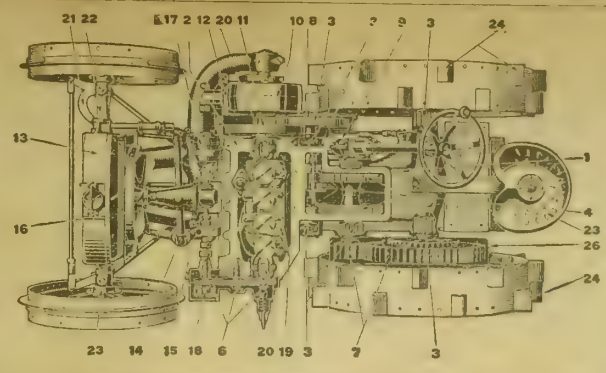
A successful grower volunteered the expression last week to the writer: "If ever, for any reason, my Marketing Association should cease to get the support from members necessary for its successful operations, I should get out of the business while the 'getting' was good."

The Elderwood packing house, near Woodlake, has shipped about 30 carloads of navel oranges for the season. The house will continue in operation for lemons and grapefruit. The latter is expected to furnish 20 carloads, after which will come the crop of Valencia oranges, which is expected to mature much earlier than usual.

As a result of examination held at Redding on November 29th, to fill vacancy caused by the resignation of Mr. Geo. A. Lamiman of Anderson, Mr. B. F. Stroup of Happy Valley has been appointed. Mr. Stroup is a well-informed young man with just those sterling characteristics that should make him a valuable asset to Shasta County, and we are assured that he will have the hearty co-operation and encouragement of horticultural interests in his jurisdiction.

Key to Plan View

1—One-Piece Main Frame—Holds all shafts, bearings and gears in proper alignment.
2—Motor Set Crosswise—Eliminates bevel gears, worm friction or chain drive.
3—Hyatt Roller Bearings at all important places.
4.—Cut Steel Gearing in transmission.
5—All Cut Steel Gearing between crank shaft and gear box.
6—All Cut Steel Helical Timing Gears.
7—Forged Cut Steel Master Gear and Bull Pinion with differential (fully enclosed).
8—Oil-Tight Housing for all gears between crank shaft and transmission.
9—Worm and Sector Steering Gear, enclosed.
10—Clutch Pulley on crank shaft.
11—Fly Wheel—Next to main bearing (normal speed 1050 R. P. M.)



Key to Plan View

12—Brake for belt or road work.
13—Cast Frame, 5-piece, Army truck type, non-clogging Radiator.
14—Sylphon Thermostat.
15—Centrifugal Pump.
16—Spiral Gear-Driven Fan; gears enclosed.
17—Dust Proof High Tension Magneto.
18—Speed Governor enclosed.
19—Pistons—Diameter 3¾ in. Stroke 5 in
20—Main Crank Bearings, 2¾ x 4½.
21—Steel Steering Knuckles.
22—Drop Forged Front Axle.
23—Dust Proof Hubs.
24—Detachable Tire Lugs—other styles furnished if ordered.
25—Spring Seat.
26—Dust Proof Housing for final drive.

Study This Chassis
of the Case 10-18 Kerosene Tractor

ABOVE we show a plan view of the Case 10-18, with an explanation of the details. Study this chassis—note its features.

In many ways, you will find the Case 10-18 far in advance of today's usual offerings. For instance, it is the first to offer a one-piece main frame with a four-cylinder motor, mounted cross-wise. This is merely one of the dozens of betterments. The one-piece frame casting constitutes a dust-proof housing for the rear axle, bull pinion shaft, transmission and the bearings for these parts.

This type of construction brings rigidity, reducing vibration, preventing disalignment. Power is conserved, while we multiply strength.

The belt pulley is mounted on engine crank shaft, doing away with bevel gears. It is part of the tractor—not an extra-cost accessory.

The Case Sylphon Thermostat insures complete combustion of gasoline or kerosene, and prevents raw fuel from passing by the pistons and diluting oil in the crank case.

The Radiator has a cast frame. The Core is copper—fin and tube non-clogging type.

A Case air-washer prevents grit or dust from getting into the cylinders.

These are but a few of the greatest advancements in tractor history. Case offers you today, NOW, what others will attempt later on.

The Case 10-18 is rated according to the conservative Case policy.

It develops nearly 14 horsepower on the drawbar and about 24 horsepower on the pulley. Thus we insure abundant reserve power.

Our booklet and specifications point out dozens of other advancements, all of which demand your consideration before you buy.

Write to us today for a copy. Or visit a Case dealer.

PERPETUAL CROPPING FOR COWS.

A mixture of barley and vetch planted just after the first September rain by a well-known San Mateo county dairyman was about two feet tall when he began cutting for green feed about the first of November, though the vetch had not thrived greatly. He continued cutting across the field, as feed was needed, and six weeks later the first strip cut was ready again. By mid-March he expects the grain to be four feet tall and it will be siloed. The ground will at once be planted to Indian corn to refill the silo when the barley and vetch are gone.

MORE AND BETTER POTATOES

Always on the alert for something better, some aid to agriculture, Aggeler & Musser Seed Company endeavored to grow potato seed perfectly free from disease, with only partial success; therefore, to make success complete, they have installed a large vat for the purpose of dipping all potato seed into a solution of Corrosive Sublimate, which will destroy the diseases of scurf and Rhizoctonia, making clean seed, which will produce 25 per cent more and better potatoes. This innovation is a great boon to potato growers in Southern California, where it is so much needed.

Here and There in the Fruit Business

(Written for Pacific Rural Press.)

Cross-fertilization of Wickson Plums.

As we have been asked twice lately as to the cross-pollenation of the Wickson plum we have been making special inquiries in our travels to find out if any new combination had been found. So far as we can learn no definite experiments have been yet made or published as an improvement on the Climax as a cross-pollenater. That and the Santa Rosa are used in Tulare county. James W. Mills. Farm Advisor of Solano county, has a tree that is half Climax and half Wickson which is loaded with fruit every year and has to be thinned. This is near Marysville. L. K. Marshall of Lodi has a Wickson plum among Tuscan Clings which he says bears every year. J. H. Clancy of Acampo said that on the Buck place, there used to be five acres of Wicksons and they were taken out some years ago because they did not bear, lacking a pollenizer. If any grower has found out an improvement on the Climax as a cross-pollenater of the Wickson, we would be glad to hear from him with definite figures of results.

To Save Waste in Grapes and Fruit.

The Contra Costa County Farm Bureau has adopted resolutions calling for the broadening of the work of the Viticultural Laboratories at the University of California.

It points out that increasing quantities of fruit are wasted each year that might be utilized for by-products and asks that the Board of Regents appropriate in its budget the necessary funds to carry out the work in the laboratories. Owing to Congressional legislation, there may be half a million tons of grapes next harvest for which no outlet is in sight. Other problems are also pressing including rain-damaged prunes or raisins and small or inferior fruit which might be made into jams, marmalades and other by-products if methods can be devised and demonstrated by the laboratories.

A Feather in Our Cap.

The French Minister of Agriculture has established an Insectory at Mentone, after plans and specifications furnished by the California State Commission of Horticulture. A recent French Bulletin that the methods formulated by our own State Insectory in the rearing and distribution of beneficial parasites have been adopted by the French Society for the Study of Agriculture at Bordeaux. A number of these insects have been furnished to the French government by the Sacramento Insectory in the past, but the increasing menace of the cottony cushion scale in Southern France made it desirable that quantities of its natural enemy—the ladybird (Novius Cardinalis) be available.

This Seems a Good Cross for Robes.

On the old Buck and Corey place at Acampo there is an orchard that is said never to miss bearing a crop. It consists of four rows of Robe de Sargent prunes and four rows of Tragedy prunes planted in alternate groups. J. H. Davis is the manager of this place. Another orchard of Robe de Sargent prunes that is a regular bearer belongs to J. H. Clancy of Acampo (formerly manager of the Buck and Corey place). He has 45 acres 24 years old that is chiefly Robe de Sargent, but it has several different varieties dotted about throughout the orchard, evidently enough for cross pollenation, for Mr. Clancy averages one and a half tons of dried fruit to the acre.

Avoid Injury by Field Mice and Rabbits.

It has been found that field mice do not attack young trees when the grass is kept away from the trunk. Keep a space hoed away around the young tree a foot and a half from the stem. Field mice generally avoid tunneling in ground that is bare of weeds and grass unless they are after peas and other seeds, but make no passageways where the ground is exposed.

Where rabbit fence does not surround a rabbit-infested orchard a good alternative is a protector made of half-inch mesh wire netting 24 inches high. This can be left on several years and will not interfere with the sun protector.

Grafting Over an Old Fig Tree.

An old White Pacific fig tree has been grafted over to Black Mission and White Adriatic in the Fly District of Napa, by Morton Duhig and H. J. Baade, Farm Advisor of Napa county. Mr. Baade reports 100 per cent stand of grafts, 16 scions were put in on the first of June, 12 at the end of June and two the latter part of July, every one of which started and thrived. The scions grafted on June 1st had fruit setting on October 20th. The stubs have been well sealed to protect them from fungus injury.

Orchard Conditions in Solano County.

James W. Mills of Solano county reports that quite a number of cherry trees died this year in his county—probably 5 per cent. The rains, however, have put the orchards into good condition and the buds are in good shape, giving promise for next year's crop. He says that many prune trees that had been grafted on old almonds have died this year and instanced one man who will lose three-fourths of his 12-acre orchard.

Peach Orchard Worked to Prunes.

George Ellicker of Coombsville (Napa county), worked over 700 six-year-old peach trees to French prunes three years ago on the writer's recommendation. Mr. Ellicker was a novice at the work, but by careful detail and watching of his grafts he had only one missed tree and practically all the unions are now grown over. This (third year from grafting) he harvested seven tons of green prunes which ran 47. From the 12 acres, he this year sold $1,400 worth of grapes which are interplanted. We were well pleased to see his successful young stand last week.

In Defense of the Grape Industry.

Theodore Bell, who has been to the National Capital as the representative of California grape growers, has just returned. He went to look over the situation to see what action should be taken to preserve this great industry. Bell said that he will bring an injunction suit to test the constitutionality of the Presidential proclamation forbidding the sale of alcoholic liquors after July 1, 1919. Beyond this he disclosed no plans.

Pear Blight and Thrips.

In the Rogue River Valley of Oregon a campaign is being directed against pear blight by spraying against Thrips, which are considered most active in disseminating pear blight. The spray used is Black Leaf 40 degrees—1-800, and distilled oil emulsion of the strength of 1½ per cent as already recommended by our own State Commission of Horticulture.

California Dried Fruit in Northwest.

Twenty carloads of California prunes and fifteen carloads of our dried peaches were handled last season by the Tri-State Terminal Co., which is owned by the Northwestern Farmers' Union, covering the States of Washington, Idaho and Oregon, according to President A. A. Elmore.

Dead Leaves Are Valuable.

Based on prices now demanded for fertilizers, 100 pounds of leaves contain fertilizing elements which would cost 56 cents if purchased in chemical fertilizers—besides the humus, add some acid phosphate to get the best results from them.

Fred K. Howard, Horticultural Commissioner of Kings county, reports that he has a squirrel free district ready for inspection. He also states that ten residents of the district will substantiate his claim, so that there is no doubt as to his ability to qualify at any time the Rodent Control Division is able to make the necessary inspection. It seems as if Mr. Howard is to be the first commissioner in the State to have a district officially declared squirrel free.

PLANT TREES

BECAUSE—

—Your raw land should be improved.

—Trees greatly enhance the value of your property.

—Our country needs greater fruit production.

—A fruit bearing orchard will furnish a perpetual income to yourself and family.

Why Buy Our Pedigreed Trees ?

BECAUSE—

—Our seedling stocks are properly selected.

—Our buds are taken from Record Bearing Orchards.

—Our trees are scientifically and intelligently budded.

—They are dug by improved methods which preserve a good root system.

—The climatic conditions of Fresno cannot be excelled for the production of well-matured trees.

—We accurately grade all our stocks. This insures uniform trees.

—In handling and packing our trees receive the most careful attention. They reach their destination in perfect condition.

You will want our big 1919 illustrated Catalogue and Price List—brim full of interesting and helpful information to the orchardist. It describes in detail all well-known varieties of deciduous, citrus and ornamental trees, vines and roses.

Free on Request.

The War Is Won

But the consumer of Food
Must Still Economize

and the producer of Food
Must Fertilize

The Food Administration is at this very time warning our people of the danger of any let up in the economical use of food.

While food will be needed next year more than ever, there are thousands of acres of valuable land idle as a result of the war. Therefore every acre under cultivation must be made to produce its utmost.

Just as our soldiers must be well fed to make them efficient, so the soil must be well fed in order to make it produce larger and better crops.

GOLD BEAR
FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

FOR CALIFORNIA SOILS

A MILLION DOLLARS TO PEACH GROWERS.

Three months' notes, given to peach growers as part payment on their crop by the California Peach Growers, Inc., are now due and the peach company is handing out checks that will aggregate a million dollars. The notes bear 7 per cent interest, but expire at the end of three months. The company does not need the money and is urging members to exchange their notes as soon as possible. The first year of the existence of this co-operative company it was glad to have the growers leave their money to assist with the financing. But the growers' organization is now well on its feet and does not need these additional funds. The above is part of a three-cent payment made on the peaches this fall. Growers will net about 11 cents a pound this year. Quite a change from a few years ago, before the peach growers organized. More power to them and success to the coming season.

HIGH-GRADE OLIVES AT OROVILLE.

L. W. Pray reports as follows: I will quote you grade of a ton of olives taken from the Moore ranch, just out of Oroville, as follows: 44 lbs., 10-16; 270 lbs., 11-16; 783 lbs., 12-16; 655 lbs., 13-16; 192 lbs., 14-16; and 56 lbs., 1 inch and over; no oil stock or smaller sizes than the above. This grade was compiled by W. Winser, manager of the Pacific Coast Products Co., which has leased the California Olive Growers' Association output and plant for two years. I saw these olives and will verify the grade, actually the finest fruit in olives I ever saw. Mr. Moore claims they are a special Mission variety and an early ripener, and I am satisfied that they are properly handled in the way of constant fertilizing and cultivation. We have the finest crop of olives here this season we ever had as regards size and quality.

PROPAGATION OF DATES.

Bruce Drummond, in charge of the U. S. Department of Agriculture experiment station at Indio, Cal., is forcing the growth of date offshoots by "plunging" them in a forcing bed consisting of one and a half feet depth of manure, covered with one foot of earth. The forcing house now in use is of canvas and the heat thus generated, together with moisture and plant food supplied, induces such a rapid and vigorous growth that offshoots cut from the parent tree in the spring are ready to plant out in the grove in the fall and will begin bearing dates four years thereafter.

There are about 1000 bearing trees of the original stock, according to Horticultural Commissioner D. D. Sharp. Offshoots are taken till the trees are about 10 years old—about nine or ten offshoots from a tree.

NURSERY STOCK MOVING.

Arthur E. Beers, Horticultural Commissioner of Merced county, sends the following report:

Kirkman's nursery at Athlone, Merced county, is busy digging over a million deciduous trees. The soil is just right for digging, but there is no surplus moisture for healing in. The trees are tied by the same man who lifts them from the ground, and the roots at once laid in a deep furrow, the trees inclining at a sharp angle. A ditcher throws freshly plowed moist soil over the roots and trunks. The broad wheel of a light tractor packs the soil on the roots, and the ditcher following, throws more loose soil on top. In no case are the trees out of the ground an hour. The trees so far dug show only two trees in a thousand affected with root knot. The trees show a fine, stocky, even growth.

In figuring on alfalfa irrigation, it is well to remember that loss of water by evaporation through the plants themselves in a well-developed field is greater than evaporation from an open water surface, as stated in a report of the Arizona Agricultural Experiment Station.

THE BASIS FOR ORCHARD PERFECTION — THE CROW TREES — TRADE MARK

MR. PLANTER:

The coming season promises to be the most favorable in many years for orchard planting. With such a season and

FIRST CLASS TREES

a successful start for a profitable orchard is assured. WE GUARANTEE OUR STOCK—BETTER CANNOT BE HAD ANYWHERE AT ANY PRICE.

OUR SPECIALTIES:

FRENCH PRUNES on all roots, grown from carefully selected bearing trees, unsurpassed for size and quantity of fruit.

PEAK'S CLING PEACH, in great demand by canners; ripens between Tuscan and Phillips and is fully equal to those old stand-bys in quality and productiveness.

KNOBEL APRICOT, an improved Blenheim; larger fruit and a heavier, more dependable bearer.

JAPANESE PERSIMMONS "Made in America." These home-grown trees live as readily as other fruit trees and are **true to name**; of the imported trees the few which live are usually untrue.

A FULL LINE

of all that is best in Fruit, Nut and Ornamental Trees, Vines and Plants; and our prices are very low as compared with other commodities. Write for our Price List; free.

Made in the west for western conditions

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

Western soils, stumps and climate need western explosives. That's why Giant Farm Powders cut the cost of clearing western land. Manufactured for more than half a century especially for the West, they naturally give better results on western farms and orchards.

Giant Farm Powders lead in economy because they go further than ordinary explosives. They break up the stumps thoroughly thereby cutting down labor cost. Money and trouble are saved because of their low freezing qualities.

Warning: If your work is done with any other powder or dynamites, the chances are it will not be done as well as with either of the two Giant brands: Eureka Stumping or Giant Stumping. Look for the Giant trademark on every case, and be sure of the genuine,

How to make the farm pay more money is explained in "Better Farming." This big free book, fully illustrated, will be sent you as soon as we receive this coupon.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Better Lady Washingtons.

Several sacks of good looking Lady Washington seed beans were obtained in 1917 from Stockton by L. C. Quimby of Stanislaus county, and sold to farmers in his territory. They proved so superior, according to Farm Advisor A. A. Jungerman, that he urged these people to save their crops from this seed to plant in 1918. This season again showed their superiority. About 1000 sacks were raised this year. Vine growth was not so heavy as in the old strains, they had a heavier setting of pods, the beans are heavy, plump, and matured ten or twelve days earlier. One man's crop was observed with regard to moisture after the rains. The old strains had absorbed much and were soft, while the new kind were hard and dry.

Alfalfa Waxes After Waning.

As a more or less accurate indication of what happened in dairy counties of California in 1917-18, Stanislaus county, which had 117,906 acres of alfalfa in 1917 according to the county board of trade, had only 60,602 acres in 1918. Though alfalfa was plowed up and cows sold in order to raise beans and barley, sentiment is swinging the other way now; and unless the latter crops are moved at high prices before spring, a great additional acreage of alfalfa will be sown. Local seed dealers last fall sold three times as much alfalfa seed for fall planting as they did the year previous. Local dairymen have quit selling cows and are buying at advanced prices.

Expectations From Gyp Corn.

To the Editor: What should I realize from one-third share-rent on 40 acres of gyp corn grown on rather light soil well irrigated?—E. J. W., Escalon.

A yield of 8000 pounds threshed per acre is reported from within 30 miles of your ranch, but half that is a good yield. What the price will be, nobody knows, but unless you put hogs on the ranch to market your crop, it may not be worth over $2 per hundred by that time.

7,000,000 Tons of Seed Planted.

American farmers plant upward of 7,000,000 tons of seed per year, most of this being wheat, corn, cotton, etc., according to the U. S. Department of Agriculture. If seed were selected enough more carefully to add one pound of yield per ton of seed planted, the crop would be increased by 7,000,000 pounds!

Wheat Matured Before Barley.

Early Baart wheat planted last February by T. A. Owen of Stanislaus county yielded 18 sacks per acre and was followed by Lady Washington beans, which yielded 12 sacks per acre. The beans were planted in mid-June. Mr. Owen's neighbor planted barley a week before the Baart was planted, but the barley matured later than the wheat.

Oats and Barley for Livermore.

Two carloads of Texas oats and two cars of Chevalier barley from Salinas have been shipped into Livermore by the Independent Warehouse Co. for seed. The acreage of these crops in Livermore Valley will be greatly reduced by the extra wheat planting.

Potato Shortage.

Storage for potatoes should be dark and cool as possible without freezing. This will avoid sprouts and greened potatoes and will minimize the spread of rots.

Agricultural Notes

Early Baart wheat was harvested as grain last season in time to follow it with a bean crop in Stanislaus county.

Four tons of threshed gyp corn per acre sold before the rains at $77 per ton is reported of O. H. Perry in Stanislaus county.

Yolo county had a light yield of alfalfa because in many places they had no irrigation up to July 1 and a great deal was allowed to go to seed.

The hay market has been depressed by the sale of damaged hay coming by boat to San Francisco. But when this is cleaned up, prices should be better.

While a great deal of hay was spoiled by early fall rains, J. S. Bomberger of Stanislaus county figured that the alfalfa grew enough more to make up the loss.

Over four tons of threshed dwarf milo per acre are reported by Stanislaus Farm Advisor A. A. Jungerman to have been made by C. Thoresen in boys' club work at Patterson.

Support of labor organizations is pledged for the proposal to establish county experiment stations for deciduous fruit, as advocated by the Farmers' Union for many years, according to Secretary Fred Millard.

Last year a personal canvas of all Stanislaus county farmers showed there were 6008 acres of wheat. This year on December 5 Farm Advisor A. A. Jungerman stated that nearly 45,000 acres had been signed up.

Seed wheat trade has been far in excess of normal in the territory served by the Grange Co. of Stanislaus county, according to A. H. Turner. Seed oats and barley began to move to planters about the first of December.

Nowhere near normal alfalfa acreage has existed in Stanislaus county the past year, according to J. C. Loomis of the Bomberger Seed Co. But farmers here are learning that they can't compete with the Delta on beans and are consequently planning to sow alfalfa.

The farmers of the Haywards district have been organized as the California Pea Growers' Association. They plan to sell their product direct. At present there are approximately 900 acres under control of the association.

To protect cotton growers from the pink boll worm and other insects injurious to the cotton crop, large houses into which freight cars may be run will be built in several Mexican border towns and smaller ones for the fumigation of trucks and wagons.

The farm value of the 1918 corn crop in the United States was over $3,500,000,000, wheat almost $2,000,000,000, hay and cotton over $1,500,000,000 each, and oats over $1,000,000,000, according to the U. S. Bureau of Crop Estimates.

California has 34,000,000 acres of public domain, but the amount which could be turned over to returning soldiers for homesteads and other purposes has never been determined, according to a late announcement from the United States Land Office.

The Sunical Packing Company of Oroville intends to add a substantial extension to its canning plant. String beans will be added to its products next year. At the present time it is packing spinach, pumpkins, olives, tomatoes and peaches, salad oil and tomato paste.

Normally 150,000 sacks of grain are stored in Livermore warehouses, according to E. G. Wente of the Independent Warehouse Co., besides what is shipped out during the summer. This season there are only 1000 sacks and these are from one farmer who operates five ranches.

Out of a total of 73 incendiary forest fires in this State during the past year, at least 50 per cent were kindled by members of the I. W. W. and German sympathizers, according to statistics given out recently by R. F. Hammant, forest examiner, and C. V. Brereton of the arson squad of the United States Forest Service.

The Natomas Orchard Company, which has over 1000 acres of olives and citrus fruit near Folsom, took 45 tons of olives from 40 acres of six-year-old Manzanillos this year, worth $175.00 a ton, orchard run. A 20 acre olive orchard, 10 years old, yielded three tons to the acre, and a 15 acre orchard 9 to 10 years.

Monarch Cultivator

KILLEFER QUALITY

KILLEFER EFFICIENCY

The Killefer Monarch Cultivator has more varied uses on the ranch than any other tool we manufacture. As a Beet and Bean Chisel it has no equal. As an Orchard Cultivator, where deep cultivation is desired, it gives perfect satisfaction.

As an Alfalfa Cultivator, when fitted with our Special Alfalfa Tooth, it does excellent work, loosening the ground to a depth of from six to eight inches without injuring the stand. This deep cultivation enables the water to percolate to a greater depth than any cultivator on the market.

Order a Monarch and make us prove our statements.

MADE IN 5, 6, AND 10-FOOT SIZES.

The Name Guarantee a New Industry

[Written for Pacific Rural Press.]

George C Husmann, pomologist in charge of viticultural investigations says that the United States Department of Agriculture has successfully demonstrated that Zante currants (the currants of commerce) can be profitably grown in California, paving the way for the establishment of another very important and extensive grape industry.

An exceedingly important matter is that currant grapes are among the earliest grapes to ripen; so early that they can be dried and warehoused before the earliest rains occur even in districts where other raisin varieties are too late in ripening. In Fresno and other raisin sections, they can be dried and stored by the time other raisin grapes ripen so that the same labor can be employed to harvest both crops. Professor Husmann says that they should be grafted on resistant stock suited to the soil. To set a good crop of fruit, the vines need girdling at the proper time. The crop ripens from July 15 to August 15.

Mr. Husmann says that the government is ready to make distributions to growers of a supply of cuttings of the currant that is considered the only variety that should be grown. Requests for these cuttings should reach George C. Husmann, Pomologist U. S. Department of Agriculture, Washington, D. C. Not more than a four-pound package, including packing, may be sent, so in the letter of request to Washington, applicants are asked to state their willingness to pay express charges. The cuttings themselves will cost nothing.

Pear Market and Latter Conditions

Prices on pears early in the season were good. Many shipments at the midseason disclosed a distinct loss to growers, while high prices reigned at the end of the season. The losses at midseason did not result from glutting of the markets, but from delay in transportation and in insufficient icing, we understand. Owing to war conditions, claims are being made against the Railway Administration for such losses as are directly traceable to lack of ice.

The market for dried pears at present runs from 10 to 12½ cents a pound to growers. If it were not for the embargo on the shipment of dried pears to Europe just now, there would be a ready market there for all the dried pears held in California, as the Scandinavian countries are the chief consumers of dried pears. Growers are hoping that the embargo will soon be lifted, but it is impossible to make any predictions, as the powers that be have their own way of doing these things and information is impossible to obtain as to their policy just now. This same situation applies to dried apples.

A Future for Figs

[Written for Pacific Rural Press.]

It is likely that before many years the fifteen or sixteen million pounds of figs annually imported from Smyrna will be supplanted by the home-grown product. This is the opinion of the U. S. Department of Agriculture in a recently issued bulletin (No. 732).

figs in California is not far from

The annual production of Smyrna 2000 tons and within a few years this production will be greatly increased. Some 10,000 acres of Smyrna fig trees have been planted in the central San Joaquin valley since importations were cut off on account of the war.

Start Right to Grow More

NEVER before has there been so loud a call for more and still more grain, coming from all points of the compass. Never did you face so great an opportunity to help the world and yourself. Never were good tillage tools so necessary!

Good tillage implements—like **Deering** and **McCormick** disk harrows, peg and spring-tooth harrows, cultivators, etc.—make mellow, uniform seed beds, free from lumps, moisture-holding, allowing crops to grow to vigorous full yield. Real cultivation means more bushels and more dollars, and the dollars will pay for your investment.

Deering and **McCormick** disk harrows have these big, new improvements: The **Third Lever,** which controls the depth of penetration, regardless of soil condition. The **Exclusive Attachment of the Tandem,** which forces the tandem always to cut the ridges left by leading gangs, yet allows perfect flexibility at turns.

Remember the other tried and thoroughly-satisfactory features—built-in angle steel weight boxes; adjustable forecarriage; tall, hard oilers, convenient and protected; 4-wear wood bushings, improved scrapers, etc.

This year every added bushel counts doubly. Start right with right seed beds. See the local dealer and write us now about **Deering** and **McCormick** tillage tools.

DISC PLOWS

Designed especially to meet the plowing conditions of the Pacific Coast—built to the same high standards of material, design and workmanship as the "Caterpillar" Tractor.

Built primarily for use behind the "Caterpillar" Tractor, these plows HAD to be exceptionally good—first, because they had the enviable "Caterpillar" reputation to uphold; second, because the "Caterpillar" Tractor's ability to do the harder, heavier kinds of work that other tractors can't handle necessitated that the plows, too, should be superior in strength and design.

"Caterpillar" Disc Plows are heavy and strong, yet light of draft and easy to operate. They have made good, in years of service, where other plows have failed. They have aided tractor success and increased tractor capacity by lessening delays to the outfit. Send, today, for the "Caterpillar" Disc Plow catalog.

The Evolution of Irrigation

Just as the open irrigation ditch was superseded first by wooden, and then by concrete flumes, so were the latter in turn forced to give way to the

"K-T SYSTEM"

of underground conduits, equipped with gates and valves. This provides for a perfect distribution of the water at the exact spot required, and at just the time it is needed. It also eliminates the constant losses resulting from evaporation, seepage and ditches choked with weeds—wasting time, water, land and money.

Write today for our Special Booklet or for any information you may require.

KELLAR-THOMASON CO., 1234 East 28th St., Los Angeles, Cal.

Avoiding Loss of Grain After Harvest

[Written for Pacific Rural Press.]

With twenty million tons of food stuffs promised Europe by the President to feed the starving millions of devastated France and Belgium, it is highly important that American farmers continue in the war time effort to raise bumper crops. In the period of reconstruction, which began with the cessation of hostilities, food will play as important a part, as it has in the war time period just concluded. So much destruction of productive territory has marked the Hun's raid across the Rhine, and there has been such a general reduction in production of food supplies in Europe, that food will be in even greater demand for the next two years or more than when the armies were facing each other prior to November 11th.

PRESERVE BUMPER CROPS.

It is just as necessary to raise a bumper crop, and it is as important to prevent waste of food products through voluntarily following the Food Conservation rules, as before the cessation of hostilities. Preservation of food products, after they are harvested, to prevent loss from weather exposure, consumption and spoilage by rats, mice and other vermin, and fire losses, form an important part in this campaign for a more plentiful food supply.

LOSSES THROUGH INADEQUATE STORAGE.

All too frequently, after the farmer has responded in these past two years of strenuous endeavor in the producing of huge crops, tremendous losses have occured through inadequate and improper storage facilities. At a time when every grain of wheat has been considered on a parity, almost, with a grain of gold we have witnessed the heart-breaking spectacle of a million dollar grain loss in a wooden grain elevator at Brooklyn, N. Y., while it was awaiting "bottoms" to carry it "over there."

Such losses have come to be regarded as a concomitant of the grain business. Every year there are losses, that center the public's attention on the need for greater protection of the crop, after it is harvested.

GRAIN SACK LARGE WASTER.

While these spectacular losses are large, and important, the amount of wastage, in a percentage sense, of the total crop raised is not nearly as large as the almost unseen loss of California wheat and barley crops, between the thresher and the mill, due entirely to the antiquated methods of handling the State's crop. Experts who have made a life-long study of the California grain situation, and these include farmers, threshermen, warehousemen, and the grain buyers of the big milling companies, unite in saying the annual crop loss through handling California wheat and barley in sacks is often close to 25 per cent—one quarter of the grain raised in California lost.

SACK HANDLING RESPONSIBLE.

This tremendous crop loss is directly at the door of the old grain sacks. Leaking sacks—and all of them leak—are listed at the top of the loss charge, and in every one of the five handlings or operations between the thresher, and the mill, there is a distinct loss in weight, due to grain spilled through the sacks.

The custom of piling California wheat in sacks in the field, covered sometimes with a scant layer of straw, is responsible for another big loss through exposure to the weather. All too often the California grain grower is too busy to get his sacked wheat to the warehouse before the early rains. Too frequently the teams are required for other and apparently more urgent work. The result is the layer of sacks on the outside of the pile sunburns, becomes water soaked, and many, many times the shipment reaches the mill with the grain sprouting through the sack. This storage method also is resultful of moldy grain, and the filtration of dust and dirt through the sacks, on the lower tier of the pile.

RATS EAT AND SPOIL.

Rats, mice and other vermin can easily attack grain stored in sacks, and while these pests eat a lot, they spoil more, and in the eating they multiply. This is an important part of the matter. Remove the rat from his source of food, and a way of exterminating these expensive pests will be immediately apparent.

THEFT OF SACKS.

Theft of grain stored in grain sacks is a simple matter, either while in the field, pile, in storage, in transit to the mill, or while being transferred from car, boat, or warehouse in one of the five operations between the thresher, and the mill. A large loss always occurs in this way.

High labor charges for handling the grain in sacks, and excessive insurance premiums, because of its storage in such inflamable material, constitute another charge against the farmer, and his crop, which reduce his profits, and add to the cost of the wheat to be passed on to the consumer.

BULK STORAGE ALMOST UNIVERSAL.

These wasteful methods prevail only in California, Argentine Republic, and in the Australian wheat fields. All other wheat growing countries, even including the primitive farmer of Africa, have been storing their wheat in bulk for years.

METAL GRAIN BINS USED.

Easily erected metal grain bins have come into general use among progressive farmers throughout the eastern, middle western, and southern states, and in the last few years have been adopted by wheat growers of Oregon, Washington and Idaho, for the storing of wheat on the farm after threshing. The grain is handled in bulk by means of grain tight wagon boxes from thresher to bin, and transferred from bin to freight car or barge and from that to elevator, or mill bin, by means of portable steel elevators, at a minimum of expense, compared with the labor charges incurred through handling in sacks.

Metal grain bins are made of galvanized sheets of rust-proof iron, shaped and punched to fit. They are easily erected by unskilled labor, being held together by stove bolts.

ELIMINATE ALL LOSSES.

These metal grain storage bins absolutely eliminate the losses due to weather exposure, leaking sacks, consumption and spoilage by rats and mice, and practically remove the fire hazard. As a consequence of the economy of handling in bulk, with inexpensive elevators of the portable tubular steel type, transferring from thresher to bins in tank wagons, and from bins to elevators or freight cars in grain tight motor truck bodies for shipment to mill elevators, there is a large reduction in labor charges. Fire insurance premiums are lower. Losses by theft are eliminated completely because the grain is stored under lock and key on the farmer's own place, rather than left out, unprotected in the open field.

Sweet peas were largely planted around Eureka, Humboldt county, the day after the armistice was signed, anticipating renewal of the annual summer sweet pea carnival, which has been suspended during the war.

DUNHAM
CULTI-PACKER
TRADE MARK REG.

The Culti-Packer Fits Your Seed Bed In Record Time—

Would you like to cut the time of fitting your seed bed by 20 or 30 percent? A hundred thousand farmers will testify that you can do this very thing with the Dunham Culti-Packer.

Here is the way they do it.

First plow the soil; then go over it with a disc harrow and follow immediately with the Culti-Packer—you can pull the two tools together if you have a tractor, or separately with horses.

In nine soils out of ten, this will give you a finished seed bed without further work.

The soil will be fine and free from clods, all air spaces and loose spots will be firmed out and the surface will be a mellow mulch ideal for seeding or planting.

Not only will you save hours of labor but the crop will start sooner, grow faster and yield better because of the good condition of soil.

Ask the nearest John Deere Dealer to show you a Culti-Packer or to get one for you if he has none in stock.

Hay for Horses Didn't Pay

[Written for Pacific Rural Press by R. E. Hodges.]

COULD INCREASE GRAIN HAY MARKETS.

About half of the crop from the Livermore-Altamont district is normally sold in San Francisco. Motorization of city work is destroying this trade, but the suggestion which grew out of a sale made last season to the Golden West Meat Co. of Oakland, might well be expanded by hay growers to make a good market for all the hay they could raise. The meat company bought 100 tons of Livermore grain hay, chopped it with alfalfa, and fed it to sheep, finding it a better, cheaper ration, according to Mr. Wente, than cheap alfalfa hay and ground barley. The writer has found dairymen and cattlemen in various parts of the State using chopped grain hay with alfalfa or other legumes. Emery Gates of Stanislaus county, has had the finest kind of success feeding a mixture of barley and vetch hay to cattle and sheep. Other dairymen in the same county have been using grain hay. Considerable wild-oat hay has been sold from Livermore Valley to dairymen. A Napa county cattleman of the Monticello district fattens his stock on a chopped mixture of alfalfa and grain hay; and a prominent San Mateo county dairyman is among others who have had fine results from grain hay with vetch. His cows produce far more than when fed alfalfa alone. Such consumers ought to be multiplied by the efforts of special marketing agents of the hay growers; for it would not only avoid the tying up of a season's expense and labor in a warehoused crop, but would increase prosperity of stockmen and dairymen by providing their stock a balanced ration more economical than alfalfa alone.

"If we can't sell grain hay when we have only a half crop, we will raise grain next year if we can," the people of Livermore Valley are saying. This valley and the hills surrounding it constitute one of the chief and most widely recognized grain-hay producing districts of America. Its product was used all over the United States in the days of horse racing, when the jockeys insisted on feed from this district wherever they jockeyed.

About three-fourths of the valley is planted to wheat for a harvest of grain next year, if conditions shall be right for its maturing, according to E. G. Wente of the Independent Warehouse Co., who handle about half of the crops sold from the district. The company has this season handled 6300 sacks of wheat for planting before New Year's. This is four or five times their normal requirements. Two dry seasons of short crops just past, along with the extra rains that have already fallen, give hopes for a good grain crop next year, as the land has had a fairly good rest.

BLUESTEM SAFEST HERE.

However, farmers are playing safe by planting only Bluestem, which will be suitable for hay if grain will not mature. Bluestem remains green to the top until growers can tell whether it will make grain. It does not yield so well as Australian or Early Baart; both of the latter dry up to the tops too soon and thus make coarser yellow, strawy hay, and the Baart beards are objectionable.

Two factors besides dryness normally operate here in favor of hay rather than grain. One is the premium of $1 or more per ton obtained over hay from the interior valleys. The other is a labor condition. The grower with one hired man can handle a hay crop on 100 acres with his own machinery, where a lot of extra help and hired machinery are necessary at a busy part of the year if grain is harvested.

HAY SCARCE BUT SLOW.

Still nobody in this district wants to raise hay next season if he can raise grain. Hills surrounding the valley are never expected to raise much grain anyway, largely for lack of water, but partly on account of superior sweetness of the hay. Two years ago the Altamont hills produced about 4000 tons; and the other hills and valley tributary to Livermore produced 18,000 tons more. Next season's crop will not be over 3000 tons, says Mr. Wente, if grain can be made. The crop this season was between 7000 and 8000 tons, and the Altamont had only 2000. Still it does not move.

Pays 100% Every Year

"An Imitation—be it Ever so Good—is Still an Imitation"

"I purchased one of your Spreaders eight years ago and it has spread all of my manure from 50 head of stock during that time. It has easily paid for itself each year. Any farmer having more than five head of stock cannot afford to be without it unless he is especially fond of spreading manure by hand, which I am not."
C. E. HOUGH. Conn.

Hundreds of progressive farmers have written that "the Nisco Spreader pays for itself every year"—"the most profitable investment on the farm"—"it doubles the yield"—"saves its cost"—"couldn't farm without it"—and other such statements.

These letters mean much to the man who is farming for profit. They are conclusive evidence to any farmer willing to consider the facts. They prove the statements of Experiment Stations and Agricultural Colleges. They prove that you should own a

NISCO The New Idea

The "NISCO" is THE ORIGINAL wide-spreading spreader, the machine that revolutionized old-fashioned methods—that has always been the leader in quality, improvements and popularity. Has solid bottom with chain conveyors. Pulverizes thoroughly and spreads evenly 5 to 7 ft. wide. Drives with heavy sprockets and chain—no gears. Low down, light draft. Loads and pulls without undue strain on man or team. Saves time, reduces labor.

"I use your Spreader and find it far superior to others in construction, durability and efficiency. The manure goes from a third to a half farther than when spread by hand. It saves at least a third of the time of man and team, not to speak of saving fertilization value by even and wide spreading. Your spreader can soon be made to pay for itself." J. F. P. THURSTON. Indiana.

See your "Nisco" dealer. He is pretty busy and may not get around to you. Call him up and when you go in, insist on the "Nisco"—the machine you are *sure* of. If you don't know him, we'll send you his name and a free copy of "Helping Mother Nature," a splendid book on soil fertility.

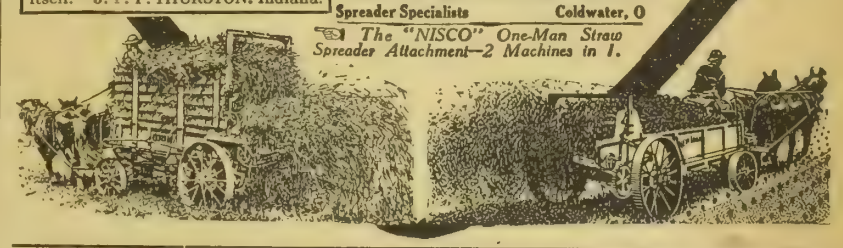
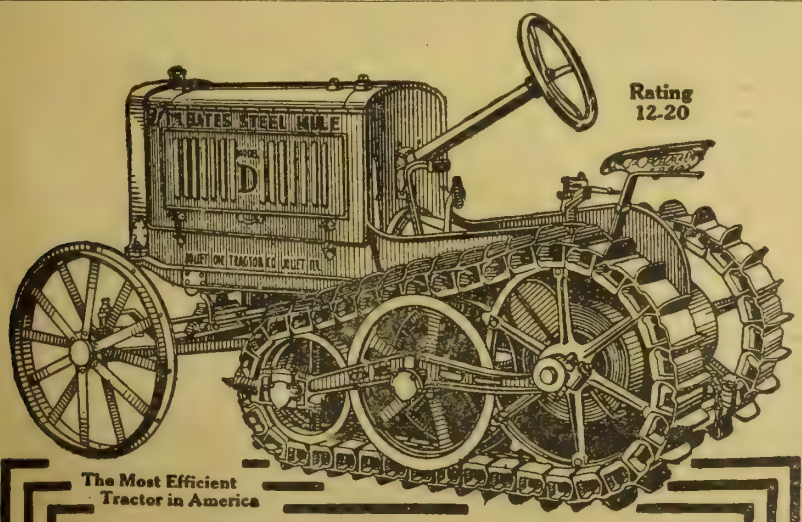
NEW IDEA SPREADER CO.
Spreader Specialists Coldwater, O

The "NISCO" One-Man Straw Spreader Attachment—2 Machines in 1.





Rating 12-20

The Most Efficient Tractor in America

POWERFUL ON SOFT GROUND

The twin crawlers of the Bates Steel Mule form a firm runway on soft ground. Twenty-four cleats prevent slipping, and the ground pressure is less than 3½ pounds per square inch. So soft ground is no different from hard, as far as pull is concerned. And the non-slip feature saves fuel.

Unit construction: Timken roller bearings; hardened cut-steel gears running in oil, and heavy duty, valve-in-head kerosene motor also contribute to the Steel Mule's efficiency.

We are anxious to have you compare the Model "D" STEEL MULE with any other tractor built. Seeing is believing, so come and inspect the machine we have on exhibition—and convince yourself.

LAY Porta Power

THIS remarkable implement, instantly attached to the rear tires of your car, delivers 5 to 8 H. P. at the belt for running any machine on your farm. LAY Porta Power saves you $150 to $300 if used instead of stationary engine, and is far more valuable because you can *take the engine to the job.* Thousands now used by enthusiastic farmers. It takes the place of missing farm labor. It may add hundreds of dollars to your income each season.

General Agricultural Review

Asparagus.

While asparagus occupies more acreage than cantaloupes in California, we hear less about it because practically the entire crop is grown in one restricted district—the islands of the San Joaquin-Sacramento Delta. There something over 23,000 acres of this perennial vegetable are grown for shipment early in the season and for canning later. The sales were good this year, the demand strong, the crop short because of lack of labor. Very early asparagus from Imperial county is a growing industry that pays well when labor is available.

Sweet Potatoes.

San Joaquin Valley produces most of the sweet potatoes of California, the acreage this year having been estimated at 6000 and the crop at over 1,000,000 bushels. The yield per acre was much above the average and the quality was better, but the total crop was only a little larger than 1917. Canning the smaller sizes assumed great importance this year, whereas formerly the small sweets were fed to hogs.

Tomatoes.

Of field vegetables, tomatoes are most important, over 30,000 acres having been contracted to canners. Acreage would have been greater had not there been an unfortunate dispute about planting time in regard to prices the growers were to be allowed. Early shipping tomatoes moved freely at prosperous prices, but very few late tomatoes could be obtained for shipment, as canners took practically all.

Cantaloupes.

Imperial county, cantaloupe leader, was estimated to have 10,896 acres of cantaloupes this year, as against 12,939 last year. Stanislaus county growers planted a little less than half that acreage and much of that was abandoned. There was a feeling that food crops should be grown instead of melons. The short crop led to a strong, profitable market demand.

Celery.

The Sacramento- Contra Costa county delta is the chief celery producer of California, a total of 2070 acres having been transplanted here this year, as against 3882 last year. Lack of hand labor is a reason for the reduction. Orange county, which used to be a large producer, is about out of it. Los Angeles county has a district of some importance.

Onions.

Prices for onions in 1918 were nearly 30 per cent higher than in 1917, but the yield per acre was less. Acreage in the Delta was estimated by R. G. Risser of the U. S. Bureau of Crop Estimates at 9204 for 1918, as against 8068 for 1917. Earliest onions are shipped from Coachella Valley, Riverside county.

Lettuce.

Most of the commercial lettuce, aside from city market gardens, is raised in Imperial Valley and shipped East. Shipment is about to begin. Some of last season's crop was delayed on the road, with damage, but the acreage is not far different from last year.

Cauliflower.

Los Angeles and San Mateo counties are the chief cauliflower producers. Their acreage in the crop now moving is materially decreased from that of last year, due to hard luck last season. The heads are of first-class quality and are moving at good prices.

NAPHTHALINE-LIME SULPHUR SPRAY.

A new combination spray tested during the season of 1917-18 by the Stoke Fruit Growers' Association, of New Zealand, consisted of naphthaline and lime sulphur, with and without the addition of arsenate of lead. The trees had been badly infested with wooly aphis early in the season, but at picking time (April 1918) fruit and foliage looked good, the fruit being clean and bright. In these applications soft water (well water) was used. The addition of naphthaline seems to thicken the spray and make it stick better. The cost per gallon is the same as ordinary lime-sulphur.

The State Quarantine Station at Los Angeles intercepted in October, shipments containing the Colorado potato beetle, alfalfa weevil and gypsy moth amongst other pests and the cars were promptly sealed and returned with their contents.

The United States Department of Agriculture has declared quarantine against the whole world on sweet potatoes to prevent the importation of the sweet potato beetle (cyclas formicarius).

Tehachapi has 3,800 acres in pears besides a large acreage of apples and is still growing.

GYP CORN AS AN EGG PERSUADER.

To the Editor: I am feeding gyp corn heads and they are all right as a grain ration; also they make hens lay. We have sold $55 worth of eggs from 40 hens since last July and had all the eggs we cared to use besides.—D. A. Nowels, Linne.

The L. A. Puente Nurseries have some fine Placentia Walnut stock this year. They are grading them in fours and sixes of one year stock. Also 10,000 saleable Placentia Perfection, two years from graft, and about half as many Eurekas. They will regraft all seedlings this year. Tilton Bros. of Whittier will do the grafting.

GROZ-IT

HIGHLY
Concentrated - Pulverized

Manure

A mixture of cattle and sheep manure from animals fed on cotton seed meal and cake and alfalfa (highly nitrogenous foods) aged for several years under climate conditions that remove moisture but prevent leaching and fermenting.

No odor.
No flies or insects.
No weed seed or foreign matter.
Many times plant food values of ordinary manure.
Guaranteed contents:
Nitrogen, 1.5 to 2%
Phos. Acid, P_2O_5, 1.25 to 2%.
Potash K_2O water soluble, 4 to 5%.

We are shipping GROZ-IT in immense quantities to Southern and Eastern states, where present freight rates make it $10 per ton more than cost to you. Place your order now to insure delivery.
Sold in bags or bulk.

CALIFORNIA FARM PRODUCTS BIGGEST IN HISTORY.

(Continued from first page.)

biggest acreage of recent years seems assured and the Government will buy it all at the established price unless higher prices prevail.

SUGAR BEETS.

Normally, sugar beet tonnage would have exceeded barley tonnage this season if manufacturers and growers could have agreed on contract prices in time to justify planting. The dry winter was an additional deterrent and both acreage and yield were less than the year previous. Better contracts have been offered this fall, and here again ability to know, before planting, approximately what price the crop will bring is leading to plans for beet raising in place of beans, etc., where feasible.

COTTON.

Estimated farm value of the 1917 cotton crop was more than double that of the previous year, due not only to more than 50 per cent increase in acreage but also to nearly that much increase in price per pound. This year's estimated production shows a 50 per cent increase over last year, and the average value per pound a trifle better than last. Long-staple varieties chiefly were tried out in scattered localities throughout the Sacramento and San Joaquin valleys, and cotton culture seems to have found a firm home already in the San Joaquin. Imperial Valley raises practically all of the California cotton.

RICE.

With a fixed price to the growers for rice, the average yield per acre practically as big as it has ever been, and the acreage increased more than 50 per cent over the previous year, this crop has continued its upward flight in importance among California field crops. Too little water early in the season caused some loss and too much rain during harvest caused a little more; but this crop is the banner one for optimism and the acreage will likely be enormously increased next year. The prices for the next crop, however, are not assured, and growers will have to look out for importations from the Orient. Milling capacity in California has been greatly increased and growers are showing greater tendency to get together with millers for mutual consideration of problems. A new earlier maturing variety has been tried out this season with gratifying results.

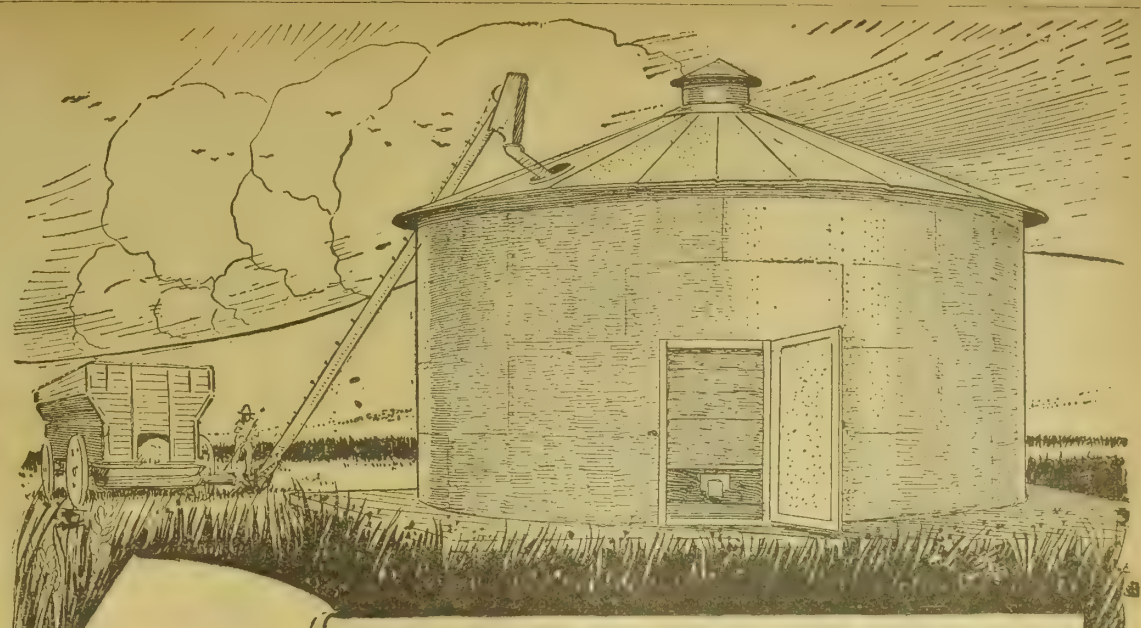
GRAIN SORGHUMS.

The appeal of the Government for growers to raise grain sorghums was heeded apparently to a greater extent than the exhortations to raise more hogs. This was true also in the six States leading in grain sorghum production, and today the market for these grains shows a little less life than their running-mate, barley. This may be partly due to the effort to market quickly the late crop, which got wet. If so, the market should recover when this is out of the way.

INDIAN CORN.

While our Indian corn prices are still determined by the price of Eastern corn laid down here, and while we do not feel the need of raising corn for hog feed there is a great increase of acreage and production in the San Joaquin-Sacramento Delta to about 25,000 acres, which is about one-third of all in the State this season. The entire California acreage and crop were only a little greater than in the previous year, but our own mills furnish a ready market for all that is grown here, provided it is handled in ways that make it of good milling quality. Probably considerable normal Indian corn acreage was this year planted to grain sorghums on account of last winter's dry weather.

In 1916 California produced 43,664 bales of cotton, and in 1917 58,974 bales. It is known that the production of 1918 will be more than 100,000 bales, valued at approximately $14,500,000.



Bulk Handling Costs Less

There were 16 tons of grain lost in a recent shipment of 2,500 tons of sacked grain from Vallejo to Stockton.

Mould, rats, gophers—leaking sacks—were the direct causes of that enormous loss.

The California milling concern that made the shipment handled its next shipment of 2,500 tons of grain over the same route—in bulk.

Out of 2,500 tons—only one-half of one ton of grain was lost. A saving of fifteen and a half tons! With grain at $2.20 a hundred that saving was considerable. In addition the entire cost of the sacks was saved.

Save the entire cost of Sacks.

By using sacks your crops are at the mercy of rats, gophers, bad sacks, thieves and rain. You pay for extra help during threshing time.

It is needless. Calco Metal Grain Bins eliminate extra labor and make your grain vermin, fire and weather-proof. The Calco Bin cuts out the high cost of sacks. One Calco Grain Bin will last a great many seasons—sacks must be bought each year.

Write for the booklet, "Calco Grain Bins." It's free, and worth your careful reading. It will open a way to you to save and sell more of your grain. Write for it today.

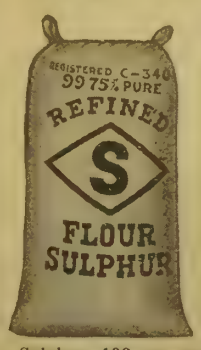
SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

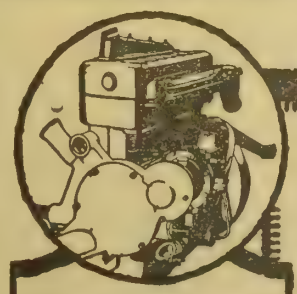
To create additional available plant food, drill into the soil 100 to 400 pounds per acre of our Diamond "S" Brand Powdered Sulphur.

It has been proven that sulphur has increased various crops up to 350 per cent.

SAN FRANCISCO SULPHUR CO.

524 California St., San Francisco, Cal.

We are equipped to make immediate shipment. Send for illustrated booklet, price list and samples and please state for what purpose you use the sulphur, quantity needed and date of shipment preferred. Tel. Kearny 871.



Correct Lubrication for the "L"-Head Type Engine

This, the "L"-Head type of automobile engine, like all *internal combustion engines*, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLENE fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude*

"Proven Entirely Satifactory"

Only perfect satisfaction can account for the use of ZEROLENE by the majority of automobile owners.

Leading coast distributors also testify that it is "a most satisfactory motor oil."

They know from the records of their service departments—and we know from exhaustive tests—that Zerolene, correctly refined from selected California asphalt-base crude, gives perfect lubrication with least carbon deposit. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations.

Power on the Farm

FARMERS' MUTUAL FIRE INSURANCE.

The $1,500 fire insurance for five years on beans and barley has cost me about the same as commercial insurance would for three months," said R. H. Frazer of Stanislaus county, speaking of the Farmers' Mutual Fire Insurance Co. of Turlock. So the writer sought Secretary John A. Orr of the insurance company and was told about this organization more in detail. It is one of fifteen or twenty such mutuals organized under the special State law for this purpose. The idea is to furnish insurance to farmers at actual cost. The only costs, aside from fire losses, are for office expenses, the salaries of two officers, and commissions for the seventeen farmers who act as agents.

This farmers' mutual insurance company was organized twelve years ago with 50 members and about $50.-000 insurance in effect. Today it has 2500 members and $2,500,000 insurance in effect. A rate per $100 is charged for premiums which does not quite cover losses and expenses. Then whenever funds get low assessments are made. The present premium rate for a five-year policy is 35 cents per $100 insurance on lath and plastered dwellings and their contents, 50 cents per $100 on all other buildings, with vehicles, except autos, and $1 per $100 on feed, grain, beans, etc.; but standing grain is not insured. The biggest loss ever encountered was last year, about $6,000 total. About $5,000 losses had been paid this year up to December. Only five assessments have been made—the first was 25 cents per $100, the second the same, the third 50 cents, the fourth 25 cents, and the fifth was 21 cents on first class, 30 cents on second class, and 60 cents on third class.

HAY "GRINDER" WITH BIG APPETITE.

Chopping mixed barley and vetch hay results in cattle and sheep eating it up clean with not half of one per cent loss, as experienced by Emery Gates of Stanislaus county. His 26-inch Smalley cutter, with grinding attachment and blower, puts about 40 tons per nine-hour day into the 26x40-foot silo, keeping eight or nine men and a 45-horsepower Caterpillar working to the limit. Three or four wagons were used, according to distance of hauling, which averaged about one-quarter mile. Two pitchers kept busy in the field; the driver of each wagon and a helper were "nearly worked to death" to pitch hay off as fast as the machine took it, one man fed directly into the machine and one man tended the engine. No man was needed in the silo, for the finely chopped dry feed packed itself so thoroughly that it did not settle over four feet in three weeks.

LESS POWER ON RIDING PLOW.

A wheel plow with the driver riding pulls as easy as a walking plow, if adjusted properly. Turning a furrow slice constantly forces a plow downward and sidewise. A landside to counteract the side pressure presents a great area for friction against the dirt. It, with the share, exerts great pressure and friction against the bottom of the furrow. Now if the pressure and friction downward and sidewise can be transferred to wheels, we have much smaller bearing surfaces which can be lubricated. Thus the friction is so reduced that a man may ride the plow and still cause less draft than a walking plow turning the same dirt. This can be illustrated by locking the wheels of a wagon. The wheels must then slide a foot for every foot the wagon moves, and you cant' lubricate the sliding surfaces.

An American tractor plowing and harrowing recently attracted wide attention near Montevideo, Uruguay, as reported by the U. S. Consul.

HIGH OR LOW SPEED ENGINE.

To the Editor: Which tractor will be in best condition at the end of two years—one that runs two and a half miles per hour on high and whose engine runs 500 r. p. m., or one that runs four miles per hour on high and whose engine runs 900 r. p. m.?—A. L., Marysville.

An engine properly designed to run 900 r. p. m. on tractor work would probably be in as good shape as the other if automatically governed and run at plow speed while plowing; but since most plows are built for a two and a quarter to two and a half mile speed, your high-speed motor would have to run on low or intermediate gear in plowing. Since this is the greatest part of tractor work, we would want the most direct drive at that speed. On general principles, the fast engine on heavy sustained work goes to pieces soonest.

Its in the TRACK

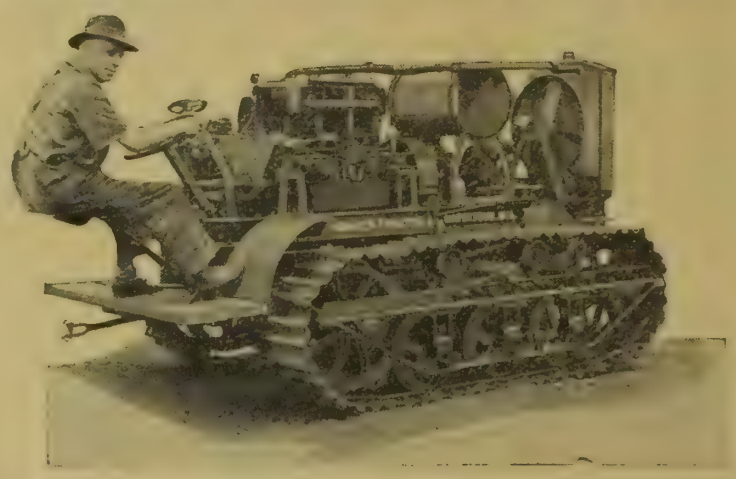
MONARCH

Indorsed by the BANKS

—Tracklaying Tractors—

The Tractor you will eventually buy because of its—

Great Simplicity
Wonderful Power
Long Life and Our
Excellent Renewal Part Service



The Monarch has a motor, transmission and power plant similar to any other strictly high-grade tractor—but, MONARCH TRACKS, like MONARCH SERVICE, stand alone. A broad, flat surface on a chilled track sprocket comes squarely against a similar surface on the MANGANESE TRACK to drive the MONARCH, thus eliminating the rub, the cause of grinding wear and short life in the ordinary track-laying tractor.

POWER NOTES.

Permission to issue $400,000 of receiver's certificates is asked from the State Railroad Commission by Receiver William F. Fowler of the Sacramento Valley West Side Canal Co. The petition states that the company now is irrigating 16,000 acres of general crops and 27,000 acres of rice. The $400,000 is to be used to complete the system and add some pumps, so an additional 15,000 acres of rice may be irrigated in 1919.

The "Denver Tractor Club" is a new organization of tractor and implement dealers of Colorado.

Motor trucks are being used to haul cotton in Imperial Valley on big bodies direct from the fields to gins.

To make rural parcels post rates compete with freight rates by use of army motor trucks, is the plan explained to the U. S. House of Representatives postoffice committee by Assistant Postmaster General Blakelee in asking $8,000,000 for rural service next year.

To counteract the effect of water in distillate used for tractor fuel, Aubury Collier of Solano county says a cheap, easy, effective way is to put half a pint of denatured alcohol in the tank every week.

WHAT SIZED CULVERT PIPE?

To the Editor: What size pipe should one have for irrigation where a bridge is built over a ditch? The party doing the work states a 36-inch pipe is necessary to carry the water.—E. J. W., San Francisco.

Since the pipe is to be used as a culvert, we would recommend a corrugated culvert, surely covered with several inches of dirt. A 36-inch pipe with a drop of half a foot in a thousand, will carry 5,500 gallons per minute. A fourteen-inch pipe would carry about 600 gallons per minute.

HORTICULTURAL JOTTINGS.

Harry Stabler has been reappointed Horticultural Commissioner of Sutter county.

The Sacramento Valley has 27,573 acres of prunes. Butte county leads the valley with 5942 acres and we understand a considerable further planting is contemplated this season.

The amount of apples held in cold storage in the United States on December 1 is represented as (reduced to boxes) 13,289,913 boxes, according to the U. S. Bureau of Markets report.

The Fig Growers' Institute is to be held at Fresno, January 3 and 4. The sessions are instructive and include addresses from commercially successful fig growers. This is a reminder.

Pruning demonstrations are being held at various orchards in Sonoma county under the auspices of the Farm Bureau and in co-operation with the County Horticultural Commissioner.

Stanislaus county this year produced 22,998 tons of cling peaches (Phillips and Tuscan), 12,556 tons of drying peaches (Muir and Lovell) and 2268 tons of Elbertas for shipping.

The book, "California Fruits," seventh edition, is out of print. No more copies will be sent out until a new edition is printed, which will not be before next fall. Possibly book stores may have some in stock.

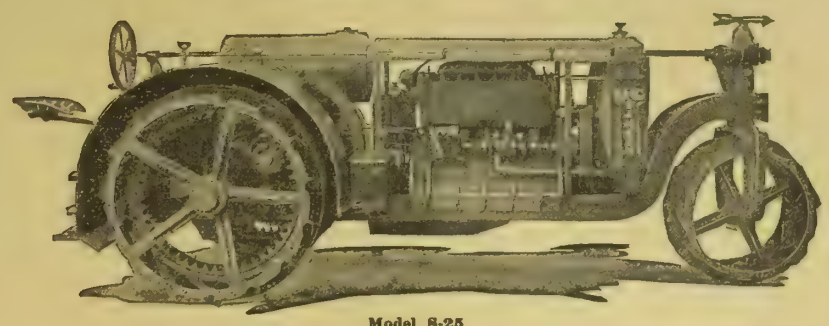
A vine-pruning demonstration was recently conducted at the W. B. Trewhitt vineyard, north of Hanford, under the auspices of the Kings County Farm Bureau. Professor F. Flossfeder of the University of California was the demonstrator and lively interest was shown in the work by attending vineyardists.

A complaint against existing freight rates on citrus fruits is to be filed with the Interstate Commerce Commission, according to A. M. Mortensen, traffic manager of the California Fruit Growers' Exchange. The increase made last June by the U. S. Railroad Administration adds an estimated total of $6,386,386 to the annual freight bill of the citrus fruit growers of the State.

Samson

GMC TRACTORS SIEVE-GRIP GMC TRACTORS

Tractor



Model 8-25

The durable tractor is not achieved in a day. Many features, time and experience dictate, enter into its construction.

After nearly two decades of manufacturing and field experience the GMC SAMSON SIEVE-GRIP TRACTOR is submitted as ideal durability. Many in successful operation for years, and in as effective use today, testify to its ruggedness.

The quality of the GMC SAMSON SIEVE-GRIP TRACTOR is guaranteed before built by careful selection of high-grade materials, made to specifications and over-sized to secure liberal reserve strength. Final severe tests further assure a durable product. It is built SAMSON in name and SAMSON in strength.

The GMC SAMSON SIEVE-GRIP TRACTOR performs the work of ten horses on the farm. It will do your plowing, discing, and harrowing economically and efficiently and without packing the ground. It is adapted to countless other uses on the farm for many of which horses are unsuited. It will CUT YOUR COSTS. It will INCREASE YOUR INCOME.

The durable is the efficient, economical tractor.

Our booklet, Better Farming, is yours for the asking.

How an Apple Differs From a Hog

[Written for Pacific Rural Press by Albert F. Etter, Ettersburg.]

That you may have the pleasure of tasting the best apple in the world, I am sending you one of my Wagner seedlings. This is not an absolutely new variety, for I have fruited it for the last five years. Its only possible rival in the world is a R. I. Greening seedling I have here, but specimens of this are not available at this writing. This high rating of one's own wares might seem bold to many, but to one who knows the facts it is necessary to do so to publish the truth and give credit where credit is due. Not that I desire credit, but that the people interested in these things may know that the world moves.

IT MAY BE CALLED "ALL-GOLD."

This new Wagner is an "all-gold" variety. Possibly some day "All-gold" may be its name. It is clear golden in color, faultless in form, of fine size, does not scab, produces only one specimen in a place instead of two to six, bears a full crop every season, does not drop from the tree and the structure and texture of the wood growth is as elastic as spring steel. The whole texture and structure of the fruit suggests culture and refinement. The seeds are small and the core structure refined and not prominent. The flesh is non-fibrous, crisp and juicy. When the flesh mellows up it does not become mealy and dry, but remains very juicy, with a tenderness that melts in one's mouth like ice cream.

WHY AN APPLE MAY BE ALL FAT.

This type of an apple is a vehicle on the way of what I would term "progressive refinement." By way of illustration, I will say: A lecturer on hog breeding once said: "The ideal of some breeders in the past had been to produce a hog without bones or muscles—just a well-rounded form covered with a thin skin, the whole hog a wobbling piece of fat."

This sort of ideal is not tolerable in animal breeding, but in plant life it is highly desirable, and is an ideal within reach. Our apple varieties of today are too near nature types, or, as the swine breeder would say of scrub hogs, "they have too many of the characters that belong strictly to the wild hog." Some of us know what the dahlia was twenty-five years ago. An ardent experimenter in dahlias in that day, I predicted the future of the dahlia by systematic work. I believed then, too, as I believe now, that we have scarcely begun to improve the apple, and systematic work through a few generations of seedlings under ideal conditions will produce varieties that will justify my optimism.

HOW THE NEWTOWN MAY BE IMPROVED.

A second variety I am sending you to sample and illustrate is a seedling of a variety (possibly only a seedling tree it was), but one would have to strain it a point or two to call it more than a commonplace cider apple. Only because I had super-ideal conditions to expect worthy results was I tempted to grow seedlings from this near-nature type. But I chanced it, and in 38 seedlings I scored just one of any value whatever. Thirty-seven worthless ones, most of these being little more than wild forms, but the thirty-eighth was one of those prodigies that come through hybridization and luxury of nutrition — a breaking-away type into refinement that may mean a glorious prepotency for great things in the future or, on the other hand, atavism may be so strong that it may be worthless for breeding stock.

As a variety it seems of decided merit. On the father's side it shows the earmarks of Newtown origin. The parent tree grew alongside a Newtown tree. The fruit is clear yellow, and in shape very full oblate. The flesh is tender, juicy and melting and the flavor sprightly acid, being easily in the class with the Newtown and far more refined. The fruit is very free of scab, and the tree a strong grower and a heavy and regular bearer. This is the first notice either this or the preceding variety has had in print.

ANOTHER NEW NEWTOWN.

A third variety is a Newtown seedling of typical Newtown type in every character. It is better in form and more uniform in size and a better size than Newtown. It bears 100 per cent better than Newtown and shows no tendency to scab or to grow in clusters like the parent, but the exterior finish of the parent is slightly superior to the seedling. The Newtown is slightly more crisp than the seedling, but it, on the other hand, surpasses it in substance, superior sweetness and high flavor, being a better keeper and shipper. It does not drop like the Newtown, but hangs to the tree exceptionally well. Its points for recognition would be superior productiveness, better and more uniform size, freedom from scab, ability to hang until perfectly matured without dropping from the tree and still with this full maturity be a wonderfully good shipper, as it bruises less easily than Newtown, in itself a remarkable shipping variety.

At the present time I do not wish to recommend this seedling as one that should supercede the Newtown, but inasmuch as a variety of its merit should come out of a lot of only seven seedlings, it would indicate that it should not be very hard to get something in the Newtown class far superior to the Newtown as we know it today, for every one of those seven seedlings proved out to be of Newtown type, and a reasonably good variety except one, it being a Newtown X Baldwin. This latter variety is a large apple of finest and truest form, with one odd character—the stem is so short as oftentimes to be even with the surface of the fruit. The quality of this latter variety is splendid, but it has some serious defects that count it out as a variety of value.

[Mr. Etters' specimens bear out his descriptions. Not only his results, but his close scrutiny of points of improvement in apples, should arouse our apple growers to closer judgment of their products.—Editor.]

BASEBALL AND FRUIT GROWING.

Harry Hooper's work is playing baseball; his recreation is running a large ranch he owns in Sutter county—and there we found a very busy man. Harry has 130 acres in fruit trees and vines and he took us into his dry yards, where many tons of Thompson Seedless raisins were in course of drying, and thence to a shed, where Harry Stabler and the writer found him packing pomegranates (October). He has 26 acres of pomegranates (interplanted with olives), four and five years old, and will be shipping 700 boxes from the young plantation this year. They are of the "Wonderful" variety and are shipped in four grades, the largest of nearly 4-inch caliper and of gorgeous coloring, and the New York market absorbs it readily at remunerative prices. Of his 25 acres of peaches—Tuscans and Phillips—there was no loss, but considerable injury had been experienced in the Thompson Seedless grapes. Adequate machinery is on the ranch for handling all the fruit and the raisin stemmer was at work when we were there, for there are nearly 100 acres of T. S. grapes on the ranch.

We have always figured that a good ball-player or an enthusiast in any other manly game has the qualities necessary to make a good farmer, in that he is level-headed, resourceful, and decided, and does not curse Providence for unpropitious happenings—weather or anything else. It has taken courage and backbone to "buck" this season in Northern California, and we feel that Harry Hooper is a worthy addition to the ranks of fruit growers.

Olive Packing Plants

[Written for Pacific Rural Press.]

There are six large plants at Oroville for packing olives and we recently went over the Mount Ida Packing Co.'s plant, the buildings of which cover nearly three acres of ground adjacent to the railroad. Oroville and its vicinity are specially adapted to the production of a first-class olive. Thousands of acres of young trees will be coming into bearing in a few years and the markets for California ripe olives will doubtless be extended to meet the increased production of this valuable fruit. Nowhere in the State do olive trees make more sturdy growth than here or set better crops. We did not see scale in any orchard or evidence of it, the leaves and twigs being silvery green and fresh throughout.

MANUFACTURE.

After being graded and weighed out—for the grower is paid on grade—all those olives that are to be used for the ripe olive trade are turned into the concrete pickling vats, of which there are 1100, each one holding 1000 pounds of fruit. In place of the old system of stirring the fruit with paddles, it is moved and churned over by compressed air, just on the same system as petroleum is agitated and refined. This obviates the bruising of the fruit by contact with paddles and insures the whole of it being turned and moved. When the fruit is ready for canning, it is conveyed on a slow-moving "sorting belt" of webbing along the center of benches running the length of the room, on each side of which girls are seated who hand pick out any imperfect fruit or impurity. From here they are taken to the canners' bench, the full cans being carried in a steady stream through to the capping machine. Each can is poured full of hot brine just before capping, immediately after which they are placed in an oven or retort for sterilizing. This is the last operation except cooling, labeling and packing, when the finished product is ready for market.

As one of the side issues, this plant also prepares a Greek style olive which is packed in barrels in dry salt. There is a very large demand for the Greek and Italian olive in the United States, most of which has been so far served by importations. We liked the flavor of those turned out at Oroville, which are not bitter like the imported article. The oil mills are in the same building with the ageing room adjoining and the powerful presses are hydraulic and express all the oil it is possible to get at a single operation.

We were told that the Mount Ida grove (Gray & Wilson) is the most regular and consistent bearing grove in the State.

All of the help required at the packing establishment is provided by the town of Oroville and vicinity. A feature that strongly appeals to the visitor is a spacious, well-warmed and ventilated rest room for the women and girls employed. This room is paneled, both walls and ceiling, with fumed oak finish. Comfortable chairs and small tables are provided and we noticed some flowers to grace the board. This method of caring for employees leads to obtaining the best class of woman worker, whose sensibilities are not shocked by unpleasant surroundings. It adds to their self-respect and pride in the institution they serve. So long as the thing is not overdone, money laid out for the convenience and comfort of ranch hands also is going to be a distinct asset to the industry. Decency and privacy for our helpers can be provided without going to extremes and coddling them. And at very little expense, if we value good men and are willing to write off the interest on money so invested as a part of their wages. Many years ago the writer had several years' experience of the bunkhouse and knows whereof he speaks.

NURSERY NOTES

Diging of nursery stock has begun generally and anyone who has decided to plant this season should get their orders in for trees without delay.

C. W. Van Gelder of Acampo reports short stock of nursery trees, though the quality is good under the new standard. He claims that the peach root for plums, prunes and 'cots is the best on any but very heavy soil, and is in increasing demand. Mr Van Gelder thinks the demand will exceed the supply on deciduous fruit stock in his section though there is a good supply of almonds.

THE PROMISE OF MILL FEEDS

With the return of all-wheat bread to our tables following the relaxation of sustitute regulations, farmers may expect a somewhat increased supply of mill feeds. The amount will be further enlarged by the recently increased purchases of flour for export; also by the cancellation of the "milling extraction rule" which diverted into flour a considerable proportion of the wheat being ordinarily used for feed.

All of the developments combined are expected to increase the mill feed output fully one-fifth, and this extra feed should be available about the end of December. But the Food Administration warns against excessive optimism over the situation, as there will be a continued shortage of mill feeds as compared with pre-war years.

Consequently, either conservation or substitution will be necessary for some time to come, and the recommendation of Prof. Fitts of the dairy department of Oregon Agricultural College may prove of value to California dairymen. He says that a good substitute for mill feeds may be made by mixing barley and cottonseed meal. He says that the mixture costs more than mill feed, but its feeding value is a fifth greater.

Cottonseed meal is not very plentiful in this state; also it is liable to prove poisonous if fed in large quantities. So we suggest using coconut meal instead. Also add beet pulp if you can get it. A mixture of two pounds each of rolled barley, beet pulp and coconut meal for each cow is about the best and most economical supplement to use with alfalfa when you do not have silage. Try it, and like as not you won't care whether or not you can ever get mill feeds, except for calves, and young pigs, and for sows right at farrowing time.

CROP Production

Is controlled by the kind and quantity of plant food furnished the tree or plant.

It is not enough to merely fertilize. It is important that the tree be fed material giving maximum results under California conditions

These materials are furnished in

Hauser's Organic FERTILIZERS

Correct Fertilizer for California conditions.

MICA AXLE GREASE

Standardization in the Dairy Industry

Extracts from an address delivered before the California Creamery Operators' Association by J. M. Henderson, Jr., President of the Associated Dairymen of California.

The reason for the existence of the Milk Producers' Associations of California lies in the necessity of service to be performed for the producer and the consumer of dairy products by improving the conditions under which these products are produced, manufactured and marketed, through standardization of the products, elimination of waste, and by doing such other things as are necessary with respect to the cost of production, quality, more economic manufacture and better and more even distribution of these products, thus increasing the returns to the producer and lowering the cost to the consumer that the interests of both may be promoted.

The failure of the farmers' cooperative creameries in the past years has demonstrated that their associations were not properly organized. Many failures have been caused because the members were at liberty to send their milk to a competitor, while our association has bound its members by a tightly drawn agreement to market all of their dairy products through the association for a term of years.

The association recognizes that those who are now manufacturing and marketing dairy products are specialists and have had long years of experience. Therefore, we do not aim to destroy the structures they have built, but seek to absorb and remodel the many organizations in such a way that they will be working for the best interests of the dairymen. Without doubt there are more manufacturers and handlers of the dairymen's products than are needed, and many will necessarily be eliminated. Our association, however, desires to co-operate with the well-organized concerns and form them into one organization in order that they may work in one direction instead of many, as at present.

ELIMINATING USELESS EXPENSE.

Beginning with the delivery of the raw product from the farmer to the factory, our aim is to perform each function with the least labor, fuel and materials, keeping in mind at all times the necessity of maintaining a high standard of quality.

In many sections of the country the creamery men have assumed responsibility for gathering milk and cream, and many are sending their trucks over the same routes, thereby increasing the cost of handling. Our association will effect a big saving, as routes are being formed in such a way that there will be no duplicated effort.

One of the most important of our activities is the proper grading of the raw product, and the payment of different prices for the different grades. The keen competition of creameries for the dairymen's products has prevented them from doing this.

With a sufficient number of general utility plants in which all known dairy products can be manufactured, a uniform product can be had and maintained by adopting uniform methods and uniform composition of the products manufactured. Laboratories will be established and chemists employed to analyze samples from every churning, or every vat of cheese. This provides a check on uniformity in moisture, salt and color. There can be no question but that our product, under these conditions, can be made practically uniform every day in the year. The association, having these plants, can buy supplies and equipment in large quantities and thereby make big savings in cost of manufacture.

NEW MARKETING METHODS.

The greatest marketing problem is solved when an association like ours can have at its disposal a large quantity of high grade, uniform butter, cheese or other dairy products. A system of grading will have to be established based upon a commercial score, and all butter will be scored by Government inspectors. There is at present too much butter, cheese and other dairy products bought by the wholesalers as second grade but sold to retailers and consumers as first grade.

The activities of our marketing department will be directed very largely to a study of the domestic and foreign markets. These markets will be studied systematically and we will be assisted by the hearty co-operation of the U. S. Bureau of Markets, which reports daily from the important domestic markets. Also the Government is building a most wonderful merchant marine, and we are co-operating with the head of that department today in an effort to build up our foreign markets.

Our association will increase the sale of our dairy products at home by a campaign of advertising at a very nominal cost to individual members. Our purpose is to save the industry by bringing forcefully and continually to the public mind the value and necessity of its products as human food, and also to show the producers the necessity of staying in the business and increasing production to meet the demand of a world market.

GOVERNMENT ASSISTANCE.

You may be interested to know that a conference of all the dairy interests was recently called at Washington by the Food Administration for the purpose of considering ways and means of establishing a uniform basis on which to adjust prices for milk, regardless of whether it is to be used for market milk, condensary milk, butter or cheese, the idea being to use a uniform feed and labor formula and then allow the proper differentials entering into the cost of producing these various classes of milk.

The plan met with the approval of both the producing and manufacturing interests, as every one today realizes that this country is confronted with a shortage of all classes of dairy products and the only way to stimulate production is to return to the dairymen a sufficient amount to pay him the cost of production plus a reasonable profit—to eliminate waste in production, manufacture and distribution so that we may give these products to the consumer at the lowest possible price. This conference was made up of representatives of the producers' organizations in sixteen States, together with representatives of all classes of manufacturers of dairy products throughout the United States.

The Department of Agriculture has adopted a model form of articles of incorporation and by-laws for dairymen's co-operative associations. In its general plan it is almost identical with the one which we have adopted in California, and a contract similar to ours is a part of the approved forms used in organization work among the dairymen of the United States. The department is now ready to put out field men throughout the different States to develop this organization work.

Big Demand for Fats and Dairy Products to Continue

The supply of fats and dairy Products is inadequate to meet the world's needs.

It will continue inadequate until producers have had time to restore the balance between demand and supply.

This cannot occur this year.

The disproportion will be reduced next year.

But it probably will not be equalized until the 1920 stocks and crops have been garnered.

U. S. FOOD ADMINISTRATION.

It contains the signed statements of many ranchers who tell how they are becoming wealthy in the famous Santa Cruz Valley near Tucson, Arizona. About 80% of all products consumed in the valley are shipped in from California. The rich mining camps and the city of Tucson (25,000 population) pay fancy prices for all farm products Local farmers are getting rich. A very limited amount of land with water (suburban to Tucson) may be had at $150 an acre on long time terms. Best farming opportunity in America. Land selling fast.

A Letter from Bossy

If a cow could speak she would talk about her health as people do—because cows suffer from ailments, little and big, the same as human beings. When a cow is sick, she needs medicine as much as a sick person does.

Mere rationing will not eliminate disease; medicinal treatment is necessary. The most common cow ailments, such as Abortion, Retained Afterbirth, Lost Appetite, Bunches, Scours, etc., result from a diseased condition of the digestive or genital organs. Any of these diseases and many others can be successfully treated or prevented by using Kow-Kure, the great cow medicine.

Kow-Kure is scientifically prepared for the treatment of cow diseases only. It puts the vital organs in condition to eliminate disease and function regularly. Prevent sickness by occasionally using Kow-Kure. Feed dealers and druggists sell it—60c. and $1.20 packages.

How to Control Ear Ticks

[Written for Pacific Rural Press.]

The cattle fever tick has been pretty well driven out of this state, but we still have the ear tick—a blood-sucking parasite which infests the ears of cattle, horses, sheep, dogs and other animals and causes heavy losses.

Unlike the cattle fever tick, which attaches itself to the outside portions of cattle, the ear tick can not be eradicated or controlled by the ordinary methods of dipping. The remedy thoroughly tested by the Bureau of Animal Industry in field investigations consists of two parts by volume of ordinary commercial pine tar and one part by volume of cottonseed oil. This mixture is injected directly into the ears by means of a metal or hard rubber syringe.

In mixing the ingredients the cottonseed oil should be added to the pine tar and stirred until a uniformly smooth mixture is obtained. In cold weather the pine tar and cottonseed oil should be warmed, so they will mix readily and flow freely, but they should not be heated more than is necessary. The mixture will remain uniform for a long time without separation or deterioration.

This preparation when properly applied kills the ticks but does not injure the animals. Cottonseed oil is a fairly good solvent for ear wax and the mixture penetrates ordinary loose masses of ear wax and ticks, but it will not penetrate the hard masses, to break up which the use of an ear probe made of baling wire is suggested. The preparation recommended not only kills all ear ticks with which it comes in contact, but being of a sticky consistency it remains in the ears and protects the animals against reinfestation for about thirty days.

Animals in infested areas should be examined at frequent intervals and treatment applied as often as necessary to protect them against discomfort and losses caused by ear ticks. Herds grazing on infested ranges should be treated late in the fall or early in the winter to prevent winter and spring losses to poorly nourished range cattle. All animals in an infested herd should be treated whether or not they show infestation.

When animals are grossly infested and the ear canals are packed full of ticks the parasites are easily visible, but when the infestion is light or moderate the ticks may be overlooked. The parasites usually attach themselves in the deep folds of the ear or crawl into the ear canal and follow it inward sometimes as far as the ear drum. Animals badly infested usually shake their heads and repeatedly turn them from side to side, meanwhile inverting first one ear and then the other.

Most animals oppose the insertion of anything into their ears. The farmer who has only a few gentle farm animals to treat may tie them to a post or restrain them by other well-known methods, but in treating heards of wild range cattle or horses special equipment, such as dehorning chutes, branding chutes or other cattle chutes, may be used.

The subject is covered more fully in Farmers' Bulletin 980, "The Spinose Ear Tick and Methods of Treating Infested Animals," which may be obtained free of charge from the Division of Publications, Department of Agriculture, Washington, D. C.

TIME FOR DEHORNING CATTLE.

To the Editor: When is the best time to dehorn cattle? Should cows be dehorned before or after freshening? At what age should heifers be dehorned?—A. I., San Bernardino.

[Answered by Livestock Editor.]

Cattle may be dehorned at any time of the year, but it is risky to do it during the hot summer months on account of infection from flies. No matter when it is done, it is best to smear the spots over with pine tar to avoid infection. Some authorities claim that if a cow is dehorned soon after freshening it will cause her to shrink on her milk during the rest of that lactation period, but we have never noticed any difference if done after she has entirely recovered from the effects of calving. If the work is done when she is very heavy with calf, she may strain herself to such an extent that abortion will result. As a rule, it is best to dehorn a cow any time from two months after calving to a month before calving. The small horny buttons on calves should be killed with caustic potash in from three to five days after the calf is born, as after five days these buttons begin to attach themselves to the skull and it is then more difficult to stop their growth.

TRUEDALE Wins Again

At Los Angeles, for the fifth consecutive time, we won first on the get of our leading sire, TRUEDALE 367159 BY DOUBLE-DALE; also firsts in all other classes shown, six in all. All except one our own breeding.

At Sacramento this year we won nine firsts in all classes shown.

The Dairy.

The Toyon Farm Association of Los Gatos sold a registered Holstein bull to M. M. Soares Co. of Milpitas.

It is reported that the Western Condensing Co. has been incorporated in Humboldt county with a capital stock of $100,000.

At the meeting of the Creamery Operators' Association at Visalia, Dr. Roadhouse urged the formation of a Western Dairy Products Show

A. B. Humphrey of Grapewild Farms, Escalon, has purchased the high-class herd of registered Guernseys from Calla Grove Farm, Manteca.

Of the total milk produced by cows it is estimated that 5 per cent goes into butter, 3 per cent into condensed milk, 10 per cent into cheese and the balance into market milk, cream and ice cream.

called at our office a few days ago. Now that he has received his discharge, he is planning on getting back into the game again. During his absence his herd has been in the care of Gotshall & Magruder, Ripon.

At the recent Holstein sale at Portland 63 head sold for an average of $279.44. This average was satisfactory to the consignors, considering that the Pacific International Show had been called off and that the date for the sale had been changed.

L. W. Hutchins, who operates a large ranch south of Turlock, raises grade Holstein cows for sale. He keeps them until six or seven years old, then sells them according to test. If they do not come up to his standard, he sells them to the butcher.

Kenneth Abbott, formerly a prominent Holstein breeder of Milpitas, but more recently with Uncle Sam, and told how successful such organization had been in other parts of the country. A resolution was adopted urging the creation of a State Dairy Council and creating a fund to work for such an organization.

The Toyon Farm Association of Los Gatos reports the following recent Holstein records: Stanislaus Princess Pontiac, a three-year-old, 25.4 pounds butter in seven days; May Lilin Segis, junior three-year-old, 24.36 pounds; Finderne Jondine Pontiac, two-year-old, 22.8 pounds. The latter made 17.3 pounds as a junior two-year-old.

There are 353 cow testing associations in the United States, representing 9778 herds containing 168,348 cows. California ranks sixth with 16 associations, second with 653 herds, second with 19,814 cows, also first in the number of cows per herd with an average of 40.8, and first in the number of cows per association with 1238.3. The average number of cows per herd in the United States is 27.6 and the average number per association 476.9.

Cows from the Palo Alto Stock Farm are represented in three of the classes of ten leading Holstein cows in America for the year, including one second and one third. Nanette Aine Pauline completed on December 19 a seven-day test, making 36.28 pounds. Johanna Princess Mooie 2nd, a junior three-year-old, eight months after calving made 24.30 pounds butter and 484.4 pounds milk in seven days. This gives her the world's combined milk and butter record in this class. She will complete her yearly record in February and promises to make over 1100 pounds butter. Laura Meeka, on yearly test, to be completed in April, is going at a 1300-pound gait.

Beef Cattle.

H. M. Barngrover of Santa Clara sold three yearling Hereford heifers to George Small of Hollister.

H. M. Barngrover of Santa Clara bought 24 head of purebred Hereford weanlings of Clinck & Peters of Quincy.

J. A. Bunting of Mission San Jose tests his herd of Herefords for tuberculosis every year. The last test showed no reactors.

Stalder Bros. of Riverside purchased 30 head of high-grade Aberdeen-Angus cows at the Tagus Ranch sale. They were in calf by one of the best of the Tagus Ranch registered bulls.

T. T. Miller has moved his Shorthorns from Los Angeles to Hollister. He is making an extensive improvement and plans for one of the finest breeding establishments on the Coast.

The Wyoming Hereford Corporation, Cheyenne, Wyo., booked orders for 130 heifers and 5 bulls at the Los Angeles Liberty Fair. And yet some breeders say that it doesn't pay to make the shows.

Warren T. McCray, Orchard Lake Stock Farm, Kentland, Ind., has sold practically a million dollars' worth of Herefords, sired by Perfection Fairfax. Who says that it does not pay to stake a big pile on a good bull?

The annual report of the Shorthorn Association shows good progress for the year, as the amount received from registrations and transfers was $255,141.93, as compared with $170,970.46 for the preceding year.

An average of $1,566 on 50 Herefords was made at the International sale held at Chicago. The grand champion heifer, Madam Donald 2nd, topped the sale at $8,300, thus establishing a new record for American-bred females.

At the sale of Shorthorns held in connection with the International Livestock Exposition at Chicago, 43 head sold for an average of $2,307—29 females averaging $1,505 and 14 bulls averaging $4,012. The grand champion bull of the show, Lord Rhybon, topped the sale at $15,000.

Last week we stated that the Hereford bull purchased by H. M. Barngrover of Santa Clara was a grandson of Woodford, the noted bull owned by Col. Woodford of Kentucky. We should have stated that Woodford was owned by Col. Taylor.

In their last report on livestock conditions, Clay, Robinson & Co. advised cattlemen to keep plenty of young cattle on hand and expressed themselves as confident that there is going to be a tremendous demand for meat for many years. J. Ogden Armour predicts that prices will remain high for at least four years.

Swine and Swinemen.

Falfaldale Farm, Perris, has sold seven young Duroc gilts to R. H. Long, Ethenac.

A. B. Humphrey, Escalon, has sold a Berkshire herd header to Adohr Ranch, Van Nuys.

Maurice Rucker, the well-known swine breeder, has been engaged by Fred Hartsook of Lankershim to take charge of his ranch.

Llano Vista Ranch of Perris has sold the sensational young Hampshire boar, Liberty, to Conejo Ranch at Newbury Park for a reported consideration of $500.

A. B. Humphrey of Grapewild Farms, Escalon, has added to his Berkshire herd a son of Epocal, the much-talked-of English boar owned by the Gossard Breeding Estate, Martinsville, Ind.

W. B. Hewitt of Van Nuys sold three herd boars at the Liberty Fair, these going to George Junior Republic at Chino, American Hog Syndicate at Palo Alto and M. A. Webber, Daggett.

L. E. Putnam of Stanislaus county is feeding his damaged blackeye peas to his hogs. He considers one bushel of peas equal to two of barley fed whole. He doesn't think it necessary to cook them.

Peters, Lamson & Walker of Devore have booked an order for foundation stock to be shipped to H. F. Bahmeir, Farm Advisor of San Bernardino county, who is about to locate in the State Settlement Colony at Durham.

Berkshire breeders will be interested in the fine china dinner service valued at $300 which Hotel Whitcomb has donated to be given for the best Berkshire boar and three sows bred and owned by exhibitor and shown at the San Francisco show. This special prize should bring out a large class.

Anchorage Farm, Orland, sold a granddaughter of Star Leader to John Cornwell of Orland some time ago. She was entered in the under-six-months class at the Orland Fair and won second prize. Mr. Cornwell was so well pleased that he bought two bred sows from Anchorage Farm, ordered two more sow pigs and wanted to pick out a boar to go with them.

The Tulare County Duroc-Jersey Breeders' Association will hold its first consignment sale of purebred sows and gilts in the new sales pavilion, Tulare, January 15, at 10 o'clock. The offering will include the picks of the best herds in the

BREED For Production and TYPE

Our great Holstein herd contains such cows as Lauramelka, State record 4 year old, who will make on her present yearly official test over 1,300 lbs. butter, Nanette Aine Pauline who has just made 36.28 pounds in 7 days. Finderne Alexis a 38 lb. 3 year old, Johanna Princess Moore 2nd, who has just made the world's combined milk and butter record in the 8 months after calving class, and many others who are making Holstein history.

Our herd sire is King Pontiac Segis Korndyke, whose first seven sires have 492 A. R. O. daughters, four of them with records over 40 lbs. and 33 over 30 lbs.

King Pontiac Segis Korndyke has to date 24 daughters in milk, their records averaging over 20 lbs in 7 days as 2 year olds.

If you want the best at reasonable prices, write or call:

PALO ALTO STOCK FARM

M. H. Tichenor, Pres. = Palo Alto, Cal.

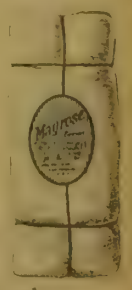
To Producers and Consumers of the California Grain-fed HOG:

It is just about two years ago since we first started our advertising campaign to

give the California Pig a chance

We were confident that California grain-fed pork is equal in quality to grain-fed pork produced anywhere else. From the hogs we received we selected the best from which to cut our

MAYROSE brand HAMS and BACON



We unhesitatingly urged you Consumers to buy these smoked meats, and we never ceased our efforts to encourage you Producers to raise better and still better hogs, second in quality to none. The results of this campaign have been most gratifying to Consumers, to Producers and to ourselves.

The California grain-fed hog has MADE GOOD—
Let us ALL keep up the good work!

WESTERN MEAT COMPANY
SAN FRANCISCO

county. The sows will represent the most popular strains and will be bred to some of the best boars in the State.

W. P. Andrews, breeder of "Andrews' Quality Durocs," Modesto, reports the following sales: March boars to Boothe & Sherwin, Ceres; D. Garzoli, Bolinas; Standard Lumber Co., Sonora, and E. R. Paige, Modesto. Bred gilts to H. P. Dwight, Merced; one to M. E. Kline, Modesto; two to Mrs. Daniel Boone, Modesto; four to H. Ortman, Modesto, and one each to William G. and C. O. Love, Danville.

Last week, in telling about the purchase of the Berkshire sow Riverby Princess by J. Francis O'Cononr of Castleview Farm, Santa Rosa, we said that she was champion at the National Swine Show, while we should have stated that she is champion of the world, having won this honor at the P.-P. I. E. Mr. O'Conner of Castleview Ranch, Santa Rosa, champion sow, Rookwood Lady 100th.

The Castleview Ranch of Santa Rosa recently sold to H. C. Muddox, the well-known banker of Sacramento, Grand Lady Mayhews, 1916 grand champion sow at the California State Fair. This great Berkshire sow was bred by A. B. Humphrey and told to A. W. Foster for $500 at public sale. Mr. Muddox is collecting a grand herd of Berkshires, having previously bought Ames Rival 102nd, junior reserve champion boar of the world, from the Frank A. Brush herd, also Rincon's Leader, junior yearling champion boar at the last State Fair.

Sheep.

The Glenn County Farm Bureau is conducting a campaign for an effective ordinance against sheep-killing dogs.

The sheepmen of the State are expected to organize the California Wool Growers' Association at a meeting to be held at the University Farm, Davis, January 20. It is intended to follow out the plan of organization of the California Cattlemen's Association. The State will be divided into five zones and a manager will be appointed in each district to keep the parent organization in touch with marketing and other business conditions. A campaign for membership is under way. It is estimated that to make the organization permanent it should include 75 per cent of the wool growers in each county.

More than three hundred representatives of mills and wool firms recently engaged in spirited bidding at a three days' auction of 15,000,000 pounds of wool commandeered by the Government last May and now to be released. It is understood that there will be another auction at about the end of the year, when 20,000,000 pounds will be turned back from the Government. The Government now holds 98 per cent of last year's crop, taken from the growers at a figure about 25 per cent above the world level of prices, as an incentive to production. Had the war continued this supply would hardly have been sufficient, but now the Government is in the market to sell over 300,000,000 pounds of wool and faces the problem of getting it back into the commercial trade without knocking the bottom out of the market.

FIFTY HEAD of Angora goats for sale. Address F. W. Nason, Jamesburg, Monterey county, Cal

POLLED JERSEY breeder's names, etc. See adv. ... page.

Lambing Sheds Reduce Losses

[Written for Pacific Rural Press.]

EXPOSURE to cold, rain and winds carries off more lambs than any other cause. That is the decision reached by Prof. R. F. Miller of the University Farm, after an investigation of California sheep-raising conditions. He found that sometimes a two- and three-day storm would carry away from 10 to 15 per cent of the lambs in a flock.

This little lamb was born in a lambing shed. Notice how well he developed.

As these conditions are realized, the desirability of lambing sheds is seen, and they are now used and recommended by many sheepmen who formerly thought them impractical. The manager of one large ranch in Tehama county estimates that 40 to 50 per cent of his losses have been eliminated since he began using these sheds.

Probably there are some sections of the State where these sheds are not necessary, but where storms occur frequently and little natural protection is afforded some shelter will be found profitable.

There are many types of shelter, and prevailing conditions determine largely the most practical shed for a given locality. But in building any kind of a shed there are certain points that should be observed.

First—The shed must furnish ample room for the number of ewes sheltered. Crowding ewes that are lambing or about to lamb is certain to result in loss. A shed or barn 80x80 will accommodate about 600 ewes. By allowing ample room, the ewes that are lambing during the night will usually go quietly into a corner by themselves. The next morning, when the gate is opened, the ewes will slowly move out, and those having just lambed will often stay behind in the barn.

Second—The barns or shed should be provided with a number of individual pens (3x3) for an ewe with twins or with a weak lamb, and the barn should be so constructed to admit of further partitioning for ewes and lambs as required.

Third—During wet weather it is important to have the shed well bedded with straw or it will become very filthy. The sheep track in more or less mud, and when the fleeces are water soaked the bedding soon becomes wet.

Fourth—In addition to the shed, it is very helpful to be able to hold the ewes with young lambs in small numbers, or to keep each day's drop separate for a few days. The ideal arrangement is to have a number of 10- or 20-acre fields adjacent to the shed, which may be used for this purpose, although this is not always possible. After the ewes are turned out in the fields, it is not necessary to bring them back to the barn at night. From these small fields the ewes are worked together into bands of 200. When the lambs are two or three weeks old they are docked and marked, and then usually the ewes are put into bands of 600 until their lambs are weaned.

When barn room is limited the ewes are sometimes worked in relays, taking out the ones that are about to lamb by inspecting their bags and marking them in a chute and then separating them by means of a dodge gate. This is a precarious undertaking, however, and heavily pregnant ewes cannot be handled too carefully. When this method is followed it would be more practical to breed the bands so as to come in at intervals of three or four weeks.

Handling the ewes very quietly is most important and the services of a good night man are almost invaluable. There are many details to look after and as every ewe is somewhat "different" the best of judgment is needed for successful lambing.

If you are thinking of building a lambing shed, write to the College of Agriculture, Berkeley, for a copy of Circular 188, "Lambing Sheds," by Prof. Miller. It covers the subject more fully, gives suggestions for building suitable lambing sheds, and includes both photographs and plans. It's a dandy.

WINTER PASTURAGE FOR COWS.

To the Editor: We are feeding 12 cows and have no silo. We wish to fence our alfalfa in small lots, so that the cows can feed off each lot in about a week's time and the ground will not be trampled too much. What disadvantages are there, if any, in this method?—C. L. E., Elk Grove.

[Answered by Livestock Editor.]

The disadvantages of the pasturing method you outline are so insignificant as compared with the advantages that they are not worth taking into consideration. Injury to the stand of alfalfa can be overcome by cultivating each field after pasturing it. Such a method seems to do the stand good, for the cows distribute the manure evenly and the cultivating not only works the manure in, but loosens up the soil.

A still further improvement on this method is to disk each field one way with the disks set straight and seed in about forty pounds of barley to the acre. This barley will grow while the alfalfa is dormant and can be pastured down several times before the alfalfa begins to grow again in the Spring. If you have several fields you can rotate the cows from one field to another and by the time they have pastured each field once, the barley in the first field will be up and ready for them again. In the spring you can let this barley grow up with the first cutting of alfalfa, and not only will this give you a heavier cut but it will tend to keep the fox-tail out and will improve the quality.

COW HAS WOODEN TONGUE.

To the Editor: I have a cow that froths at the month and her tongue is swoolen so badly that she cannot eat. What can I do for her?—W. L. T., Tulare.

[Answered by Livestock Editor.]

First of all, examine the mouth carefully, as some foreign body may be lodged in the tongue or somewhere in the month, or a sharp, split or diseased tooth may cause the irritation. It is probable, however, that the animal is affected with a condition known as wooden tongue, which is lumpy jaw affecting the tongue instead of the jaw. It is due to a mold known as "ray fungus" which lodges in the tongue. The treatment consists in making several slits along the upper surface of the tongue with a sharp knife and painting them with iodine; also, give the animal daily, three drams of iodide of potash in her feed. If this treatment causes loss of appetite, watery eyes, or scurfy skin, discontinue for a few days and then begin again with smaller doses.

San Francisco Show Notes

Some breeders felt that the directors of the California International Livestock Show made a mistake in postponing the show until February 8. They thought that it ought to have been held sooner, but that the directors exercised wise judgment is now self-evident. The influenza epidemic has not yet run its course, and shows which have been held recently have had small exhibits and even smaller crowds. It is expected that conditions will be normal before the new date, and the entries that are pouring in indicate that a much larger and better lot of livestock will be seen than if the show had been held on the original date.

Several intending exhibitors have inquired about the switching charges at San Francisco, and Manager Joseph E. Painter gives the following information:

On all stock originating on the Southern Pacific lines there will be no switching charge made by them, but there will be a switching and hauling charge made by the Ocean Shore Railroad to the show grounds of $5 per car.

Where the stock originates on the Santa Fe Railroad, there will be an additional $2.50 switching charge made by the Southern Pacific, which railroad will have to haul the cars of stock between the Santa Fe terminal and the Ocean Shore switch.

In case the stock originates on the Northwestern Pacific and comes across the bay from Sausalito, an additional $3.25 charge will be made by the State Belt Line for delivery to the Southern Pacific, but in order to obviate this the stock may be switched over to the Santa Fe and hauled around the bay and thus save this $3.25 charge.

There will therefore be the charge of $5 in the majority of cases. In the case of the Santa Fe the total charge will be $7.50 and if a car is handled by the three roads there will be a maximum charge of $10.75.

The tariffs governing shipping rates have nothing to do with the switching charges within the city limits; therefore the one-way rate to the show and return free on all stock shipped for exhibition purposes does not apply to the return switching charges as at present. Mr. Painter is taking the matter up with the various railroads and is endeavoring to have the return switching charges omitted. We will report on this later.

DON'T RUSH HOGS TO MARKET.

The California Swine Breeders' Association asks that wide publicity be given the following announcement just sent out by them:

"This is to call your attention to the fact that, in agreement with the Food Administration, the packers of this State have agreed to pay within one cent of the Chicago prices for hogs. The minimum for Chicago for January has been set at $17.50 for average packers' droves over 150 pounds weight. This means, then, that the minimum for California for January will be $16.50. We want to call your attention, however, to the fact that the California buyers, for the present, can apply this minimum only to hogs averaging between 150 and 250 pounds; in other words, the demand for heavy carcasses, hogs weighing 250 pounds or more, has dropped until killers are having difficulty in disposing of them.

"Also, due to the influenza epidemic, none of the packers, particularly in San Francisco, are able to kill more than one-half as many hogs as they normally do. There will be no reduction in price if the quality continues as at the present time, but until health conditions among their employees are normal it would be advisable to correspond with the packer to whom your hogs might go, before shipping them, in order to find out whether or not they can be handled. This will avoid delay, confusion and some loss."

Make Hogs Pay

Our Anchorage Farm Berkshires are money-makers. They are strong in the blood of our world's reserve champion, Star Leader, and have size, type, quality, vigor, and easy-feeding qualities—everything necessary for the ideal profit-producing hog.

Bred Gilts Will Start You Right

Don't let anything on earth stop you from getting some of the wonderful gilts we are now offering—granddaughters of Rival's Champion, and bred to Anchorage Leader 2nd, an outstanding son of Star Leader. This is the blood you need to insure your success.

Gilts with good bone, well sprung ribs, strong backs, heavy hams. Right in every way and all ready to go ahead and make money for you.

It's a crime to offer them at $75 each, but we are going to do it to introduce our stock in new localities. They are worth much more.

Order Early—Avoid Disappointment

Don't put it off, for these gilts will go quickly. Get yours right now and begin to reap a golden harvest. If you want further information, send for free illustrated booklet.

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood. Pomona.]

NEW YEAR'S POULTRY WORK.

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

Before commencing on the new year, we ought to take a retrospective view of the last, or old year. Find out where we have missed it and promise ourselves to never again make the same mistake. One of the farmer's greatest mistakes, in California, is in neglecting to provide proper housing for a flock of chickens. If the women of the family insist on keeping chickens, he allows them some old open shed, where the wind whistles around and the rain beats in, then the chickens take cold, followed by roup and all the feed and care that has been given is so much thrown away. Given decent shelter, which for poultry consists in a rain-tight roof, and three wind and rain-proof sides, a small flock of poultry will hold their own in regard to health, out on range; then whatever is fed to them will be returned in eggs. But with poor shelter feed is almost of no use except to keep up the organism of the fowl.

Then, too, the farmer should find out which of the standard breeds he and his family like best, not what somebody else tells him is best, and having a good shelter, he should begin to grow into his favorite breed by purchasing at least a male bird to improve the flock he has. There is not anything looks worse than a farmer having a decent automobile, and a garage for it, a well painted house and stable, and then a flock of mongrel chickens scratching around. They simply don't fit in. On a prosperous farm things should harmonize and they can be made to do so at very little cost, both of money and labor.

It has been proven at nearly all egg laying contests, that standard bred hens lay more eggs with less mongrel. Some even go so far as to claim a $6.00 annual lay of eggs and charge the hen with a board bill of $2.00 leaving the neat sum of $4.00 for the housing and the first investment, care, etc., of the fowls.

LIBERTY FAIR POULTRY DISPLAY.

At the Liberty Fair I saw the best display of Bronze turkeys it was ever my lot to see in any show—some magnificent breeders—and in poultry there were almost all the standard breeds. Some very fine White Orpingtons, which, being an old Orpington breeder, made me wish I was in the game again. Wyandottes, too, have improved so much the last few years that it was a pleasure to look them over. I spent the whole day in the poultry department and feasted my eyes on all the birds. Then, too, I had a few Bantams in. You know when old fanciers get past caring for the heavy breeds, they go to the other extreme and take up with Bantams. Anyway, mine brought home the bacon, so, of course, like a kid with a Christmas horn. I've been tooting ever since. Three blues, three reds, a green, a yellow and a white ribbon was a pretty good haul for one exhibit. Rhode Island Reds were very well represented, but ducks and geese were a small exhibit. The real annual show for Los Angeles comes off in January and I will take more time to visit that and will tell you all about it later.

STANDARD BRED FOWLS—AMERICAN CLASS.

Commencing with the class called "American Class," we have all Wyandottes irrespective of color; Rhode Island Reds and Buckeyes; Rocks of all colors including the old Dominiques and the Javas. Taking them again in turn the standard weight of Wyandottes is for cock, 8½ pounds; hen, 6½ pounds; cockerel, 7½ pounds and pullet, 5½ pounds. Anything over that is superfluous fat, except in occasional specimens that make big bone; under weight the specimen is not up to standard, unless it is in poor condition and can take on weight without being what is called fat.

Weight of Rocks: cocks, 9½ pounds; hen, 7½ pounds; cockerel, 8 pounds and pullet, 6 pounds. And the same rule applies to Rocks as Wyandottes concerning over and underweight. There are always some large, fine specimens that run over and yet are not fat, because they have been fed for bone when young.

JAVAS.

Weight of cock for Javas, 9½ pounds; hen, 7½ pounds; cockerel, 8 pounds, and pullet, 6 pounds.

DOMINIQUES.

These are the old fashioned Plymouth Rocks and are a smaller bird than our modern improved Rocks. Weight of cock is 7 pounds; hen, 5 pounds; cockerel, 6 pounds, and pullet, 4 pounds.

Rhode Island Reds: Weight for cock, 8½ pounds; hen, 6½ pounds; cockerel, 7½ pounds, and pullet, 5 pounds.

BUCKEYES.

Cock, 9 pounds; hen, 6 pounds; cockerel, 8 pounds, and pullet, 5 pounds. Characteristics of the American class. All of these varieties have clean legs, that means no feathers or stubs on them; yellow in color; all breeds have red earlobes and all these breeds in the American class, without exception, lay a colored egg, a little varied in shade, especially in Rocks, but they never quite come white, though I have seen some very pale in color; so remember, all American classes lay colored eggs and all have red earlobes, stand well up on clean, stout legs and are the poor man's business hen in general. All have the dual quality of being good layers and also making good table fowl. The difference in breed or variety is merely a matter of choice.

BONES TOO BRITTLE.

To the Editor: I have every once in a while some Leghorn pullets that have both legs broken, sometimes two a day. They are in a big yard, 50 in a yard; there is no roosters or any other animal with them. It always gets my best layers. I even find them on the nest with both legs broken.—P. S., Oakley.

[Answered by Susan Swaysgood.]

Unless you are feeding some kind of grit that affects the bones, I would suspect the water of containing too much lime. Breakage in bones is always due to a brittle condition and it may be your hens are getting more mineral in grit, water or feed than the system will absorb rightly. Feed more green stuff and change your grit. I wish you would let us know how this pans out, for this is interesting to us, though not to you while you are having the loss. But there is where the trouble is—too much mineral.

$50.000.000 OF POULTRY PRODUCTS FOR 1918.

[Written for Pacific Rural Press by Geo. H. Croley.]

Poultry products as a whole actually increased in volume about 10 per cent during 1918, but owing to advance in prices the value will probably reach the sum of $50,000,000, as compared with $32,500,000 for 1917. This increased value was created by an advance of about 40 per cent in the price of eggs and about 60 per cent in poultry. Of this total volume, eggs make up about 65 to 75 per cent, and chickens about 22½ per cent, pigeons 3½ per cent, and turkeys, geese, ducks, etc., about 4 per cent.

Large flocks have been reduced in size as well as in number, but thousands of small flocks have been established in sections or neighborhoods where formerly poultry was produced in small numbers or not at all, thus becoming producers instead of buyers in the large distributing centers, as reflected in the market reports of receipts and sales.

This scattering of the field of production is responsible for much of the increase, for the reason that the ever present supply of fresh eggs and desirable table poultry encouraged consumption. In some localities as much as five to ten times as many dollars' worth of poultry products were consumed during 1918 as in any previous year.

Prospects for the poultry industry as a whole were never better.

EGG MEN OPTIMISTIC.

Manager J. H. Barber of the Poultry Producers' Association is very hopeful of high prices for eggs all through next year and particularly during the next two months. With a view to marketing their eggs in the East, the Poultry Producers have established an agency in New York.

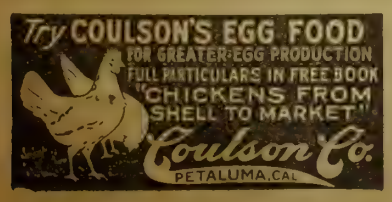
L. BRIEFNER & SONS

(Est. 1861)

154 West 25th St., New York City.



BOTH SIDES CLAIM VICTORY.

In a recent issue we printed an item under "Poultry Notes" to the effect that in the case of the Poultry Producers of Central California vs. J. R. Bell, tried before Judge Woods in the Alameda Superior Court, that decision was given to the defendent.

Since printing this item we have received a letter from J. H. Barber, manager of the Poultry Association, stating that we were in error and calling our attention to the fact that judgment was rendered the plaintiff for $244, being for eggs sold by Bell before he sold out his poultry business.

Mr Barber writes: "I am sure you will be glad to publish the actual facts in the case, which are as follows: J. R. Bell was one of the original subscribers to the Poultry Producers' agreement, but refused to fulfill his agreement. We brought suit against him for specific performance of the contract, that is, to compel Mr. Bell to deliver his eggs to the Association as he had agreed to do. We also sued for damages as provided in the contract. Immediately after the suit was brought, Mr. Bell sold off his hens and went out of the poultry business and his attorney argued that on this account specific performance of the contract should not be granted because Mr. Bell no longer has any eggs to deliver. Naturally it would be useless to order him to deliver eggs that he has not got.

"But this does not affect the validity of the contract nor relieve Bell from his liability for damages as provided in the contract. The court therefore gave judgment against Bell in favor of the Poultry Producers for five cents a dozen on all eggs sold by Bell as long as he was in the business amounting to a total of $244."

This case has caused considerable interest to poultry men, as the question of validity of contracts was involved, and we have gone further into the matter to ascertain the facts.

From a statement by C. W. Petersen, the attorney for Bell, he states that the question of damages was not at issue but that the case was tried upon the merits of holding Bell to the performance of contract signed with the Poultry Producers' Assn. Attorney Petersen claims that the defendant won on the questions involved outside the damages for eggs not delivered.

The following is the last paragraph of the judge's decision as quoted by Mr. Petersen:

"Defendant seems to concede that plaintiff is entitled to a judgment for two hundred and forty-four ($244) dollars damages for his failure to deliver eggs produced before he disposed of the poultry business, so it becomes unnecessary to examine the provision in the agreement providing for liquidated damages. The prayer for specific performance is denied, and plaintiff is awarded a judgment for two hundred and forty-four ($244) dollars damages."

PREVENTING DAMAGE TO EGGS IN TRANSIT.

The Bureau of Chemistry, through the Food Research Laboratory, has been assisting in reducing the damage to eggs in transit by giving practical demonstrations at shipping points in loading cars of eggs or mixed eggs and dressed poultry. Much of the damage is directly due to faulty methods of packing eggs in cases and stowing the cases in the car. Four meetings held recently in Iowa were attended by over 100 practical shippers who send cars weekly, at least, to Eastern markets and who expressed great interest in the methods which the department has worked out for the conservation of this valuable foodstuff. They and many others have found the department's folder, "How to Load Cars of Eggs," of assistance. Copies of this folder can be had by writing to the Bureau of Chemistry, United States Department of Agriculture, Washington, D. C.

THE HOME CIRCLE

Oh Say, Can You?

O say, can you sing, from the start to the end,
What so proudly you stand for when orchestras play it;
When the whole congregation, in voices that blend,
Strike up the grand tune and then torture and slay it?
How valiant they shout when they're first starting out;
But "the dawn's early light" finds them floundering about.
'Tis "The Star Spangled Banner" they're trying to sing,
But they don't know the words of the precious, brave thing.

Hark, "the twilight's last gleaming" has some of them stopped,
But the valiant survivors press forward serenely
To "the ramparts we watched," when some others are dropped,
And the loss of the leaders is manifest keenly.
Then "the rocket's red glare" gives the bravest a scare,
And there's a few left to face "the bombs bursting in air";
'Tis a thin line of heroes that manage to save
The last of the verse, and "the home of the brave."

—Chicago Standard.

Careless Kitty Caramel.

Pretty little yellow Kitty Caramel was careless. Even her best friends could not deny it. She did not mean any harm; but she thought of so many interesting things to do, and just the very minute that she thought of any such thing she did it! That's the way she often fell into trouble.

Her mother, Tabitha Catchemquick, gave her a great deal of good advice. Tabitha Catchemquick was very wise. She had had experience, and she knew.

"Always look before you leap, my child," she said rather anxiously.

"Yes'm," politely responded Kitty Caramel.

But when she saw a butterfly alight on the piazza railing she leaped without looking beyond the railing. Over she went, and struck with a dreadful thump on the brick walk. It seemed to her she could never get her breath again.

"I'll be careful next time!" she gasped.

But next time it was something different.

"Always chew your food well, my daughter," said Tabitha Catchemquick, oh, very earnestly!

"Yes'm," obediently answered Kitty Caramel.

But when she had a fine big bite of sweet potato in her mouth, and saw Puggy, the dog, coming, she did not stop to chew it at all. "He'll get it!" she said to herself; and she swallowed it whole—or tried to. It stuck, and the poor kitkin choked until her little Mistress Dorothy's big brother Tom held her up by her tail and shook her until he "unchoked her," as Dorothy called the process. There may be better ways to unchoke a kitten, but that was the only way that big brother Tom knew. It was most unpleasant.

"I'll be careful next time!" she gurgled.

But next time it was something still different—oh, very, very different. It happened in this way:

One morning big brother Tom came rushing in from the post-office and shouted that he must catch the next train or something awful would happen to his business.

"Pack my suitcase while I telephone, will you, sister?" he called to Dorothy. "You konw what to put in. I'll be gone over night."

So Dorothy very proudly and carefully packed her big brother's suitcase. Kitty Caramel, also, was greatly interested, and seemed to want to help. Dorothy had just put in the last thing—Tom's buff bathrobe—and had gone for a pink for his buttonhole—when he came flying up the stairs.

"All ready, sister?" he called.

"All ready!" answered Dorothy.

Tom clapped down the lid, strapped it, gave Dorothy a kiss, and one-tenth of a second to put the pink in his buttonhole, and was off. He barely caught the train, in the station at the head of the street. As he dropped into a seat the train moved out.

"Close shave!" he puffed.

"Meow!"

What was that—and where?

"Meowwwww!!!" Then a faint scratching inside the suitcase!

In half a minute, or less, Tom had it open. Out popped a very big-eyed Kitty Caramel and lighted on Tom's hat. From there she jumped again, coming down neatly in the lap of a big, burly drummer, then slipping and scratching him. Her next leap took her to a stout lady's bonnet, and when she went the bonnet went with her, away under the seats!

Poor big brother Tom! With such a red face, he followed, and finally he caught her. Her little heart was going pit-a-pat, as if it were trying, itself, to get out; but finally Tom got her nerves partly settled, and she cuddled close to him on the seat.

The stout lady brought out a bottle of cream from her lunch-box, and the big burly drummer offered the top of his silver drinking-cup for a saucer. By the time Tom's station was reached she was a perfectly calm kitten. From the station he telephoned to Dorothy, so she would not worry.

At the hotel where he stayed that night the cook liked kittens. She took the best care of the small stowaway, and in the morning put up a nice luncheon for her to eat on the way home.

But how glad she was to be home again!

"Folks are extremely nice, mother," said she, in telling Tabitha Catchemquick all about it, "but I do not wish to take another journey, ever! I like home best. After this I am going to be a Very Careful Kitten."

"I am pleased to hear you say that, my daughter—very pleased!" purred Tabitha Catchemquick.

"Yes," went on Kitty Caramel, "when I was struggling to get out of that dreadful fuzzy bathrobe, which is just the color of me, I thought, 'Oh, how often my mother has told me never to go where I was not invited!"

"I am sure you never will again, my dear," purred Tabitha Catchemquick.—Minnie Leona Upton.

EVERY WOMAN CALLED.

The food supplies of the world have been steadily lessening—we hold it in our power to keep the wolf from the door of the world. This is a duty as wide as our humanity, and women, who are the guardians of the food resources, are called to serve in the work of war relief.

The new program in conservation calls for rigid acceptance and discipline, because it does not demand brief, dramatic sacrifices, but a steady saving of all foods and the giving up of everything beyond our definite needs.

"Without discussing the rights and wrongs of the principles of unionism," said Franklin K. Lane, "there is no question but what it is a frequently abused institution working many injustices through technicalities. Too many union men follow the logic of the painter who came to work late one morning.

"'Youre' late,' remarked the boss. 'How does that happen?'

"'Well,' answered the painter surlily, 'I stopped to get a hair cut.'

"'What do you mean getting a hair cut on my time?' demanded the boss.

"'Well, it grew on your time, didn't it?' demanded the painter truculently."

New Year's resolution—save more food and indigestion.

Applied Patriotism

Woman has made herself indispensable to the Nation's war activities. This is being demonstrated daily in many splendid ways. The telephone operator takes her place in the front ranks of our "national army" of women.

Back of the scenes, invisible, her war work is to make telephone communication possible. Through her the Chief of Staff in Washington speaks to the Cantonment Commandant in a far-off state. The touch of her fingers forges a chain of conversation from Shipping Board to shipyard, Quartermaster General to supply depot, merchant to manufacturer, city to country, office to home.

Without her this increasing complexity of military, business and civil life could not be kept smoothly working. Hers is patriotism applied. She is performing her part with enthusiasm and fidelity.

The increasing pressure of war work continually calls for more and more telephone operators, and young women in every community are answering the summons—cheerfully and thoughtfully shouldering the responsibilities of the telephone service upon which the Nation depends. Each one who answers the call helps speed up the winning of the war.

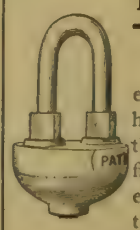
Dad's Good Resolution



That the New Year may be abundant in clean comfort and economy—one of continuous pleasure to mother and the entire household—I have resolved to purchase "The Simplest Thing in the World"—a "Premier" Burner, which makes a clean, hot gas fire, from coal oil, in cookstove or heater—that we may eliminate entirely drudgery and muss, the smoke, soot and fumes, that there may be indeed "no place like home."

I will write at once for circular " " and drawing, that I may decide whether to buy a burner alone for five dollars or a complete installation for nine eighty-five. While I know that one burner is sufficient for a heater or medium cookstove, I will mention the size of our firebox and style of stove that no mistake may be made. Lest I forget the name and address, will make notation on this, one of the best resolutions I ever made—

PREMIER BURNER CO., 246 So. Spring St., Los Angeles, Cal.

DAD.

End your wash day worries with COCOA NAPTHA SOAP the modern laundry soap

You can just as well avoid a lot of hard, tiresome rubbing and devote your time to pleasanter and more agreeable things.

No need to look forward with dread every week to wash day if you have Cocoa Naptha Soap on hand.

Your Dealer

Order some of this splendid soap from your dealer—a home product made by the Los Angeles Soap Company.

Replace Your Old-fashioned Plumbing Fixtures

The added convenience of modern plumbing fixtures will more than compensate you for the slight cost involved in replacing them for your present fixtures.

The attractive designs of Pacific Plumbing Fixtures will make you proud of your bathrooms.

Pacific Plumbing Fixtures are guaranteed forever against any defects in workmanship or materials, and although their quality is higher, cost no more than any other reputable brand.

Write for a free copy of The Book of Bathrooms. It is a 56 page book, brim full of ideas.

RING OUT, WILD BELLS.

Ring out, wild bells, to the wild sky,
The flying cloud, the frosty light;
The year is dying in the night;
Ring out, wild bells, and let him die.

Ring out a slowly dying cause,
And ancient forms of party strife;
Ring in the nobler modes of life,
With sweeter manners, purer laws.

Ring out false pride in place and blood,
The civic slander and the spite;
Ring in the love of truth and right,
Ring in the common love of good.

Ring out old shapes of foul disease;
Ring out the narrowing lust of gold;
Ring out the thousand wars of old,
Ring in the thousand years of peace.
—Tennyson.

THE CHILDREN'S YEAR PROGRAM.

The report of Dr. Adelaide Brown on the recent drive for weighing and measuring children in this State is most interesting. A total of 53,000 children under six years of age were examined; of these, 29 per cent are below the average in height and weight, 31 per cent show abnormal tonsils and adenoids, and 6 per cent defective teeth, while there were found to be 47 per cent correctable defects in supposedly healthy children.

The object of this drive was to reduce the appalling infant mortality in the United States by correcting defects of childhood and to arouse mothers to understand the value of intelligent guidance.

The national committee urges two things that will help in this cause—first, the county health nurse; second, children health centers, where babies may be brought to be weighed and measured and proper care and diet outlined.

In this State 21 health centers have already been established, a number of counties have installed a visiting nurse and most of the counties have a campaign on for both.

LITTLE KITCHEN HELPS.

Every woman should plan to have as many conveniences in her kitchen as she can possibly afford. Many times it is neglect rather than the cost that causes a housekeeper to do without small articles that would be of great assistance.

Among these are a wire dipper to be used in lifting any article from hot water without taking up any of the liquid; a combination apple corer and slicer that, when pushed over the apple, cores and slices into twelve pieces at one time; a spatula, whose flexibility makes it extremely useful for turning over anything that is baking or frying; a set of skewers of varying length from three to eight inches long, with a hook to hang them up by; a set of four aluminum measuring spoons, ranging from a quarter of a teaspoon to a tablespoon; a perforated mixing spoon for beating batter to be made very light; a small rubber dish scraper. For marking fancy cookies, either a carved board covered with designs on which the dough is pressed, or a carved rolling pin. None of these articles are expensive and there are many more that will be of great help.

TO MAKE JAVELLE WATER.

For bleaching sink boards, molding boards or kitchen tables, there is nothing more satisfactory than javelle water. It can be made at home in quantities, put in bottles or jars and is always ready for use.

To make, take 1 can chloride of lime, 3 or 4 pounds of sal soda and pound fine, put into a large pail or kettle and cover with several quarts of water. Let come to a boil and boil well, then, when cool, pour off the water into the bottles.

If the sink is in bad condition, it may need more than one application to bleach it. The wood should be free from grease to get good results, as the water acts upon stains largely.

"Mamma," said the little boy, "now that the people know that the kaiser is going to hell when he dies, won't everybody try, extra hard, not to go there?"

more than a scrap of paper -the Ghirardelli label

The Ghirardelli label on the Ghirardelli can is *more* than a scrap of paper. It is a *dependable* assurance of Ghirardelli quality. It carries with it the *certainty* that you are getting the chocolate of highest purity and nutriment.

Always dependable —never disappoints!

At the store where you do your trading —in ½ lb., 1 lb. and 3 lb. cans.

Ghirardelli's Ground Chocolate is put up *only* in cans—to safeguard your health and to protect you against inferior substitutes. Look for the label. Then you will be doubly sure that you are getting the *original* Ghirardelli's Ground Chocolate.

Ghirardelli's Ground Chocolate

PERFECTION OIL HEATER

THE MARKET REPORTS

Where commodities are consigned on a commission basis, the only price obtainable is the San Francisco price, from which customary charges are deducted to ascertain actual price paid to producer. Lines of commodities sold on exchanges, as butter, eggs, cheese, grain, etc., are priced according to exchange figures, which are not the prices paid to grower. From these figures must be deducted the legal percentages permitted to be taken by wholesalers before remitting balance of sale price to shippers. Schedules of discounts governing these transactions may be obtained from the offices of the Food Administration or of various exchanges.

SAN FRANCISCO

San Francisco, December 24, 1918.

WHEAT.

ANNOUNCEMENT.

The following are the prices announced by the Federal Grain Corporation, which are still in effect:

Per bushel—
No. 1 hard....$2.20
No. 2 .... 2.17
No. 3 .... 2.13
No. 1 soft.... 2.18
No. 2 .... 2.15
No. 3 .... 2.11
Club or Sonora, No. 1.... 2.16
do, No. 2.... 2.13
do, No. 3.... 2.09

Recleaned for seed, per ctl.—
California Bluestem ....$4.15@4.25
Early Baart .... 4.15@4.25

BARLEY.

The California Brewers' Protective Association scoffs at the belief that much of the accumulated stock of barley in this State can be disposed of by shipping abroad. It calls attention to the fact that local breweries had been the principal consumers of barley and also to the inconsistency of the action which permits shipping of barley for foreign breweries while the breweries at home are kept closed. Very little interest is manifested in barley in the local exchange and the grain is weak in this market.

Choice feed, per ctl....$2.17½@2.22½

OATS.

There is practically no business in any of the grains at this season of the year. While some inquiry for red for seed strengthened that description, red feed is weaker.

Red feed, per ctl....$2.40@2.55
Red for seed .... 2.75@2.95
Black for seed .... 2.80@3.00
Recleaned Red or Black for seed 3.35@3.50

CORN.

There is no change in the corn situation. The demand seems to be at a standstill and no sales are reported.

Egyptian, choice ....$2.75@3.00
Milo .... 2.70@2.75

HAY.

Receipts of hay for the past week were 775 tons, compared with 816 the previous week. Trade is extremely light, as is usual at this season of the year. The receipts have been more than ample to take care of all demands and, although a lower range of prices is quoted throughout, it might be said that prices are nominal, as there has been absolutely no trading. Consignments have been sold for what they bring, with few buyers in evidence. Considerable damaged hay, mostly alfalfa, arrived from the river and has been offered at figures that cannot be satisfactory to producers, but this hay must be disposed of as it arrives, as it is not in condition to keep any length of time.

Wheat, No. 1....$23.00@25.00
do, No. 2 .... 17.00@21.00
Choice tame oat.... 22.00@24.50
Wild oat .... 17.00@19.00
Barley .... 17.00@19.00
Alfalfa .... 15.00@19.00
Stock .... 15.00@18.00
Barley straw .... .50@ .80

FEEDSTUFFS.

The market for feedstuffs reflects the condition of the hay market. Most of the buyers are showing no interest and refuse to buy except for immediate needs at this season of the year. The market is dead, but no change in quotations is noted.

New alfalfa meal, per ton....$[illegible]
Coconut cake or meal.... 45.00@47.00
Whole yellow corn .... 77.00@80.00
Cracked corn .... 80.00@82.00
Linseed Oilcake Meal.... 77.00@78.00
Rolled barley .... 45.00@47.00
Rolled oats .... 55.00@57.00
Mill run .... 34.00@35.00
Fish meal, per 100 lbs.... 4.80@ 5.00

POTATOES, ONIONS, ETC.

The receipts of both potatoes and onions continues large, while the demand is normally low at this season of the year. It is believed that there may be more activity in potatoes about the 10th of January or shortly thereafter when a demand for seed potatoes should develop. The street reports a good trade during the past week in other vegetables with practically no change in prices from last week. Beans continues one of the most popular vegetables at this season, although tomatoes, celery and lettuce all moved well.

String beans ....12@15c
Lima beans .... 8@9c
Carrots, per sack ....85c@$1.00
Rhubarb, San Jose, per box....$1.00@1.25
Pumpkins ....75@90c
Cucumbers, hothouse, box of 30..$2.50@3.00
Los Angeles lugs....$3.00
Eggplant, per lb....8@12½c
Lettuce, per crate ....$1.50@2.00
Celery, bunch .... [illegible]@25c
do, crate ....$3.75@5.00
Tomatoes per crate—
Southern ....$2.50@3.00

Potatoes—
Fancy whites ....$2.00@2.15
Choice .... 1.85@1.90
Sweets, per sack .... 3.50@3.75

Onions—
Yellows .... 60@90c
Australian Browns ....60@90c
Garlic, new ....20@25c
Green corn, Alameda, per sack....None
Okra, per box....None

BEANS.

The holiday season is always quiet in the bean market. There is practically no demand and the entire list is weak. Limas is the only description on which quotations are changed and they are quoted 15 cents below last week's prices.

Bayos, per ctl ....$7.25@7.50
Blackeyes, new crop.... 5.50@5.75
Cranberry beans .... 7.75@8.00
Limas (south, recleaned), new crop $10.25
Pinks ....$6.65@6.75
Mexican Reds ....$6.75@7.00
Tepary beans .... 5.00@5.50
Garbanzos .... 8.50@9.00
Large whites, new crop.... 8.20@8.30
Small whites, new crop.... 9.10@9.25

POULTRY.

The entire poultry market is strong and prices have been well maintained throughout the week. The demand for nearly all descriptions has been good, although of course the principal demand has been for turkeys. Some of this stock sold as high as 50 cents on Monday, but that price was not maintained and was asked in only a few instances. On Tuesday there was an effort on the part of some dealers to clean up their stock before the Holiday, but where less than 45 cents was asked it was mostly for inferior stock. Several cars of eastern turkeys were on the market during the week and these served to stabilize the market and to keep quotations below the 50 cent mark.

Turkeys, live, young spring, lb....38@40c
do, old ....36@38c
do, dressed ....45@48c
Broilers, 1½ to 2 lbs....39@42c
do, 1¼ lbs....43c
do, ¾ to 1¼ lbs....43@45c
Fryers 35c
Hens, extra, per lb., colored....33@34c
do, Leghorn ....33@34c
Smooth young roosters, per lb. (3 lbs. and over) ....34@35c
Old roosters, colored, per lb....24c
Geese, young, per lb....34@35c
do, old, per lb....30@32c
Squabs, per lb....55@60c
Ducks ....33@35c
do, old ....30@33c
Belgian hares ....23@24c
Jack Rabbits ....$3.00@3.50

BUTTER.

On Monday, December 23, the Directors of the San Francisco Dairy Exchange recinded the resolution of October 10, effective October 14, whereby weekly quotations only were made on butter, and butter again became today subject to daily changes based on market conditions. As a result extra jumped at once to 67 cents. The plan to have weekly quotations on butter was adopted at the request of the Federal Food Administration in an effort to stabilize the price. It was not wholly a success and for some time past the quotations on the exchange had little relations to the actual cost of butter. Eastern quotations plus transportation charges are higher than the local exchange prices in the past and this has resulted in a scarcity of butter in this market. The new rules just adopted by the Food Administration, whereby the manufacturer cannot sell butter at an advance of more than 5 cents a pound over the cost of butter fat necessary to make a pound of butter, are expected to stabilize prices.

	Thu	Fri	Sat	Mon	Tu	Wed
Extra	64	64	64	64	67	..
Prime first	63½	63½	63½	63½	Nom.	
Firsts	58	58	58	Nom.	..	.

EGGS.

Eggs are strong and higher again this week as is usual at this time of the year. After the holiday season lower prices are looked for if eggs follow the traditional trend. While not a record price for extras, which sold at 89 cents on November 8, 81½ for pullets is the highest of the year. The previous high record for pullets was 80¼ on November 4.

	Thu	Fri	Sat.	Mon	Tu.	Wed.
Extra	80½	81	81	83½	84	..
Extra 1sts	81	Nom.	..	..	..	..
Firsts	Nominal.					
Extra pullets	78½	78½	79	82½	81½	..

CHEESE.

Trade has been brisk in cheese on the exchange this week. While Fancy California Flats dropped at the close, Oregon triplets continued strong throughout the week and closed at the top.

Fancy California flats, per lb....35c
Firsts 34c
Oregon triplets, fancy 40c
Monterey cheese ....26@29c

FRESH FRUITS.

Trade in fruits has been active throughout the week. Apples have been in demand and all prices were strongly maintained. Persimmons have gone well considering the fact that many are not acquainted with this fruit.

California apples ....$1.00@2.00
Northwest apples .... 2.00@3.75
Winter pears ....$2.00@[illegible]
Persimmons .... 1.00@1.50

CITRUS FRUIT.

There was no change in the citrus fruit market this week. The demand was excellent and last week's prices were maintained. Somewhat lower prices are looked for after the first of the year but no change is expected during the coming week.

Oranges, navels ....$3.00@5.00
Mandarins .... 1.50@1.75
Tangerines .... 2.50@3.00
Lemons, fancy .... 4.50@5.00
do, choice .... 4.00@4.50
do, standard .... 3.50@4.00
California limes 1.50
Grapefruit, new .... 2.25@3.00

HONEY.

The ban on the exportation of honey has been lifted and the growers are said to be hopeful that they will now be able to dispose of their stocks. According to the local dealers as yet the lifting of the ban has had no effect on the San Francisco market and no prices can be quoted.

DRIED FRUITS.

Dried fruit market is always quiet at this season and there is no change in the situation of last week noted by the dealers.

RICE.

Paddy rice, 1918 crop....$4.32
Clear No. 1, 1918 crop, at mill.... 7.00

LOS ANGELES

Los Angeles, December 24, 1918.

BUTTER.

A scarcity of good fresh butter continues in this market. Cold storage stocks have been reduced to 91,330 pounds, and much of this sweet butter, against 129,955 pounds this time last year. Receipts for the week were 265,400 pounds, against 310,300 pounds the same week last year. The Eastern markets are weaker and there is a growing consumption of butter substitutes. Yet in the face of the light supply of choice goods on the market the consumptive demand took all the receipts the past week and so strong was the demand that extras were sold up Monday to 63c on 'change, an advance of 1c since a week ago. The market is now 14c higher than this time last year.

We quote—
California fresh extra creamery....63c
do, prime first 61c
do, first 59c
Same time last year—
California fresh extra creamery....49c
do, prime first 47c
do, first 46c

Daily quotations—

1918—	Tu	Wed.	Thu.	Fri.	Sat.	Mon
Extra	62	62	62	62	62	63
1917—						
Extra	47	47	47	49	49	49

EGGS.

There were more fresh ranch eggs in the past week than for some time. Receipts for the week by rail were 634 cases, against 731 cases the same week last year. The supply for the week was 3170 cases, against 3655 cases the same week last year. The Eastern markets are also lower. Chicago went off 3c during the week and New York declined 21c. San Francisco, however, is sharply higher than a week ago. Hence the market here held steady and firm on fresh extras and pullets, but case count declined 3c. The demand for fresh eggs, however, was not strong, the difference in the price of fresh and storage eggs giving cold storage the call, they meeting with a strong demand throughout the week. There was withdrawn from cold storage during the week 4869 cases, reducing the holdings now down to 10,992 cases. At the present rate of consumption this supply will be exhausted by the end of January, and the question now with the trade is, Will the fresh receipts by that time take care of the demand? The cold storage holdings this time last year were 8043 cases, which is less than present stocks, but the fresh receipts a year ago were heavier than now.

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon
Extra	70	72	72	72	72	72
Case count	67	67	67	67	64	64

1917—						
Extra	55	55	53½	52	49	49
Case count	51	51	51	47	47	47
Pullets	51	51	51	48	47	47

POULTRY.

A good Christmas demand was had the past week for everything. Receipts were not heavy, and what came in were easily absorbed at full quotations. Turkeys, owing to the season, showed most life, though they sold no higher, present quotations being considered strong enough.

The following prices were agreed upon last Friday, December 20, and hold good until the coming Friday:

Broilers, 1@1¼ lbs....40c
Broilers, 1½@1¾ lbs....45c
Fryers, 2@3 lbs. 35c
Roasters (soft bone), 3 lbs. and up....30c
Stags and old roosters, per lb....20c
Hens ....28@32c
Tom turkeys ....28@30c
Ducks ....22@28c
Geese 28c

VEGETABLES.

The market showed less life the past week. The near approach of the Christmas holidays showed itself in a number of ways. Potatoes were in good supply, slow sale and Idaho a shade lower. Brown onions, too, were slow sale and lower. More coming in than for some time and the market was fully 25c lower. White Globe scarce and sharply higher and demand fair. Cabbage dead, dull and much lower. Cauliflower came in quite freely and were lower, but demand was good at quotations. Sweet potatoes slow of sale and offerings heavy. Green peppers steady and what came in met with a very good demand. Peas steady and firm. Local celery in fair demand, but market lower. Fancy tomatoes were steady and firm and in good demand. Poor stock hard to sell. Squash and pumpkins steady but slow sale.

We quote from growers:
Peas, per lb.... 9@11c
Bell peppers, per lb....9@10c
Chile peppers, per lb....9@10c
Potatoes, northern, per cwt....$2.00@2.25
do, Idaho Russets, per cwt.... 1.90@2.00
Sweet potatoes, per cwt.... 1.75@2.25
Garlic, per lb....30c
Onions—
Australian Brown No. 2....$1.10@1.15
Australian Brown, per cwt.... 1.35@1.50
White Globe, per cwt.... 4.00@4.50
Cabbage, per 100 lbs.... .40@ .45
Celery, local, per crate.... 3.50@4.00
Tomatoes, No. 1, per lug.... 1.50@1.65
do, No. 2, lug.... .30@ .40
Cauliflower, standard crate .... .90@1.00
Hubbard squash, per cwt....$1.00
Banana squash, per cwt.... 1.00
Pumpkins, per cwt.... .75

FRUITS.

The market has now narrowed down to apples. Quite a number are coming in and meeting with a good demand. Prices are firm all around. Some fancy lots the past week brought a little more money. Japanese persimmons are now about all marketed from the country. A few are being had out of cold storage, but that is all. Hence the season may be considered over.

We quote from growers:
Apples—
King Davids, 4-tier ....$2.75@3.00
Black Twigs, 4-tier 3.00
Baldwins, 4-tier.... 2.50
Red Pearmains, 4-tier 1.75
White Pearmains, 4-tier.... 2.00
Yellow Newtown Pippins, 4-tier ....$1.75@2.00
Bellefleur, 4½-tier .... 1.60@1.75
do, 3½-tier .... 1.85@2.00
Bellefleur, 4½-tier .... 1.75@1.80
Jonathans, Northwestern pack 3.00@3.25
Winesap, loose per lb.... 6@6½c

WALNUTS.

The season is fast drawing to a close. No more No. 1 are to be had from first hands. Some culls are still coming in and are bringing readily 14c to 15c. The association's deliveries will soon be over. Their shipments the past week were only three cars.

F. o. b. California points—

	1918	1917
Fancy budded	33c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

BEANS.

If anything, the market the past week was duller than ever, the near approach of the Christmas holidays causing dealers to hold back. Only a few lots needed for immediate consumption were taken. Prices, however, show no change.

We quote from growers—
Limas, per cwt $10.00
Large white, per cwt....$8.00@9.00
Small white, per cwt. 8.00
Pink per cwt 6.50
Tepary, per cwt 4.00
Blackeyes, per cwt.... 4.50

HAY

The past week was another dull one in this market. The receipts were not heavy, though ample for the demand. Dairy people were the purchasers. Horse hay was especially dull and prices weak.

We quote f. o. b. Los Angeles:
Barley hay, per ton ....$24.00@25.00
Oat hay, per ton .... 26.00@28.00
Alfalfa, northern per ton.... 21.00@22.00
Alfalfa, local per ton.... 22.00@24.00
Straw, per ton .... 9.00@10.00

COTTON.

The market the past week took on new life and advanced sharply. The announcement the early part of the week that there had been released 1,000,000 tons of ocean tonnage encouraged good export buying, and with a better demand for the actual cotton there was new speculative life in the market. The result was a sharp advance by Monday of the current week, when December closed in New York at 30.50c and January at 29.17c. Spot middling, 32.10c.

HIDES.

Wet Salted Hides—Per lb., taken off before May 1: Cows and steers, all weights, No. 1, free of grubs, 14@15c; bulls and stags, 12c; kip, 20c; veal and calf, 28c; damaged, 8@12c. Taken off after May 1 and before August 1: Steers and cows, 17@18c; bulls and stags, 13@14c; kips, 20@21c; calfskins, 32@38c. Taken off from August 1 to September 1, all weights: No. 1, 19c; No. 2, 17c; No. 3, 16c; bulls and stags, No. 1, 15c; No. 2, 13c; kips, No. 1, 21c; No. 2, 19c; calf, under 15 lbs., No. 1, 33c; No. 2, 31c.

Special Citrus Market Report

Los Angeles, December 23, 1918.

Good shipping weather in the East has permitted fruit to roll freely, and buyers have cleaned up all arrivals closely. Shipments for the week have dropped heavily from all districts and the usual after-holiday slump is not looked for. Tulare stock ranged from $1.50 to $7.50 per box on the auctions, averaging $5.50 to $6.50. Shipments 194 carloads during past week. Southern California shipments dropped to 208 carloads. Prices during the week averaged $2.75 to $4 f. o. b. shipping point. Lemon shipments have been the heaviest ever, and the demand for use in the epidemic is still insistent. Several cargoes of foreign lemons are coming. Florida oranges are moving well at $3.25 to $4 f. o. b.

California is now able to supply easily the entire demand for lemons in the United States, and if adequately protected against the low-priced labor of Italy and Spain, notably the former, will do so. There is an ample outlet in Germany and other northern European countries for Italy's lemon supplies and when peace is restored much of Italy's output may be diverted in that direction if restrictive legislation is enacted in favor of California lemon growers.

Special Livestock Market Report

San Francisco, December 26, 1918.

CATTLE—Cattle being marketed in sufficient numbers, but poor quality, especially of small lots consigned or sold for butchering in small customs slaughter houses, holds the price down on all grades. Some cattle coming from Oregon and Nevada. Early grass cattle looked for this season on account of early and frequent rains. Thirty carloads of cattle and calves were shipped for San Francisco December 23.

Hay-fed Steers—
No. 1, weighing 1000@1200 lbs..12¾@13c
do. weighing 1200@1400 lbs.....13@13½c
do. second quality..............11@11½c
do. thin ....9½@10c

Cows and heifers—
No. 1 ....9@10c
do. second quality...............8@8½c
do. common to thin..............6@6½c

Bulls and stags—
Good ....6@7c
Fair ....6@6½c
Thin ....4½@5½c

Calves—
Lightweight ....11@11½c
Medium ....10½@10¾c

SHEEP—Sheep are coming mostly out of feed lots and are fat. Lambs from Oregon and Nevada and yearlings from California not very plentiful arrivals; quality good, though rather heavy. Twenty-four carloads shipped December 23 for San Francisco.

Sheep—
Yearlings ....12@12½c
Lambs ....13½@14c
Wethers 11½lb12c
Ewes ....9@9¼c

HOGS—Hogs have been coming very freely; good quality and desirable weights. Note the classification of prices according to weights.

Hard, grain-fed, 100@150 lbs...........16c
do. do, 150@250.......................16½c
do. do, 250@300.......................16c
do. do, 300@400.......................15¾c

Los Angeles, December 24, 1918.

CATTLE—The past week was a very quiet one in this market. The nearness of the Christmas holidays caused killers to hold back and take fewer cattle, as the dressed meat trade was dull. Not only were there fewer cattle moving, but the tone of the market was weak.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers........ 8.00@ 9.00
Good cows and heifers.......... 7.00@ 7.50
Canners, per cwt............... 5.50@ 6.00
Calves, per cwt................ 8.50@10.00

HOGS—There were more hogs in the past week and the quality of the offerings was good. Demand fair and prices steady. Killers, while all wanting a fewer hogs, did more or less picking around and the better offerings had a bearish influence upon the market.

Per cwt. f. o. b. Los Angeles—
Heavy, averaging 275@350 lbs—$14.00@15.00
Mixed, 225@275 lbs........... 15.00@16.00
Light, 175@225 lbs........... 16.00@16.50

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—The market the past week was quiet. Not many are coming in, and what are arriving are mainly of poor quality. The choice coming in met with a very good demand.

Per cwt. f. o. b. Los Angeles—
Prime wethers ....$9.00@10.00
Prime ewes .... 8.50@ 9.50
Yearlings .... 9.50@10.50
Lambs ....14.00@15.00

Portland, December 23, 1918.

CATTLE—Grass fed, on foot, gross weight: No 1 steers, weighing 950 to 1050 pounds alive, 12½@12¾c; 1050 to 1200 pounds, 12¾@13c; second quality, 11@11½c; thin steers, 9½lb10c. Cows and heifers: No. 1, 9@9½c; second quality, 8@8½c; common to thin, 6@6½c. Bulls and stags: Good, 6@6½c; fair, 5½@6½c; thin, 4½@5½c. Calves: Light weight, per lb., 11@11½c; medium, 10½@10¾c.

SHEEP—Per lb., gross weight: Wethers, 11½@12c; ewes, 9@9¼c; lambs, yearlings, 12@12½c; milk, 14@14½c.

HOGS—Hard, grain fed, weighing 100 to 150 lbs., 16c; 150 to 250 lbs., 16½c; 250 to 300 lbs., 16c; 300 to 400 lbs., 15¾c.

EASTERN MARKET.

Chicago, December 23, 1918.
(U. S. Bureau of Markets.)

HOGS—Receipts, 4000; market strong; bulk of sales, $17.30@17.65; butchers, $17.45@17.70; light, $16.70@17.50; packing, $16.65@17.45; throwouts, $15.50@16.50; pigs, good to choice, $13.50@15.00.

CATTLE—Receipts, 20,000; strong to 25c higher; calves, 25c lower. Beef cattle: Good to choice and prime, $15.00@19.50; common to medium, $9.00@9.15; butcher stock, cows and heifers, $7.25@14.00; canners and cutters, $6.65@7.25; stockers and feeders, good, choice and fancy, $10.25@13.50; inferior, common and medium, $7.25@10.25; veal calves, good and choice, $14.00@14.50.

SHEEP—Receipts, 12,000; market on killing classes strong, mostly 25c higher; feeders, strong; lambs, choice and prime, $14.85@15.00; medium and good, $13.50@13.85; culls, $9.50@12.00; ewes, choice and prime, $9.25@9.75; medium and good, $8.00@9.25; culls, $4.00@6.75.

Truck Crop Notes

[Written by R. G. Risser, United States Truck Crop Specialist.]

ASPARAGUS.

The acreage of asparagus grown in the Imperial Valley for shipment in 1917, 1918 and 1919, respectively, is estimated as follows: 287 acres, 282 acres and 312 acres. The average yield for 1917 was 97 shipping crates, and 81 shipping crates for 1918, 25 pounds net weight. The heavy shipments normally run March 15 to April 15.

CANTALOUPES.

The growers have generally made excellent progress in preparing the land. Some experimental plantings have been made. More planting will be done this month, but most of the crop will be planted after the first of the year. Compilation of acreage data indicates there will probably be 13,000 acres planted. Contracts have not all been let, but 22 shippers are arranging the distribution of the crop. If the season is normal, shipments will be heavier than last year.

CELERY.

The quality is fine, but blanching is only medium. Some fields are about finished, others are just beginning. Yields are good. The shipments have been larger than expected. The total production is estimated to be not over 60 per cent of last season's.

CAULIFLOWER.

The cauliflower crop is late in maturing in spite of the favorable weather in the southern section. The growers are unable to explain the unexpected delay in the development of the shipping stock. Prices paid growers are high for this time of year. The cauliflower crop in the Colma district is still maturing slowly on account of cool weather.

A Prosperous New Year to You!

To the thousands of good friends who find pleasure and profit in our pages we wish the happiest of happy New Years. And we feel that if we delight you fifty-two times with a paper chock full of human interest we will contribute to your happiness.

But we want the coming year to be more than a happy one—we want it to be the most prosperous one in your history. We measure our success by the way we help you to succeed, and while we have tried to serve you most efficiently in the past we are determined to double-discount our best previous efforts during 1919.

We shall introduce many new and practical ideas. Our articles will tell of real folks and their actual accomplishments, and, besides making them helpful to the nth degree, we shall try to have them interesting and inspiring. We shall work right with you to make 1919 notable for better farming, greater progress and larger profits.

Success and Happiness request the honor of your presence at the Dinner of Plenty, courses of which will be served weekly in the Rural Press during 1919.
